Tablo 1 incelendiğinde, müzik eğitimi alanında öğrenim gören öğrencilerin performans kaygılarına yönelik olarak 10 lisansüstü tezin olduğu belirlenmiştir. 2018 ve 2021 yılında 2'şer lisansüstü tez, 2019, 2020 ve 2023 yıllarında 1 lisansüstü tez, 2022 yılında ise 3 lisansüstü tez bulunmaktadır. Hazırlanan lisansüstü tezlerin 5'i yüksek lisans tezi, 4'ü doktora tezi 1'i ise sanatta yeterlik tezi şeklindedir.

Tablo 2. Müzik Eğitimi Alanında Eğitim Gören Öğrencilerin Performans Kaygılarına Yönelik Olarak Lisansüstü Tezlerin Türlerine Göre Dağılımı

Tez	f	%
Yüksek Lisans Tezi	5	50
Doktora Tezi	4	40
Sanatta yeterlik	1	10
Toplam	10	100

Tablo 2 incelendiğinde, lisansüstü tezlerin 5'inin yüksek lisans tezi, 4'ünün doktora tezi, 1'inin ise sanatta yeterlik tezi olduğu ortaya çıkarılmıştır.

Tablo 3. Müzik Eğitimi Alanında Eğitim Gören Öğrencilerin Performans Kaygılarına Yönelik Olarak Lisansüstü Tezlerde Kullanılan Yönteme İlişkin Dağılım

Tez Başlığı	Yöntem
Konservatuvarda ortaokul ve lise düzeyinde öğrenim gören müzik öğrencilerinin müzik performans kaygı düzeyleri ile duygusal zekâ düzeylerinin çeşitli değişkenlere göre incelenmesi	Nicel
Müzik öğretmeni adaylarının mükemmeliyetçilik ve öz-yeterlik inançlarına göre müzik performans kaygılarının yordanması	Nicel
Müzik öğretmenlerinin müzik performans kaygılarının ve iş doyumlarının çeşitli değişkenler açısından incelenmesi	Nicel
Müzik öğretmeni adaylarının müzik performans kaygısı ile bireysel çalgı performans sınavı kaygısı arasındaki ilişkinin incelenmesi	Nicel
Mesleki çalgı eğitimi gören öğrencilerin müzik performans kaygısının giderilmesinde sinir dili programlama (NLP) yönteminin uygulanması	Karma
Müzik bölümü öğrencilerinin çalgı performans yönetimi öz yeterlilik algıları performans kaygı düzeyleri ve aralarındaki ilişkinin incelenmesi	Nicel
Lisans düzeyinde çalgı eğitimi alan Konservatuvar Müzik Bölümü öğrencilerinin müzik performans kaygısına ilişkin görüşleri	Nicel
Müzik öğretmeni adaylarının çalgı performansı özyeterlilikleri ve müzik performans kaygılarının öğrenci başarısı üzerine etkisi	Karma
Müzik performans kaygısının korno sanatçıları örneklemini üzerinden nitel olarak incelenmesi	Nitel
Müzik öğretmeni adaylarının müzik performans kaygısı, algılanan stres, sürekli kaygı ve bilinçli farkındalık düzeylerine ilişkin düzenli yoga pratiklerinin etkisi	Nicel

Tablo 3’de, hazırlanan çalışmaların 7’sinin nicel araştırma yöntemi ile hazırlandığı, 2’sinin karma yöntemle, 1’inin ise nitel yöntemle hazırlandığı görülmektedir.

Tablo 4. Müzik Eğitimi Alanında Eğitim Gören Öğrencilerin Performans Kaygılarına Yönelik Olarak Lisansüstü Tezlerde Kullanılan Örneklem Gruplarına İlişkin Dağılım

Çalışmanın Adı	Örneklem Grubu
Konservatuvarda ortaokul ve lise düzeyinde öğrenim gören müzik öğrencilerinin müzik performans kaygı düzeyleri ile duygusal zekâ düzeylerinin çeşitli değişkenlere göre incelenmesi	Ortaokul-lise Konservatuvar öğrencileri
Müzik öğretmeni adaylarının mükemmeliyetçilik ve öz-yeterlik inançlarına göre müzik performans kaygılarının yordanması	Müzik eğitimi lisans öğrencileri
Müzik öğretmenlerinin müzik performans kaygılarının ve iş doyumlarının çeşitli değişkenler açısından incelenmesi	Müzik eğitimi lisans öğrencileri
Müzik öğretmeni adaylarının müzik performans kaygısı ile bireysel çalgı performans sınavı kaygısı arasındaki ilişkinin incelenmesi	Müzik eğitimi lisans öğrencileri
Mesleki çalgı eğitimi gören öğrencilerin müzik performans kaygısının giderilmesinde sinir dili programlama (NLP) yönteminin uygulanması	Konservatuvar ve GSL öğrencileri
Müzik bölümü öğrencilerinin çalgı performans yönetimi öz yeterlilik algıları performans kaygı düzeyleri ve aralarındaki ilişkinin incelenmesi	Müzik eğitimi lisansüstü öğrencileri
Lisans düzeyinde çalgı eğitimi alan Konservatuvar Müzik Bölümü öğrencilerinin müzik performans kaygısına ilişkin görüşleri	Konservatuvar lisans öğrencileri
Müzik öğretmeni adaylarının çalgı performansı özyeterlilikleri ve müzik performans kaygılarının öğrenci başarısı üzerine etkisi	Müzik eğitimi lisans öğrencileri
Müzik performans kaygısının korno sanatçıları örneklemini üzerinden nitel olarak incelenmesi	Sanatçı
Müzik öğretmeni adaylarının müzik performans kaygısı, algılanan stres, sürekli kaygı ve bilinçli farkındalık düzeylerine ilişkin düzenli yoga pratiklerinin etkisi	Müzik eğitimi lisans öğrencileri

Tablo 4 incelendiğinde, 5 çalışmanın örneklem grubunu müzik eğitimi lisans öğrencilerinin oluşturduğu; 1'er tane olmak üzere ortaokul-lise konservatuar öğrencileri, konservatuar ve GSL öğrencileri, sanatçı, konservatuar öğrencileri, müzik eğitimi lisansüstü öğrencileri oluşturmaktadır.

Sonuç ve Öneriler

Araştırmanın sonucunda, müzik eğitimi alanında öğrenim gören öğrencilerin performans kaygılarına yönelik 10 lisansüstü tezin hazırlandığı görülmektedir. 2018 ve 2021 yılında 2 lisansüstü tez, 2019, 2020 ve 2023 yıllarında 1 lisansüstü tez, 2022 yılında ise 3 lisansüstü tez olduğu görülmektedir. Aynı zamanda, lisansüstü tezlerden 5'inin yüksek lisans tezi, 4'ünün ise doktora tezi, 1'inin ise sanatta yeterlik tezi olduğu belirlenmiştir.

Araştırmanın diğer sonuçları incelendiğinde, hazırlanan çalışmaların 7'sinin nicel araştırma yöntemi ile hazırlandığı, 2'sinin karma yöntemle, 1'inin ise nitel yöntemle hazırlandığı görülmektedir.

Bir başka araştırma sonucunda, lisansüstü tezlerin 5'inin örneklem grubunu müzik eğitimi lisans öğrencilerinin oluşturduğu, 1 tane olmak üzere ortaokul-lise konservatuar öğrencileri, konservatuar ve GSL öğrencileri, sanatçı, konservatuar öğrencileri, müzik eğitimi lisansüstü öğrencileri oluşturduğu tespit edilmiştir.

Araştırma sonuçları ışığında, şu önerilere yer verilmiştir:

- ✓ Çeşitli örneklem grubu ile ilgili çalışmalar bulunmakla birlikte, daha az gerçekleştirilen çalışmalara ağırlık verilebilir. Bu yönde, araştırmanın örneklem gruplarının müzik eğitimi alan ortaokul ve lise öğrencilerine yönelik olarak yapılabilir.
- ✓ Müzik alanı öğrencilerinin performans kaygılarının saptanabilmesi amacıyla deneysel çalışmaların artırılması faydalı olabilir.
- ✓ Müzik eğitimi alanında eğitim gören öğrencilerin kaygılarının sorunlarının betimsel olarak ele alınması amacıyla hazırlanacak nitel çalışmaların artırılması faydalı olabilir.
- ✓ Gelecek yıllarda müzik alanına yönelik lisansüstü tezlerin daha fazla artması alan yazına önemli katkılar sağlayabilir.
- ✓ Bu çalışma, lisansüstü tezler ile sınırlıdır. Bu konuyu ele alan yeteri kadar lisansüstü tezlerin olmadığı söylenebilir. Bu bakımdan, durumu daha detaylı ele alacak bu alana ilişkin diğer çalışmaların yapılması da önerilebilir.

Özet

Çin kuşak yol projesi son dönemde adından sıkça bahsettiren ve önemli ekonomik sonuçları bulunan projelerden biridir. Çin devlet başkanı Xi Jinping'in 2013 yılında Kazakistan'da yapmış olduğu bir konuşmada dünya kamuoyunun gündemine gelen kuşak yol projesi ile ipek yolu ülkeleri arasındaki ticari ilişkilerin geliştirilmesi ve bu ülkeler arasındaki ekonomik ilişkilerin canlandırılması hedeflenmiştir. Proje, ipek yolu ekonomik kuşağı ve deniz ipek yolu şeklinde olmak üzere olarak ikili bir yapıya sahiptir. İpek yolu ekonomik kuşağı ise Çin - Hindini Yarımadası Ekonomik Koridoru, Çin - Pakistan Ekonomik Koridoru, Çin - Orta Asya - Batı Asya Ekonomik Koridoru, Bangladeş - Çin - Hindistan - Myanmar Ekonomik Koridoru, Çin - Moğolistan - Rusya Ekonomik Koridoru ve Yeni Avrasya Kara Köprüsü Ekonomik Koridoru şeklinde olmak üzere 6 koridor (güzergah)'dan oluşmaktadır. Bu koridorlar Çin'den Avrupa'ya kadar olan ülkeler birbirine bağlanmaktadır. Türkiye projenin Çin-Orta Asya- Batı Asya ekonomik koridoru (kısa adıyla orta koridor) üzerinde bulunmaktadır. Bu koridor Türkiye üzerinden Avrupa'ya ulaşılabilen bir koridordur ve bu koridor üzerinde Kazakistan, Kırgızistan, Türkmenistan, Özbekistan, Tacikistan ve Türkiye bulunmaktadır. Bu bağlamda kuşak yol projesinin Türkiye açısından önemli ekonomik sonuçlarının olabileceğini söylemek mümkündür. Hazırlanmış olan bu çalışma ile Türkiye ile Çin arasındaki dış ticaret faaliyetlerinin proje öncesi ve sonrası dönemdeki yapısı karşılaştırmalı olarak analiz edilecek ve projenin iki ülke arasındaki ticari faaliyetler üzerindeki etkisi ortaya konulmaya çalışılacaktır.

EFFECTS OF THE CENTRAL CORRIDOR, ONE OF THE CORRIDORS OF THE CHINA BELT ROAD PROJECT, ON FOREIGN TRADE ACTIVITIES BETWEEN TURKEY AND CHINA: 2002-2022 PERIOD

Abstract

The China belt road project is one of the projects that has been frequently mentioned recently and has significant economic consequences. The belt road project, which came to the agenda of the world public in a speech made by Chinese President Xi Jinping in Kazakhstan in 2013, aimed to develop commercial relations between the Silk Road countries and revitalize the economic relations between these countries. The project has a two-way structure in the form of an economic segment of the Silk Road and a marine silk road. The Silk Road Economic Corridor consists of 6 corridors, including the China- Indochina Peninsula Economic Corridor, China-Pakistan Economic Corridor, China - Central Asia - West Asia Economic Corridor, Bangladesh - China - India - Myanmar Economic Corridor, the China - Mongolia - Russia Economic Corridor and the New Eurasia Land Bridge Economic Corridor. These corridors connect countries from China to Europe. Turkey is located on the China-Central Asia-West Asia economic corridor (shortly the middle corridor) of the project. This corridor is a corridor that can be reached to Europe via Turkey, and on this corridor there are Kazakhstan, Kyrgyzstan, Turkmenistan, Uzbekistan, Tajikistan and Turkey. In this context, it is possible to say that the belt road project may have important economic consequences for Turkey. With this prepared study, the structure of foreign trade activities between Turkey and China before and after the project will be analyzed comparatively and the impact of the project on commercial activities between the two countries will be tried to be revealed.

Keywords: China Belt Road Project, China, Central Corridor, Turkey, Foreign Trade

Giriş

Günümüzde dünya ticaretinin en önemli ülkelerinden biri Çin'dir. Dünya ticaretinin gelişimi açısından gerek altyapı gerekse de ulaştırmanın son derece önemli olduğunun bilincinde olan Çin, kuşak yol projesini geliştirmek ve uygulamak suretiyle küresel çapta bir ticari hakimiyet elde etme gayreti içerisinde. Kuşak yol projesi, temel olarak 65'den fazla ülkeyi ve dolayısıyla bu ülkeler arasındaki ticari faaliyetlerin önemli bir kısmını birbirine bağlamayı, bu yolla da ülkelerin karşılıklı iş birliği içerisinde ve sürekli bir şekilde gelişim göstermesini sağlamayı amaçlayan küresel nitelikli bir taşımacılık projesidir. Kuşak yol projesinin biri karadan, diğeri de denizden olmak üzere iki temel güzergâhı bulunmaktadır. Projenin kara güzergâhı "İpek Yolu Ekonomik Kuşağı", deniz yolunu ise "Deniz İpek Yolu" oluşturmaktadır. İpek Yolu yıllar boyunca güzergâhı üzerinde bulunan ülkeler arasındaki ticaret başta olmak üzere siyasi, ticari ve kültürel ilişkilerin gelişmesinde önemli katkılarda bulunmuştur ve günümüzde de hala önemini korumaktadır. Çin, Orta Asya, Rusya, Orta ve Doğu Avrupa ile Batı Avrupa'yı birbirine bağlamayı amaçlayan ipek yolu ekonomik kuşağında 6 koridor bulunmaktadır. Bu koridorları Çin - Hindçini Yarımadası Ekonomik Koridoru, Çin - Pakistan Ekonomik Koridoru, Çin - Orta Asya - Batı Asya Ekonomik Koridoru, Bangladeş - Çin - Hindistan - Myanmar Ekonomik Koridoru, Çin - Moğolistan - Rusya Ekonomik Koridoru ve Yeni Avrasya Kara Köprüsü Ekonomik Koridoru şeklinde sıralamak mümkündür. Bu koridorlar ile Çin'den Avrupa'ya kadar olan ülkeler birbirine bağlanmaktadır. Türkiye projenin Çin-Orta Asya-Batı Asya ekonomik koridoru (kısa adıyla orta koridor) üzerinde bulunmaktadır. Türkiye üzerinden Avrupa'ya ulaşılabilen bir koridor niteliğindeki bu koridor üzerinde Kazakistan, Kırgızistan, Türkmenistan, Özbekistan, Tacikistan ve Türkiye bulunmaktadır. Çin kuşak yol projesi ile güzergâh üzerindeki ülkeler arasında siyasi yakınlaşmaların sağlanması, ticari faaliyetlerin artması ve finansal kaynaklara ulaşımın kolaylaşması gibi birçok hedefin gerçekleştirilmesi amaçlanmaktadır. Bunlara ilaveten kuşak yol projesinin bir diğer önemli amacının da yine güzergâh üzerindeki ülkelerin ve de özellikle Avrasya'nın hem sosyal hem ekonomik hem de finansal olarak bütünleşmesini sağlamak olduğunu söylemek mümkündür. Bu bağlamda projenin diğer ülkelerde olduğu gibi Türk ekonomisi üzerinde de önemli ekonomik etkilerinin olacağını söylemek mümkündür. Bununla birlikte Türkiye, kuşak yol projesinin en önemli ülkelerinden biridir. Zira Türkiye dünya üzerinde sahip olduğu eşsiz konumu itibarıyla bu projenin en önemli geçiş noktalarından birini teşkil etmektedir. Kuşak yol projesi açısından bu denli önemli bir niteliğe haiz olan Türkiye'nin proje kapsamında önemli ticari kazanımlar elde etmiş olmasını beklemek mümkündür. Bu kazanımların sadece ulaştırma sektörüne ilişkin olarak değil ulaştırma sektörü ile ilgili diğer bütün sektörler ile ilgili olarak da

gerçekleşmesi söz konusudur. Zira kuşak yol projesi yapısı itibariyle proje kapsamındaki ve güzergâhtaki bütün ülkelerin ticari açıdan çok yönlü olarak gelişim göstermesini hedeflemektedir. Kuşak yol projesinin açıklandığı 2013 yılından sonraki dönemde Türkiye ile Çin arasındaki ticari faaliyetlerin hacminde de artışların beklenmesi muhtemeldir. Bu bağlamda, hazırlanmış olan çalışma ile kuşak yol projesinin açıklanmasından önceki 10 yıllık dönem ile sonraki 10 yıllık dönemde Çin ile Türkiye arasındaki dış ticaret faaliyetlerinin yapısı ve hacmindeki gelişmeler ortaya konularak kuşak yol projesinin iki ülke arasındaki dış ticaret hacmi üzerindeki etkisi ortaya konulmaya çalışılacaktır.

LİTERATÜR TARAMASI

Süleyman (2023), 2013 – 2019 dönemi içinde TÜİK’den elde ettiği mikro veri setlerle Kuşak ve Yol Projesi güzergâhında yer alan ülkelerin mesafeleri arasındaki yakınlaşmaların Türkiye dış ticareti üzerine etkisini Çekim Modeli ile tahmin etmiş, yapılan tahmin neticesinde, kuşak yol projesinin Türkiye’nin ihracatına belirli düzeylerde olumlu yansımaları olmasına karşın ithalatı daha fazla artırması nedeniyle dış ticaret açığına neden olacağı sonucuna ulaşmıştır.

Ece (2023), ilanından günümüze kadar geçen sürede Bir Kuşak Bir Yol (OBOR) Projesi’nin güçlü ve zayıf yönleri ile fırsatlar ve tehditlerini tespit etmek amacıyla hazırlanmış olduğu çalışmada SWOT analiz yönteminden yararlanılmış, yapılan analiz neticesinde Bir Kuşak Bir Yol (OBOR) Projesi’nin güçlü yönlerinin enerji kaynaklarına erişimi kolaylaştırması ve güzergâh üzerindeki ülkelerin ticaret hacmini artırması, zayıf yönlerinin Orta Asya ülkelerinin coğrafi yapısı ve alt yapı yetersizlikleri ile Çin’den ithal eden ürünlere uygulanan anti-damping uygulamaları olduğu, söz konusu projenin sağlamış olduğu başlıca fırsatların güzergâh üzerindeki ülkelerinin ulaşım ve enerji ağlarını birbirine bağlamak suretiyle bu ülkelerin ekonomilerinin yeniden canlanmasına olanak sağlaması, Çin ile Avrupa ülkeleri arasındaki ticaretin gelişmesine katkıda bulunması ve sanayileşmek suretiyle bölge ülkelerindeki refahı artırması iken projenin için başlıca tehditlerin güzergâh üzerindeki ülkelerde yaşanan siyasi istikrarsızlıklar, komşu ülkeler arasındaki sınır anlaşmazlıkları ve bu ülkelerin kendi aralarındaki sorunlar olduğu tespit edilmiştir.

Koçpınar ve Şeker (2022), Türkiye’nin, Kuşak Yol Projesi güzergahında bulunan ülkelere yönelik ihracat potansiyelini analiz etmek amacıyla hazırlanmış olduğu çalışmada, 2000-2019 dönemine ait veri setinden yararlanarak çekim modeli ile analiz gerçekleştirilmiştir. Yapılan

analiz neticesinde Türkiye'nin gayrisafi yurtiçi hasılasındaki artışların, ülkenin ihracatını da artırdığı, Kuşak Yol ülkelerinin gayrisafi yurtiçi hasılasındaki artışların ise yine Türkiye'nin ihracatını pozitif yönde etkilediği, Türkiye'deki nüfus artışlarının Kuşak Yol Projesi kapsamındaki ülkelere ihracatı önemli ölçüde artırdığı, Kuşak Yol Projesi kapsamındaki ülkelere olan mesafe artışlarının Türkiye'nin bu ülkelere olan ihracatını negatif yönde etkilediği, Kuşak Yol güzergahında bulunan ülkelerinin uyguladığı ortalama gümrük tarife oranlarındaki artışın Türkiye'nin Kuşak Yol ülkelerine ihracatını olumsuz yönde etkilediği ve son olarak Kuşak Yol Projesi güzergahında bulunan ülkelerin deniz yolu ile bağlantısının bulunmamasının Türkiye'nin bu ülkelere ihracatını olumsuz yönde etkilediği tespit edilmiştir.

Çakılcı (2021), Kuşak-Yol projesinin hedeflerine ilişkin bilgiler verdiği ve projenin kapsam dahilindeki ülkeler ile Türkiye'ye ne gibi avantajlar sağladığı ve projenin ne gibi dezavantajlara sahip olduğunu ortaya koymak amacıyla hazırlanmış olduğu çalışmada konuya ilişkin çeşitli incelemeler yapmış ve değerlendirmelerde bulunmuştur. Yapılan değerlendirmeler kapsamında Çin'in kuşak yol projesi kapsamındaki ülkelere borç vermek suretiyle bu ülkeleri finansal açıdan kendisine bağlı hale getirdiği ve projenin devamlılığını sağlaması açısından bu durum Çin için avantaj bir durum teşkil ettiği, ancak borç verilen ülkelerde yaşanan ekonomik sıkıntılar nedeniyle verilen borçların geri dönüşümünde sıkıntıların yaşanmasının Çin açısından dezavantajlı bir durumu teşkil ettiği tespit edilmiştir. Ayrıca Çin'in, proje kapsamındaki ülkelerle ticaretini geliştirmekte olduğu, bu ülkelerle arasındaki ihracat ve ithalatı arttırdığı ve diğer ülkeleri kendi ekonomik sistemine entegre etmek suretiyle ekonomik olarak yükseliş sürecindeki yavaşlamalara yeni bir hareketlilik kazandırabilmek için yeni pazarlar bulabildiği, bu sayede de Çin'in dışa açılma hedeflerine hız kazandırdığı ifade edilmiştir. Kuşak yol projesinin Türkiye'ye konumu itibarıyla önemli avantajlar sağladığı ve gerek Avrupa'ya gerekse de ekonomik açıdan son derece önemli pek çok bölgeye bağlantının sağlanabilmesi nedeniyle yeni yatırım ve istihdam alanlarının ortaya çıkmasına olanak sağladığı, turizm sektörüne olumlu yansımalarının bulunduğu ve hem enerji kaynaklarına ulaşımı kolaylaştırdığı hem de enerji bağımlılığının azalmasına olanak sağladığı ifade edilmiştir.

Algül (2020), kuşak yol projesinin Türk enerji sektörü açısından sahip olduğu önemi ve sunabileceği fırsatları değerlendirdiği çalışmada 3 önemli noktanın altını çizmiştir. Bu noktalardan ilkinin ekonomik büyüme açısından önemli bir ivme yakalamış olan Türkiye'nin bu büyüme hızının devam etmesi durumunda enerji ihtiyacının artış göstermesi ve bu ihtiyacın

kuşak yol projesi sayesinde ulaşılabilecek yeni enerji kaynakları ile karşılanabilmesi oluşturmaktadır. Projenin sağladığı bir diğer önemli fırsatın Türkiye'nin arz güvenliği açısından ortaya çıktığı belirtilmiş ve arz güvenliği açısından kaynak ülke çeşitlendirmesinin sağlayacağı avantajların önemi üzerinde durulmuş, son olarak mevcut durumda enerji açısından sadece bir geçiş ülkesi konumunda bulunan Türkiye'nin kuşak yol projesi sayesinde yeni enerji kaynaklarına ulaşabileceği ve bu kaynakları uluslararası piyasalarda pazarlamak suretiyle enerji arzı noktasında küresel bir merkez olabileceği ifade edilmiştir.

Akdağ (2019), açıklandığı tarihten 2019 yılına kadar olan dönemde kuşak yol projesinin Türkiye ile Çin arasındaki ilişkiler üzerindeki etkilerini ve projenin önemini inceleme ve değerlendirmeye yönelik olarak hazırlanmış olduğu çalışmada projenin iki ülkeye sağlayacağı fırsatlar ve tehditler üzerinde durmuştur. Yapılan değerlendirmeler neticesinde Türkiye'nin, Çin mallarının Avrupa pazarına taşınması sürecinde kritik bir öneme sahip olduğu, kuşak yol projesi sayesinde Türkiye'ye yönelik yatırımlarda artışların meydana geleceği, Türkiye'nin dış ticaret hacminde artışların meydana geleceği, Türkiye'nin de Asya pazarlarına daha hızlı, kolay ve ekonomik bir şekilde ulaşabilme fırsatını yakalayacağı ve Türkiye ile Çin arasındaki en önemli ekonomik sorunu teşkil eden dış ticaret açığının azaltılması noktasında önemli bir rol oynayacağı ve son olarak Türkiye'nin Çin başta olmak üzere Doğu Asya ülkelerinin önemli bir kısmı ile sürdürülebilir ve güçlü ekonomik ilişkiler kurmasına olanak sağlayacağı ifade edilmiştir.

KUŞAK YOL PROJESİ VE TÜRKİYE-ÇİN DIŞ TİCARET İLİŞKİLERİ

Kuşak yol projesi özünde bir ulaştırma projesi olmakla birlikte, ulaştırmaya bağlı pek çok sektörü doğrudan etkileyen bir projedir. 2013 yılının Eylül ayında Çin Devlet Başkanı tarafından dünya kamuoyuna tanıtılan kuşak yol projesi ile Çin, dünya ticareti açısından büyük bir öneme sahip Asya, Avrupa ve Afrika kıtalarını hem karayolu ile hem de deniz yolu ile birbirine bağlamak istemiştir. Bir diğer ifade ile kuşak yol projesi Asya, Avrupa ve Afrika kıtalarındaki altmış beş ülkeyi kapsayan, yatırım, ticaret, güvenlik ve lojistik konularında yeni bir küresel tedarik zinciri oluşturma ve ekonomik değer üretmeye yönelik bir projedir (Aybar, 2017). Projenin adında yer alan "Kuşak" kelimesi projenin karayolları, demir yolları, petrol ve doğalgaz boru hatları ve altyapı yatırımlarını kapsayan Kara güzergâhını ifade ederken "Yol" kelimesi projenin kapsamında yer alan Deniz yollarını ifade etmektedir (Yılmaz, 2020: 5276). Bu proje sayesinde Çin, dünya ticaretine yeni bir ivme kazandırmak ve projenin hem kara hem

de deniz güzergâhında bulunan ülkelerin ticari faaliyetlerinde artışlar sağlamak suretiyle çeşitli ekonomik kazanımlar elde etmeyi hedeflemiştir. Zira Çin dışındaki ülkelerin refahındaki ve ticari faaliyetlerindeki artışların Çin'in ekonomik gelişimine dolaylı katkıları da olabilecektir. Hem Çin hem güzergâh üzerindeki ülkeler hem de dolaylı olarak dünya ekonomisi için son derece önemli olan kuşak yol projesinin temel amacını proje kapsamındaki ülkelerin ulaşım altyapılarını iyileştirmek ve hem ulusal hem de bölgesel kalkınma planlarını koordine etmek şeklinde ifade etmek mümkündür (Çelik vd. 2022:1127). Kuşak yol projesinin kara güzergâhı altı koridordan oluşmaktadır. Bu koridorları, Çin-Moğolistan-Rusya Ekonomik Koridoru, Türkiye'nin de içinde yer aldığı Çin-Orta Asya-Batı Asya Ekonomik Koridoru, Çin-Hindini Yarımadası Ekonomik Koridoru, Yeni Avrasya Kara Köprüsü Ekonomik Koridoru, Bangladeş-Çin-Hindistan-Myanmar Ekonomik Koridoru ve son olarak Çin-Pakistan Ekonomik Koridoru şeklinde sıralamak mümkündür. Projenin deniz güzergâhında ise sadece Güneydoğu Asya Ülkeleri Birliği (ASEAN) ile değil Batı Asya, Güney Asya, Kuzey Afrika ve Avrupa ekonomilerini birbirine bağlayacak ekonomik bir koridordan oluşmaktadır (Yılmaz, 2020: 5276). Kuşak yol projesi kapsamında karayolu, demiryolu, liman altyapı projeleri ile enerji sektörleri, kamusal hizmetler, ulaştırma, lojistik ve inşaat faaliyetleri ayrıca finansal piyasalar, teknolojik gelişmeler, telekomünikasyon, medya ve bilgi teknolojileri yer almaktadır (Çelik vd. 2022: 1127).

Türkiye'nin de dahil olduğu Çin-Orta Asya-Batı Asya Ekonomik Koridoru kuşak yol projesinin en önemli güzergâhlarından birini teşkil etmektedir. Çin-Orta Asya- Batı Asya Ekonomik Koridoru olarak bilinen Çin'in Orta Koridoru, Avrasya'dan geçmek suretiyle tarihi İpek Yolu'nun ana bağlantılarını oluşturan Asya, Kafkaslar ve Orta Doğu yoluyla ekonomik iş birliğini teşvik etme yanında, Avrupa ve Çin'in uzak pazarlarını birbirine bağlamak suretiyle eski bir güç, kültür ve ticaret bağı yeniden canlandırmayı hedeflemektedir (Çatal, 2019: 104). Orta koridor üzerinde bulunan Türkiye, gerek coğrafi konumu, gerek ekonomik yapısı ve gerekse de ticari ilişkileri itibariyle kilit rol oynayan ülkelerden biridir. Bu bağlamda Türkiye ile Çin arasında ticari ilişkilerde önemli gelişmeler yaşandığını söylemek mümkündür. Özellikle Türkiye'nin coğrafi konumu, proje açısından Türkiye'nin önemini son derece artırmaktadır. Zira Türkiye ekonomik açıdan önemli pazarların geçiş noktası üzerinde bulunmaktadır. Bu özelliği itibariyle de Çin'den Avrupa'ya ve birçok stratejik bölgeye uzanan önemli bir bağlantı noktası olma niteliğine sahiptir. Bu yapısı itibariyle Türkiye'nin, Çin-Orta Asya-Batı Asya güzergâhındaki ülkeler ile ticari bağlantılarının ve ilişkileri güçlenmesine

katkıda bulunmakta, bu gelişmeler ise Türkiye’de yeni yatırımların yapılmasına ve istihdam artışlarına olanak sağlamaktadır. Bununla birlikte Çin’i, Türkiye üzerinden Avrupa’ya bağlayacak olan Orta Kuşak Koridoru, genelde güzergâh üzerindeki ülkelerin, özelde ise Türkiye-Çin ilişkilerin daha fazla gelişim göstermesi açısından önemli bir ortam sağlamaktadır. Bu süreçte Orta Kuşak Koridoru, güzergâh üzerindeki tüm ülkeler arasında hem ticaretin artmasına hem de bu ülkeler arasındaki ekonomik entegrasyonu gerçekleşmesine olanak sağlamaktadır. Ayrıca bu süreçte projenin tamamlanmasıyla birlikte Çin mallarının Avrupa’ya ulaştırılması noktasında Türkiye’nin kilit bir rol oynayacağını söylemek mümkündür (Akdağ, 2019: 82). Bununla birlikte Kuşak yol projesi sürecinde Türkiye ile Çin arasındaki ticari ilişkilerin sadece bir transit ülke formasyonunda olmadığını, kuşak yol projesinin Çin ile Türkiye arasındaki ticari ilişkilerin gelişmesine de önemli katkılarda bulunduğunu ifade etmek gerekir. Bununla birlikte iki ülke arasındaki ticaretin gelişimi Kuşak yol projesinin açıklanmasından hemen sonraki dönem de değil, çok daha sonraki yıllarda gerçekleşmiştir. Tablo 1 de yer alan veriler, iki ülke arasındaki ticarete incelenen dönem boyunca Türkiye’nin net ihracatçı konumunda olduğunu göstermektedir. Aynı tabloda Türkiye’nin Çin’e ihracatının 2013 yılında 3.7 milyar dolar olduğu ancak sonraki dönemde Türkiye’nin Çin’den elde ettiği ihracat gelirlerinin sürekli olarak 3 milyar doların altında gerçekleştiği görülmektedir. Türkiye’nin Çin’e ihracatından elde ettiği gelir 2021 yılında yaklaşık 3.6 milyar olarak gerçekleşmek suretiyle 2013 yılındaki seviyesini ancak yakalayabilmiş, 2022 yılında da bu seviye korunarak Çin’e yaklaşık 3.2 milyar dolarlık ihracat gerçekleştirilmiştir. 2017 yılında Çin’e yapılan ihracatta metal cevherleri ağırlık bir paya sahiptir. Çin’e satılan ürünlerin başında mermer, traverten, ekosin, su mermeri ve kireçli taşlar gelmektedir. Bu ürünleri krom cevheri, tabii barotlar, kıymetli metal cevherleri, kurşun cevherleri takip ederken, radyatör, yün ve yapağı da önemli ihracat ürünleri arasında yer almaktadır (Çatal, 2019: 108). 2021 yılında ise Çin’e ihracat edilen ürünler yine mermer ve traverten, diğer kıymetli metal cevherleri ve konsantreleri, kurşun, krom, bakır, demir, çinko, tabii borat cevherleri, bor oksitleri ve borik asitlerden oluşmuştur. Bu ürünlere ilaveten Türkiye’den Çin’e meyve, hayvansal ve bitkisel katı ve sıvı yağ, antepfıstığı, hububat, un, nişasta ve müstahzarları, su ürünleri ve süt ürünleri ihracatı (Dışişleri Bakanlığı, 2021). Bu bilgiler doğrultusunda hem ürün çeşitliliği hem de ihracat gelirleri açısından çok önemli değişikliklerin olmadığını ve kuşak yol projesinin Türkiye’nin Çin’e yönelik ihracatına olumlu yönde bir katkısının bulunmadığını söylemek mümkündür. Konuya ithalat açısından baktığımızda ise durum biraz farklılık göstermektedir. Tablo 1 de yer alan verilere bakıldığında

kuşak yol projesinin açıklanmasından sonraki 4 yıllık süreçte (2013-2016 dönemi) Türkiye'nin Çin'den gerçekleştirdiği ithalat için yaptığı ödemelerde neredeyse hiçbir değişiklik olmamış ve 2013 yılında 25,2 milyar dolar olarak gerçekleşen ithalat harcamaları 2016 yılında 25,4 milyar dolar olarak gerçekleşmiştir. Ancak sonraki 3 yılda Çin'den gerçekleştirilen ithalat azalmaya başlamış ve 2017 yılında 23,3 milyar dolara gerileyen ithalat harcamaları 2019 yılında daha da gerileyerek 19,1 milyar dolar olarak gerçekleşmiştir. Ancak 2019 yılından itibaren Türkiye'nin Çin'den gerçekleştirdiği ithalatta yıllar itibariyle önemli artışlar yaşanmış ve 2019 yılında 19,1 milyar dolar olan ithalat harcamaları sırasıyla 2020 yılında 23 milyar dolara, 2021 yılında 32,2 milyar dolara ve son olarak 2022 yılında 41,3 milyar dolar olarak yükselmiştir. Bu gelişme, ihracatın sabit kaldığı bir ticari ilişki içerisinde Türkiye'nin Çin ile olan dış ticaretinde açık vermesine neden olmuştur. Bu bağlamda Kuşak yol projesinin Türkiye ile Çin arasındaki ticarete gecikmeli olarak ve Çin'in lehine olacak şekilde bir gelişme gösterdiğini söylemek mümkündür. 2022 yılında Çin'den elektronik aksamli makine ve makine parçaları, manyetik veya optik okuyucular, telefon ve TV başta olmak üzere çok sayıda elektrikli ve elektronik makine ile teçhizatlar, demir-çelik ürünleri, otomotiv yedek parçaları, makine sanayi, organik kimyasallar ve plastik sanayi başta olmak üzere pek çok sektör için hammadde ve yarı mamul ithal edilmiştir (Alan 2023). Tablo 1. de yer alan veriler incelendiğinde Türkiye'nin Çin'e olan ihracatının son derece sınırlı düzeylerde gerçekleştiği görülmektedir. İncelen dönemin başı itibariyle Türkiye'nin Çin'e olan ihracatı toplam ihracatın sadece % 0.11'i kadar iken bu oran sonraki yıllarda artış göstermiş olmakla birlikte yine de son derece düşük düzeylerde gerçekleşmiştir. 1. alt dönem olan 2003-2012 döneminde Türkiye'nin Çin'e ihracatının 2011 yılı hariç oransal olarak artış eğiliminde olduğu ve 2012 yılında % 1,86 olarak, incelen alt dönem itibariyle en yüksek ihracat oranının ise 2010 yılında % 1,99 olarak gerçekleştiği görülmektedir. Başlangıcını kuşak yol projesinin açıklandığı tarih oluşturan ikinci alt dönemde (2013-2022) ise Türkiye'nin Çin'e ihracatında oransal olarak çok büyük dalgalanmalar olmamış ve ortalama olarak % 1.60 oranında gerçekleşmiştir. İncelen ikinci alt dönem (2013-2022) boyunca en yüksek oransal değere kuşak yol projesinin açıklandığı yıl olan 2013 yılında ulaşılmış ve Türkiye'nin Çin'e ihracatı % 2,33 olmuştur. En düşük oransal değer ise 2022 yılında % 1,29 olarak gerçekleşmiştir. Bu veriler doğrultusunda, projenin ilan edildiği yıl hariç son 10 yıllık dönemde kuşak yol projesinin Türkiye'nin Çin'e olan ihracatını çok da fazla etkilemediği ve dönemin genelinde istikrarlı bir yapının geçerli olduğu anlaşılmaktadır. 2013 yılındaki sıçramayı ise kuşak yol projesinin doğurduğu ticaret artırıcı beklentiye bağlamak mümkündür. 2013-2022 yıllarını kapsayan 2. alt dönemi 2003-2012 yıllarını kapsayan 1. alt dönem ile

karşılaştırdığımızda ise 1. dönemdeki Türkiye'nin Çin'e olan ihracatındaki oransal artış eğiliminin 2. dönemde belli bir ortalama düzeyde durağanlaştığı görülmektedir. Bir diğer ifadeyle kuşak yol projesinden önceki dönemde Türkiye'nin Çin'e olan ihracatı oransal olarak artış eğiliminde iken kuşak yol projesinin açıklanmasından sonraki dönemde durağanlaşmış ve hatta 2022 yılı itibarıyla de önemli azalış göstermiş durumdadır. Bu değerlendirmeler kuşak yol projesinin Türkiye'nin Çin'e olan ihracatını çok da fazla olumlu yönde etkilemediğini göstermektedir.

Tablo 1. Türkiye ile Çin Arasındaki Dış Ticaret Verileri

Yıllar	Türkiye'nin Çin'e İhracatı (Dolar)	Türkiye'nin Toplam İhracatı (Dolar)	Türkiye'nin Çin'e İhracatının Toplam İhracat İçindeki Payı (%)	Türkiye'nin Çin'den İthalatı (Dolar)	Türkiye'nin Toplam İthalatı (Dolar)	Türkiye'nin Çin'den İthalatının Toplam İthalat İçindeki Payı (%)

Türkiye'nin Çin'den olan ithalat değerlerine baktığımızda ise ihracatın aksine yüksek oranların söz konusu olduğu görülmektedir. Böyle bir durumun ortaya çıkmasında Türkiye'nin Çin'den gerçekleştirdiği Demir-Çelik ürünleri ithalatının önemli olduğunu söylemek mümkündür. Ayrıca Demir-Çelik ürünleri ithalatına son dönemlerde haberleşme ve ses kaydetme cihazlarının ithalatındaki artış da eklenince Türkiye'nin Çin'den gerçekleştirdiği ithalat için yaptığı ödeme miktarı hızlı bir şekilde arttığı, özellikle 2019 yılından sonraki dönemde bu artışların hızlandığı görülmektedir. Tablo 1 de yer alan verileri kuşak yol projesi açısından değerlendirdiğimizde ise ihracattakine benzer bir durumun söz konusu olduğunu söylemek mümkündür. Kuşak yol projesinin açıklanmasından önceki 1. alt dönemin (2003-2012) ilk yıllarında Türkiye'nin Çin'den gerçekleştirdiği ithalatın nominal değeri 2009 yılına kadar sürekli olarak artış göstermiş ve 2008 yılı itibariyle 15,6 milyar dolara kadar yükselmiştir. 2009 yılında ise 2008 küresel krizi nedeniyle keskin bir azalışın yaşandığı ve 12,6 milyar dolara kadar geriledikten sonra bir sonraki yıl yeniden hızlı bir artış gösterdiği ve 17, 1 milyar dolar olarak gerçekleştiği, kuşak yol projesinin açıklanmasından önceki iki yılda ise ithalat harcamalarını 21 milyar dolar seviyesinde gerçekleştirdiği görülmektedir. Bu veriler doğrultusunda Türkiye'nin Çin'den ithalatının kuşak yol projesi açıklanmadan önceki 10 yıllık dönemde 2008 yılındaki kriz yılı hariç genel olarak artış eğiliminde olduğu anlaşılmaktadır. Kuşak yol projesinin açıklanmasından sonraki 10 yıllık dönemde ise Türkiye'nin Çin'den ithalatının inişli çıkışlı bir seyir izlediği ve 2017 yılına kadar ortalama olarak 25 milyar dolar seviyesinde gerçekleştiği, 2017 yılından 2019 yılına kadar önemli miktarda gerilediği 2019 yılında 19,1 milyar dolar olarak gerçekleştiği görülmektedir. Ancak 2019 yılından sonraki 4 yıllık dönemde önemli bir artış ivmesi yakalamış olan ithalat harcamaları 2022 yılı itibariyle 41,3 milyar dolara kadar yükselmiştir. Bu veriler doğrultusunda Kuşak yol projesinden önceki 10 yıllık ve sonraki 10 yıllık dönemi karşılaştığımız zaman, 2003-2022 döneminde kriz yılı hariç Çin'den yapılan ithalatın düzenli olarak artış eğiliminde olduğu kuşak yol projesinin açıklanmasından sonraki ilk 4 yıllık dönemde ithalat açısından stabil bir sürecin yaşandığı, sonraki 3 yıllık dönemde keskin düşüşlerin yaşandığı ve son 3 yıllık dönemde ise önemli yükselişlerin meydana geldiği görülmektedir. Türkiye'nin Çin'den ithalatının toplam ithalat içindeki payına bakıldığında ise benzer bir durum ile karşılaşılmaktadır. Türkiye'nin Çin'den yaptığı ithalatın toplam ithalat içindeki payı, 2003 yılından 2009 yılına kadar hızlı bir şekilde artış göstermiş ve 2009 yılında % 9 olarak gerçekleşmiştir. 2009 yılından 2013 yılına kadar olan süreçte ise bu oranın korunduğu ve ortalama olarak % 9 civarında gerçekleştiği görülmektedir. Kuşak yol projesinin açıklanmasından sonraki 10 yıllık dönemde ise 2013 yılında 2016 yılına kadar Türkiye'nin

Çin'den ithalatının toplam ithalat içindeki payı artış göstermiş ve 2026 yılı itibariyle % 12,81 olarak gerçekleşmişti. Sonraki yıllarda ise bu oran ortalama olarak % 10-11 seviyelerinde gerçekleşmiştir. Bu bağlamda Türkiye'nin Çin ile olan dış ticaretin sürekli olarak Türkiye'nin aleyhine geliştiğini, kuşak yol projesinin etkilerinin, projenin açıklanmasından sonraki ilk 4 yılda (2013-2016) Türkiye'nin aleyhine olacak şekilde ciddi şekilde hissedildiğini ve Çin ile olan ticarete ilişkin olarak dış ticaret açıklarını artırdığını, sonraki dönemde ise yine Türkiye'nin aleyhine olacak şekilde istikrarlı bir yapıya kavuştuğunu söylemek mümkündür. Bütün bu değerlendirmeler neticesinde kuşak yol projesinin açıklanmasından önceki dönemde Türkiye'nin Çin ile olan dış ticaret faaliyetlerinin artış eğiliminde olduğunu, kuşak yol projesinin açıklanmasından sonraki 10 yıllık dönemde ise iki ülke arasındaki ticari faaliyetlerin hız kazandığını, bu bağlam kuşak yol projesinin dış ticaret açısından Çin lehine, Türkiye aleyhine sonuçlarının olduğunu söylemek mümkündür.

SONUÇ

Son dönemin en önemli ekonomik ve küresel nitelikli projelerinden biri olan Kuşak yol projesi, Çin merkezli ve finansmanı da yine Çin tarafından planmış olan bir projedir. Projenin temel amacı oluşturulmuş güzergâh ve koridorlar üzerindeki ülkeler arasında ekonomik iş birliğini geliştirmek, ticari canlılığı artırmak ve bu sayede proje kapsamındaki 65 ülkede refah düzeyini iyileştirmektir. Bu temel amaçlar yanında ticaretin en önemli unsurlarından biri olan taşımacılık faaliyetleri için ülkelerin ulaşım altyapılarını iyileştirmek ve bölgesel nitelikli kalkınma planlarını hayata geçirmek de projenin önemli amaçları arasında yer almaktadır. Kazan-kazan mantığına dayalı olarak ortaya atılmış olan kuşak yol projesinde amaca uygun faaliyetler ve girişimlerde bulunmuş olmasına karşın ağırlıklı olarak Çin'in önemli ekonomik kazanımlar sağladığı gözlemlenmektedir. Zira daha önce de ifade edildiği üzere Çin projenin planlayıcısı ve finansman kaynağı konumundadır. Bu durum nedeniyle de projenin uygulanma sürecinde belirlemiş olduğu kurallar çerçevesinde Çin'in dünya ticaretini dizayn etme gayret ve eğiliminde olduğu anlaşılmaktadır. Böyle bir gayretin temelinde ise Çin'in önemli miktarlarda hammaddeye, doğal kaynağa ve ucuz iş gücüne sahip olması nedeniyle üretim miktarındaki artışlar yatmaktadır. Zira sahip olduğu bu üretim faktörleri nedeniyle Çin, Dünya'nın net ihracatçısı konumundaki bir ülkedir ve üretilen ürünlerin ihraç edilebilmesi için çok sayıda ve büyük pazarlara ihtiyaç bulunmaktadır. Bu noktada kuşak yol projesi Çin'in bu amacına hizmet edecek önemli projelerden biri belki de en önemlisidir.

Kuşak yol projesinin gerek Çin gerekse de bölge ülkeleri açısından en önemli ülkelerinden biri Türkiye'dir. Türkiye gerek coğrafi konumu gerek tüketici nitelikteki genç nüfusu ve gerekse de

gelişim sürecinde, girişimci ve yeniliklere açık yapısıyla kuşak yol projesinin en kilit ülkelerinden biri konumundadır. Ayrıca Çin özelinde Türkiye, kuşak yol projesinin önemli parçalarından birini teşkil etmektedir. Zira Türkiye, kısa adıyla orta koridor olarak bilinen ve Çin'i Avrupa'ya bağlayan Çin-Orta Asya- Batı Asya ekonomik koridoru üzerinde bulunmaktadır. Bu niteliği ve coğrafi konumu itibarıyla Türkiye, Çin'in Avrupa'ya mallarını ulaştırabilmesin için güvenli bir geçiş ülkesi niteliğindedir. Ayrıca sahip olduğu genç nüfus nedeniyle Türkiye, Çin için mallarını satabileceği önemli bir pazar niteliğine sahiptir. Bu iki nitelik Türkiye'yi proje kapsamında diğer ülkelere kıyasla çok daha önemli hale getirmektedir. Doğal olarak bu proje kapsamında Türkiye'de bir takım ekonomik kazanımlar elde etmektedir. Özellikle güzergâh üzerindeki yakın ülkelerle yapılacak ticaretler sayesinde ihtiyaç duyulan ürünler çok daha kolay temin edilebilmekte ve bu ülkelere ihracatta artışlar söz konusu olabilmektedir. Ama bu durum Çin ile Türkiye arasındaki dış ticaret ilişkileri için söz konusu değildir. Yapılan inceleme ve değerlendirmeler neticesinde Türkiye'nin Çin ile olan ticaretinde Çin'in Türkiye karşısında net ihracatçı ülke konumunda olduğu ve bunun karşılığında doğal olarak Türkiye'nin Çin'e karşı sürekli olarak ve büyük miktarlarda dış ticaret açığı verdiği anlaşılmaktadır. Bunun temelinde ise Türkiye'nin tüketici niteliği ağır basan genç bir nüfusa sahip olmasının etkili olduğunu söylemek mümkündür. Zira Çin'den gerçekleştirilen ithalatta elektronik aksamli makine ve makine parçaları, telefon ve TV başta olmak üzere çok sayıda elektrikli ve elektronik makine ile teçhizatları, Demir-Çelik ürünleri, otomotiv yedek parçaları önemli bir paya sahiptir. Özellikle son yıllarda Türkiye'nin Çin'e olan ihracatında herhangi bir artış söz konusu olmazken Çin'den ithalatında çok hızlı bir artışın gerçekleşmiştir, ki bu da Türkiye'nin Çin ile olan dış ticaretinde çok büyük açıklar vermesine neden olmaktadır. Bu bağlamda kuşak yol projesinin hareket noktası olan kazan-kazan mantığı Türkiye ile Çin arasındaki dış ticaret için geçerli değildir. Bu bağlamda hem küresel nitelikteki hem de Çin özelindeki bağımlılıktan kurtulmak için mutlak surette teknoloji ve elektronik sektörüne yönelik yatırımlara ağırlık verilmeli, üretim maliyetlerini düşürmeye yönelik tedbirler alınmalı, milli girdiler kullanılmak suretiyle kendi üretimimizi gerçekleştirmeye yönelik girişimlerde bulunulmalı ve beşerî sermayenin gelişimine daha kaynak ayrılmalıdır.

Özet

Bu araştırmanın amacı birleştirilmiş sınıflı ilkokullardaki 2. sınıf öğrencilerine simülasyon destekli öğretimin matematik dersi başarısına etkisini araştırmaktır. Bu araştırmanın yöntemi nicel araştırma yöntemlerinden yarı deneysel araştırma yöntemidir. Araştırmanın modeli ön test-son test kontrol gruplu yarı deneysel araştırma modelidir. Araştırmanın örneklemini Kahramanmaraş ili Onikişubat İlçesi ile Mardin İli Savur ilçesinde bulunan toplam 4 farklı birleştirilmiş sınıflı ilkokulun 2.sınıfında okuyan öğrencilerden toplam 4 farklı şube oluşturmaktadır. Her gruba araştırma öncesinde Millî Eğitim Bakanlığı'nın yayınlamış olduğu ders kitabı ve çalışma soruları kitaplarında bulunan geçerliliği ve güvenilirliği test edilmiş çoktan seçmeli 10 adet sorudan oluşturulan bir ölçek (Eldesiz Toplama İşlemi Başarı Testi), ön test olarak uygulanmıştır. Hazırlanan başarı testi uzman bir sınıf öğretmeninin görüşleri doğrultusunda MEB kitaplarındaki sorulardan seçim yapılarak oluşturulmuştur. Ön test sonucunda aritmetik puan ortalaması diğer gruba göre daha düşük olan Kahramanmaraş ili Onikişubat ilçesinde seçilen sınıfların bir şubesi ve Mardin ili Savur ilçesinde seçilen sınıfların bir şubesi toplam 2 şube deney grubu olarak belirlenmiştir. Aritmetik puan ortalaması daha yüksek olan diğer iki şube ise kontrol grubu olarak belirlenmiştir. 'Toplamları 100'e kadar olan doğal sayılarla eldesiz toplama işlemi yapar' adlı kazanımını deney grubunda simülasyon yöntemi ile, kontrol grubunda ise müfredatın önerdiği öğretim yöntemi kullanılmıştır. Başarı testi (Eldesiz Toplama İşlemi Başarı Testi) çalışma gruplarına bir hafta arayla tekrar uygulanmıştır. Veriler SPSS programı ile analiz edilmiş olup araştırma sonucunda simülasyon materyali ile öğrenim gören deney grubunun başarısının, müfredatın önerdiği yöntem ile öğrenim gören kontrol grubunun başarısına göre anlamlı düzeyde daha yüksek olduğu görülmüştür. Bu bulgular sonucunda MEB'in müfredatına simülasyon destekli materyal kullanımının eklenmesi önerilmektedir.

Anahtar kelimeler: Birleştirilmiş Sınıf, Simülasyon, ilkokul, eldesiz toplama, matematik

THE EFFECT OF SIMULATION ON HANDLESS ADDITION IN A COMBINED CLASSROOM

Abstract

The purpose of this research is to investigate the effect of simulation-supported teaching on mathematics course success for 2nd grade students in primary schools with multigrade classes. The method of this research is the semi-experimental research method, one of the quantitative research methods. The model of the research is a quasi-experimental research model with a pretest-posttest control group. The sample of the research consists of a total of 4 different students studying in the second grade of 4 different multi-grade primary schools in Kahramanmaraş province Onikişubat District and Mardin Province Savur district. Before the research, a scale consisting of 10 multiple-choice questions whose validity and reliability were tested in the textbooks and study question books published by the Ministry of National Education was applied to each group as a pre-test. The prepared achievement test was created by selecting questions from the Ministry of Education books in line with the opinions of an expert classroom teacher. As a result of the pre-test, one branch of the classes selected in Onikişubat district of Kahramanmaraş province, whose arithmetic score average was lower than the other group, and one branch of the classes selected in Savur district of Mardin province, were determined as the experimental group, for a total of 2 branches. The other two branches with higher arithmetic score averages were determined as the control group. The learning outcome named 'Performs addition without carrying with natural numbers whose sum is up to 100' was used with the simulation method in the experimental group, and the teaching method recommended by the curriculum was used in the control group. The achievement test (Non-Carry Addition Achievement Test) was re-applied to the study groups with an interval of one week. The data were analyzed with the SPSS program, and as a result of the research, it was seen that the success of the experimental group, which learned with the simulation material, was significantly higher than the success of the control group, which learned with the method recommended by the curriculum. As a result of these findings, it is recommended to add the use of simulation-supported materials to the curriculum of the Ministry of Education.

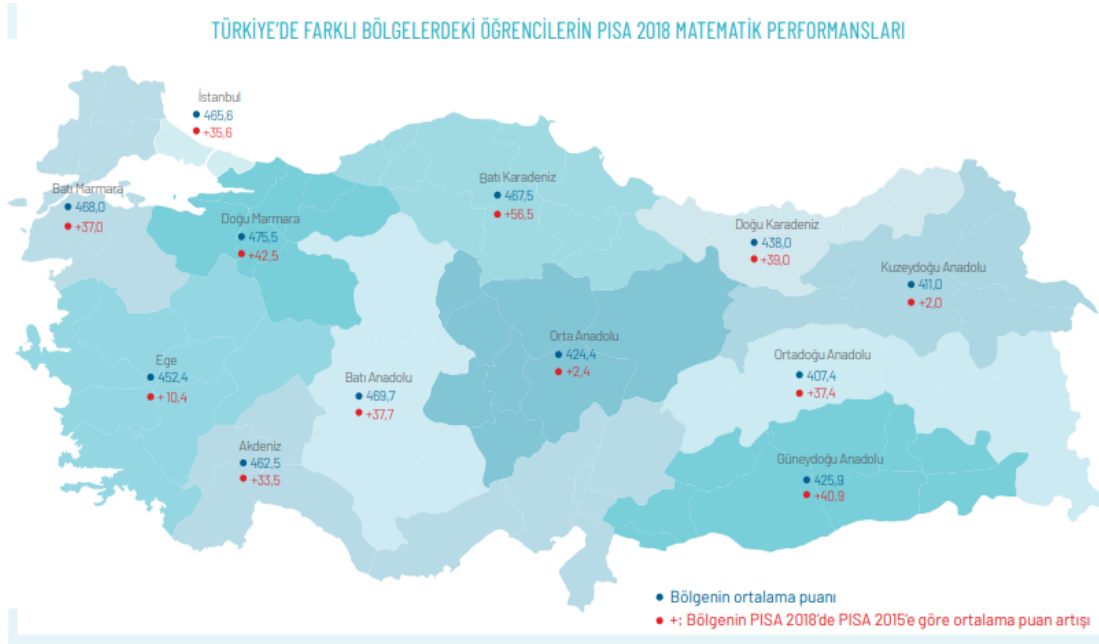

Keywords: Multigrade Class, Simulation, primary school, addition without carrying, mathematics.

Giriş

Matematik dersi, öğrenciler tarafından pek can atılmayan, derste büyük bir ilgiyle dinlenilmeyen ve daha ders başlamadan ön yargıyla yaklaşılın, öğretmenler tarafından ise öğretilmesinde güçlükler yaşanan ve öğrencinin ilgisini çekmenin güç olduğu bir ders olarak görülmektedir (Öcalan, 2004; Peker ve Mirasyedioğlu, 2003). Bulduğumuz ülkede öğrencilerin büyük bir çoğunluğu matematik dersinde başarısız olacaklarını düşünerek kaygılanmakta, bu sebeple de bu derse karşı negatif bir tutum göstermektedirler. Kavramların soyut olması öğretmen için anlatımını öğrenci için anlaşılmasını güçleştirir (Baykul,2005).

PISA 2018 Türkiye ön raporuna göre ortaya çıkan en önemli sorunlardan biri okullar ve bölgeler arasındaki başarı farkıdır (şekil 1). Sadece bu raporda değil daha önceki üç PISA araştırmasında da MEB'in yayınladığı raporlarda okullar ve bölgeler arasındaki farklılıklar göze çarpmıştı. Bu sorunların hala devam ettiği 2018 raporunda da görülmektedir.

Şekil 1. Türkiye’de Farklı Bölgelerdeki Öğrencilerin PISA 2018 Matematik Performansları

MEB bu konuda İYEP (ilkokullarda yetiştirme program) gibi birçok proje yapmıştır. Bu başarı farkını daha da aza indirmek, bireylerin 21. yüzyılın maharetlerine sahip olmasını sağlamak ve onların daha fazla teknolojiden yararlanmasını sağlamak için MEB, FATİH (Fırsatları Arttırma ve Teknolojiye İyileştirme Hareketi) projesini başlatmış ve bunu kırsallara kadar indirebilmiştir. Ülkemizde eğitime olan teknolojik yatırımlar son zamanda ivme kazanmış, sınıflar bu

teknolojik aletlerle donatılmış ve çocukların bu yeni cihazlar, teknolojiler ile tanışmasına olanak sağlamıştır. FATİH (Fırsatları Arttırma ve Teknolojiye İyileştirme Hareketi), bunu destekleyen bir projedir (MEB,2018). Öğretim programlarında da yer alan “dijital yetkinlik” ismiyle tayin edilen yetkinlikle, öğretmen adaylarının teknolojiyi verimli kullanmaları beklenmiştir. Buradan da anlaşılıyor ki MEB, öğretmenlerin teknolojiyi verimli bir şekilde kullanmaları ve çağa ayak uydurup öğrencileri de ona göre yetiştirmeleri için çaba sarf etmiştir (MEB, 2013 akt. Önal,2022).

Hızla gelişen teknolojinin eğitime de yedirilmesi gerektiği kaçınılmaz bir gerçektir (Güven & Sülün, 2012). Eğitimde teknolojiyi kullanmanın faydalarına değinmek gerekirse; öğrenmeyi kolay ve eğlenceli hale getirme, ilköğretim çocuğunun anlayabileceği şekilde dersi daha somut hale getirme, olabildiğince çok duyu organına hitap edebilme, basamaklı öğrenmenin temelini sağlamlaştırma vb. olarak sıralayabiliriz (Yaylacı ve Yaylacı, 1999). Teknolojik materyallerle desteklenen matematik dersi, çocukların öğrenme stillerine daha çok hitap eder ve çoklu zekayı destekleyen bir ortam sunar (Duran, Özden, & Yeşilyurt, 2023), (Akyıldız, Uçan, & Yeşilyurt, 2023), (Çelikçi, Karabacak, & Yeşilyurt, 2023).

Çalışmanın Varsayımları ise aşağıdaki gibidir;

- 1.Kontrol altına alınan veya alınamayan farklı değişkenlerin kontrol grubu ve deney grubunu aynı şekilde ve aynı oranda etkilediği,
- 2.Çalışmada deney grubuna uygulanan simülasyon destekli eğitimin amacına uygun olduğu,
- 3.Öğrencilerin başarı testinde yer alan sorulara içtenlikle cevap verdiği varsayılmıştır.

ARAŞTIRMA

Bu bölümde araştırmanın modeli, amacı, problemi, evreni, örnekleme, veri toplama aracı ve verilerin analizi bulunmaktadır.

Araştırmanın Modeli

Yapılan araştırmada nicel araştırma yöntemlerinden, Ön Test-Son Test kullanılarak kontrol ve deney grubu belirlenerek, yarı deneysel desen araştırma yöntemi kullanılmıştır. Yarı deneysel araştırma modeli, araştırmada deney ve kontrol grubunu yansız bir şekilde seçilen ve bir değişkenin sebep-sonuç ilişkisini belirlemek için kullanılan bir modeldir (Özmen & Karamustafaoğlu, 2019, s. 210).

Araştırma deseninde kullanılan bağımsız değişken "simülasyon ile desteklenen öğretim yöntemi - geleneksel öğretim yöntemi" iken, bağımlı değişken ise "birleştirilmiş sınıf

öğrencilerinin eldesiz toplama işlemi başarı düzeyi"dir. Araştıranlar tarafından yapılan seçkisiz atama yöntemi ile belirlenen şubelerden yapılan ön test sonucunun ortalamasının daha düşük olduğu şube, deney grubu; ön test sonucunun daha yüksek olduğu şube kontrol grubu olarak belirlenmiştir(Tablo 1).

Tablo 1. Ön Test Ortalamaları

<i>Okul</i>	<i>Gruplar</i>	<i>Ön Test</i>	<i>N</i>	<i>X</i>
<i>Onikişubat/ Kahramanmaraş</i>	<i>Kızılseki İlkokulu</i>	<i>Başarı Testi</i>	<i>3</i>	<i>43,33</i>
	<i>Ö İlkokulu</i>		<i>2</i>	<i>45,00</i>
<i>Savur /Mardin</i>	<i>Bengisu İlkokulu</i>	<i>Başarı Testi</i>	<i>4</i>	<i>44,00</i>
	<i>M İlkokulu</i>		<i>5</i>	<i>47,50</i>

Kontrol grubunda yapılan öğretim Milli Eğitim Bakanlığı Talim Terbiye Kurulunun müfredatına uygun olarak gerçekleştirilmiştir. Deney grubunda yapılan öğretim, öğrencilerin aktif bir şekilde katılması gözetilerek akıllı tahtadan etkileşimli olarak Okulistik desteği ile gerçekleştirilmiştir. Araştırma için izlenen yol Tablo 2’de belirtilmiştir.

Tablo 2. Araştırma İçin İzlenen Yol

<i>Okul</i>	<i>Gruplar</i>	<i>Öğretim Öncesi</i>	<i>Öğretim Yöntemi</i>	<i>Öğretim Sonrası</i>
<i>Onikişubat /Kahramanmaraş</i>	<i>Deney Grubu N=3</i>	<i>Zihinden Toplama Başarı Testi (Ön Test)</i>	<i>Simülasyon Destekli Öğretim</i>	<i>Zihinden Toplama Başarı Testi (Son Test)</i>
	<i>Kontrol Grubu N=2</i>		<i>Müfredata Uygun Öğretim</i>	
<i>Savur /Mardin</i>	<i>Deney Grubu N=5</i>	<i>Zihinden Toplama Başarı Testi (Ön Test)</i>	<i>Simülasyon Destekli Öğretim</i>	<i>Zihinden Toplama Başarı Testi (Son Test)</i>
	<i>Kontrol Grubu N=4</i>		<i>Müfredata Uygun Öğretim</i>	

Araştırmanın Amacı

2.sınıf matematik dersindeki doğal sayılar ünitesinden seçilen “Toplamları 100’e kadar olan doğal sayılarla eldesiz toplama işlemini yapar.” konusunun simülasyon destekli teknolojik materyallerle yapılan öğretimin öğrencilerin akademik başarıları üzerindeki etkisini belirlemektir.

Araştırmanın Problemi

Araştırmanın problemi, ilkokulda birleştirilmiş sınıfta öğrenim gören 2. sınıf öğrencilerinin simülasyon destekli teknolojik materyallerle yapılan öğretim programının eldesiz toplamaya etkisi incelenmek istenmiştir. Araştırmanın alt problem cümlesi; Simülasyon destekli teknolojik materyallerle yapılan bir öğretim yönteminin uygulandığı deney grubu öğrencileri ile müfredatın önerdiği anlatım yönteminin uygulandığı kontrol grubu öğrencilerinin matematik dersinde eldesiz toplama konusuna ilişkin akademik başarıları açısından farklılık var mıdır?

Bu araştırma; ilkokul 2. sınıf Matematik dersi “Doğal Sayılar” ünitesi, “Toplamları 100’e kadar olan doğal sayılarla eldesiz toplama işlemini yapar.” konusu deney grubunda kullanılmak üzere teknolojik öğretim materyali ve 2023-2024 öğretim yılı, Kahramanmaraş İli Onikişubat İlçesi ile Mardin İli Savur ilçesinde bulunan toplam 4 farklı birleştirilmiş sınıflı ilkokulun 2. sınıfında okuyan öğrencilerden toplam 4 farklı şube oluşturmaktadır. Etik nedenlerden dolayı okul isimleri açıkça belirtilmemiştir.

Araştırmanın Örneklemi

Araştırmada çalışma grubu, 2023-2024 Eğitim Öğretim yılı içerisinde Kahramanmaraş İli Onikişubat İlçesinde bulunan ve devlet okulunda öğrenim gören 5 tane birleştirilmiş sınıflı okulda öğrenim gören 2. sınıf öğrencisi ve Mardin ili Savur ilçesinde bulunan ve devlet okulunda öğrenim gören 9 tane 2. sınıf öğrencisi olmak üzere, birleştirilmiş sınıfta öğrenim gören toplam 14 öğrenciden oluşmaktadır. Örneklem, araştırmaya hız ve kolaylık sağlaması için kolay ulaşılabilir örnekleme yöntemi olarak belirlenmiştir.

Veri Toplama Aracı

Araştırmada belirlenen veri toplama aracı 2023-2024 Eğitim Öğretim yılında kullanılan MEB’in öğrencilere uygun görmüş olduğu EBA sisteminde bulunan tarama testlerinden ve matematik ders kitaplarında bulunan “Toplamları 100’e kadar olan doğal sayılarla eldesiz toplama işlemini yapar.” kazanımına uygun görülen sorulardan, geliştirilen 10 maddelik

“Eldesiz Toplama İşlemi Başarı Testi” hazırlanmıştır. Hazırlanan testte her doğru cevap 10 puan, yanlış cevaplar 0 puan olacak şekilde puanlandırma yapılmış ve başarı testine ilişkin başarı verileri elde edilmiştir. Bu puanlama doğrultusunda testten alınabilecek en yüksek puan 100 olurken en düşük puan 0 olarak hesaplanmıştır. Araştırmada uygulanan ön test ve son testler aynı sorulardan oluşmaktadır. Testler belirlenen kontrol ve deney gruplarına araştırmacılar tarafınca uygulanmıştır.

Verilerin Analizi

Araştırmada elde edilen veriler SPSS20.0 programı ile analiz edilmiştir. Ön test ve son test uygulanarak, deney ve kontrol gruplarından elde edilen verilerin arasındaki farkın bağımsız olarak analiz edilmesi için veriler Bağımsız Örneklem T testi uygulanarak analiz edilmiştir. Anlamlılık düzeyi 0.05 olarak belirlenmiş, deney ve kontrol gruplarından elde edilen verilerin arasında anlamlı bir fark olup olmadığı P değeri ile belirlenmiştir.

BULGULAR

Araştırma doğrultusunda elde edilen bulgular tablo halinde belirtilmiş ve tablolardaki verilere göre yorumlanmıştır.

Deney ve kontrol grubu öğrencilerinin ön test değişkenli t testi sonuçları Tablo 3’de verilmiştir.

Tablo 3. Ön Test T Testi Sonuçları

<i>Okullar</i>	<i>Değişken</i>	<i>Gruplar</i>	<i>N</i>	<i>X</i>	<i>SS</i>	<i>t</i>	<i>df</i>	<i>p</i>
<i>Onikişubat /Kahramanmaraş</i>	<i>Ön test</i>	<i>Deney</i>	3	43,33	5,773	-	3	,789
		<i>Kontrol</i>	2	45,00	7,071	-	,277	
<i>Savur /Mardin</i>	<i>Ön test</i>	<i>Deney</i>	5	44,00	11,401	-	7	,589
		<i>Kontrol</i>	4	47,50	5,000			

Tablo 3. incelendiğinde, deney ve kontrol grupları ortalamaları arasında çok da büyük bir fark olmadığını, yani düzeylerinin benzer olduğunu görüyoruz. P değerinin 0,05’den büyük olması

da deney ve kontrol grupları arasında anlamlı bir fark bulunmadığı tespit edilmiştir ($p=,789$, $p=,589$). Bu durum öğrencilerin ön bilgileri açısından ciddi oranda bir farklılık göstermediğini belirtmiştir. Deney ve kontrol grubu öğrencilerinin son test değişkenli t testi sonuçları Tablo 4'te verilmiştir.

Tablo 4. Son Test T testi Sonuçları

<i>Okullar</i>	<i>Değişken</i>	<i>Gruplar</i>	<i>N</i>	<i>X</i>	<i>SS</i>	<i>t</i>	<i>df</i>	<i>p</i>
<i>Onikişubat /Kahramanmaraş</i>	<i>Son test</i>	<i>Deney</i>	<i>3</i>	<i>76,66</i>	<i>5,773</i>	<i>3,873</i>	<i>3</i>	<i>,030</i>
		<i>Kontrol</i>	<i>2</i>	<i>60,00</i>	<i>0,0</i>			
<i>Savur /Mardin</i>	<i>Son test</i>	<i>Deney</i>	<i>5</i>	<i>76,00</i>	<i>5,477</i>	<i>2,679</i>	<i>7</i>	<i>,032</i>
		<i>Kontrol</i>	<i>4</i>	<i>62,50</i>	<i>9,574</i>			

Tablo 4. incelendiğinde, deney ve kontrol grupları son test puanları arasında anlamlı bir fark olduğu görülmektedir ($p=,030$, $p=,032$). Bu durum Tablo 3 ile karşılaştırıldığında yapılan deneysel çalışmanın deney grubunda eldesiz toplama kazanımında akademik başarı gösterildiğini belirtmektedir.

Deney ve kontrol grubu öğrencilerinin son test değişkenli Anova testi sonuçları Tablo 5'da verilmiştir.

Tablo 5. Son Test Değişkenli Anova Testi Sonuçları

<i>Değişken</i>	<i>Varyansın Kaynağı</i>	<i>Kareler Toplamı</i>	<i>df</i>	<i>Kareler Ortalaması</i>	<i>F</i>	<i>p</i>	<i>η^2</i>
<i>Son Test</i>	<i>Gruplar Arası</i>	<i>738,333</i>	<i>3</i>	<i>246,111</i>	<i>5,331</i>	<i>,019</i>	<i>0,615</i>
	<i>Gruplar İçi</i>	<i>461,667</i>	<i>10</i>	<i>46,167</i>			
	<i>Toplam</i>	<i>1200</i>	<i>13</i>				

Tablo 5 incelendiğinde, deney ve kontrol gruplarındaki öğrencilerin son testten aldıkları puanlar arasında anlamlı bir fark bulunmuştur. Bu durum teknolojik materyal kullanmanın

öğrencilerin eldesiz toplama kazanımı konusunda akademik başarıları üzerinde orta düzeyde (0,5 ile 0,8 arası) bir fark görüldüğünün göstergesidir($\eta^2=0,615$).

TARTIŞMA, SONUÇ VE ÖNERİLER

Bu araştırmada birleştirilmiş sınıflı ilkokulda öğrenim gören 2. sınıf matematik dersi eldesiz toplama konusunun öğretiminde, simülasyonun öğrencilerin akademik başarılarına etkisi incelenmiştir. Dört sınıf arasından belirlenen deney ve kontrol grupları arasında yapılan ön test puanları arasında anlamlı fark bulunamamıştır. Bu durum öğrencilerin düzeylerinin birbirine yakın olduğunu ifade etmektedir. Deney ve kontrol grupları arasında yapılan son test puanları arasında anlamlı bir fark bulunmuştur. Bu durum ise eldesiz toplama işlemi kazanımını öğrencilerin kazandığını göstermektedir. Ayrıca alanyazındaki bulgularda da simülasyonun öğrencilerin akademik başarısına olumlu etkisi olduğunu belirten ifadeler yer almaktadır.

Matematik dersi soyut olduğu için teknolojik materyallerle desteklendiğinde, soyut olan konular somutlaşmaya başlar. Özellikle somut işlem döneminde bulunan ilkokul öğrencilerine kavram ve konular simülasyon destekli materyallerle sunulduğunda öğrencilerde kalıcı öğrenmeye olumlu katkı sağlar. Ayrıca simülasyon destekli öğretim çoklu zeka öğrenme kuramına da uygundur. Matematik kazanımlarını somut işlemler döneminde bulunan ilkokul çağındaki çocukların daha kolay ve istekli şekilde öğrenmesi için bazı farklılıkların olması önemli bir gerekliliktir. Bunlar çizgi filmler, simülasyonlar, etkileşimli uygulamalar, matematiksel oyunlar veya materyaller olabilir. Bu yöntemler çocuklarca anlaşılması zor görünen kavramların daha kolay öğrenilmesine olumlu olarak ve önemli ölçüde katkı sağlar. Yani derslerin çeşitli teknolojik materyaller ile sunulmuş olması, çocukların bu alandaki başarısını doğru orantılı olarak desteklediği alanyazında bulunmaktadır (Duran, Özden, & Yeşilyurt, 2023), (Elmas, Doğan, & Yeşilyurt, 2023), (Çelikçi, Karabacak, & Yeşilyurt, 2023).

Araştırmada elde edilen sonuçtan yola çıkarak; birleştirilmiş sınıflarda sınıf öğretmenlerinin öğrencilerine ders sırasında müfredatın önerdiği yöntem ile ders anlatmasının yanı sıra simülasyon destekli teknolojik materyal kullanarak ders anlatması öğrencilerin akademik başarılarını olumlu etkilemekle birlikte öğrencilerin derse aktif katılmalarına ve güdülenmelerine destek olabilir.

Öğrenciler için ise teknolojik materyal kullanarak ders çalışmak kendi kendilerine öğrenme düzeylerine katkı sağlayabilir.

Özet

Bu araştırmanın amacı, farklı dizinlerde yayımlanan matematik eğitimi ile ilgili çalışmaların örneklem yöntemleri ile düzeylerini belirlemektir. Bu amaç doğrultusunda Web of Science, ERIC ve TR Dizin dergi veri tabanlarıyla beraber ProQuest, ve YÖK Tez Merkezlerinde yer alan, 2018-2023 yılları arasında yayınlanmış 287 adet bilimsel çalışma araştırma kapsamına dahil edilmiş ve incelenmiştir. Doküman analiz yönteminin kullanıldığı bu çalışmada verilerin analizi sürecinde içerik analizi yapılmıştır. İçerik analiz yapılırken çalışmaların yayınlandığı dizin, kullanılan örneklem türü ve örneklem düzeyleri dikkate alınmıştır. Elde edilen veriler, tablo ve grafikler aracılığıyla araştırmacılara sunulup frekans ve yüzdelere göre yorumlanmıştır. Araştırma bulgularına göre, bilimsel yayınlar örneklem türü olarak en çok amaçlı örneklem türünün tercih edildiği, kartopu örneklem türünün ise hiç kullanılmadığı tespit edilmiştir. Çalışmalardaki örneklem türünün ise çoğunlukla öğrencilerden oluştuğu ve daha çok ortaokul öğrencileri ile üniversite öğrencilerine yer verildiği belirlenmiştir. Araştırma sonunda, bu alanda yapılacak çalışmaların örneklem türü ve düzeyi olarak çeşitlendirilmesi gerektiğine vurgu yapılarak, araştırmacılara olağan eğilimle ilgili birtakım önerilerde bulunulmuştur.

Anahtar Kelimeler: Matematik eğitimi, örnekleme yöntemi, örneklem düzeyi, güncel araştırmalar.

**TRENDS OF CURRENT STUDIES PUBLISHED IN THE FIELD OF
MATHEMATICS EDUCATION: SAMPLING METHOD AND LEVEL**

Abstract

The aim of this study is to determine the sampling methods and levels of studies on mathematics education published in different databases. For this purpose, 287 scientific studies published between 2018-2023 in Web of Science, ERIC and TR Index journal databases, ProQuest, and YÖK Thesis Centres were included in the scope of the research and examined. In this study, where document analysis method was used, content analysis was used in the process of data analysis. During the content analysis, the index in which the studies were published, the type of sampling used and the sampling levels were taken into consideration. The data obtained were presented to the researchers through tables and graphs and interpreted according to frequencies and percentages. According to the research findings, it was determined that purposive sampling was mostly preferred as the sampling type in scientific publications, and snowball sampling was never used. It was determined that the samples in the studies mostly consisted of students and mostly secondary school students and university students were included. At the end of the research, it was emphasised that the studies to be conducted in this field should be diversified in terms of sample type and level, and some suggestions were made to the researchers about the usual tendency.

Keywords: Mathematics education, sampling method, sampling level, current research.

Giriş

Bilimsel alandaki teknik gelişimler ve değişimler, insanların varoluşundan sonra kaliteli yaşam isteğinin sonuçları arasında yer almakta olup belli bir sistematiklik çerçevesinde meydana gelmektedir. Matematik, en genel ifadeyle soyutlanmış bir yaşam biçimi olarak tanımlanmakta olup bu disiplin bilimsel ve teknik alanlardaki değişimlerin ve gelişmelerin öncüsü olarak ifade edilmektedir (Altun, 2006). İnsanlar doğada kalmayı sağladıktan ve yaşama alıştıktan sonra, hayatlarındaki soyutlamayı matematiğe entegre ederek yaşam şartlarını üretme boyutuna getirebilmiştir (Özkan, 2006). İnsanoğlunun bu üretebilme süreci temelde öğrenme kavramı ile genel anlamda ise eğitim kavramıyla yaşantımızda karşılığını bulmaktadır. Eğitimin ve öğretimin ana çerçevesi insan olup, bilim insanları tarafından bu konuda birçok tanımlama yapılmıştır (Gül, 2004). Yaşantısal farklılaşmalardan yola çıkılarak uzlaşa sağlanan tanım ise bireyin davranışlarında kendi yaşantısı yoluyla kasıtlı ve istendik yönde davranış değişikliği meydana getirme süreci şeklindedir (Fidan, 1986). Bu sürecin istendik olması ve davranışlarda kalıcı izli değişiklik meydana getirmesi, eğitimin en genel amacı olup bu durum matematik eğitimi alanı için de geçerlidir.

Türkiye’de matematik eğitimi alanı, evrensel boyutta yaşanan değişimlere paralel olarak 2005 yılından itibaren matematiğin anlamlı öğrenilmesini sağlamaya yönelik amaçlar oluşturmuştur (Bozkurt & Dülger, 2021). Bu değişimler eğitimin her aşamasında temel eğitimden başlayarak yüksek öğretime kadar devam etmektedir. Yaşanan bu değişim ile öğretme-öğrenme sürecinde öğretmenler bilgiyi doğrudan aktarandan rehber konumuna gelirken, öğrenciler ise pasif alıcı konumundan sorgulayan ve araştıran konumuna yönelmiştir (Millî Eğitim Bakanlığı [MEB], 2005). Yani öğretmen rolü kolaylaştırıcı, öğrenci ise süreçte daha aktif ve katılımcı bir yer edinmiştir. Matematik eğitiminde gerçekleşen bu değişimler, çağın gereklerine ayak uydurarak öğrenme süreçlerinin yürütülmesini gerekli kılmaktadır (National Council of Teachers of Mathematics [NCTM], 2011). Bu değişimlerin gerekçesi ise bireylerin günlük yaşamında farklı problemler veya sorunlarla karşı karşıya kalması gösterilmektedir (Kaya, 2022). Bunun yanı sıra değişimler aracılığıyla öğrenen bireylere yansıtıcı, yaratıcı ve eleştirel düşünme gibi üst düzey düşünme becerileri kazandırmak hedeflenmektedir (Işık, 2021). Öğrenen bireylerin öğrenme-öğretme sürecinde, bu üst düzey düşünce becerilerini kazanması ile günlük hayatla ve diğer disiplinlerle ilişkilendirmeler yaparak matematiksel becerilere sahip olması ve karşılaştığı problemleri çözebilme yetisine sahip olması sayesinde zorlukların üstesinden gelebilecekleri ifade edilmektedir (Çalışkan-Dedeoğlu & Eğerci, 2021). Bu çerçeveden bakıldığında, alanyazında matematik eğitiminin yadsınamaz bir yeri olduğu söylenebilir.

Alanyazında son zamanlarda yapılan çalışmaların, eğitim ve öğretim süreçlerini biçimlendirmede önemli bir katkısının olduğu görülmektedir (Korkmaz vd., 2022). Öğretim sürecinin geliştirilmesine yönelik yayınlanan çalışmalarda son yıllarda dikkate değer bir şekilde artış yaşanmaktadır. Yayınlanan bu çalışmaların bir kısmı eğitim alanına yönelik yeniliklere zemin hazırlarken, diğer bir kısmı ise önceden yapılmış konu ya da konular ile ilgili çalışma sonuçlarının betimlenmesi aracılığıyla güvenilirliğini veya içeriğini tespit etmeye çalışmaktadır (Karadağ, 2009). Hangi tür çalışma olursa olsun amaç itibarıyla, yapılan bu araştırmalar eğitimin kalitesini ve işlevselliğini arttırmaya yönelik düşünülebilir (Yavuz, 2016). Matematik eğitimi tarih boyunca birçok değişime uğramış olup, ülkemizdeki son zamanlardaki en köklü değişim 2005 yılında öğretim programları, materyalleri ve sürecinin yapılandırmacı yaklaşıma geçmesi ile olmuştur (İlhan & Aslaner, 2019). Yapılandırmacı eğitim yaklaşımı ile öğrenen bireyler merkeze alınmış olup, bu bireylerden birtakım üst düzey yeterlik ve yetkinlikler (akıl yürütme, problem çözme vb.) çerçevesinde öğretim sürecini takip etmeleri amaçlanmaktadır (MEB, 2005).

Günümüz dünyasında bilim ve teknoloji alanlarıyla beraber eğitimde yaşanan hızlı değişimler göz önüne alındığında belirli zaman aralıklarıyla yapılacak izleme ve değerlendirme araştırmalarına her geçen gün daha fazla ihtiyaç duyulduğu ifade edilmiştir (Kaya, 2022). Ayrıca, yapılan araştırmalarda 2005 yılından bu yana ciddi bir artışın olması da matematik eğitimi alanı için alınacak kararların kalite ve yeterliliğin değerlendirilmesinde bu ve buna benzer çalışmaların yapılmasını gerektirmektedir (Çiltaş vd., 2012). Dolayısıyla matematik eğitimi için yaşanan gelişmeler ve yeniliklerin detaylarının zaman zaman ortaya konularak bu alanda yapılan araştırmaların genel çerçevesinin çizilmesinin önemli olacağı düşünülmektedir (Kaya, 2022). Matematik eğitimi alanı ile ilgili yürütülen bilimsel araştırmalarda son yıllarda görülen artışa yönelik çalışmalarda, yöntemsel yönelim ve eğilimlerin değerlendirilip geleceğe dair tahminlerde bulunulması gerektiği belirtilmektedir (Çalık & Sözbilir, 2014). Diğer bir ifadeyle, yapılan her bir araştırma sonradan yapılacak çalışmalara rehberlik etmesi bakımından önem arz etmektedir. Daha önce yapılan çalışmalar genellikle yurtiçi yayınlanmış çalışmaların genel eğilimlerini belirlemeye dönük olup (Aldemir & Tatar, 2014; Kaya & Aydoğdu, 2022; Tatar, vd., 2013; Tereci & Bindak, 2019) bu çalışmanın ölçütleri ve içeriğine göre farklılık göstermektedir. Bu noktada çalışmada yurtiçinde ve yurtdışında farklı dizinlerde yayınlanan hem tez hem de makale gibi farklı türde yayınlanmış çalışmalar incelenmiş, önceki araştırmalara göre daha kapsamlı ve güncel bir çerçevede yapılandırılmıştır. Alan yazında matematik eğitimi ile ilgili yapılan araştırmalar değerlendirilmiş, 2018 yılından bu yana son beş

yıllık süreci bu çalışmadaki gibi betimleyen bir çalışmaya rastlanmamıştır. Bu sonuçtan yola çıkarak araştırmanın çerçevesi 2018-2023 yılları arasında ulusal ve uluslararası veri tabanlarında yer alan ve araştırma ölçütleri doğrultusunda ulaşılan bilimsel çalışmalardan oluşmaktadır. Yapılacak çalışmanın, matematik eğitimi alanında çalışma yapmak isteyen araştırmacılara rehberlik etmesi bakımından önemli olacağı düşünülmektedir.

Araştırmanın Amacı ve Alt Problemler

Bu araştırma kapsamında, alan yazına matematik eğitiminde yapılan çalışmalarda kullanılan örnekleme yöntemleri ve katılımcı düzeyleri hakkında veriler sunulmaya çalışılmıştır. Bu amaç doğrultusunda yanıt aranan araştırmanın alt problemleri şu şekildedir:

Araştırma kapsamına dahil edilen çalışmalar;

1. Kullanılan örneklem yöntemlerine göre nasıl bir dağılım göstermektedir?
2. Dizinlendikleri veri tabanlarına göre örneklem yöntemleri nasıl bir dağılım göstermektedir?
3. Tercih edilen örneklem düzeylerine göre nasıl bir dağılım göstermektedir?
4. Dizinlendikleri veri tabanlarına göre örneklem düzeyleri nasıl bir dağılım göstermektedir?
5. Dizinlendikleri veri tabanlarına göre nasıl bir dağılım göstermektedir?

YÖNTEM

Araştırmanın Deseni

Bu çalışmada araştırma kapsamına dahil edilen dizinlerde 2018-2023 tarihleri aralığında yayınlanan matematik eğitimi ile ilgili bilimsel çalışmalar (tezler ve makaleler) doküman incelemesi yöntemi ile değerlendirilmiştir. Bu yöntem, bilimsel çalışma kapsamında araştırılan konu ya da konular ile ilgili bilgiler barındıran yazılı belgelerin veya dokümanların incelenmesi ile veri sağlanması olarak ifade edilmektedir (Yıldırım & Şimşek, 2006). Bilimsel dokümanlar incelenirken, konuyla ilgili belgeler belirlenen amaç ya da amaçlar doğrultusunda analiz edilerek belli görüşleri açığa çıkaracak bir senteze gidilmesi hedeflenmektedir (Uysal, 2021). Bu çalışmada matematik eğitimi alanında yapılmış ve araştırma kapsamına dâhil edilmiş olan dizinlerdeki araştırmaların bir araya getirilerek birlikte incelenip düzenlenmesi ve bu araştırmalardaki örneklem türleri ile birlikte örneklem düzeylerindeki eğilimlerin bir bütün olarak değerlendirilmesi amaçlandığından bu yöntemin kullanılmasının uygun olacağına karar verilmiştir.

Araştırmanın Veri Kaynakları

Bu çalışmada örnekleme yöntemi olarak seçkisiz olmayan örnekleme yöntem türlerinden biri olan amaçlı örnekleme yöntemi tercih edilmiştir. Amaçlı örnekleme yöntemi, seçkisiz olmayan bir örnekleme türü olup araştırmanın amacına yada amaçlarına bağlı olarak bilgi bakımından zengin durumların seçilerek derinlemesine bir şekilde çalışma yapılmasına olanak sunmaktadır (Büyüköztürk vd., 2013). Bu örnekleme yönteminde temel görüş araştırmacının çalışmanın amaçları doğrultusunda en iyi bilgiyi nereden alacağına ilişkin yargılarıdır (akt. Arastaman, 2021). Çalışmanın amacı doğrultusunda belirlenen ölçütler ışığında uygun yayınlara erişebilmek ve farklı disiplinlerde yayınlanan çalışmaları kapsam dışında tutabilmek için bu yöntemle başvurulmuştur. Bu kapsamda ölçütler kapsamında ulaşılan 287 bilimsel çalışma (makale ve tez) içeriği analiz edilmiştir.

Veri Toplama Araçları

Bu çalışmada veri toplama aracı olarak alan yazındaki benzer çalışmalardan yararlanarak araştırmacılar tarafından oluşturulmuş “Yayın Sınıflandırma Formu” kullanılmıştır. Bu form araştırmanın problemlerine göre dört kategoriden oluşan bir Microsoft Excel tablosudur. Formu oluşturan bu kategoriler: çalışmanın künyesi, yayınlandığı dizin (veri tabanı), kullanılan örnekleme yöntemi ve örnekleme düzeyi şeklindedir. Araştırma kapsamında literatür taraması bu form çerçevesinde gerçekleştirilmiştir.

Veri Toplama Süreci

Araştırmada incelenecek ve değerlendirilecek bilimsel çalışmaların belirlenmesinde ölçüt örnekleme yöntemi kullanılarak şu ölçütler dikkate alınmış ve bilimsel çalışmalar seçilmiştir:

Araştırma kapsamına dahil edilecek bilimsel çalışmanın;

- ✓ ProQuest, YÖK Tez Merkezi, TR Dizin, ERIC veya Web of Science veri tabanlarının herhangi birinde yayınlanmış olması,
- ✓ Başlığında veya anahtar kelimelerinde “Matematik Eğitimi” veya “Math Education” sözcüklerinin birini içermesi,
- ✓ Matematik dersine ya da öğretim süreçlerine ilişkin olması,
- ✓ Tam metnine erişim izninin olması,
- ✓ Türkçe veya İngilizce dillerinden herhangi birinde yayınlanmış olması,
- ✓ 2018-2023 yılları aralığında yayınlanmış olması,
- ✓ Örnekleme yönteminin araştırmanın yöntem kısmında net bir şekilde ifade edilmiş olması,

- ✓ Örneklem düzeyinin arařtırmada net bir řekilde ifade edilmiř olması gerekmektedir.

Yapılan alan yazın taraması sonucu 349 bilimsel arařtırmaya ulařılmıř, ancak bu ölçütler çerçevesinde 287 bilimsel çalıřma (makale ve tez) arařtırma kapsamına dahil edilmiřtir.

Verilerin Analizi ve Yorumlanması

Arařtırmada, toplanan verilerin analiz edilmesinde içerik analiz yöntemi tercih edilmiřtir. Bu analiz yöntemi ile arařtırmanın problemine ve alt problemlerine karşılık gelen verilere ulařılmaya çalıřılmıřtır. Bu noktada gerçekleştirilen süreç, birbirine benzeyen verileri belirli terim ve temalar etrafında bir araya getirmek, sonrasında bu verileri anlaşılır olması için organize edip yorumlamak ve en sonunda okuyucuya sunmak şeklinde ifade edilmektedir (Yıldırım & Şimşek, 2006). Dolayısıyla bu arařtırmada elde edilen verilerin incelenmesinde, belirlenen amaç ya da alt amaçlar doğrultusunda ve arařtırma problemlerine göre kategoriler oluşturulmuřtur. Ayrıca çalıřmada meydana gelen kategorilere ait frekanslar ve yüzdeler hesaplanmıř, hesaplanan bu veriler yorumlanmaya çalıřılmıřtır. Böylece arařtırmanın bulguları şekillendirilmiřtir.

Arařtırmanın Geçerlik ve GüvenirliđiBu çalıřmada güvenilirlik kavramı; aktarılabirlik, tutarlılık ve teyit edilebilirlik ölçütlerine bakılarak sađlanmaya çalıřılmıřtır. Bu kavramlardan aktarılabir ölçütünü sađlamak için arařtırmaya dâhil edilen çalıřmaların dâhil edilme süreçleri ayrıntılı bir şekilde betimleme yöntemi kullanılarak ifade edilmiřtir. Diđer bir kavram olan tutarlılıđı sađlamak için veri toplama işleminin kaydedildiđi yayın sınıflama formunun içeriđi ile çalıřmalardaki örnekleme yöntemi ve örneklem düzeyleri bulunduđu biçimde herhangi bir yorum katılmadan verilmiřtir. Verilerin analizinde yanlı davranmamak amacıyla literatürdeki benzer çalıřmalarda bulunan analiz süreçlerinden yararlanılmıřtır. Teyit edilebilirlik kavramı için ise incelenen arařtırmaların listesi oluşturulmuř ve veriler istenildiđinde sunulmak üzere arřivlenmiřtir. Ayrıca çalıřmada arařtırmacılar arası kodlayıcı uyumuna bakılmıřtır. Bunun için Miles & Huberman (1994) tarafından önerilen kodlayıcılar arası güvenilirlik formülü kullanılmıřtır. Bu formüle göre [güvenirlik katsayısı = görüş birliđi / (görüş birliđi + görüş ayrılıđı)] çalıřmanın kodlayıcılar arasındaki güvenirliđi %99.3 olarak belirlenmiřtir. Anlaşmazlık bulunan arařtırmalardaki sınıflandırma tutarlılıđını artırmaya yönelik olarak, bu arařtırmalar arařtırmacılar tarafından birlikte incelenerek anlaşmazlıklar çözüme kavuşturulmuřtur. Böylece arařtırma kapsamına dahil edilen bilimsel çalıřmaların örnekleme yöntemleri ve örneklem düzeylerine iliřkin verilerin analizi sonunda elde edilen bulgular, frekans ve yüzde deđerlerine göre her bir kategoride sayısallařtırılacak şekilde okuyucuya

sunulmuştur.

Çalışmaya İlişkin Etik Hususlar

Bu araştırma Yükseköğretim Kurumları Bilimsel Araştırma ve Yayın Etiği Yönergesinde belirtilen tüm kurallara uygun bir şekilde yürütülmüştür. Yönergenin ikinci bölümünde yer alan “Bilimsel Araştırma ve Yayın Etiğine Aykırı Eylemler” kısmında belirtilen ifadelerden hiçbiri gerçekleştirilmemiştir. Araştırma çalışmaları insan veya hayvan gibi herhangi bir canlı üzerinden gerçekleştirilmediğinden etik kurul izni gerekmemektedir. Bu nedenle araştırma için herhangi bir etik kurul belgesi alınmamıştır.

BULGULAR

İlk olarak araştırma kapsamına dâhil edilen bilimsel yayınlarda kullanılan örnekleme yöntemlerinin nasıl bir dağılım gösterdiği araştırılmıştır. Bu doğrultuda elde edilen bulgular Tablo 1’de sunulmuştur.

Tablo 1. Çalışmaların Örneklem Yöntemine Göre Sınıflandırılması

Örneklem Çeşitleri	Örneklem Yöntemleri	ERIC		WOS		ProQuest		YÖK Tez		TR Dizin	
		f	%	f	%	f	%	f	%	f	%
Seçkisiz Örneklem	Basit rastlantısal (Seçkisiz)	6	15.4	1	4.8	6	14.3	6	7.1	5	5
	Tabakalı	-	-	-	-	1	2.4	-	-	-	-
	Küme	1	2.6	-	-	-	-	1	1.2	1	1
Seçkisiz Olmayan Örneklem	Kota Örneklem	1	2.6	-	-	-	-	-	-	-	-
	Gelişigüzel (Kazara) Örneklem	3	7.7	6	28.6	1	2.4	10	11.8	7	7
	Amaçlı (Yargısal) Örneklem	26	66.7	12	57.1	34	81	66	77.6	87	87
	Uzman Örneklem	2	5.1	1	4.8	-	-	2	2.4	-	-
Karma Örneklem	Kartopu Örneklem	-	-	-	-	-	-	-	-	-	-
	Sistemik Örneklem	-	-	1	4.8	-	-	-	-	-	-
Toplam		39	100	21	100	42	100	85	100	100	100

Tablo 1 incelendiğinde, araştırma kapsamına dahil edilen matematik eğitimi ile ilgili farklı dizinlerde yayınlanan çalışmalarda en çok amaçlı örneklem (f=225, %78.4) ile gelişigüzel örneklem türünün (f=34, %11.8) tercih edildiği, kartopu örneklem yönteminin ise hiçbir çalışmada kullanılmadığı görülmektedir. Bunun yanı sıra araştırma kapsamındaki çalışmalarda tabakalı örneklem (f=1, %0.3) yönteminin de çok tercih edilmediği belirlenmiştir.

Dizinlere göre örnekleme yöntemleri incelendiğinde; ERIC veri tabanında yayınlanan 39 çalışmanın 26'sında (%66.7), Web of Science dizininde yayınlanan 21 çalışmanın 12'sinde (%57.1), ProQuest'te yayınlanan 42 çalışmanın 34'ünde (%81), YÖK Tez merkezinde yayımlanan 85 çalışmanın 66'sında (%77.6), TR dizininde yer alan 100 çalışmanın ise 87'sinde (%87) amaçlı örnekleme yöntemlerinin tercih edildiği görülmektedir. Bunun yanı sıra gelişigüzel örnekleme yönteminin amaçlı örnekleme yöntemlerinden sonra en çok tercih edilen örnekleme yöntemi olduğu da dikkat çekmektedir.

Sonrasında araştırma kapsamına dâhil edilen bilimsel yayınlarda kullanılan örnekleme düzeylerinin nasıl bir dağılım gösterdiği araştırılmıştır. Bu doğrultuda elde edilen bulgular Tablo 2'de sunulmuştur.

Tablo 2. Çalışmaların Örnekleme Düzeyine Göre Sınıflandırılması

Örnekleme düzeyi	ERIC		WOS		ProQuest		YÖK Tez		TR Dizin	
	f	%	f	%	f	%	f	%	f	%
Okul öncesi	2	5.1	1	4.8	-	-	1	1.2	1	1
İlkokul	-	-	3	14.3	8	19	9	10.6	6	6
Ortaokul	12	30.8	10	47.6	11	26.2	33	38.8	29	29
Lise	-	-	-	-	2	4.8	5	5.9	6	6
Üniversite	6	15.4	5	23.8	6	14.3	5	5.9	26	26
Öğretmen	7	17.9	2	9.5	11	26.2	11	12.9	11	11
Öğretim Elemanı	2	5.1	-	-	3	7.1	2	2.4	-	-
Veli	1	2.6	-	-	-	-	3	3.5	-	-
Doküman (makale ve tez ders kitapları, öğretim programı)	9	23.1	-	-	1	2.4	16	18.8	21	21
Toplam	39	100	21	100	42	100	85	100	100	100

Tablo 2'de, bu araştırma kapsamında sürece dahil edilen matematik eğitimi ile ilgili farklı dizinlerde yayınlanan çalışmalarda örnekleme düzeyi olarak en çok ortaokul öğrencileri (f=95, %33.1) sonrasında üniversite öğrencileri (f=48, %16.8) ve doküman incelemesinin tercih edildiği (f=47, %16.4), okul öncesi öğrenciler (f=5, %1.7) ile velilerin (f=4, %1.4) örnekleme grubu olarak çok fazla tercih edilmediği görülmektedir.

Dizinler tek tek incelendiğinde; ERIC dizininde yayınlanan 39 çalışmada 12'sinde (%30.8), Web of Science dizininde yayınlanan 21 çalışmanın 10'unda (%47.6), ProQuest'te yayımlanan

29 çalışmanın 8'inde (%27.6), YÖK Tez Merkezi'nde yayımlanan 85 çalışmanın 33'ünde (%38.8), TR Dizin'inde yer alan 100 çalışmanın 29'unda (%29) örneklem düzeyi olarak ortaokul öğrencileri tercih edilmiştir.

Çalışmada son olarak araştırma kapsamına dâhil edilen bilimsel yayınların dizinlendikleri veri tabanlarına göre nasıl bir dağılım gösterdiği araştırılmıştır. Araştırma kapsamındaki çalışmalar ERIC, Web of Science, YÖK Tez, ProQuest ve TR Dizin olmak üzere toplamda 5 farklı veri tabanından alınmıştır. Bu doğrultuda elde edilen bulgular Grafik 1'de sunulmuştur.

Grafik 1. Çalışmaların Yer Aldığı Veri Tabanlarına Göre Dağılımı

Grafik 1 incelendiğinde araştırma kapsamında incelenen çalışmaların 100 tanesi (%35) TR Dizin'de, 85 tanesi (%30) YÖK Tez Merkezi'nde, 42 tanesi (%15) ProQuest dizininde, 39 tanesi (%13) ERIC veri tabanında ve 21 tanesi de (%7) Web of Science dizininde yer aldığı görülmektedir.

SONUÇ, TARTIŞMA VE ÖNERİLER

Sonuç ve Tartışma

Bu çalışmada ERIC, Web of Science, ProQuest, TR Dizin ve YÖK Tez veri tabanlarında yer alan 2018-2023 yılları arasında yayınlanmış ve araştırmanın ölçütleri göz önüne alınarak seçilmiş 287 bilimsel araştırmanın örnekleme yöntemi ve örneklem düzeyini belirlemek amaçlanmıştır. Verilerin analizinde içerik analiz yöntemi kullanılmış, elde edilen bulgular tablo ve grafiklerle gösterilip frekans ve yüzdelere göre yorumlanmıştır. Araştırma kapsamına alınan bilimsel yayınlar ilk olarak kullanılan örnekleme yöntemlerine göre değerlendirilmiştir. Sonuçlar matematik eğitimindeki bilimsel araştırmalarda en çok amaçlı örnekleme yöntemi ile gelişigüzel örneklemin kullanıldığını göstermektedir. Kartopu örnekleminin ise hiçbir

çalışmada kullanılmadığı sonucuna ulaşılmıştır. Tabakalı örnekleme yönteminin de benzer şekilde çok fazla tercih edilmediği belirlenmiştir. Amaçlı örnekleme oransal olarak en çok TR Dizin'deki çalışmalarda en az Web of Science'daki çalışmalarda tercih edilmiştir. Bu sonuçların sebepleri amaçlı örnekleme yöntemi ile gelişigüzel örneklemin matematik eğitimi alanındaki çalışmalara daha uygun olması olabilir. Mandev ve Yavuz (2022), ile Kanadlı ve Akay'ın (2019) yapmış oldukları çalışmalarında da araştırmanın sonuçlarına paralel sonuçlara ulaşılmıştır. Yine Kalıncara ve Özek (2021) çalışmasında gelişigüzel örnekleme yönteminin en fazla tercih edilen örnekleme yöntemi olduğunu, rastgele örnekleme yöntemi ve amaçlı örnekleme yönteminin de benzer şekilde çok tercih edildiğini ifade etmiştir.

Araştırma kapsamına alınan bilimsel yayınlar örneklemin düzeylerine göre değerlendirilmiştir. İncelenen dizinlerdeki yayımlanan çalışmalarda en çok ortaokul öğrencilerinin (ilköğretim ikinci kademe) tercih edildiği görülmektedir. Ayrıca elde edilen sonuçlara göre en az velilerin tercih edildiği söylenebilir. Veri tabanı kapsamında ortaokul grubu oransal olarak değerlendirildiğinde en çok ERIC veri tabanında, en az ise TR Dizinde bulunan çalışmalarda örnekleme olarak tercih edildiği sonucuna ulaşılmıştır.

Araştırmada son olarak çalışma kapsamına alınan bilimsel yayınlar veri tabanlarına göre değerlendirilmiştir. Çalışma kapsamında matematik eğitimi alanında en çok TR Dizinde en az ise Web of Science da dizinlenen araştırma olduğu görülmüştür. İncelenen çalışmaların neredeyse yarısı yurtiçi veri tabanlarında (YÖK Tez Merkezi ve TR Dizin) kalan yarısı ise yurtdışı veri tabanlarında (ERIC, Web of Science ve ProQuest) dizinlenmiştir. Ulaşılan bu sonuçlar Kaya'nın (2022) çalışmasında elde ettiği sonuçlarla benzerlik göstermektedir. Benzer şekilde Ulutaş ve Ubuz (2008) çalışmasında alan yazındaki çalışmaların örneklemlerinde ilköğretim öğrencilerinin daha çok tercih edildiğini belirtmiş olup, ortaöğretim öğrencilerine ve öğretmenlere de örnekleme seçiminde yer verilmesi gerektiği vurgulamıştır. Öte yandan alanyazında bulunan farklı dönemlere ait içerik analizi araştırmaları değerlendirildiğinde çalışmadan farklı sonuçların olduğu da görülmüştür. İncikabı vd. (2017) çalışmasında, örneklemlerin dağılımında büyük bir payın lisans öğrencilerine (öğretmen adayı) yönelik olduğu sonucuna varmıştır. Yine Üztemur vd. (2021) ile Kalıncara ve Özek (2021) yaptıkları araştırmalarda örneklemlerin büyük çoğunluğunun üniversite öğrencilerinin ya da öğretmen adaylarının oluşturduğu sonucuna ulaşılmıştır.

Sınırlılıklar ve Öneriler

Araştırma belirlenen ölçütler kapsamında çalışma kapsamına dahil edilen bilimsel yayınlarla sınırlıdır. Ölçütler kapsamında oluşan sınırlılıkların önüne geçebilmek için veri tabanları

taranırken arařtırmacılar ayrı ayrı tarama yapmıř ve sonuçlar karřılařtırılmıřtır. Ayrıca yurt içinde ve yurt dıřında en çok yaygın olan bilimsel yayın veri tabanları kapsama dahil edilmiřtir. Bununla birlikte veri tabanlarında bulunan bilimsel yayınlara ulařabilmek için üniversitelerin ađ erişimleri kullanılmıř, böylece ücretli yayınlara ulařılabilme imkânı sađlanmıřtır. Bu dođrultuda ileride bu matematik eđitimi alanında çalıřmak isteyen arařtırmacılara řu önerilerde bulunulmuřtur. Teknoloji ve bilimdeki gelişim ve deđişim hızı göz önüne alındığında yapılacak yeni çalıřmalarda, ölçüt olarak daha uzun süreli bir veri seti üzerinde matematik eđitimi alanındaki arařtırmalar deđerlendirilebilir. Ölçütler belirlenirken farklı veri tabanları deđerlendirilerek arařtırma kapsamı geliřtirilebilir. Kitap bölümleri, bilimsel projeler ve sempozyumlar ile kongrelerin çıktılarına dönük matematik eđitimi alanında örnekleme yöntemleri ve örnekleme düzeyi kořulları deđerlendirilebilir.

Proje kapsamında uygulanmış olan ankette toplamda yüz mahkûma bu projenin faydalı olup olmadığının, amacına ulaşp ulaşmadığının anlaşılması adına sekizi çoktan seçmeli, ikisi de açık uçlu olmak üzere on soru yöneltilmiştir.

Anahtar Kelimeler: Eğitim, Hükümlü ve Tutuklu, Manevi Rehberlik, Rehabilitasyon,

**THE IMPORTANCE AND RESULTS OF THE "We Support Spiritual Guidance"
PROJECT IMPLEMENTED FOR CONVICTS AND DETAINEES IN THE
CONTEXT OF VALUES EDUCATION**

Abstract

In this study, will be made the results and evaluation of the project implemented under the title of "We Support Spiritual Guidance" under the leadership of Yalova University Faculty of Islamic Sciences Members in cooperation with the Ministry of Justice (Maltepe Penitentiary Institution Directorate) and the Presidency of Religious Affairs (Istanbul Provincial Mufti's Office). Within the scope of the project, the following topics were taught to convicts and detainees by relevant experts. Experience of Living Together: Assoc. Dr. Hasan Gümüőođlu, Res. See. M. Vehbi Yavuz. Human Dignity: Assoc. Dr. Ahmet Gökdemir. Love of Homeland and Nation: Assoc. Dr. Yusuf Oktan, Res. See. Ahmet Őaban Altınıőık. Morals of the Hz. Muhammed Prophet: Assoc. Dr. Mr. Muhammad. Allah and Man: Dr. Ahmet Gezek. Time Management: Server Akın (Istanbul Mufti's Office Prisons and DSM Provincial Coordinator) and Tolerance Culture: Dr. Lecturer member İlyas Akyüzođlu.

Giriş

Şerefli bir varlık olarak yaratılan insan; akıl, irade ve ilim gibi, özelliklerle donatılmıştır. Kendisine verilen bu özellikler sebebiyle insan, kâinattaki varlıkların hâkimi ve efendisi konumundadır. İlahî sanatın ve kudretin en belirgin bir tezahürü olan insan, maddî açıdan küçük olmakla beraber manevî açıdan akılları hayrete düşürecek derecede donanıma sahiptir. Kâinatın hülasası olan insan, bütün meziyetlerine rağmen zayıf ve aceleci bir tabiata sahiptir. İnsanın, maddî ve manevî yapısında, duygu, düşünce ve temayüllerinde bu zafiyetin izleri müşahade edilmektedir. İnsan hayatının her devresinde zafiyetin bu etkisi kendini açıkça göstermektedir. Söz konusu sebeple insan hata edip, suç işleyebilir. Hükümlüler ve tutuklular da bir insan olduğuna göre onlar da nisyarla ve hata ile malüdürlükler. Ancak bu noktada hatadan dönmek ve kesin bir pişmanlık hissi duymak önem arz etmektedir. Bu çerçevede hükümlü ve tutuklulara manevî rehberlik yapmak, rehabilitelerine destek olmak toplumun onurlu birer üyesi olarak tekrar sosyal hayatın içerisine uyumlu fertler olarak katılmalarını sağlamak son derece önemlidir. Hükümlü ve tutukluların yeni bir tarz ve bilgilerle maddî ve manevî sorumlulukları açısından doğru değerlendiremedikleri hususları gündeme taşıyarak onların bilinç seviyelerini yükseltmek ve tekrar suça itilmelerini önlemek için bu proje düşünülmüş ve uygulamaya konulmuştur. Bu sebeple projemizden beklenen fayda, Diyanet İşleri Başkanlığı ile Adalet Bakanlığı arasında yapılan protokol çerçevesinde Ceza İnfaz Kurumlarında yapılan Manevî Rehberlik çalışmalarına katkı sağlamaktır.

Kişinin doğal ortamı, içinde doğduğu ve içinde hürce yaşadığı toplumdur. Ancak çeşitli nedenlerle suça itilmiş ve neticede cezaevine düşmüş hükümlü ve tutuklulara manevi rehberlik çerçevesinde ulaşıp onları rehabilite ederek yeniden topluma kazandırmak, sosyal ve kültürel yönden gelişimlerini sağlamak büyük önemli bir konudur. Bilindiği gibi en değerli ve üstün etkinlik insana yapılan hizmettir. İnsan, Allah Teâlâ'nı şerefli kıldığı bir varlık olup kim olursa olsun, "Yaratılanı hoş gör yaratandan ötürü" ilkesi ile hareket edilerek hükümlü ve tutukluların suçlarına bakılmadan onlara yardımcı olmak, insan onuruna yakışan bir faaliyettir. Bununla birlikte insanın eğitim-öğretimi ve sosyal çevreye intibakı uzun bir zaman alabilmekte, hatta bilgi edinip ve kendini geliştirme süreci hayat boyunca devam etmektedir. Bu itibarla insanın, hangi seviyesinde ve konumda olursa olsun sürekli eğitime, öğretime ve bilinçlendirilmeye ihtiyacının olduğu bir gerçektir.

Söz konusu sebeple bu proje Yalova Üniversitesi İslami İlimler Fakültesi Öğretim Üyelerinin öncülüğünde Adalet Bakanlığı (Maltepe Ceza İnfaz Kurumu Müdürlüğü) ve (Diyanet İşleri Başkanlığı (İstanbul İl Müftülüğü) ile ortaklaşa hareket edilerek "Manevi Rehberliği

Destekliyoruz” başlığıyla hazırlanmıştır. Doç. Dr. Hasan Gümüőođlu’nun yürütücü olarak görev yaptığı proje, Yalova Üniversitesi öğretim üyeleri, İstanbul Müftülüğü ve Maltepe 2 Nolu L Tipi Ceza İnfaz Kurumu’nun koordinesi ile gerçekleştirilmiştir. Bu projenin planlanmasında hükümlü ve tutukluların moral değerlerini yükseltmek, onlara toplumun asli üyeleri olduklarını hatırlatmak, ayrıca devlet ve toplum olarak onlardan vazgeçilemediğini vurgulayarak mesuliyetlerini tekrar hatırlatma amacı etkin rol oynamıştır.

Projenin Amacı

Adalet Bakanlığı Maltepe 2 Nolu L Tipi Kapalı Ceza İnfaz Kurumu Hükümlü ve Tutuklulara yönelik Değerler Eğitimi (Ar-Ge- Projesi) çerçevesinde uygulanan projenin başlıca amaçları arasında hükümlü ve tutukluların temel değerler açısından daha doğru bilgi sahibi olması ve bu çerçevede kendilerini yenileme fırsatı bulması yer almaktadır. Proje, uygulandığı kişilere sorumluluklarını hatırlama, hatalarından dönme konusunda yardımcı olacak ve kendilerinde toplumun birer ferdi olarak yapmaları gerekenleri gözden geçirme fırsatı sağlayacaktır. Ayrıca geleceğe ümitle bakma duygusunun yeşermesine hizmet edecektir. Böylece toplumda güven ve istikrarın bozulmasına sebep olan yanlış davranışların asgarîye indirilmesine yardımcı olunacaktır.

Bir diğer önemli amaç, öğretim üyelerinin ve uzmanların katkıları ile birlikte yapılacak bu değerler eğitimi, hükümlü ve tutukluların muhtemelen daha önce alamadıkları ve kazanamadıkları bilgileri iktisap edinmelerine vesile olacaktır. Ayrıca, bu faaliyetler, üniversite-halk ilişkisinin gerçekleşmesine katkı sağlayacaktır. Diğer taraftan ilim adamlarının sosyal sorumluluklarını yerine getirmesine azımsanmayacak ölçüde katkı sağlayacaktır.

Proje Ekibi ve Görev Tanımları

Proje Yürütücüsü:

Doç. Dr. Hasan Gümüőođlu (Yalova Üniversitesi, İslam Mezhepleri Uzmanı)

Proje Araştırmacıları:

Doç. Dr. Muhammet Beyler (Yalova Üniversitesi, Hadis Uzmanı)

Doç. Dr. Ahmet Gökdemir (İstanbul Üniversitesi, Kıraat ve Tefsir Uzmanı)

Doç. Dr. Yusuf Oktan (Yalova Üniversitesi, Hadis Uzmanı)

Dr. Öğr. Üys. İlyas Akyüzöđlu (Yalova Üniversitesi, İslam Tarihi Uzmanı)

Server Akın Dr. Öğrencisi (İstanbul Müftülüğü Cezaevi İl Koordinatörü)

Dr. Ahmet Gezek (Yalova Üniversitesi Dil Uzmanı)

Arş. Gör. Mehmet Vehbi Yavuz (Yalova Üniversitesi, Mezhepler Tarihi)

Arş. Gör. Ahmet Şaban Altınıőık (Yalova Üniversitesi, Fıkıh)

Proje Kapsamında Yapılan İşler

Projenin hazırlık aşamasında üst yönetici Doç. Dr. Hasan Gümüsoğlu başkanlığında Doç. Dr. Ahmet Gökdemir, İl Müftülüğü cezaevi koordinatör vaizi Server Akın ve araştırma görevlisi Mehmet Vehbi Yavuz başkanlığında bir heyet ile Ocak 2023'de İstanbul İl Müftülüğüne ve Ceza İnfaz Kurumu Müdürlüğü ziyaret edilerek proje hakkında bilgi alış verişinde bulunulmuştur. İl Müftülüğüne gerekli resmi müracaatlar yapıp Adalet Bakanlığı Ceza ve Tevkifevleri Genel Müdürlüğü tarafından uygun görülmesinden sonra Maltepe 2 Nolu L Tipi Ceza İnfaz Kurumunda proje uygulamasına başlanmış ve planlandığı gibi on ayda tamamlanmıştır. Proje kapsamında aşağıdaki konular hükümlü ve tutuklulara ilgili uzmanlar tarafından işlenmiştir.

Birlikte Yaşama Tecrübesi: Doç. Dr. Hasan Gümüsoğlu, Arş. Gör. M. Vehbi Yavuz

İnsan Onuru: Doç. Dr. Ahmet Gökdemir

Vatan ve Millet Sevgisi: Doç. Dr. Yusuf Oktan, Arş. Gör. Ahmet Şaban Altınışik

Hz. Peygamber'in Güzel Ahlakı: Doç. Dr. Muhammet Beyler

Allah ve İnsan: Dr. Ahmet Gezek

Zaman Yönetimi: Server Akın (İstanbul Müftülüğü Cezaevleri ve DSM il Koordinatörü)

Hoşgörü Kültürü: Dr. Öğr. Üys. İlyas Akyüzöglü

Anket Çalışmasının Değerlendirilmesi

Proje kapsamında uygulanmış olan ankette toplamda yüz mahkûma bu projenin faydalı olup olmadığını, amacına ulaşıp ulaşmadığının anlaşılması adına sekizi çoktan seçmeli, ikisi de açık uçlu olmak üzere on soru yöneltilmiştir. Çoktan seçmeli olanlara verilen cevaplar Tablo 1'de özetlenmiştir. Grafik haline getirilirken anketteki çoktan seçmeli soruların uzun uzadıya yazılması imkânı olmadığından soruların numaralandırılması ile iktifa edilmiş olup, soruların açık halleri şöyledir:

1. Konular anlaşılır şekilde sunulmuştur.
2. Sunulan konular yeterliydi.
3. Sunumlardan genel olarak memnun kaldım.
4. Eğitim sonucunda, konuyla ilgili yeterli bilgi aldım.
5. Bu çeşit eğitimleri gerekli görüyorum.
6. Eğitimden genel olarak memnun kaldım.
7. Eğitimin organizasyonu yeterliydi.
8. Eğitimden sonra bazı bakış açıları değişti.

(Tablo 1)

Ankette “Kesinlikle katılmıyorum”, “Katılmıyorum”, “Kararsızım”, “Katılıyorum” ve “Kesinlikle Katılıyorum” şeklinde beş şık sunulmuş ve anketi cevaplayanların bu şıklardan birini seçmeleri istenmiştir. Grafik haline getirilen sonuçlar göz önüne alındığında, hükümlü ve tutukluların katılım oranının en yüksek olduğu cevabın beşinci soru olduğu görülmektedir. Beşinci soruyu verilen cevabı katılım oranında üçüncü soruya verilen cevabın takip ettiği de dikkate alınırsa, projede hedeflenen amaçlar ile katılım sağlayan mahkûmların taleplerinin büyük ölçüde örtüştüğü ve projede sunulan içeriklerin katılımcıları memnun ettiği görülmektedir.

“Katılmıyorum” ve “Kesinlikle katılmıyorum” cevaplarının en yüksek olduğu ikinci ve sekizinci sorular dikkate alındığında ise mahkûmların, projenin faydalı olmakla birlikte yeterli olmadığı kanaatine sahip olduklarını göstermektedir. Nitekim açık uçlu sorulara verilen cevaplarda genel anlamda programdan memnun kalındığı, ancak daha farklı konuların detaylı ve daha sık işlenmesinin istendiği ortaya çıkmaktadır. (bk. Tablo 2, Tablo 3)

Mahkûmlara sorulan açık uçlu sorular ise şu şekildedir:

1. Sizlere verilecek eğitimde başka hangi konuların olmasını istersiniz?
2. Bu eğitimin geliştirilmesi için önerileriniz nelerdir? (Düşüncelerinizi yazınız.)

Yüz kişinin atıldığı ankette açık uçlu ilk soruya verilen cevaplar şu şekildedir:

1	Bu konular yeterli.
2	Bu konular yeterli.
3	Tarih ve coğrafya ile ilgili konuların olmasını çok isteriz.
4	Tarihlerle ve yaşantılarla ilgili konuların olmasını çok isterim.
5	Hayvanlarla ve ailelerle ilgili konuların olmasını isterim.
6	Ailelerle ve sağlıkla ilgili konuların olmasını isterim.
7	Ailelerle olan ilişkilerin geliştirilmesi, kuvvetlendirilmesi olabilirdi.
8	Dini konular ve gelişimimiz için
9	Aile ve tarihimiz ile ilgili konular
10	Bu tür eğitimlerin devam etmesi olabilir ve teknolojik aletleri kullanma fırsatı verilebilir.
11	Çok yararlı buldum böyle etkinliklerin artmasını istiyorum.
12	Aile ve çocukların dini eğitimi ile ilgili konferansların sıklaşmasını istiyoruz.
13	Kişisel gelişimle ilgili faaliyetler olması...
14	Bu konular yeterli.
15	Bu konular yeterli.
16	Dini bilgiler ile alakalı daha detaylı olmasını isterim.
17	Ailelerle olan ilişkilerin geliştirilmesi ve kuvvetlendirilmesi olabilirdi.
18	Hz. Ömer ve Peygamber Efendimizin hayatını öğrenmek isterdik.
19	Peygamberlerin hayatlarını detaylı dinlemek isterdik.
20	Bütün peygamber efendilerimizin hayatını öğrenmek
21	Duaları ve anlamlarını sizlerden öğrenmek
22	Psikiyatri alanında konu
23	İslam ve düzenli beslenme, psikolojik eğitim
24	İnsan gelişimi ve psikiyatri, sporla alakalı olabilir.
25	Bu konuların devamı
26	Şu anda cezaevinde olan ve ne hakları olduğunu bilmeyen, neden ve nedensizce yatan o kadar insan var ki. Bunlara TCK'yı ve yasal haklarını, söz sahibi olduğu tüm imkânların aydınlatılmasını, seminer verilmesini talep ederdim.
27	Teşekkürler...
28	Kul hakları hakkında videolu konferans verilmesini istiyoruz.
29	Bilgisayar kursu ve bunun gibi farklı, az değinilmiş ya da hiç uygulanmamış seminerlerin düzenlenmesi, üniversitelerden hocaların katılımıyla düzenlenmiş birliktelikler olabilir.
30	Tarihi konularda bilgilendirilmeyi isterdim.
31	Mahkûmiyet süreci sonrası aktif yaşama, topluma uyum sağlama problemlerinin nasıl üstesinden gelineceği işlenebilir.
32	Bu konular yeterli.
33	Manevi
34	Toplumsal aile ile ilgili konular
35	Dinimiz hakkında tarihi bilgiler.
36	İlkyardım ve temel trafik konuları. Dinimiz hakkında tarihçe bilgiler.
37	Sinema ve tiyatro gibi eğitimlerin olmasını

38	Saz kursu olmasını isterim.
39	Dinler tarihi daha detaylı anlatılabilirdi. Konuşan uzmanın alanı da İslamiyet'in tarihiydi ama hiç detay verilmeden üstünkörü geçildi.
40	Kafamızın dağılacağı konuların olmasını isteriz.
41	Dinimizin tarihi ile alakalı
42	Aile ve din ile alakalı her şey
43	Sizlerin verdiği konular zaten güzel.
44	Sosyal ilişkiler ile ilgili daha çok rehberlik yapılmasını isterim.
45	Dinimize yoğunlaşmak isterim.
46	Konular yeterliydi.
47	Dinimizin varoluşu.
48	Dini değerler
49	Hz. Peygamber Yusuf'un hayatı
50	Milli değerler
51	Bulduğumuz konum ve yaptığımız hataların düzeltilmesinde etkili olacak şeylerin ele alınması.
52	Kur'an okuma geliştirmeyi, dini sohbetleri, daha sık bilgiler
53	Bulduğumuz konum ve yaptığımız hataların düzeltilmesinde etkili olacak şeylerin ele alınması.
54	Milli ve manevi değerlerimiz ile toplumun yanlış bildiği nesnel yargılara değinilmesi
55	Değerlerimizin daha çok ayrıntılarının anlatılması
56	Melekler hakkındaki konular varoluşumuz hakkında ve de geçmiş ve gelecek hakkındaki konuların olmasını
57	Bütün peygamberlerimizin hayatlarını merak ediyorum. Bunun hakkında eğitim veya konuları öğrenmek isterim.
58	İslamiyet hakkında daha derin bilgiler almak istiyorum.
59	Eskiye anlatan, tarihi güzelliklerimizi açıklayıcı anlatılan konuların olmasını isterim.
60	Hz. Yusuf Peygamber efendimizin hayatını siz büyüklerimizden dinlemek isteriz.
61	Kişisel gelişim, insanlarla iletişim ve dini ve manevi değerlerimizin anlatılması
62	Bu tür konuların daha fazla gelmesini, daha fazla etkinlik yapmayı düşünüyorum.
63	Bu tür konuların daha sık olması, devamının gelmesini isterim.
64	Bu tür eğitimlerle alakalı konuların devamının gelmesini isterim.
65	"Haram ve haksız kazançtan uzak durmak" temalı kapsamlı konferanslar verilmesini istiyorum.
66	15 Temmuz Darbe Girişimleri, Hain Saldırıları
67	Peygamber Efendimiz'in hayatı ve darbe girişiminin hikâyesi
68	15 Temmuz Darbe Girişimi
69	Peygamberlerimizin hayatları, dini bilgiler
70	Tüm dini eğitimlerle ilgili bilgilendirici seminerlerin olmasını istiyorum.
71	Peygamber Efendimiz'in hayatı
72	Dini konular
73	Çeşitli konular...

74	Aile, toplumsal gelişim ve insan hakları konularında da eğitim ve oturumlar olsun isterim.
75	İnsanların davranışlarını düzeltme konusunda...
76	Çifte standardın olmadığı adil bir dünya düzenine nasıl kavuşulur, haksızlığa karşı yapmamız gerekenler konuları...
77	Tarih, insan zihni, psikiyatri eğitimleri
78	Bilişim, resim ve daha farklı kurs faaliyetlerinin yapılmasını isterim.
79	Fark etmez.
80	Sosyal alanda ve maneviyata dönük her konu olur.
81	Hz. Peygamber'in (s.a.v.) hayatının tamamını dinlemek.
82	Sevgi ve saygı, hoşgörü konu
83	Peygamberlerimizin yaşamları hakkında daha detaylı bilgilendirme yapılmasının gerektiğini belirtiyor ve de istiyorum.
84	Peygamberlerimizin hakkında detaylı bilgilendirme yapılmasını istiyorum.
85	İlk peygamberimiz Hz. Âdem hakkında bilgi verilmesini istiyorum.
86	Son peygamberimiz Hz. Muhammed Mustafa'nın hayatının daha detaylı anlatılmasını isterdim.
87	Çeşitli konular ve daha eğitici konuların olmasını.
88	Konular genişletilmeli.
89	Tarih
90	Eğitim faaliyetleri hakkında farklı konularda
91	İnsanlar arasında birbirine saygı ve sevgi ile ilgili konu ve İslami ahlak
92	Genel kültür ve tarih konuları da ele alınabilir.
93	Eğitimin konusunu beğendim.
94	Kişisel gelişim ve İslami eğitimler.
95	Güzeldi, konular yeterli oldu.
96	Peygamberlerimizin hakkında daha detaylı bilgilendirme yapılmasını isterim.
97	Hz. Ali hakkında daha detaylı bilgilendirme yapılmasını isterim.
98	Hocadan memnun kaldık. Bir dahaki sefer de gelmesini istiyorum.
99	İnsan gelişimi, spor önemi ve düzenli besin de anlatılmalı.
100	Kişisel gelişim üzerine konuların olmasını isterim.

(Tablo 2)

İkinci soruya verilen cevaplar da aşağıdaki tabloda görülebilir:

1	Devamlı böyle güzel konular olsun.
2	Devamlı yapılabilir böyle güzel seminerler.
3	Hayat ve yaşamla ilgili konuların olmasını çok isteriz.
4	Yiyecek ve çocuklarla ilgili konuların olmasını çok isterim.
5	Hayvanları daha çok çevremize sevdirmek ve korumak, aile bağlarımızı güçlendirmekle daha fazlasının olmasını isterim.
6	Çocuklarımız ve kardeşlerimizle diyalog kurmak için bu konuyla ilgili daha çok etkinlik görmek istiyoruz.
7	-
8	Sürekli olmasını isterim.
9	Sıklıkla olmasını isterim.

10	Devletimizin bu tür faktörlere imkânını yeterli buluyorum ama siz de biraz elinizi taşın altına koyup bize destek olabilirsiniz.
11	Bu tarz etkinliklerin geliştirilmesini ve ailelerimizle iletişimin güçlenmesini istiyoruz.
12	Daha sık ve çeşitli etkinlikler olmalı.
13	Daha çok faaliyetlerin olması ve kişilerin fikirlerinin alınması ve hayata geçirilmesi.
14	Devamı yapılan (?) böyle güzel seminerler
15	Devamı yapılan (?) böyle güzel seminerler
16	Bu tür eğitimlerin sürekliliğinin ve devamlılığının olmasını isterim.
17	Devamlı böyle şeyler görmek isterim.
18	Ayda değil haftada bizleri seminerlere çıkartmanız
19	Saatlerin uzatılmasını ve hocalarımızı daha fazla dinlemek isterdik.
20	Daha detaylı ve uzun olması
21	Seminerlerin devamlı olması
22	Seminerlerin devamlı olması
23	İslam'ın tarihi anlatılmalı
24	Cezaların anlatılması, suçu meslek haline getirenlerin eğitim alması ve iyilik, kötülük anlatılması, İslamiyet'in anlatılması
25	Bu gibi eğitimlerin devamının gelmesini isterim.
26	Profesyonel eğitim verilmeli, uzman kişilerce eğitim verilmelidir. Kolundan tuttuğunuzu hoca diye buraya getiriyorsunuz. Verdiği bilgilerin yarısı da kinayeli ve çelişkilidir.
27	Görseller olabilir. Slaytlar da olabilir.
28	Görseller ve videolarla desteklenebilir.
29	Kurumda bulunduğum süre içerisinde eğitim düzeyi düşük veya okuma yazma oranı çok düşük kişilerin bulunduğunu gözlemledim. Daha çok bu konuya eğilerek gerekli organizasyonlar yapılabilir.
30	Toplumda suç işlemenin maruz bırakılanlar üzerinde ne gibi etkilerinin olabileceği seminerler faydalı olabilir.
31	Toplum, birey ve suç ilişkilerinin işleneceği seminerler bu anlamda daha faydalı olacaktır.
32	Devamlı yapılabilir böyle güzel seminerler.
33	-
34	Sürekli hale getirilmesi ve alanında uzman kişiler tarafından bilgi verilmesi.
35	Daha sık yapılması ve uzman kişiler tarafından uzun tutulması.
36	Haftalık olarak sürekli yapılması
37	Daha çok seminerlere çıkmalıyız.
38	Ne eğitimi anlamadım.
39	Süre uzatılıp daha detaylı anlatımlara girilebilir ve soru--cevap kısmı daha belirginleştirilip uzatılabilir.
40	Öncelikle bu yapmış olduğunuz program hoşuma gitti. Daha derin konuları ilerleyen zamanlarda görmek isterim.
41	Her hafta olmasını isterim
42	Sürekli olmasını isteriz.
43	Bu konuları siz daha iyi bilirsiniz.
44	Eğitimlerin daha sık ve soru cevap niteliğinde güçlendirilmesini öneririm.

45	Sürekliлик.
46	Devamlılık olması daha iyi olur.
47	Allah razı olsun bir önerim yok.
48	Sık sık yapılması
49	Sunucuların hatalarını düzeltmesi
50	Sık sık yapılması
51	Daha sık olmasını isterim. Dini konuların daha kapsamlı ele alınmasını, söz hakkı verilerek sorulan soruların cevaplanmasını, dinleyicinin öğrenmek istediği konuların ele alınması daha etkili olacağını düşünürüm. Saygılarımla...
52	Daha sık olmasını isterim. Dini konuların daha kapsamlı ele alınmasını, söz hakkı verilerek sorulan soruların cevaplanmasını, dinleyicinin öğrenmek istediği konuların ele alınması daha etkili olacağını düşünüyorum. Saygılarımla...
53	Daha sık olmasını isterim. Dini konuların daha kapsamlı ele alınmasını, söz hakkı verilerek sorulan soruların cevaplanmasını, dinleyicinin öğrenmek istediği konuların ele alınması daha etkili olacağını düşünürüm. Saygılarımla...
54	Daha sık yapılarak konuların giriş, gelişme, sonuç olarak anlatılması
55	Eğitimin sık sık yapılması
56	Farklı hocaların yani farklı görüş açılarının olması çok daha iyi olur. Teşekkürler.
57	Sık sık yapılması yeterlidir. Konuların kafamızda sabit bir şekilde yer alması için sağ olun.
58	Size kalsın. Sağ olun.
59	Manevi rehberliğin daha çok sıklıkla yapılmasını ve daha açıklayıcı olmasını öneririm.
60	15 Temmuz'da yaşananları dinlemek isterim.
61	Daha sık yapıp detaylı anlatıma girilip sosyal konulara önem verilmesi
62	Daha fazla eğitim olması
63	Daha sık ve daha detaylı anlatım ve soru cevap olarak güçlendirilmesini isterim.
64	--
65	Video ve slayt görsellerine de yer verilmesi
66	Ayda bir cezaevlerinin gezilmesi, gençlerle sohbet edilmesi. Onlara daha çok elinizden geldiği kadar bilgi verilmesi.
67	Bence haftada bir ya da ayda bir cezaevlerini ziyaret etmeleri, bilgi verilmesi
68	Cezaevi ziyaretleri, gençlerle sohbet edilmeli.
69	Ayda bir cezaevlerinin ziyaret edilmesi, daha çok bilgi verilmesi
70	Daha sık eğitimlerin olmasını öneririm.
71	Daha sık bu tür konferansların olmasını isterim.
72	Daha sık konferansların olması
73	Tek konu üzerine olmaması
74	Daha sık yapılmalı. Sosyal aktivite olarak da insani gelişim adına da kıymetli.
75	Bir psikolog tarafından toplu eğitimler verilmesi mesela...
76	Daha sık aralıklarla yapılması. Katılımları artıracak teşvik edici puanlar zaten var, bir de telefon görüş ödülü verilmesi uygun olur diye düşünüyorum.
77	Tek konu olarak değil, çeşitli konularda olması
78	Eğitim ve okur-yazarlık konusunda zayıf olanlara eğitim verilmesi.
79	Daha çok yapılmalı.
80	Sık ve fazla olmalı.
81	Bizlerin bu seminere her hafta çıkartılması

82	Seminerlerin devamlı olması
83	Ayda iki defadan az tekrarlanırsa bir anlam ifade etmeyeceğini düşünüyorum.
84	Bu seminerlerin daha sıklıkla tekrarlanmasını istiyorum.
85	Ayda en az iki kere tekrarlanmasını istiyorum.
86	Sadece bir defalığına değil de ayda en az iki defa bu seminerin tekrarlanmasının gerektiğini düşünüyorum.
87	Kişisel gelişim hakkında eğitim verilmesi.
88	Sıklıkla konferans yapılmalı.
89	Devamlılık
90	Faaliyetlerin daha sık ve kapsamlı olması
91	Daha sık olmalı.
92	Düzenli olarak eğitim verilmesi
93	Düzenli olarak konferanslar olabilir.
94	Devamlılık.
95	Bu tarz konferanslar sürekli yapılmalı.
96	Sadece bir defalığına değil en az ayda iki defa bu seminerin tekrarlanmasının gerektiğini düşünüyorum.
97	Ayda en az iki defa bu seminerin yapılması gerekmektedir.
98	Farklı konuları dinlemeyi ve kısa zamanda bir seminer daha talep ediyorum.
99	İslam dininin düzenli olarak tarihi ve mucizeleri anlatılmalı.
100	Daha farklı ve geliştirici faaliyetlerin yapılması

(Tablo 3)

Projenin Sonunda Yapılan Çalıştay

Projenin bitiminin ardından 19 Ekim 2023 Perşembe günü Yalova Üniversitesi İslami İlimler Fakültesi'nde projeye katkı sunan öğretim elemanları ve cezaevi görevlilerinin katılımıyla bir çalıştay düzenlenmiştir. Bu çalıştayda, katılımcıların projenin uygulanmasına yönelik görüşlerini açıklamanın yanında cezaevindeki seminerlere katılan mahkûmlar tarafından cevaplanan anket değerlendirilmiş, bu minvalde projenin ne ölçüde başarılı olduğu, faydalı yönleri ile birlikte eksik kalan yanlarının neler olduğu, ilerleyen dönemlerde bu kapsamdaki çalışmaların nasıl geliştirilebileceği değerlendirilmiştir.

Çalıştay projenin yürütücüsü Doç. Dr. Hasan Gümüşoğlu'nun konuşmasıyla başlamıştır. Gümüşoğlu, projede emeği geçenlere teşekkür ettikten sonra katılımcılardan proje hakkındaki kanaat ve düşüncelerini ifade etmelerini istemiştir. Gümüşoğlu, konuşmasında söz konusu projenin gerek cezaevi personeli gerekse öğretim üyeleri tarafında büyük bir ilgiyle karşılandığını, özellikle böyle bir projede ilk defa yer alan öğretim üyelerinin çok farklı bir tecrübe yaşadıklarını ifade ettiklerine vurgu yapmıştır. Gümüşoğlu, projenin öğretim üyelerinin yanı sıra sunumlara iştirak eden cezaevi personeli ve mahkûmlar tarafından da ilgi ve merakla izlendiğine işaret etmiştir. Gümüşoğlu, projenin geliştirilmesi ve sonraki çalışmalara yön

verebilecek sonuçlara ulaşılması noktasında sürekli belirli bir kesime eğitim vermenin daha faydalı olacağını dile getirerek projede yer alan konuların aynı insanlara uygulanması durumunda daha sağlıklı bir ölçme-değerlendirme yapılabileceğini belirtmiştir.

Çalıştayda da söz alan Doç. Dr. Yusuf Oktan, genel olarak projeden memnun kaldığını dile getirmiş ve projenin başka cezaevlerine de teşmil edilemesin faydalı olabileceğini ifade etmiştir. Seminerlerin artırılmasının daha münasip olacağını dile getiren Oktan, sunumların iki haftada bir gerçekleştirilecek şekilde yapılmasını önermiştir. Çalıştayda, programların koşullarda gerçekleştirilmesinin daha faydalı olup olmayacağı konusu da müzakere edilmiş ve durumun hükümlülerin ve cezaevlerinin şartlarına göre değişebileceği ifade edilmiştir. Bu çerçevede her koşulda her hafta farklı hocaların vereceği dersler yoluyla dönüşümlü bir programın hazırlanmasının daha etkili olabileceği gündeme gelmiştir.

Dr. Öğr. Üyesi İlyas Akyüzoğlu ise, mahkûmların yanında, cezaevinde görev yapan manevi rehberlere yönelik destekleyici bir faaliyetin yürütülebileceğini gündeme getirmiş, bu noktada mahkûmların manevî rehberlere sordukları sorulara cevaplar verilmesi ve bu cevapların bir kitapçık haline getirilip “cezaevi rehberi” formatında yayımlanabileceği düşünülmüştür. Ayrıca bu minvalde atölye çalışmalarının yapılmasının münasip olduğu da gündeme getirilmiştir.

Çalıştayda gözlem ve önerilerini ileten İstanbul Müftülüğü cezaevleri koordinatörü Server Akın, kandiller gibi belirli dini günlerde sohbet, dua, musiki programlarına benzer faaliyetler yahut bunların bir arada bulunduğu paket programların üniversite ile birlikte düzenlenmesinin, mahkûmlar açısından oldukça faydalı olacağını belirtmiştir.

Maltepe cezaevi koordinatörü Abdülkadir Budak ise projenin faydalı olduğunda ve cezaevindeki görevli arkadaşlarının da kanaatinin bu yönde olduğuna işaret ettikten sonra başta Ceza İnfaz Kurumu Müdürleri olmak üzere, kurum öğretmenlerinin ve eğitime katılan hükümlü ve tutukluların memnuniyetlerini ifade etmişlerdir. Manevi değerler eğitimine çok ihtiyaç olduğunu dile getiren Budak, tutuklu ve hükümlülerin farklı kişileri dinlemenin önemine değinmişlerdir. Proje sunumlarında görsellerden faydalanılsa daha etkili olacağını ifade eden Budak, her oturuma farklı koşulların katılmasının projeden daha fazla kişinin istifade etmesine yönelik olduğunu belirlemekle birlikte konu hakkında neler yapılabileceğinin müzakere edilebileceğini açıklamışlardır. Budak ayrıca İlahiyat Fakültelerinin sahada olmasını önemsediklerini ve sorunları yerinde görmek, verilen eğitimlerin sonucunu gözlemlemek bakımından bu türden projelerin yaygınlaşması büyük önem arz ettiğine vurgu yapmışlardır.

Çalıştayda ankete verilen cevaplar gündeme getirilmiş, yapılan değerlendirmeler sonucunda genel olarak seminerlerin kapsamının genişletilip devam etmesi yönünde bir fikir oluşmuştur.

Ayrıca projenin geliştirilmesi noktasında cezaevindeki Selefilik, Kur'âncılık gibi çağdaş İslami hareketlere yönelik belirli çalışmaların yapılabilmesi fikri kuvvet kazanmıştır. Çalıştayda gündeme getirilen başka bir önemli mesele, projeye mali destek bulunması olmuştur. Proje ile ilgili bir başka önemli husus, çalışmaların bir makale haline getirilmesidir. Nitekim bu husus önemle vurgulanmış olup, seminerlerde sunulan konuların içeriklerinin metinleştirilip bir makale formatında yayımlanması kararlaştırılmıştır. Çalıştayın sonunda her konuşmacının, sunumunun iki yüz elli kelimelik bir özetini yazılıp bu özetlerin bir araya getirilmesi yoluyla bir özet kitapçığının oluşturulması önemli görülmüştür. Bu şekilde hem yapılan sunumların muhtevalarının kaybolmaması, hem de bir el kitapçığı formatında bu konulara ilgi gösteren başka kimselerin faydalanmasına imkân sağlanacağı değerlendirilmiştir.

Sonuç

Projenin gerek cezaevi personeli gerekse öğretim üyeleri tarafında büyük bir ilgiyle takip edildiği, özellikle bu nevi projede ilk defa görev alan öğretim üyeleri, farklı bir tecrübe yaşadıklarını ifade edilmiştir. Projenin aynı mahkûmlara sürekli eğitim verme şeklinde uygulanmasının ve bu nevi projelerin başka cezaevlerine de teşmil edilmesinin faydalı olacağı anlaşılmıştır. Ayrıca seminerlerin artırılmasının daha münasip olacağını mesela sunumların iki haftada bir gerçekleştirilmesi durumunda daha iyi netice alınacağı söylenmiştir.

Proje kapsamında programa iştirak eden hükümlülerin bazısına uygulanan ankete göre projede hedeflenen amaçlar ile katılım sağlayan mahkûmların taleplerinin büyük ölçüde örtüştüğü ve projede sunulan içeriklerin katılımcıları memnun ettiği görülmektedir. Ancak mahkûmların, projenin faydalı olmakla birlikte yeterli olmadığı kanaatine sahip olduklarını ve ilave konularla programın daha yoğun olarak uygulanmasını istedikleri anlaşılmıştır.

Açık uçlu sorulara verilen cevaplara da bakıldığında, genel anlamda programdan memnun kalınmakla birlikte çoğunlukla projede; İslâmiyet hakkında daha detaylı bilgiler, İnsanlar arasında birbirine saygı ve sevginin önemi, Dinimiz ve tarihimiz hakkında konular, Mezhepler ve çağdaş İslâmî hareketleri konusu, Helal ve sağlıklı beslenme, konularının yer alması istenilmiştir. Aynı şekilde Kul hakları, Peygamber Efendimiz ve sahabe-i kiramın hayatını, Aile hayatının önemi ve sorumluluk duygusu, Kur'an-ı Kerim okumayı geliştirme, Kişisel gelişim ve insanlarla iletişim gibi konuların da proje kapsamında işlenmesi talep olunmuştur. Ayrıca projelerde kandiller gibi belirli dini günlerde sohbet, dua, musiki programlarının bir arada bulunduğu paket programlara da yer verilmesinin mahkûmlar açısından faydalı olacağı kanaati oluşmuştur.

**THE SOCIOMETRIC STATUS OF SYRIAN CHILDREN ATTENDING
PRESCHOOL EDUCATION IN TURKIYE**

Abstract

This study aims to reveal the preference levels of preschool children for Syrian children in their classes. A qualitative study was designed to examine the peer relationships of Syrian children attending independent preschools with their classmates. The research was conducted in independent kindergartens affiliated with Kilis Provincial Directorate of National Education with 5-year-old children in the fall semester of the 2023-2024 academic year. The position of Syrian children in peer relationships and the level of preference of these children as friends were determined with the "sociometry technique". Sociograms were prepared from the data obtained from the sociometry tool and presented. As a result of the research, it was observed that Syrian children were preferred by their Turkish peers at a level almost negligible. Most of the Syrian children who were not preferred by their Turkish classmates were also not preferred by their Syrian classmates.

Keywords: Peer Relations, Sociometry, Syrian Children

Introduction

Due to the anti-regime protests that started in March 2011 and turned into a civil war, more than half of the Syrian population fled to neighboring countries or had to migrate within the country. Turkey hosts the largest number of Syrian refugees and has also become the country with the highest number of refugees in the world (Aktaş, 2018).

The city of Kilis, where the study was conducted, hosts a large number of Syrians under temporary protection status due to its location neighboring Syria and being a border city. According to the data of the General Directorate of Migration Management, the number of Syrians registered in Kilis as of 19.01.2023 is 87,408. The ratio of the number of Syrians in Kilis to the total number of people living in the province is 37.48. With this ratio, Kilis ranks first in Turkey.

The education of families and children who had to leave Syria for war and security reasons is both a fundamental human right and an important need for their integration into Turkey (Aytaç, 2021). The Association for Solidarity and Support for Refugees and Asylum Seekers (MSYD) (2017) stated that peer bullying and discrimination faced by migrants, refugees, or children under temporary protection is one of the biggest obstacles to their schooling. Studies conducted in Turkey have also revealed that peer acceptance is one of the main educational problems experienced by Syrian children (Kılıç & Toker-Gökçe, 2019; Külekçi-Akyavuz et al., 2020).

However, peer relationships are one of the most important factors in the development of school-age children. Being able to interact with peers is one of the important developmental goals of early childhood (Bakkaloğlu, Sucuoğlu, & Özbek, 2019). Friendship relationships established during this period have a positive impact on children's social, emotional, and cognitive development, and it is known that these relationships are closely related to children's social acceptance by their peers (Guralnick, Neville, Hammond, & Connor, 2007). Peer relationships can be a risk factor as well as a protective and developmental feature of children's mental health. Negative interactions with peers, which have an important place in children's lives, may cause children to encounter problems in interpersonal relationships and academic skills and may pave the way for the development of emotional/behavioral problems (Healy, Sanders, & Iyer, 2014; Keane & Calkins, 2004). In this regard, Cirit-Karaağaç and Güvenç (2019) stated that Syrian students under temporary protection experience difficulties in the education process due to their exclusion and exclusion by their peers, and as a result, students do not continue their education regularly.

Therefore, examining the peer relationships between Turkish and Syrian children and revealing the mutual perceptions of both Syrian students and Turkish children who share the same classroom and social environment with Syrian children can be used in a wide range of activities, from simple arrangements such as choosing the friends with whom Syrian students will sit in the same desk, to activities that increase Syrian students' school adaptation and belonging. Unlike studies conducted only on Turkish or Syrian students, since both groups of students were reached at the same time in this study, the information obtained from the examination of peer relationships may enable counselors and teachers to be more practical and effective (Sinan, 2019).

In studies on peer relations of preschool children in Turkey, the preference levels of children with special needs by their peers with normal development were mostly examined (Bakkaloğlu, Sucuoğlu, & Özbek, 2019; Karadağ, Yıldız-Demirtaş & Girli, 2014). Limited studies have been conducted to determine the level of acceptance of Syrian children by their peers and the factors affecting peer acceptance (Bozan, Akçay & Karahan, 2021; Üstündağ & Şenol, 2023). Hence, it is thought that this study will contribute to the field in terms of addressing the peer relations of Syrian and Turkish children.

This study aimed to examine the preference levels of Syrian children attending preschool education institutions in Turkey by their peers in their classrooms. For this purpose, the following question was sought to be answered:

What is the preference level of Syrian children by their Turkish peers?

METHOD

Study Design

A qualitative study was designed to examine the peer relationships of Syrian children attending independent preschools with their classmates. The data were collected with the interview technique from qualitative methods. The interview question was selected from the questions used in the sociometry technique based on peer selection.

Data collection tools

Sociometric measurements in the sociometry application in this study were conducted based on the peer selection technique for a given criterion. The criterion was "playing games" considering children's developmental characteristics and children's peer relations were evaluated based on this criterion. In accordance with the sociometric technique based on peer

selection, all children in the study were asked to indicate the names of the 3 friends they liked to play with the most in the classroom in order.

Analysis of Data

The data obtained from the interviews were analyzed with descriptive analysis, one of the descriptive research methods. As a result of the descriptive analysis, frequencies, and percentages of Syrian children being preferred by others in 1st, 2nd, and 3rd places were obtained and discussed. In addition, sociograms were created after the sociometry technique based on peer selection.

FINDINGS

The data obtained from the sociometry technique and semi-structured interviews are presented under the following headings.

Findings Related to the Data Obtained from the Sociometry Technique

Sociogram

The students participating in the study were asked to choose three friends to play games in the classroom. A sociogram was created in the sociometry tool with the data obtained.

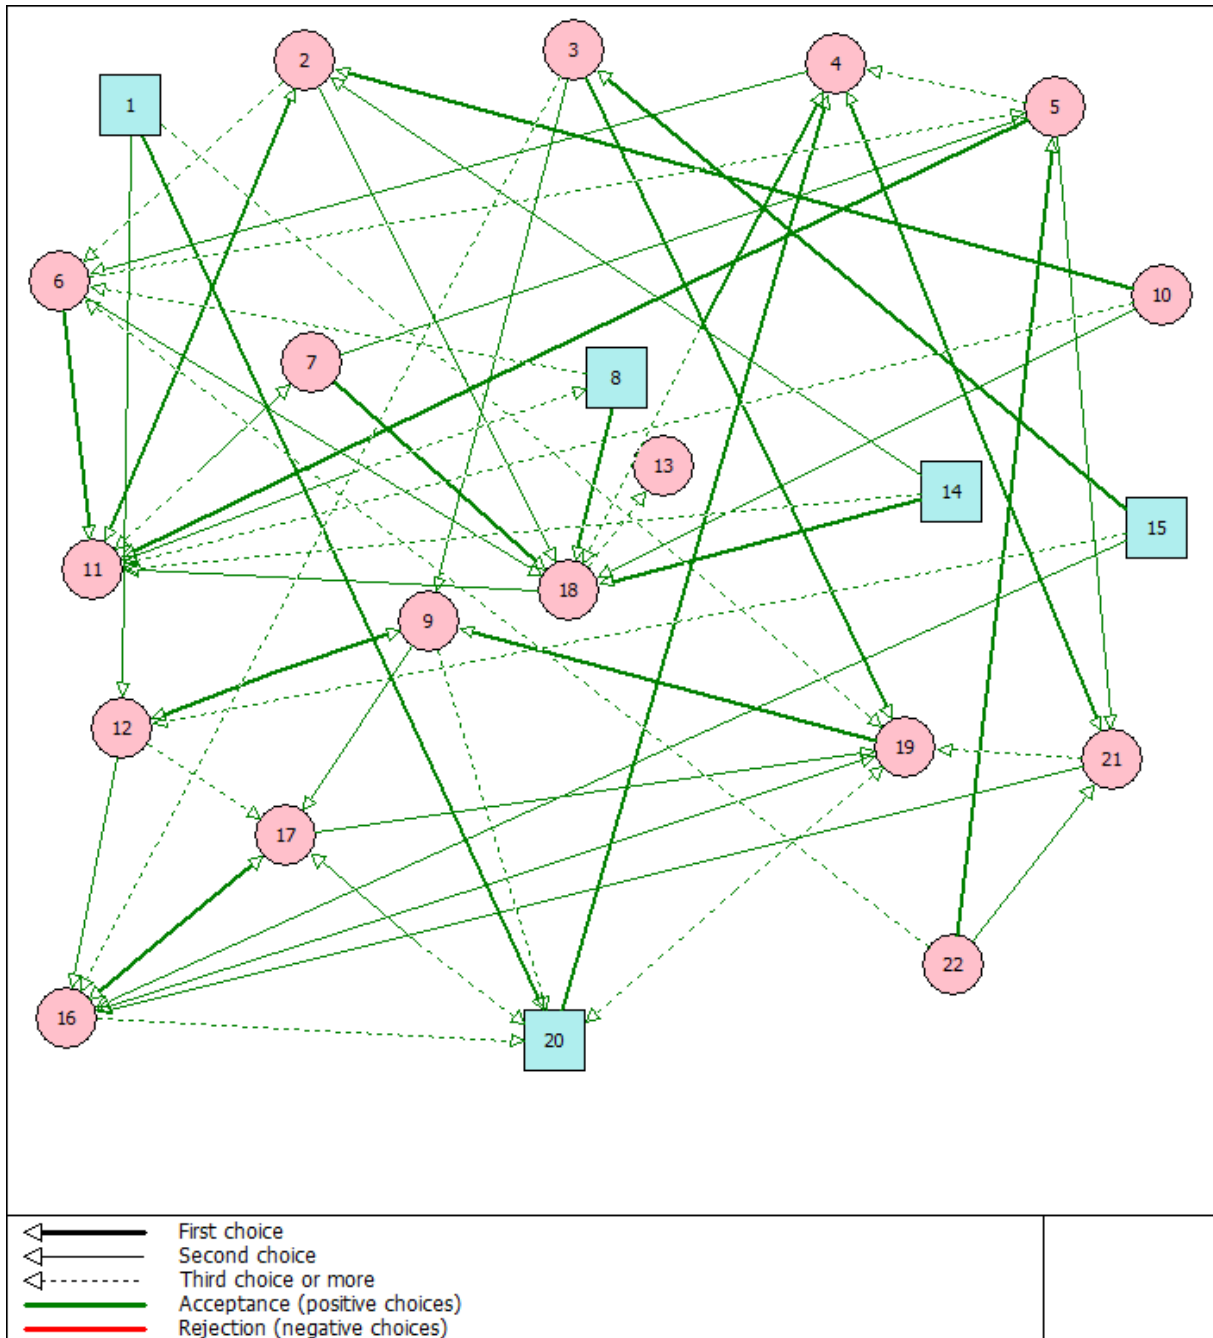

Figure 1. Sociogram for the class

As seen in the sociogram in Figure 1, there are a total of 22 children, 5 Syrian and 17 Turkish in the class. Thirteen of the children are girls and 9 are boys. According to Figure 1, although many Turkish children were selected by their peers, only one of the Syrian children was commonly selected by Turkish children.

Frequencies and percentages of Syrian children's level of preference by their Turkish peers

The order of preference of Syrian children by their Turkish peers is illustrated in Table 1.

Table 1. Frequency table for the preference of Syrian children

SC	Being Preferred from the First Place	Being Preferred from the Second Place	Being Preferred from the Third Place
	f	f	f
A1	-	-	-
A8	-	-	1
A14	-	-	-
A15	-	-	-
A20	-	-	4

SC: Syrian Children

The examination of Table 1 regarding the order of preference of Syrian children by their Turkish peers showed that the boy coded A20 was preferred by his 4 Turkish friends in the 3rd place. In addition, the boy A8 was preferred by his 1 Turkish friend in the 3rd place.

Table 2. Percentages regarding the preference levels of Syrian children

SC	Being Preferred from the First Place	Being Preferred from the Second Place	Being Preferred from the Third Place
	%	%	%
A1			
A8			5.8
A14			
A15			
A20			23.5

According to Table 2 regarding the percentage of Syrian children preferred by their Turkish peers, boy A20 was preferred by 23.5% of Turkish children in the 3rd place. In addition, the boy coded A8 was preferred by 5.8% of Turkish children in the 3rd place.

DISCUSSION AND CONCLUSION

This study examined the status of preschool children's peer relations with Syrian children in their classrooms. The collected data were presented with the findings obtained from the sociometry tool. The sociometry technique based on peer selection was used, and the preferences of Syrian children by their classmates were revealed.

The findings of the study revealed that Syrian children are hardly preferred by their Turkish peers. Similarly, Üstündağ and Şenol (2023) found that the preference level of Syrian children

attending preschool education institutions was between 1% and 3%. Sociograms obtained in a previous study conducted with primary school children also revealed that there is a problem of integration between Turkish and Syrian students (Bozan, Akçay, & Karahan, 2021).

As listed below, many factors are thought to have led to the emergence of these results.

It can be said that the language problem they experience has a significant effect on the non-selection of Syrian children. Language emerges as an important problem in all studies on the educational problems experienced by Syrian children (Kardeş & Akman, 2018; Özer, Komşuoğlu, & Ateşok, 2016). In the study conducted by Aydın and Kaya (2017), it was emphasized that refugee children should receive language education in order to receive healthy education in the same environment as their peers.

Social skills may also have affected Syrian children's order of preference by their classmates. In a study conducted by Dinçer et al. (2019), it was determined that children with inadequate social skills faced rejection/non-preference by their peers. Many studies on social skills have emphasized the importance of the relationship between these skills and peer relationships/peer acceptance (Gülay-Ogelman & Erten-Sarıkaya, 2010; Gülay-Ogelman & Erten-Sarıkaya, 2014).

These results may be due to the fact that teachers did not emphasize peer communication and acceptance and did not integrate children with each other sufficiently. However, it was highlighted that teachers should plan and implement appropriate activities for children who have to live in a foreign country to better communicate and integrate with their peers (Bozan, Akçay, & Karahan, 2021). For example, positive teacher approaches and accepting attitudes of parents are recognized as factors that increase the acceptance of children with special needs by their peers. Similar factors may also apply to Syrian children's peer acceptance.

RECOMMENDATIONS

In order to ensure that children with refugee status are minimally affected by the problems they face, it is very important to identify the factors that will increase their resilience against stressful situations and to support them accordingly.

It can be argued that peer relationships need to be strengthened in order for Syrian children to benefit from preschool education at the highest level. Educators have important duties in strengthening peer relationships. It may be useful for researchers to create programs to support

peer acceptance and for teachers to implement classroom activities that will positively affect this acceptance.

Future studies may examine the peer relations of Syrian children receiving preschool education in terms of different variables (age, socio-economic level, cognitive, emotional, and physical development, duration of preschool attendance, single-parent families, number of siblings, etc.).

Syrian children should be included in language education programs appropriate to their needs and needs.

Abstract

The self-consistent full-potential linearized augmented plane wave approach (FP_LAPW) based on density functional theory (DFT) was used to study the structural and electronic properties of zincblende gallium arsenide (GaAs). Density functional theory (DFT) is a powerful and widely used computational quantum mechanical modeling method for investigating the electronic structure of atoms, molecules, and solids. The reliability of the computation depends on the implementation of appropriate exchange-correlation functionals. Choosing a suitable exchange-correlation functional is essential for predicting the material's behavior accurately. In this study, we investigated the impact of exchange-correlation functionals on the structural and electronic properties of GaAs employing the Wien2k software package. We systematically analyzed the performance of various functionals including local density approximation (LDA), and generalized gradient approximation (GGA). The modified Becke-Johnson (mBJ) exchange-correlation potential which is known to produce more accurate results for the band gap of many semiconductors and insulators was also applied. The effect of different functionals on lattice parameters, bulk modulus, band gaps, and density of states were calculated and analyzed. A detailed comparison was made with the existing experimental data as well as the results from the previous theoretical studies. It is found that by changing the exchange-correlation functionals, lattice parameters, band gap energy, and density of states were highly affected. According to the results, the optimized lattice constant obtained by LDA and GGA functionals is $a = 5.62 \text{ \AA}$ and $a = 5.74 \text{ \AA}$, respectively. Moreover, GaAs exhibits a direct band gap of 0.42 eV when LDA is applied, which is underestimated by 72% with the experimental findings. On the other hand, when mBJ-1 potential is added to the LDA, GaAs has a direct band gap of 1.76 eV with an overestimation of 15% based on the experimental findings. Overall, our findings indicate that the exchange-correlation functional does matter and that always be cautious during the first principle calculations of materials.

Keywords: Wien2k, DFT, GaAs, First-principles calculations.

Introduction

In recent years, theoretical and experimental studies to investigate the electronic and physical properties of semiconductor alloy III-V elements have attracted great attention. These alloys are technologically important semiconductor compounds with numerous applications in electronic and optoelectronic devices[1]. Gallium arsenide (GaAs) is of particular interest among III-V compounds due to its high electron mobility, high electron velocity, and direct bandgap, which make it suitable for high-frequency and high-speed applications [2]. First-principles calculations, which is based on the principles of density functional theory (DFT), enable these devices to be designed and optimized by tailoring GaAs properties (structural, optical, and mechanical) to the desired requirements. Correct knowledge of the structural, electronic, and optical properties of any materials is critical for determining their potential applications in technology. Although DFT-based computer simulations can calculate these fundamental properties in a short time and at a low cost, standard exchange-correlation functionals (LDA and GGA) are insufficient to reproduce the experimental findings [3, 4]. Because exchange-correlation functionals can have a significant impact on the accuracy and precision of these calculations, a proper choice of exchange-correlation functionals can overcome this problem. However, the choice of exchange-correlation functional in DFT can seriously affect the accuracy and precision of these calculations. First-principles calculations using various exchange-correlation functionals in the Wien2k [5] software package are one of the most powerful and versatile approaches in computational materials science [6]. Wien2k software is particularly appropriate for exploring the properties of crystalline materials like GaAs due to its use of full-potential linearized augmented plane wave (FP-LAPW) methods. Various exchange-correlation functionals can be used in the Wien2k software package within the framework of density functional theory (DFT), which allows researchers to investigate how these functionals affect the electronic properties, band structures, and optical responses of materials. The most commonly used exchange-correlation functionals in Wien2k are local density approximation (LDA) [7], generalized gradient approximation (GGA), and Perdew-Burke-Ernzerhof (PBE) [8] which is a specific form of GGA. Standard DFT functionals have some limitations in the context of semiconductors and insulators. To predict the electronic structure of the semiconductor and insulator, the mBJ potential was developed by Tran and Blaha [4].

In the present work, we perform first-principles calculations by using the Wien2k software package to investigate the effect of different exchange-correlation functionals on the electronic and structural properties of GaAs.

COMPUTATIONAL DETAILS

The Wien2k package was used to perform electronic structure calculations of GaAs using density functional theory (DFT). Our calculations are based on full potential density functional theory. The linearized augmented plane wave (LAPW) method with Perdew-Burke-Ernzerhof generalized gradient approximation (PBE-GGA) and local density approximation (LDA) exchange-correlation functionals are used. Recent studies have proven that mBJ methods are useful for more complete prediction of electronic bands in semiconductors. Here we used three types of mBJ potentials: mBJ-0, mBJ-1, and mBJ-3 for more accurate band structure calculations. Self-consistent area (scf) calculations were performed with a $14 \times 14 \times 14$ k-mesh according to the Monkhorst and Pack scheme. It represents 104 k-points in the irreducible Brillouin zone. The energy cutoff is set to -6 Ry (-81.63 eV) and the convergence threshold is less than 10^{-4} Ry. For Scf calculations, the plane wave cutoff point $R_{MT} \times K_{max} = 7$ and the Fourier expansion cutoff point $G_{max} = 12$ are used. For partial waves used in atomic spheres, the maximum l value (l_{max}) is kept at 10.

RESULTS AND DISCUSSION

The geometry was optimized using lattice constants acquired from earlier experimental research. The volume corresponding to the lowest energy was found as a result of the optimization, and the lattice constants were obtained. In Figure 1, the plots show the total energy versus volume for LDA and GGA exchange-correlation functionals for GaAs. The lattice constants corresponding to the minimum energy are 5.62 Å and 5.74 Å for LDA and PBE-GGA, respectively. Our findings for lattice constants are comparable with the previous experimental result of 5.64 Å [9]. It is clear that the lattice constant determined using LDA is

Figure 1. Total energy versus volume obtained by LDA and PBE-GGA functionals.

more consistent with the results of experiments. Furthermore, we compared calculated results with the previous theoretical studies. The calculated minimum volume, bulk modulus, and minimum energy with LDA and PBE-GGA are presented in Table 1. The results of previous experimental and theoretical studies are also shown in Table 1 to make better comparison. Figure 2. shows the electronic band structure of GaAs calculated using the LDA and PBE-GGA functionals. The fermi energy level has been set to 0 eV. The calculated band gaps and band gap types of GaAs has been presented in Table 2. The valence band maximum and the conduction band minimum are located at Γ high symmetry point for both LDA and GGA functionals, which indicates GaAs has a direct band gap. The bandgap energies for LDA and PBE-GGA are 0.42 eV and 0.19 eV, respectively. These findings are presented in Figure 2.

Table 1. The calculated volume optimization parameters of GaAs are compared to the experimental and other theoretical data available in the literature.

	$V_0(a.u.^3)$	$B(GPa)$	$E_0(Ry)$	Lattice constant (\AA) ($a = b = c$)
LDA	299.17	84.2677	-8398.831226	5.6181 ^{this work}
LDA	301.14			5.6300 ^{[10] theoretical}
LDA	294.06–305.74	72.6–75.5		5.5860–5.6590 ^{[11] theoretical}
LDA	299.44			5.6200 ^{[12] theoretical}

Exp.	304.80	78.9		5.6532 ^{[14] experimental, T=300 K}
Exp.	302.92			5.6416 ^{[15] T=0 K}

Figure 2. Band structure of GaAs obtained by LDA and PBE-GGA functionals.

Although LDA and PBE-GGA functionals successfully predict the bandgap type of GaAs, bandgap energies differ significantly from the experimental result of 1.52 eV [15]. The mBJ method is a well-known method that overcomes the shortcomings of the LDA and PBE-GGA functionals. Therefore, three different exchange-correlation functionals, mBJ-0, mBJ-1, and mBJ-3, have been applied to the LDA and PBE-GGA functionals to get more accurate bandgap energies. When we look at the Figure 3, Figure 4, and Figure 5, bandgap energies are 1.78 eV, 1.76 eV, and 0.88 eV for LDA + mBJ-0, LDA + mBJ-1, and LDA + mBJ-3, respectively. On the other hand, the calculated bandgap energies are 1.30 eV, 1.28 eV, and 0.42 eV when GGA + mBJ-0, GGA + mBJ-1, and GGA + mBJ-3 are used. These values are also shown in Table 2. If the results with only LDA and GGA are compared with the results when mBJ-0, mBJ-1, and mBJ-3 exchange-correlation functionals are applied, it is clearly seen that bandgap energies are improved. When all the results in Table 2 are compared, one can see that the closest band gap energy to the experimental value is obtained when GGA+mBJ-0 functional is used. According to the results, we can conclude that the choice of exchange-correlation functional is essential during the first principle calculation of GaAs.

CONCLUSIONS

We investigated the structural and electronic properties of GaAs using the full potential linear augmented plane wave method. Our primary purpose was to explore the performance of the different exchange-correlation functionals for determining the structural and electronic properties of GaAs. We first discussed geometry optimization and calculated the lattice parameters, as well as the bulk modulus and total energy for LDA and PBE-GGA functionals. The results showed that LDA and PBE-GGA functionals were successful in determining lattice parameters that were closer to previously obtained theoretical and experimental results. When different exchange-correlation functionals were utilized, we found a significant difference in bandgap energies. We determined that PBE+mBJ-0 exchange correlation functional is the most suitable one for the first principle investigations of GaAs. Finally, one can conclude that the choice of exchange-correlation functional is an important part of DFT calculations.

Özet

Küreselleşme, kitle iletişim ve ulaşım araçlarının da etkisi ile bireyleri farklı yaşam tarzlarına maruz bırakan ve özellikle çocukları için potansiyel olarak yeni standartlara ulaşma mesajı vermesi ile göç ve kentleşme de hız kazandırmıştır. İnsan yaşamını ve yaşam standartlarını önemli ölçüde etkileyen bilimsel ve teknolojik ilerlemeler nedeniyle para ekonomisi giderek daha önemli hale gelmiş ve bu standartlar bir tercihten ziyade bir gerekliliğe dönüştürmüştür. Kent yaşamının maddi imkânlar olmadan neredeyse imkânsız hale gelmesi, ailelerin hayatta kalma mücadelesinin farklı boyutlara kaymasına, aile içi rollerin ve statülerin değişmesine yol açmıştır. Geleneksel yapılarda kadınlar ev işleriyle görevlendirilirken, erkekler geçim kaynaklarının sağlanması da dâhil olmak üzere hane dışındaki sorumlulukları üstlenirdi. Ancak kentleşme ve artan mali kaynak ihtiyacı bu düzeni değiştirmiştir. Böylece, çalışabilecek durumda olan aile üyeleri, ailelerinin hayatta kalma çabalarına etkin bir şekilde katkıda bulunmak için iş aramaya başlamıştır. Bu değişim, aile içindeki rol ve sorumlulukların yeniden tanımlanmasında önemli bir rol oynamıştır. Özellikle marjinal iş kollarında çocukların kolay iş bulup evin ekonomisine katkı sağlaması ile birlikte sokakta çalışan çocuk problemi de yaşanmaya başlanmıştır. Korunmaya muhtaç çocuklar üzerindeki bu ekonomik bağımlılık, çocukların erken yaşta sokak hayatının sert gerçekleriyle yüzleşmek zorunda kalmalarına neden olmakta ve böylelikle güçlü ve yaşam mücadelesine erken başlayan çocukların yetişmesinde etkili olmuştur. Bu sorunu kapsamlı bir şekilde ele almak için, babaların neden çocuklarının bu koşullar altında çalışmasına izin verdiklerini veya kendilerini buna mecbur hissettiklerinin anlaşılması gerekliliği bu çalışmanın ortaya çıkmasında etkili olmuştur. Bu çalışma, sokakta çalışan çocukların babalarıyla yapılan yarı yapılandırılmış görüşme verilerini sosyolojik bir mercekle değerlendirmeyi ve bu yaygın toplumsal endişeyi ele almak için potansiyel çözümler önermeyi amaçlamaktadır.

Anahtar Kelimeler: Sokakta çalışan çocuklar, Değişen aile içi roller, Babalık.

**STREET LABOURING CHILDREN AND THEIR FATHERS: A JOURNEY
THROUGH CHANGING AUTHORITIES**

Abstract

Globalisation has accelerated migration and urbanisation by exposing individuals to different lifestyles through mass communication and transportation. This has potentially given the message of reaching new standards, especially for their children. Due to scientific and technological advances that significantly affect human life and living standards, the money economy has become increasingly important. These standards have become a necessity rather than a preference. Urbanisation has led to a shift in the struggle for survival of families and a change in roles and status within the family. In traditional structures, women were responsible for household chores, while men provided livelihoods. However, the increasing need for financial resources has made material means almost indispensable for urban life. Therefore, family members who were capable of working started seeking employment to contribute effectively to their families' survival efforts. This change has played a crucial role in redefining roles and responsibilities within the family. The issue of children working on the streets has also become prevalent, particularly in marginal work sectors, as children can easily find jobs and contribute to the household economy. The economic dependence on vulnerable children forces them to confront the harsh realities of street life at a young age. This has resulted in the development of resilient children who begin their struggle for survival early. To comprehensively address this issue, it is crucial to understand why fathers permit or feel compelled to have their children work in such conditions. This study aims to evaluate data from semi-structured interviews with fathers of children working on the streets through a sociological lens and propose potential solutions to address this widespread social concern.

Keywords: Street working children, Changing family roles, Fatherhood.

Giriş

Modern dünyanın insanlara sunmuş olduğu imkânların fazlalığı, bilim ve teknolojiye meydana gelen değişimlerin toplumların hayatlarına yansıyan olumlu yönleri bir taraftan toplumsal problemlerin ortadan kalkması beklentisini arttırırken diğer taraftan da yeni sorunlarla karşılaşılmasını beraberinde getirmiştir. Yeni kurulan sanayi kentleri beraberinde büyükşehir hayatını getirirken aile ve sosyo-kültürel yapılanmada da değişimin yaşanmasına sebep olmuştur. Alışılmanın aksine, farklı sosyo-kültürel yapılanmalar ortaya koyan bu yeni yerleşim yerlerine hem bireyin hem de ailesinin uyum süreci çok da kolay olmamıştır. Daha önce aile içinde gerçekleşen eğitim, meslek edinme, beslenme gibi pek çok faaliyet bu yenedünya düzeninde, farklı kurumlarda yerine getirilmeye başlanırken ailenin fonksiyonlarında da değişimin yaşanmasını beraberinde getirmiştir.

Geleneksel toplumlarda ücretsiz aile işçisi olarak çalışan aile bireyleri, paraya ihtiyaç hissetmeden çalışıp paranın tek elde toplandığı bir sistemin içinde yaşarken, iş bulmak, çocukların eğitimlerini daha iyi imkânlarla gerçekleştirebilmek, daha iyi yaşam şekline kavuşabilmek, vb. için büyük kentlere göç etmeleri ile birlikte farklı yaşam şekillerini tercih etmek durumunda kalmışlardır. Göç edilen yerlerdeki yeni yaşam şekilleri birtakım imkanlar sağlamış olsa da sorunları da beraberinde getirmiştir. Yeni yaşam alanlarında paranın çok daha fazla önemli olduğunun anlaşılması ile birlikte aile fertlerinin her biri para kazanmanın yollarını aramaya başlamıştır. Özellikle ekonomik zorluklar, geçimlerini sağlamak için çaresizce yollar arayan savunmasız aileleri etkilemeye devam ettikçe, çocuklar genellikle küçük yaşta çalışmaya zorlanmaktadır. Dolayısıyla geleneksel toplumlarda babaların evin geçimini sağlamak gibi bir görevleri varken kent hayatına geçiş ile birlikte bu görevi eş ve çocukları ile birlikte paylaşmak durumunda kaldılar. Bu yeni süreçte babaların çoğu zaman kendileri çalışıp para kazanamazken çocuklarının kazandıkları ücretlerle evlerini geçindirmek durumunda kalmaları hem otoriteleri hem de kendilerine olan bakış açılarında değişikliklere yol açmıştır. Bu çalışmada aile bütçesine destek olmak veya kendi şahsi ve okul ihtiyaçlarını karşılayabilmek için sokaklarda çalışan çocukların babalarının, çocuklarının erken yaşlarda sokaklarda çalışarak para kazanma mücadelesinin içinde olmalarını nasıl değerlendirdikleri, babalarla yapılan yarı yapılandırılmış görüşme verileri üzerinden ortaya konulmak istenmiştir.

SOKAKTA ÇALIŞAN ÇOCUKLAR

Günümüzün hızla gelişen dünyasında, sokaklarda çalışan çocukların dünyanın bazı bölgelerinde çok yaygın bir görüntü haline geldiği açıktır. Çocuklar hayatta kalmak için

dilencilik, seyyar satıcılık, çöpçülük, kağıt toplama yankesicilik ve küçük eşyalar satmak gibi bir dizi tehlikeli işler yapmakta, genellikle bu yollarla ailelerine destek olmaktadır (Şişman, 2006; Yılmaz ve Dülgerler, 2011). Bu durum, ailelerini geçindirmek için sokaklarda çalışan çocukların omuzlarına ağır yükler yüklemekte, aynı zamanda da çocuklara açısından fiziksel tehlikeler, duygusal travmalar, sosyal dışlanma ve eğitim yoksunluğu gibi başka sorunları da ortaya çıkarmaktadır (Puri, vd., 2017; Şahin, 2021; Taib, vd., 2023). Örneğin sokak işçileri, koruma kisvesi altında kendilerini işgücü ve hatta insan ticareti amacıyla sömüren suç çetelerinin de kurbanı haline getirmektedir (Pinzón-Rondón, 2009; Self-Brown, 2021). Bu senaryolarda, çocuğun korkunun üstesinden gelmesi ve yeni 'koruyucularına' sadakat göstermesi gerektiğinden, bu tür bir kontrolden kaçmak giderek zorlaşmaktadır. Bununla birlikte çocukların sokak işçiliğine dahil olmalarının, içinde buldukları koşulların çok ötesine uzanan geniş kapsamlı sonuçları olduğu görülmektedir. Sınırlı fiziksel büyüme, bilişsel bozukluk, duygusal dengesizlik ve sosyal uyum problemleri gibi sorunlarla uğraşmak zorunda kalan bu çocuklar, erken yaşta iş yaşamına dahil olmaları nedeniyle “kayıp çocukluk” dönemi yaşamaktadırlar (Hoffmann, vd., 2017; Maciel, vd., 2013). Dolayısıyla sokakta çalışan çocukların yaşadıkları deneyimlerin kümülatif etkisi, gelişimleri üzerinde derin ve zararlı bir etkiye sahip olabilmektedir (Acar, 2010; Kahraman ve Karataş, 2018).

Elbette yaşlarının çok ötesinde ağır yükler ve sorumluluklar taşımalarına rağmen, sokakta çalışan birçok çocuk muazzam bir dayanıklılık ve beceriklilik göstermektedir. Dahası, çocuklar aile gelirine katkıda bulunmaya başladıklarında, finansal bağımsızlık talep ettiklerinden karar alma süreçlerinde güç kazanabilmektedirler. Bu güç, zorlu koşullar altında yaşarken değişen otoritelere uyum sağlamayı öğrenmesini sağladığı gibi sorumluluk, bağımsızlık ve girişimci yönlerinin gelişmesine katkıda bulunabilmektedir. Ancak potansiyel kazanımlar genellikle erken yaşta işe dahil olmayla ilişkili önemli kayıpların gölgesinde kalmaktadır. Sokakta çalışmanın fiziksel, duygusal ve sosyal maliyetleri, çocukların gelişimi ve gelecekteki yaşam fırsatları üzerinde olumsuz yansılarda da bulunabilmektedir. Eğitim eksikliği ve olumlu rol modellerine sınırlı maruz kalma, sosyal entegrasyonlarını engelleyebileceği gibi gerçek potansiyellerine ulaşmalarını da sınırlayabilmektedir (Şişman, 2006; Yılmaz ve Dülgerler, 2011). Bu nedenle sokakta çalışan çocuklar konusu karmaşık ve çok yönlü olup, altta yatan nedenleri ele alan ve etkili destek mekanizmaları sağlayan kapsamlı bir yaklaşım gerektirmektedir. Bazı çocuklar, sokaklarda çalışıyor olmalarından dolayı olumlu kazanımlar da elde ediyor olmalarına rağmen fiziksel, duygusal ve sosyal gelişimleri açısından çok önemli kayıplar yaşadıkları da önemli bir gerçektir.

KÜRESELLEŞME VE KENTLEŞME KISKACINDAKİ AİLEDE “BABA”NIN DEĞİŞEN OTORİTESİ

Babanın aile içindeki rolü, gelişen sosyal, ekonomik ve kültürel faktörler tarafından şekillendirilerek tarih boyunca önemli dönüşümler geçirmiştir. Geleneksel toplumlarda babalar, edindikleri bilgeliği çocuklarına aktaran, temel yaşam becerilerini ve hiyerarşik yapıları öğreten otorite figürleri ve koruyucular olarak görülmüştür (Sriram, 2011; Smit, 2002). Böylece ataerkil yapı birçok toplumda derinlemesine kök salmış ve babalara atfedilen beklenti ve sorumlulukları şekillendirmiştir. Babanın sorumluluğu genellikle ailenin maddi ihtiyaçlarını karşılayan, önemli kararlar alan ve çocukları disipline eden sınırlarla çizilirken anne, büyük ölçüde ev içi alana hapsedilmiş, rolleri çocuk bakımı ve ev işleriyle sınırlandırılmıştır. Bu nedenle geleneksel toplumlarda baba figürü, ailenin reisi olarak algılanır ve hane halkı üzerinde muazzam bir güce ve etkiye sahiptir. Ancak kültürel normlar, ekonomik güç ve yasal sistemlerin birleşimiyle sağlam bir şekilde kurulan babanın otoritesi, küreselleşme ve kentleşmenin ortaya çıkmasıyla birlikte önemli bir değişim geçirmiştir (Dette-Hagenmeyer, 2014).

Küreselleşmenin getirmiş olduğu önemli etkilerden biri, kadınların iş gücüne katılımının artması olmuştur. Kadınlar eğitim ve istihdam olanaklarına erişim sağladıkça ekonomik olarak daha bağımsız hale gelmiş ve mali destek için erkeklere olan bağımlılıkları azalmıştır. Bu değişim, kadınların hane içinde daha fazla özerklik kazanmasını sağlayarak gücün ve karar alma mekanizmalarının daha eşitlikçi bir şekilde dağılmasına yol açmıştır. Küreselleşmenin bir diğer sonucu da bireycilik ve kişisel özerkliğe yapılan vurgunun artması olmuştur. Bireyin artan hareketliliği, ebeveynlik ve otoriteye ilişkin farklı bakış açılarını bir araya getirirken aynı zamanda geleneksel aile yapısı ve bakım verme uygulamalarının dönüşüme uğramasının da zemini hazırlanmıştır (Dainel ve Pasley, 2016). Bu kültürel değişim, babalar da dahil olmak üzere otorite figürlerine koşulsuz itaat kavramını aşındırmıştır.

Küreselleşme birlikte eş zamanlı olarak kentleşme ve kentlileşme sürecine katılım da aile yapısının yeniden şekillenmesinde önemli bir rol oynamıştır. Kırsal ortamlardan kentsel ortamlara geçiş, yaşam tarzında, değerlerde ve ailevi beklentilerde bir değişimi de beraberinde getirmiştir (Edwards, 1986). Kentsel ortamlarda aileler genellikle daha küçük ve çekirdek yapıda olup, geniş aile ağları daha az destek ve rehberlik sağlamaktadır (Bhugra, vd., 2019). Bununla birlikte kent yaşamının getirmiş olduğu ekonomik zorluklar aile içerisinde yaşayan her bireyin çalışma yaşamına katılımını zorunlu hale getirmiştir. Bu değişim iş, çocuk bakımı ve ev sorumluluklarını yönetmek için babalar da dahil olmak üzere bireysel ailelere daha fazla sorumluluk yüklemiştir. Ayrıca, kentsel yaşamın anonimliği ve hızlı temposunun getirdiği yeni

yaşam tarzları, geleneksel aile yapılarını zorlayabilmekte ve babaların geleneksel toplumlarda olduğu gibi haneleri üzerinde aynı düzeyde kontrol sahibi olmalarını zorlaştırmaktadır (Hendriati ve Okvitawanli, 2019). Çünkü kentsel ortamlardaki çocuklar daha geniş bir yelpazede sosyal etkilere maruz kalmakta ve baba otoritesine daha az açık olabilmektedirler. Özellikle gelişmekte olan ülkelerin kentsel bölgelerinde çocuk işçiliğinin artan yaygınlığı, aile otoritesinin dinamiklerini daha da karmaşık hale getirmektedir. Sokaklarda çalışan çocuklar genellikle ailelerinin geçimine önemli ölçüde katkıda bulunmaktadır Ancak bu durum baba otoritesinde ciddi kırılmalar meydana gelmesine neden olmakta ve babanın hane içindeki etkisini azalttığı gibi babanın değer aşılmasını ve rehberlik etmesini de zorlaştırabilmektedir. Dolayısıyla, küreselleşme ve kentleşme sadece babaların geleneksel bakım sorumluluklarını etkilemekle kalmamış, aynı zamanda çağdaş toplumda babalığın anlaşılma ve uygulanma biçimlerini de etkilemiştir.

YÖNTEM

Saha çalışmaları, diğer araştırma yöntemleriyle erişilemeyen bağlamsal zenginlik ve gerçek dünya anlayışı sağlayarak birçok disiplinin kritik bir bileşenini temsil eder. Bu tür çalışmaların en önemli yönleri katılımcılarının öznel deneyimleri, davranışları ve perspektifleri hakkında derinlemesine içgörüler sunan yöntemlerinin kullanılmasına olanak sağlamalarıdır. Doğası gereği keşifsel olan saha araştırmaları; araştırmacıların karmaşık ve dinamik durumları arasındaki bağlantıları ortaya çıkarmak için nitel araştırma yöntemlerini tercih ederler. Nitel araştırma yöntemleri, öznelinin sosyal ve kültürel bağlamlarının daha derinlemesine anlaşılmasını sağlayarak nicel yöntemlerin gözden kaçırabileceği örüntü ve temaların ortaya çıkarılmasını sağlarlar. Böylelikle katılımcıların seslerinin de araştırma sonuçlarına dahil edilmesi sağlanarak araştırılan olgunun daha bütüncül ve incelikli bir şekilde anlaşılmasına olanak oluşturulur (Denzin ve Lincon, 2011; Creswell, 2013; Creswell, 2017). Bu yöntemde yaygın olarak katılımcı gözlem, derinlemesine görüşmeler, odak grupları ve doküman analizi gibi çeşitli teknikler kullanılmaktadır (Moustakas, 1994). Bu araştırmada da yarı yapılandırılmış görüşme formu kullanılarak derinlemesine görüşmeler gerçekleştirilmiştir.

Sokakta çalışan çocukların babaları ile yapılan görüşmeler, 11.05.2023- 1.11.2023 tarihleri arasında Ankara ilinde gerçekleştirilmiştir. Daha önceden sokakta çalışan çocukların anneleri ile görüşmeler gerçekleştirilerek yapılan çalışma (Şenol ve Dinç; 2023) sırasında, babalarla görüşmenin çok daha zor olacağı ancak çok da gerekli olduğu, bilgi verici içeriğinin fazla olacağı fark edildi. Sokakta çalışan çocukların anneleri ile görüşmeler gerçekleştirilirken babalara da ulaşılmaya çalışıldı. 50'nin üzerinde babaya çocukları ve yakınları üzerinden

kendilerine ulaşılmış olmasına rağmen “*Bu konuda ne konuşulacak?*”, “*Konuşmaya gerek var mı?*”, “*Bu konudan kime ne?*”, “*Bu bizi ilgilendirir.*” gibi sözlerle görüşme talebimiz reddedilmiştir. Bu sebeple görüşülebilir baba sayısı 19 ile sınırlı kalmıştır. Ancak görüşmeyi kabul eden babalar, görüşme talebini kabul etmeyen babaların genellikle çocuklarını çalıştırıyor olmanın ezikliğini hissediyor olmaları sebebi ile görüşme taleplerini kabul etmediklerini düşündükleri hatta böyle düşündüklerini biliyor olduklarını iddia etmiştir. Tüm bu gerekçelerle sadece 19 baba ile görüşme gerçekleştirilebilmiştir.

Sokakta çalışan bir çocuğun annesinin erkek kardeşini görüşmeye ikna etmesi ile başlayan bu görüşmeler, o babanın diğer sokakta çalışan çocuğu olan babaları ikna etmesi ve bizimle görüşme bağlantısını sağlaması sonrasında kartopu örneklem yöntemi ile devam ettirilmiştir. Çalışmada kartopu örneklem yönteminin seçilmiş olmasının sebebi, kendi içlerinden olan, güvendikleri, kıramadıkları kişilerin görüşmeci olmaya babaları ikna etmelerinin çok daha kolay olduğunun fark edilmiş olmasıdır. Babaların görüşmelere ikna süreçlerinde çocuklarından daha fazla eşleri, kız kardeşleri, anneleri gibi aile fertlerinden olan kadınların etkili olduklarını söylemekte de fayda var.

Demografik Bilgiler

Görüşme talebini kabul eden babaların yaş ortalamaları 31 olarak tespit edilmiştir. Görüşme talepleri iletildiğinde yaşları daha ileri olan babaların görüşme talebini daha kesin bir dille reddetmeleri ve bunun konuşulacak bir konu olduğunu düşünmediklerine vurgu yapmış olmaları, görüşmelere katılan babaların yaş ortalamalarının düşük olmasında etkili olduğu düşünülmektedir.

Görüşmeci babalardan 3’ü kadrolu bir işinin olduğunu, 9’u günlük geçici işlerde çalıştığını ancak her zaman iş bulma şansının olmadığını, 7’si de kendisinin de çocuklarının yapmış olduğu işleri yaptığını, vasıflı bir eleman olmadıkları için başka iş bulmakta zorlandıklarını, hatta 2 baba vasıflı işgücü olmadıkları için daimî bir iş bulmalarının imkânsız olduğuna inandıklarını belirtmiştir. Babaların eğitim seviyelerine bakıldığında 4’ünün ilköğretim mezunu, 5’inin ortaokul mezunu, birisinin ortaokul terk, 2’sinin lise terk, 3’ünün lise mezunu olduğu, birisinin açıktan lisede okuduğu, 2’sinin yüksek okul ve birisinin de üniversiten mezunu olduğu görülmektedir.

Görüşmeye katılan babaların 1’inin 8, 4’ünün 5, 2’sinin 4, 9’unun 3, 2’sinin 2 ve birisinin de 2 çocuğu olup eşinin de halen ikiz bebeklere hamile olduğu öğrenilmiştir. Babalara “*kaç çocuklarının sokaklarda çalıştığı*” sorulduğunda görüşme grubunda “*hepsi*” cevabını veren 13 baba, “*sadece büyük çocuklarım*” cevabını veren 2 baba, “*sadece erkek çocuklarım*” cevabını

veren 3 baba ve “Ben iş bulamadığım zaman eşim ve çocuğum çalışıyor” cevabını veren bir babanın olduğu tespit edilmiştir.

BULGULAR

Anne ve babalarda çocukları için her zaman en iyisini, en doğrusunu yapma, onlara en iyi şartları sunma isteğinin genellikle baskın olduğu bilinmektedir. Anne babaların bu konudaki hassasiyetlerine rağmen sokaklarda, sokağın olumsuz şartlarında çalışmalarına nasıl göz yumdukları ve bu durumu nasıl içselleştirdikleri, sokakta çalışan çocuklar probleminin ortadan kaldırılmasında, bu problemle mücadele sürecinde önemli bir adım olacağı düşüncesi ile hazırlanan bu çalışmada babalardan alınan cevapları dört grupta toplamak mümkün oldu. Bu bölümde her bir başlık görüşmecilerin ifadeleri doğrultusunda sosyolojik bakış açısı ile değerlendirilmeye çalışılacaktır.

Önceleri Zorunluluktan Sonra Alistık

Ailelerin çocukları için en iyi imkanları sağlama çabalarının köylerden kentlere göçü zorunlu hale getiriyor olması sonrasında, göç edilen yerlerdeki hayatın zorlukları kendisini paraya olan ihtiyaçla en şiddetli şekilde ortaya koymaktadır. Kent hayatı kiradan, suya, elektriğe, yiyeceğe kadar para olmadan hayatın sürdürülmesini imkânsız hale getirmektedir.

12 Numaralı görüşmeci çocuklarının sokaklarda çalışmaya başlamasını şu ifadelerle ortaya koymaktadır: “Para ne kadar önemli bişeymiş biz buralara gelince anladık hep. Köyde para lazım olmaz insana. Kasabaya, şehre gidince lazım olur biliriz hep ama. Bu kadar lazım olmanı söyleseler inanmazdım. Abla, şehirde yediğin, içtiğin para. Soluma parası alacaklar utanmasalar. Elimizde bi kısım para ile geldik. Çok para sandıydık. Anammmmm bir gitti para bir gitti anlatamam ilkgünler. Sonralarda da gitti tabi ama ilk günler giden çok kötüydü. Birkaç ay bizi idare eder sandıydık para eriyiverdi. Can hıraş iş aradık hanımla. Kör olası iş bulunmadı bitürlü, Benim en ufak, geldi “Baba Emirlerle ben de su satmaya gitcem. Ben de para kazancam dedi.” Anası ağlar durur “olmaz” der. Bigün iki gün geçti. “Biz iş buluncaya kadar gitsin.” dedik. Sona sona diğerleri de gitmeye başladılar. Anlaycan alistık gitti. Hiç neden çalışır bunlar demedik uzun zamandır. Anaları da ağlamıyo artık (gülüyor). Böyle işte. Başladılar çalışır giderler. Biz de yuvarlanır gider olduk. Anaları bi kocakarı bakar. Ben de iş buldukça giderim. Allah bugünümüzü aratmasın.”

8 numaralı görüşmeci de çocukların daha iyi bir eğitim alması için geldikleri bu yerde çocuklarının eğitimini sürdürebilmek için çocuklarını çalıştırmak zorunda kaldıklarından manidar bir şekilde bahsetmektedir: “Buraya neden geldik? Çocukları okutmak için. Ben lise

mezunuyum. Okumanın önemini bilirim. Çocuklarımız okusun dedik hanımla, ana ata demedik terk edip geldik buralara. Vicdansa vicdan. İnsan kendisini kötü hiss ediyor. Ben tek erkek çocuğum ailemde. Anam babam beni bırakmak istemedi. Ben de onları bırakmak istemedim ama herkes kendi çocuğuna üzülür. Biz de bebe belik rezil olmasın dedik. Eskisi gibi değil. Liseden sonra da okumaları lazım. Bizim köydeki ilkokul bile şimdilerde kapandı. Biz 12 yıl oldu geleli. Çocukları okula yollayalım dedik gelince elde yok evde yok. Kırdık döktük, topladık yolladık okula. Ama masraf bitmiyor ki. Bir gün geliyor çocuk defter lazım diyor, öbürün geliyor yardımcı kitap lazım diyor. Öbürü küçük o zamanlar suluboyası da kuru boyası da bitmiyor. Kıvrır oldu. İlla ki okusunlar istiyoruz. Neden geldik biz buraya? Düşünsene onlar okusun diye geldik okula gücümüz yetmiyor. Konu komşu, çocuğunu çalıştırıyor baktık. Ben okumuşum ya olmaz dedim. Olmadı ama masrafınızı çıkaracak kadar iki kardeş gitsinler bari dedik. Baktık sonra onlar eve de katkı sağlıyorlar. Öyle başladı gidiyor. Abla güç yetmiyor okul masraflarına. Bir bilsen anlarsın bizi. Kınama bizi. İnsan hem eğitilmiş olur hem de çocuğunu çalıştırır mı ama mecburiyetler işte. Şükür iyi okuyorlar ama. Biri lisede, biri, 7'ye gidiyor. Öbürü yeni başladı ilkokula. O da abileri ile gidiyor. Ufak tefek o da kazanıyor. Ama eşim de ben de onu çok yollamayız. Bazan ben de gidem diye ağlıyor da o zaman gider. İşte öyle böyle başladık. Kınama ama bizi. Olsa biz de özel okullara yollamak isteriz. Evlattan tatlısı mı var.”

7 numaralı baba da çocuklarını neden çalıştırdığını şu ifadelerle ortaya koymaktadır: “Sen şimdi bizi kınıyor musunnnnn, yoksa ayıplıyor musun anlayamadım ben. İnsan çocuklarına kıyamaz. Sizin gibi bizi de vaktiyle okutsalardı, biz de halden anlamayıp sorardık belki çocuklarınızı neden çalıştırdığınız diye. Halden anlamak lazım. Sen hiç kira ödedin mi? Ödesen de para varsa ödemek kolay. Ay dediğin dönüp dönüp gelir önüne. Evsahibi acımaz sana. Ver de ver der. Elentrik, su parası da öyle. Kaç aydır askıdan ödensin diye ben başvururum belediyeye. Kimin umrunda evsahibi seni atmış. Benim yükümü evsahipleri iki defa sokağa koydu. Ne yapar insan? Kim iş bulduysa çalışır. Biz de istemeyiz ama. Hem çocuklar oyun yapar çalışmayı da. Herkesin çocuğu, karısı çalışır burlarda. Çalmak çırpamak ayıp. İnsan yeter ki utancak iş yapmasın. Ayıp oluyo böyle yargılar gibi neden çocukların çalışıyor demek? Bilmek istediğinizi biliyom da anlıyom da ama sanki babalığımı yargılıyon gibi geliyor insan. Sebebini bilerseniz ne bilmeseniz ne. Çalışırlar işte. Çalışmak kötü değil hem. Sokaklar da kötü değil. Onlar birbirlerini korurur kollarlar. Sizin çocukları siz korursunuz. Bizim çocukları Allah korur. Sizinkiler şımarıp giderler. Bizimkiler altın değerinde Allah esirgesin her birini. Hayat sizinki kadar kolay değil. Anlamazsınız tabi (çok sinirleniyor).

Görüşmeler sırasında yedi numaralı babanın 8 çocuğunun olduğu ve her çocuğunun da sokaklarda çalışarak büyüdüğü öğrenilmiştir. Baba çocuklarının her birinin sokaklarda çalışarak büyümesinden kendisinin sorumlu tutulacağını düşündüğü için olsa gerek görüşmelerde son derece tepkili ifadeler kullandığı düşünülmektedir. Önceleri ilk üç çocuğu çalışırken zaman içinde diğer çocuklarının da çalışmaya başladığını ve neden bütün çocuklarının çalışmaya başladığını sorgulamadığını, sürecin kendiliğinden geliştiğini, görüşmeler sırasında vurgulamaya çalıştığı dikkati çekmiştir. Belki muhakemenin yıllar sonra dışarıdan birisinin yanında yapılıyor olması da kendisini kırmış olabilir. Görüşme talebine olumlu cevap vermesine rağmen görüşmeler sırasında çalışmanın yapılmasını yargılayıcı ifadeler kullanıyor olması sebebi ile görüşmelerin yarıda bırakılabileceği ve böyle bir durumda yapılan kısmın çalışmada da kullanılmayacağı kendisine söylenilmesine rağmen ısrarla “Siz de bizi anlayın. Bizi yargılamak neymiş görün. Çocuğunu kim çalıştırmak ister? Mecburuz, ben de bunu anlatayım size. Yoksa böyle herkese sorup sorup oturduğunuz yerden bize ahkam kesmek olmaz. Sor sor bakayım.” gibi ifadelerle görüşmeye devam etmek istediğini belirtmiştir. Babanın bu ifadelerinden çaresizliklerinin anlaşılmasını istediği düşünülmektedir. Köyde yaşanan geniş aile hayatı, evlenenlerin anne babaları ile birlikte kalmaları sebebi ile kira gibi önemli bir masraf kalemini ortadan kaldırmaktadır. Aynı şekilde aynı evin içinde çalışanların ücretsiz aile işçisi olması sebebi ile para tek elde toplanmakta, elektrik, su, ısınma gibi giderlerin tek ortak kasadan karşılanabilmesi, tarladan toplananın, hayvanlardan elde edilen ürünlerin yemeğe dönüştürülmesi ve tek tencereden tüketimin olması paraya olan ihtiyacı en alt seviyelere taşımaktadır. Kent hayatının işe, okula vb. gitmek için dahi paraya ihtiyaç hissettirdiği babaların ifadelerinden de anlaşıldığı gibi sadece çocukların değil, aile fertlerinin tümünün çalışmasını da zorunlu hale getirdiği anlaşılmaktadır.

Biz Bir Aileyiz

Görüşmeci babalardan bir kısmı aile olmanın, zorluklarla mücadele sürecinde çok önemli olduğuna, zorluklarla mücadele ederken aile bireylerinin dayanışmasının gerekliliğine inandıklarını ve bunu zorlu süreçlerinde tecrübe ettiklerine vurgu yapmış oldukları dikkati çekmektedir.

5 numaralı görüşmeci, aile birliğini sağlamanın önemini şu ifadelerle ortaya koymaktadır: “Rahmetli ağababam, aile elim gibidir derdi. Beş parmağın var der tek tek gösterirdi. Sonra her birini çekiştirir. Bak kırılır derdi. Ama yumruk yaparsan kimse sana bir şey yapamaz. Yapsa da işlemez derdi. Bizim buralara gelip de darmadağın olan köylülerimiz var. Allah muhafaza etsin inşallah. Biz hep bunu kulağımıza küpe ettik. Sen ben olmaz bizde. Büyük, küçük olmaz bizde.

Kim iş buldu çalışır. Köylük yerde bizler de çalışarak büyüdük. Biyanımızda bişey mi eksik. Köyde biz de büyürken dedelerimizle, amcalarımızla çalıştık hepberaber. Evlenmeden ben geldim. Askerlik sonrası ağababam beni evlendirdi köyden. Buralar bizi bozar diye korktu rahmetli. İyi de etmiş. Evlenip geldik buralara. Bizimki bikere bile benim önümden aykırı geçmedi. Çocuklarımı da öyle yetiştirdi Allah razı olsun. Bizimki çalışmaz. Evden de çıkmaz. Aha şurda Kızılay'ı görmemiştir daha. Çocuklarla ben çalışırız. Çocuklar birlikte giderler işe. Birbirlerini kollarlar. Okula da devam ederler. Biz kazanır götürürüz. Akşam olunca çocuklar da bana kazandıklarını verirler. Eve bişeyler lazımsa alır getiririm. Bizimki de pişirir, yoksa yetirir. Aile bizde böyle olur.” Ailenin bireyleri arasında birlik olmanın önemli olduğunu ve bu sebeple de aile bireylerinin her birinin üzerine düşeni tespit ederek görev şuurunu yerine getirmesi gerektiğini 19 numaralı görüşmeci de şu ifadelerle ortaya koymaktadır: “Çocuk da çalışır, baba da çalışır. Evde kim varsa çalışır. Şu çalışsın bu çalışsın olmaz ki. Kim ne bulursa yapar. Kim ne bulursa eve taşır. Önemli olan akşam bir sufra başında toplanmak değil mi? Karın doyurmak değil mi? Hem bu şehirlerde herşey para. Bikişinin çalışması ile olmaz. Memurlar bile bi kişi çalışmıyor ki artık. Onlar sadece çocuklarını çok çalıştırmazlar. Paraları var çünkü. Bizim çocuklar da çalışır herkes çalışır. Çocuklarımızı da okuldan mahrum etmeyiz ama. Anaları çok takip eder. Ben çalışırım. Şunu da yapmayiverem demez. Çocuklarım da Allah var. Hem işe gider para kazanırlar hem de okulları hep takdir. Çok iyi okurlar. Allah onlardan da razı olsun. Eh biz bu kadarını yapabildik. Onlar okuyup memur olsunlar, çocuklarını çalıştırmassınlar. Ama şimdi hayat mücadelesinde biraz güçsüzüz ya. Namerde muhtaç olmamak için çalışırlar. Hepimiz çalışırız ama. Misal ben. Çiçek satarım kavşaklarda. Ama bir taraftan da yakınım arabamı koyarım. Bulduğum kartonları içine atarım. İki işi bir arada yaparım. Anaları da temizliğe gider buldukça. Ama boş kaldıkça da parça başı iş alır komşulardan. Çocuklar da çalışıp hayatın zorluklarını anladıkları için haylazlık yapmazlar Allah var şimdi. Ben bunda kötülük görmem. Hepimiz çalışıp ailemizi güçlendireceğiz tabi de. Böyle böyle Sincan'dan bir ev aldık. Şimdi bitane daha alalım deriz. Çocuklar evlenmeden başlarını sokacak evleri olsun ki evlenince rahat etsinler. Kötü mü tapmışız. Biz iyi yaptık bence. Boş olanı Allah da sevmez.”

13 numaralı görüşmeci de aile oldukları için görevlerini yerine getirdiklerine inandıklarını şu ifadelerle ortaya koymaktadır: “Aile olmak, bir olmak demektir. Baba çalışır öbürleri yer demek değildir. Bizler böyle gördük büyüklerimizden. Misal paran pulun var. O zaman evlatlarını çalıştırmazsın. Ama paran yetmiyorsa kusura bakma o zaman herkes bir işin ucundan tutacak. Bizler böyle gördük. Bizim evin en küçüğü çalışmaz. Anası kıyamaz ona. Evlat bu kim kıyar

ama. Aile tutunsun diye elimizden geleni yaptık bugüne kadar. Biz böyle gördük. Böyle de öğrettik evlatlara.” Bu görüşmeci babanın da vurguladığı gibi aile bireylerinin üzerlerine düşen görev bilinci ile buldukları işlerde çalışarak aileye destek sağlamaya çalıştıkları anlaşılmaktadır.

Görüşmeci babaların ifadelerinden de anlaşılacağı gibi aile olmayı dayanışmanın ön şartı olarak kabul ettiklerini söylemek mümkün. Bu gruptaki görüşmeci babalar, aile bireylerinin birbirlerine dayanarak ayakta kalabileceklerine inandıkları için genç, yaşlı demeden her bir bireyin üzerine düşeni yapması gerektiğine vurgu yapmış oldukları dikkati çekmektedir. Biz bilincin hakîm olduğu ailelerden geldikleri ve bu tür ailelerde yaşadıkları için de çocuklarının erken yaşlarda çalışma hayatının içinde olmasında bir sakınca görmediklerine sık sık vurgu yapmış oldukları görülmektedir. Aile içinde yaşanan sıkıntılarda çözüm üretebilecek konumda olan her bir bireyin az çok demeden çözüm üreterek ailenin devamlılığının sağlanmasında etkin rol alması gerektiğini savunmaktadırlar.

Keşke Okumuş Olsaydım

Görüşme grubundaki babalara çocuklarının neden sokakta çalışıyor olduğu sorulduğunda, kendi eğitim seviyelerinin düşüklüğünü gerekçe göstermiş oldukları dikkati çekmektedir.

17 numaralı görüşmeci baba “Eğitimim olsa ben de doğru düzgün bir iş bulurdum. İş bulmak için çok çabalarım hep. Yok, yok. İş yok. İş bulsam ne karımı ne de çocuklarımı çalıştırırım. Babayım ben. Tabi ki ben çalışıp onlara bakmalıyım. İş bul sen bana, bak çalıştırır mıyım hiç.” derken 2 numaralı görüşmeci baba da “Bizim zamanımızda okumak bu kadar önemli değildi. Okumasan da iş bulurdun. Ben hastalık geçirdim. Herkes iş bulurken ben bulamadım. İyileşince aradım ama yok. Bulamadım. Okumuş olsaydım bulurdum. Okumamışsın, yaşın da geçmiş. Karınlar aç para lazım. Kira gelir para lazım. Elektrik, su derken. Yaşamak için ne bulursan yapıyorsun. Okusaydım deme okumamışsınız işte.” şeklindeki ifadeleri ile eğitimini sürdürememiş olmanın hayatlarına yansıyan olumsuzluklarını dile getirmektedir.

“Ben okumak istedim. Ama rahmet olsun babam “Tarlaya, takkaya kim bakacak? Okuyanlar hep tok da sen aç mısın? Küçükler okusun sen benim yerime geçeceksin.” diyerek beni okula yollamadı. Sonuç, işte bu. Baba hakka yürüyünce malaları da paylaşmak istedi kardeşler. Biz kaldık küçücük toprağa. Yeter mi? Yetmedi tabi. Geldik mecbur buralara ama okuyana iş yok şimdi. Bizlere hiç yok. Çocukları okutmaya çalışıyorum ama hem oku hem çalış. O da olduğu kadar işte. Çocuk ne yapsın. Okul bitsin de para kazanayım diye kafayı yoruyo. Keşke hiç kimseleri dinlemeden okusaydım derim ama bizim zamanımızda baba ata dinlemeden olmazdı. Çok sayardık biz büyüklerimizi. Büyükler de bilse böyle yapmazdı ama. Bizden geçti artık.

Çocuklarımız okusun, karnımız doysun yeter. Ama az yiyelim ama çocuklar okusun istiyoruz analarıyla.” şeklindeki ifadeleri ile 2 numaralı görüşmeci, eğitimin öneminin farkına vardıklarını ancak kendileri için geç kaldıklarını, çocukları için bu gerçekliği dikkate alarak çocuklarının eğitimlerini sürdürmeye gayret ettiklerini ortaya koymaktadır.

Görüşmeci babaların ifadeleri, eğitim seviyelerinin düşük olması sebebi ile iş bulamadıkları, iş bulsalar dahi vasıfsız işlerde çalıştıkları için düşük ücretler elde ediyor oldukları, daimî işlerinin olmadığı, kayıt dışı işlerde çalıştıkları için ailelerinin ihtiyaçlarını yeterli oranda karşılayamamaları sebebi ile aile fertlerinin özellikle de çocuklarının çalışmasına ihtiyaç duydukları hatta buna mecbur kaldıklarını ortaya koymaktadır. Görüşmeler sırasında bu yönde cevaplar veren babaların genellikle eğitimin öneminin farkında olan babalar oldukları, kendi eğitimlerini ailelerinin geleceği açısından önemsemiş olmalarına rağmen sosyal ve ekonomik sebeplerle eğitimlerine istedikleri seviyelerde devam edemedikleri, bunun da sadece kendi hayatlarına değil aile bireylerinin hayatlarına da olumsuz yönde etki ettiğinin farkında oldukları anlaşılmaktadır.

Onlar Çocuklarını Çalıştırmazlar

Görüşme grubundaki babaların bir kısmı, çocuklarının çalışma hayatına erken yaşlarda atılmış olmalarını kendilerinin yaşamış olduğu çaresizliğe bağladıkları için çocuklarının hayatında yaşanacak dönüm noktaları ile bu durumun ortadan kalkabileceğine inandıkları anlaşılmaktadır. 9 Numaralı görüşmeci: *“Ben üniversite okuduğum halde iş bulamadım. Çok aradım. Yok. Biz doğuştan şanssızlarız. Anada atada biraz bişeyler olacak ki sen de bişeyler yapabilesin. Ben çok çabaladım olmadı işte. Çocuklarımı sonuna kadar okutacam. Üniversite de yetmiyor artık. Üstüne yollayacam. Başka türlü bizim kaderimiz değişmez. Benim de şimdi bitane çocuğum çalışıyor senin dediğin gibi sokaklarda. Ama okul hayatları sürsün diye çalışıyor. Bizim gibi ev geçindirme gaylesi ile çalışmıyor. Kardeşi okusun, kendisi okusun diye çalışıyor. Onlar evlenince artık ben diyom ki onlar çocuklarını çalıştırmazlar. Bir Hocam söylemişti üniversitede okurken derste. Akademisyen üçüncü nesilde olurmuş ancak. Bizde de üçüncü nesil çocuklar sokakta çalışmaktan kurtulacaklar bence. Sence de öyle değil mi? Kıramıyoruz işte zincirlerimizi. Değiştiremiyoruz kaderimizi. Ama değişecek tabi. Onlar çocuklarını çalıştırmazlar. Benim elimden gelen bu. Ben zaten onları tek başlarına koymam sokağa. Birlikte karton topluyoruz. Bazan anneleri de gelir gece gidersek işe. Anne de üniversite mezunu. Kreşlerde yardımcı anne. Hayat mücadelesi işte. Ama onlar çocuklarını çalıştırmazlar.”* şeklinde bu konudaki görüşlerini ortaya koymuştur.

4 numaralı görüşmeci de kendilerini zorlayan şartlar sebebi ile çocuklarının çalışmak zorunda kaldığına şu ifadelerle ortaya koymaktadır: *“Ben çocuğum sokaklarda çalışsın istemem. Kimse istemez. Ama lise bitirdim ben. İş bulamadım. Köyde toprağımız da verimli değil. Asıl sebep eşim “illâ gidelim, illâ gidelim.” tutturdu. İyi mi oldu geldiğimiz? Bazı yönlerden iyi oldu, bazı yönlerden kötü. Orda tüm kardeşler bir arada çalışır, bir arada yerdik. Karnımız bugünkünden daha iyi doyardı o zamanlar. Köylük yer. Tavuğun var, ineğin var. Bahçeden yetişenler karnımızı doyururdu. Ama herkesler göç etmeye başlayınca bizim kadınlar da “Gidelim Allah gidelim” demeye başladılar. Herkes göç edince okul da sorun olmaya başladı. “Eşim bizim çocuklar da bizim gibi olacak.” diye kafamın etini yemeye başladı. Kadın kısmı işte bilirsin. Bi tutturdu mu tutturur. Geldik işte buralara. Tutunmaya çalışıyoruz hep birlikte. Ben gece bekçiliği yaparım inşaatlarda. Yetmez tabi. Eşim ev temizliğine gider. Çocuklar da mevsimine göre işte ne bulurlarsa satarlar. Okumaksa okudum. Lise mezunuyum ama olmuyor işte. Ben daha iyi büyütmek isterdim tabi çocuklarımı. Bu inşaat bitince belki beni kapıcı alacaklar. O zaman kira derdi olmaz. Apartmanda eşim de iş tutar. Çocuklara gerek kalmaz diye düşünüyoruz. Öyle işte. Ne yapalım onlar okusun diye biraz da bu katlandıklarımız. Onlar okusun, çocuklarına daha iyi şartlar sağlasınlar. Onlar çalıştırmasınlar çocuklarını. Ben onlara daha çok imkan verdim. Biz okul okuduk ama ne zorluklarla. Onlar sadece okula gidip boş kalınca da çalışıyorlar. Olur o kadar.”*

3 numaralı görüşmeci de: *“Onlar çocuklarını çalıştırmasınlar. Ben babamdan böyle gördüm böyle yaptım. Biz zengin bebeleri olamadık hiç. Bizi çalıştırdılar biz de böyle gördüğümüz için böyle yapıyoruz. Zengin olup çalıştırsak anlarım da. Hem ne var çalışsın. Hayatı öğrensin. Biz öyle bir eli yağda bir eli balda tipler değiliz. Onlar çalıştırmasın çocuklarını. Yaşamadan konuşmak olmaz. Zaten üzülürüm hep çocuklarıma iyi hayat sunamadım diye. İmkan olsa ben de çalıştırmam ama işte. Ben onlar okusun diye çabaladım. Onlar çalıştırmasın ben ne edeyim.”* şeklindeki ifadesi ile gönül rızası ile çocuklarını çalıştırmadığını ancak yaşanan çaresizliklerin onları bu hayat şekline mecbur bıraktığını net bir şekilde ortaya koymaktadır. Görüşmeci babaların pek çoğunun görüşmeler sırasında kendi tercihleri olmayan bu durumun zorunluluk olduğu için ortaya çıktığına sık sık vurgu yapmış oldukları dikkati çekmiştir.

Çocukların sokaklarda çalışmasının olumsuz taraflarını bildikleri halde onların çalışması ile evin geçimini daha insani şartlarda sağlayabildiklerini, çocuklarının eğitimlerini sürdürebildiklerini, çocuklarının çalışmaması durumunda ailenin diğer fertlerinin ve de özellikle çocuklarının daha istenmeyen şartlarda yaşamak zorunda kalacaklarını bildikleri için bu istenmeyen durumu onaylamak durumunda kaldıklarını belirten bu gruptaki babaların ortak

noktaları, eğitim seviyelerinin görüşme grubundaki diğer babalardan görece daha yüksek olmasıdır. Yaşam şartlarının onları, bildiklerine aykırı şartlarda yaşamak zorunda bırakıyor olmasından kaynaklanan serzenişlerini sık sık dile getirmiş oldukları dikkati çekmektedir. Öğrenim hayatı içinde öğrendiklerini uygulayamıyor olmanın, almış oldukları eğitime uygun işlerde çalışmıyor olmanın ve bu seviyelerde yaşama şekline kavuşamamış ve aile fertlerine bu düzeylerde yaşama şartları sunamamış olmanın ezikliğini hissettikleri görülmektedir. Kendilerinin çabalarına rağmen sağlayamadıkları yaşam şartlarını çocuklarının sağlayabilmesinin hem temennileri hem de beklentileri olduğuna yapmış oldukları vurgu son derece manidar bulunmuştur.

Sonuç

Dünyanın her döneminde ve her bölgesinde yaşam şartları aynı şekilde sürmemekle birlikte, bazı dönemlerin ortak özellikleri söz konusu olabilmektedir. Sanayi ihtilali ile birlikte başlayan kentleşme, kent hayatına uyum sürecinde aile içi rol ve sorumluluklarda da farklılıkların yaşanmasını beraberinde getirmiştir. Öncesinde kadın, erkek, yaşlı, genç rol ve sorumlulukları keskin çizgilerle ayrılmışken, kent hayatının hâkim olması ile birlikte daha iç içe geçmişlik söz konusu olmaya başlamıştır. Kentlerin genellikle kenar mahallelerinde yaşayan, eğitim ve ekonomik seviyeleri düşük olan ailelerin yaşam mücadelelerini sürdürebilmek için mümkün olan her bir ferdinin çalışmasına duyulan ihtiyaç, çalışan çocuklar probleminin ortaya çıkmasında etkili olmuştur.

18 yaşına kadar her birey çocuk olarak kabul edilmektedir. Çocukluk sürecinde çocukların hayatlarını anne babalarının koruması, desteği ile sürdürmeleri gerekir. Oysa sokakta çalışan çocuklar, erken yaşlardan itibaren sokaklarda mendil, poşet, simit, satıp ayakkabı boyayarak para kazanıp aile bütçesine katkı sağlamaya çalışmaktadırlar. Hem geleneksel hem de kent ailelerinde erkekler evin geçimini sağlama, kadınlar da ev içi işleri düzenlemek görevini yüklenirken geçiş aileleri olarak kabul edilen bu ailelerde çocuklar, evin geçimini sağlama ile ilgili sorumluluklar almak zorunda kalabilmektedirler. Bu durum, aile içi ilişki ağının farklılaşmasında etkili olduğu gibi çocukların sağlıklı bir şekilde büyümeleri ve sosyal hayatın içinde yer almalarını da olumsuz yönde etkileyebilmektedir.

Sokaklarda çalışarak aile bütçesine katkı sağlayan ya da eğitimlerini sürdürebilmek için çalışmak zorunda olan bu çocukların babaları ile yapılan nitel araştırma verilerine dayanarak, çocuklarının kendilerinden uzakta, bilmedikleri, kontrollerini sağlayamadıkları yerlerde çalışmalarını onaylamamakla birlikte yaşamış oldukları zorlu hayat mücadelesinin onları buna mecbur bıraktığını söyleyebilmek mümkün. Babaların, kendilerinin büyüme süreçlerinde de

çalışmış olmaları ve yaşadıkları sosyo-kültürel yapılardaki diğer ailelerin de çocuklarını çalıştırıyor olmaları sebebi ile çocuklarının erken yaşlardan itibaren çalışma hayatının içinde olmalarını çok da sakıncalı bulmadıkları anlaşılmaktadır. Özellikle evin zarurî ihtiyaçlarının karşılanması, çocuklarının kendi ve kardeşlerinin eğitimlerini sürdürebilmeleri için çalışmalarını normalleştirmiş görünüyorlar. Babalar, kendi eğitim seviyeleri düşük olduğu için çocuklarının çalışarak eğitim imkanlarından faydalanmalarını dolayısı ile de içinde buldukları sarmalı aşmalarının mümkün olduğunu düşünüyor olmaları da çocuklarının sokakta çalışmalarını kabullenmelerinde etkili bir faktör görünüyor. Görece eğitim seviyeleri yüksek olan babalar da kendilerinin kıramadığı olumsuz şartları çocuklarının hem çalışıp hem de kıracağına inandıkları anlaşılmaktadır.

Sokakta çalışan çocuklar problemi her ne kadar ailelerin bir tercihi gibi görünüyor olsa da babaların ifadelerine dayanarak tercih değil hayat şartlarının aileleri ve çocuklarını mecbur bırakması olduğunu söylemek gerekir. Bu noktada ailelerin bu kısır döngüden kendi gayretleri ile çıkmalarının son derece zor olduğunu belirtmek gerekir. Aile ve Sosyal Politikalar Bakanlığı'nın bu çocuklar ve aileleri ile ilgili çalışmaları olmakla birlikte yerel yönetimlerin ve sivil toplum kuruluşlarının yardımı ve desteği ile sorunun çözülmesinin çok daha kolay olacağına bir kez daha vurgu yapmak gerekecektir.

Özet

Ataerkil toplumlarda erkeğin kadın üzerindeki hâkimiyeti, toplumsal yapılanmanın doğal bir süreci gibi görünebilmektedir. Ancak bu örüntünün sadece kadınları, erkekleri ve çocukları değil, aynı zamanda toplumsal dokunun tamamına nüfuz eden zararlı etkilere yol açabildiği görülmektedir. Toplumlar, yapısal sürekliliklerini koruma arayışında, ortaya çıkan anormallikleri ele almak ve düzeltmek yerine, genellikle sistemi korumak için kısıtlamalar getirme yoluna başvurmaktadır. Bu kısıtlamalar, bir grubun diğerine boyun eğdirilmesi şeklinde tezahür edebilir veya yanlış yönlendirilerek sürdürülmesi nedeniyle istemeden de olsa sistemin istikrarına yönelik bir tehdit haline gelebilir. Bu nedenle bu araştırma öncelikle erken yaşta evliliklerin kadınlar üzerindeki etkisini ve bunun çocuklarıyla olan ilişkileri üzerindeki sonuçlarını incelemektedir. Her ne kadar tüm aile bileşenleri erken evliliklerden olumsuz etkilense de, bu çalışma odak noktasını kadınlar ve onların çocuklarıyla olan dinamikleri üzerindeki yansımaları incelemek üzere daraltmaktadır. Bu bağlamda araştırma, erken evliliklerin çocuk doğurma, annelik memnuniyeti, annelik rolleri ve sorumlulukları ile anne-çocuk ilişkileri üzerindeki etkilerini incelemeyi amaç edinmektedir. Bu amaçla, erken yaşta anneliğe geçiş yapmış 17 kadınla yarı yapılandırılmış görüşmeler yapılmış ve kadınların yanıtları sosyolojik boyutlar ışığında analiz edilmiştir. Anne-çocuk bağının önemini vurgulayan çok sayıda araştırmaya rağmen, kayda değer sayıda kadının çocuklarıyla sağlıklı bir ilişki kurabilecek olgunluğa erişmeden anneliğe adım atması endişe vericidir. Bu durum, bu araştırmanın aciliyetinin ve uygunluğunun altını çizmektedir. Bu erken yaştaki annelerin yaşadıkları deneyimleri ve bunun hem kendileri hem de çocukları üzerindeki etkilerini ortaya çıkarmanın, konuyla ilgili karar alma süreçlerinde yer alan paydaşlar için daha etkili çözümler düşünmeye katkıda bulunacağı beklenmektedir.

Anahtar Kelimeler: Annelik, Erken yaş evlilikleri, Ataerkil yapılanma.

BEING A MOTHER" ACCORDING TO WOMEN WHO MARRIED AT AN EARLY AGE

Abstract

In patriarchal societies, men often dominate over women, which may seem like a natural social order. However, this pattern can have harmful effects on not only women, men, and children, but also the entire social fabric. Societies often impose restrictions to protect the system rather than addressing and correcting emerging anomalies, which can perpetuate these harmful effects. Restrictions may arise, leading to the subjugation of one group by another or unintentionally threatening the stability of the system due to misguided perpetuation. This research primarily examines the impact of early marriage on women and its consequences for their relationships with their children. Although early marriages have negative effects on all family members, this study specifically focuses on the impact on women and their relationships with their children. The study aims to investigate the effects of early marriage on childbearing, maternal satisfaction, maternal roles and responsibilities, and mother-child relationships. Semi-structured interviews were conducted with 17 women who became mothers at an early age. Their responses were analysed in the light of sociological dimensions. Despite numerous studies emphasising the importance of mother-child bonding, a significant number of women enter motherhood before they are mature enough to establish a healthy relationship with their children. This highlights the urgency and relevance of this research. Understanding the experiences of early mothers and their impact on themselves and their children is expected to contribute to more effective solutions for stakeholders involved in decision-making processes on this issue.

Keywords: Motherhood, Early marriages, Patriarchal structuring.

Giriş

Aile, toplumun en küçük birimi olmasına rağmen toplumun işleyişinde çok önemli fonksiyonlar yüklenmektedir. Aileyi oluşturan bireylerin de bu önemli sorumlulukları yerine getirebilecek nitelikte olması gerekmektedir. Bu sebeple evlenen çiftelerin eş ve anne baba sorumluluğunu alabilecek yeterliğe ve olgunluğa ulaşmaları, sorumluluklarını olması gerektiği şekilde yerine getirebilmeleri önem arz etmektedir. Bu nedenledir ki hem resmi nikah hem de dini nikah sırasında tarafların tam ehliyetlerinin olması, akıl ve ruh sağlıklarının yerinde olması ve evliliğe rızalarının olması şartları aranır. Ancak 5395 sayılı Çocuk Koruma Kanununa göre 18 yaşını doldurmayan her birey çocuk olarak kabul edilmesine rağmen medeni kanun izin vermediği için 18 yaşının altındaki çocuklarını evlendirmek isteyen aileler, çocuklarını dini nikâhla evlendirmekte, 18 yaşını doldurduktan sonra da resmi nikah yapmaktadırlar. Bu durum medeni kanun koymuş olduğu müeyyidelerle ve resmi nikah öncesinde başlatılan süreçle kontrol edilebilirken dini nikah için resmi bir sürecin olmaması istismar yaşanmasına sebep olabilmektedir. Oysa her iki nikâh şekli de bu kuralları koyarken hem çiftlerin hem doğacak çocuklarının hem de toplumun sağlıklı bir şekilde devam etmesini sağlamak istemektedir. Bu hassasiyet sağlanmadığında cinsel, ekonomik, sosyal, psikolojik ihmal ve istismarın önü açılmış olmaktadır. Bununla birlikte erken yaşta evliliğin hem kadın hem de erkek için çok sayıda olumsuz yönleri olmakla birlikte ülkemizde erkeklerin evlenebilmeleri için askerliklerini tamamlamaları ve evlerinin geçimini sağlayabilmeleri için iş bulmaları tercihten öte bir zorunluluk gibi kabul edildiği için erkeklerin erken yaşta yapmış oldukları evlilikler, kadınlara oranla daha az olmaktadır. Buna karşın ataerkil yapılanma, erkeğin hakimiyetini daha kolay kabul ettirebilmesi için erkeğin evlenirken eşinden yaş olarak büyük olmasının tercih edilmesi kadınların erkeklere oranla daha erken yaşta evlendirilmelerinin önünü açmaktadır. Dolayısıyla kadınların erken yaşta yapmış oldukları evliliklerde yaşamış oldukları deneyimler daha fazla yıpratıcı olmakta ve yaşamlarının tümüne etki etmektedir. Bu nedenle bu çalışmada sadece erken yaşta evlendirilen kadınların yaşadığı süreci, ilk annelik deneyimleri, hissettikleri ve çocukları ile olan iletişimlerinin nasıl yapıldığına ilişkin bir çerçeve ortaya konulmaya çalışılacaktır.

ERKEK YAŞTA EVLİLİK VE KADIN

On sekiz yaşından önce yapılan evlilik olarak tanımlanan erken yaşta evlilik, dünya çapında gelişmekte olan birçok toplumda görülebilen yaygın bir uygulamadır. Bu evlilik türü, yalnızca doğrudan ilgili bireyleri değil, aynı zamanda içinde buldukları daha geniş toplumsal yapıyı

da etkileyen, kayda değer genişlikte sonuçlar doğurmaktadır. Bununla birlikte, erken evliliğin zararlı yansımalarının orantısız bir şekilde genç kızlar tarafından üstlenildiğinin altını çizmek büyük önem taşımaktadır (John, 2019, s.853; Adekoya ve Sokunbi, 2021, s.102).

Erken yaşta evlilikler, genç kadınların bütünsel gelişiminin önünde ciddi bir engel teşkil ederek kişisel gelişim, eğitim ve sosyo-ekonomik ilerlemeyi kapsayan birçok önemli alanda ilerleme kaydedilmesini engellemektedir. Bu tür durumlara maruz kalan kadınların önemli bir kısmı, zorunlu eğitimlerini tamamlama fırsatı bulamadan eğitim kurumlarından hızlıca alınmakta ve evliliğe itilmektedir. Esasen hala çocuk olan bu genç kadınlar, kendilerini sıklıkla ev içi sorumluluklar üstlenmek, çocuk doğurmak ve yetiştirmek ve zamanından önce yetişkin rolleri üstlenmek zorunda bulmaktadır. Bu ani yetişkinlik sorumlulukları, akademik ve kişisel olgunlaşmalarını önemli ölçüde engellemekte, muhtemel istihdam fırsatlarını kısıtlamakta ve onları çok sayıda sağlık tehlikesine maruz bırakmaktadır (Ahmed, 2013, s.84).

Nitekim çok sayıda akademik araştırma, erken yaşta evliliğin kadınların kırılganlığını farklı boyutlarda artırdığı gerçeğinin altını çizmektedir. Bunlar arasında ekonomik bağımlılık, tehlikeli sosyal davranışlara katılım, hayati önem taşıyan sağlık hizmetlerine sınırlı erişim, sosyal izolasyon, yoksullaşma, istismar ve şiddete yatkınlık yer almaktadır (Goel, 2022; İlham, vd., 2023). Bununla birlikte, erken evliliğin kadınlar için en acil ve doğrudan sonuçlarından birisi de erken çocuk doğurmanın yol açtığı sağlık komplikasyonlarıdır (Yoosefi Lebni, vd., 2023). Ergenlik çağındaki anneler için erken gebelik ihtimali önemli sağlık riskleri doğurmaktadır. Bunlar arasında yüksek riskli gebelikler, fiziksel rahatsızlıklar, depresyon, duygusal sıkıntılar ve yüksek ölüm oranları yer almaktadır (Kader, vd., 2022; Nisa, 2022; Hardiyati, 2023; Rusramov, 2023). Dahası bu küçük yaştaki annelerin çocukları, düşük doğum ağırlığına veya bebeklik dönemini atlatamamaya daha yatkındırlar. Erken yaşta evliliğe adım atan kadınların evlilik memnuniyetsizliği, bireysel özerklik ve bağımsızlığın erozyona uğraması ve aşırı sorumluluk yükü gibi aileyle ilgili bir dizi çıkmazla karşılaşma olasılığı da daha yüksektir (Kyari, 2014).

Özetle, erken yaşta evliliğin kadınlar için sonuçları çok yönlü ve geniş kapsamlıdır. Kişisel gelişimden aile ilişkilerine ve toplumsal katılıma kadar varoluşlarının tüm yönlerine nüfuz etmektedir. Bu nedenle konu, yoğun ilgi ve özel çaba gerektirdiği için konu ile ilgili mağdurların yaşadıkları deneyimler oldukça önem arz etmektedir. Bu deneyimlerin nasıl elde edileceğine ilişkin süreç yöntem başlığı altında tartışılacaktır.

YÖNTEM

Nitel araştırma, bir araştırma konusunu derinlemesine ve ayrıntılı olarak incelemek için kullanılan bir araştırma yöntemidir (Neuman, 2014). Bu yöntem, insan davranışlarını ve deneyimlerini derinlemesine anlamaya odaklanır. Sosyal ve kültürel konular, eğitim, sağlık, iş gibi farklı alanlarda kullanılmakla birlikte derinlemesine bilgi sağlaması, karmaşık konuları incelemeye uygun olması ve katılımcıların bakış açısını yansıtması nedeniyle yaygın olarak tercih edilir (Patton, 2015; Yıldırım ve Şimşek, 2018). Nitel araştırma yöntemlerinde çeşitli araştırma teknikleri bulunmakla birlikte sıklıkla katılımcı gözlem, görüşme ve döküman incelemesi teknikleri kullanılır (Denzin ve Lincoln, 2011). Bu çalışmada da yarı yapılmış görüşme formu kullanılarak görüşmeler gerçekleştirilmiştir.

Görüşmeler, Kırıkkale’de yaşayan ve erken yaşta evlenerek anne olmuş olan 17 kadın ile 21.01.2023-18.07.2023 tarihleri arasında gerçekleştirilmiştir. Amaçlı kartopu örneklem metodu kullanılan çalışmada erken yaşta evlenip çocuk sahibi olmuş bir anne ile başlayan araştırma süreci, o annenin ve çevresindeki diğer annelerle tanışması ile sürmüştür (Yıldırım ve Şimşek, 2018, s.116-120). Görüşme yapılan annelerin görüşmelere katılma konusunda istekli olmaları sebebi ile görüşmeler sırasında önemli bir engelle karşılaşmamıştır. Ancak görüşmeler sırasında kayınvalideleri yanında olan ve görece daha küçük olan kadınlara görüşme talebi iletildiğinde kayınvalidelerine baktıkları, onlardan izin alma gereği duydukları fark edilmiştir. Bu sebeple görüşme ortamında kayınvalideleri bulunan 8 kadının kayınvalidelerinden de izin istenmiştir. Ancak 3 kayınvalide “*Herkes erken evleniyor. Bunu araştıracak ne var?*”, “*Kocasını izin vermez. O bana emanet. Olmaz konuşamaz.*” ve “*Olmaz, olmaz. Bizim konuşacak bir şeyimiz yok. Ne anlatacak. N biliyor da anlatacak. Çocuğuna baksın O.*” şeklindeki mazeretleri ile görüşme talebine olumsuz cevap vermiştir. Dolayısıyla çalışmada her ne kadar erken yaş evliliği yapmış olan annelerle görüşme gerçekleştirilmiş olsa da yaşları genç olanların görüşmelere daha az katılabildikleri, yaşları ilerlemiş olanların daha kolay katılım sağladıkları fark edilmiştir. Bundan dolayı erken yaş evliliği yapan görüşme grubundaki kadınların yaş ortalamaları beklendiği kadar düşük olmamıştır. Erken yaş evliliği yapan kadınların her geçen gün sayılarının azalmaya başlaması da yaş ortalamasının yüksek olmasında etkili olmuştur.

Demografik Bilgiler

Görüşmeye katılan kadınların yaş ortalamaları 51 olarak tespit edilmiştir. Erken yaşta evlilik yapmış olan kadınların eğitim seviyelerinin dağılımına bakıldığında birisinin okuma yazmasının olmadığı, birisinin ilkokulu terk ettiği, 8’inin ilkokul mezunu olduğu, 2’sinin liseyi

terk ettiği, 4'ünün lise mezunu olduğu ve birisinin de sonradan yüksekokul bitirdiği tespit edilmiştir. Görüşmeciler kadınlar arasında devlet memuru olan yok. Kadınlardan birinin eşinin züccaciye dükkânının olduğu ve kadının da eşi ile birlikte bu dükkânda çalıştığı, diğer kadınların çalışma hayatlarının olmadığı tespit edilmiştir. Kadınların ilk evlilik yaşlarına bakıldığında bir kadının 12, 10 kadının 13, 3 kadının 14, 3 kadının 15 ve bir kadının da 16 yaşının başında evlendirildikleri tespit edilmiştir. Kadınların 2'si 13, 8' 14, 5'i 15 ve 2'si de 16 yaşında ilk çocuğunu doğurduğunu belirtmiştir. Bu kadar erken yaşta evlendirilen ve anne olan kadınların çocuk sayılarına da bakıldığında 4 kadının 6, 5 kadının 4, 6 kadının 3 ve 2 kadının da 2'şer çocuklarının olduğu öğrenilmiştir. 5 kadının 3, 2 kadının da 2 çocuğunun ölü doğduğu veya doğduktan sonra öldüğü tespit edilmiştir.

BULGULAR

Erken yaşta evlendirilen kadınların erken yaşta anne olmaları da beraberinde gelmektedir. Ancak kendileri reşit olmadan evlendirilen ve ardından da çocukları olan bu kadınlar sadece kendileri mağduriyet yaşamıyorlar, çocukları da onlarla birlikte mağduriyetler yaşamak zorunda kalıyorlar. Bir kişinin evlenip anne baba olabilmesi için kendi gelişim dönemlerini tamamlamış olması gerekir. Aksi halde hem kendi sorumluluğunu alamayacak hem de doğacak çocuklarına olması gerektiği şekilde annelik yapmaları mümkün olamayacaktır. Bu bölümde erken yaşta anne olan kadınların kendi ifadeleri ile annelik süreçleri, bu süreçte yaşadıkları, hissettikleri, düşünceleri, karşılaştıkları güçlükler ortaya konulmaya çalışılacaktır.

İlk Hamilelik

Erken yaşta anne olan kadınlara ilk hamile olduklarını öğrendiklerinde neler hissettikleri, neler düşündükleri sorulduğunda alınan cevaplarından bazıları aşağıda verilmiştir:

“Ben hamile olduğumu anlamadım ki bir şey düşünüp, bileyim. 12 yaşında evlendim. Evlilik ne bilmezdim ki, annelik ne bileyim. Sokaktan çocuğu alıp getirirsen ne bilir ki hamilelik bilsin. Uşağım bedenime düşmüş. Ne bilem ben. Kaynanam bakarmış demek bana. Bir akşam sofrada eşime dönüp “Bulsa beni yiyecek. Yarın karını ebe Hatice’ye götürem. İnşallah hamiledir. Yoksa bu bizim ocağımızı söndürür. Ne bu kadar yemek.” dedi. Elimi hemen sofradan çektim. Ama ölçem sanki açlıktan. Kayınbabamdan Allah razı olsun, hep korudu kolladı beni. Kaynanama kızdı. Kocamın sesi bilem çıkmadı. Yemeğini yemeye devam etti...yiyesi. Kayınbabam önündeki etten bi parça benim önüme attı “Ye kızım, bundan sonra yemeğin en güzel yeri benim gelinime verilsin.” dedi. Hep de dikkat etti Allah Ondan razı olsun. Herkes ortak tabaktan yer o zamanlar. Ev kalabalık. 7 kayın var. İlk gelin benim. Adam benden 13 yaş

büyük. Ben 12 yaşındayım. Utandım eti verse de kayınbabam elimi çektim sofradan. Bugün gibi hatırlarım. Elimi tuttu o eti yedirdi bana. Sonra da yufkayı büktü büktü yedirdi. Karnımın iyice doyduğunu anlayıncaya kadar yedirdi. “Yüklüyse kız acıkır, kendinin o obur günlerini unuttun mu?” diye kaynanama kızdı. Ertesi gün ebe hamile olduğumu söyleyince çok korktum. Hep böyle acıkırsam, ne yaparım diye korktum. Yani senin beklediğin gibi sevinmek felan olmadı. Açlıkla nasıl baş ederim korkusu oldu. (gülüyor).” (81 yaşında, 13 yaşında anne olmuş). Kadının ifadeleri, evliliğin ve hamileliğin, henüz çocuk yaşta bir kız için anlaşılabilir bir realite olduğunu vurgulamaktadır. Evliliğin getirdiği sorumlulukları kavramadan, hamileliğiyle baş başa kaldığı görülmektedir. Kayınbabasının koruyucu tavırları, kadının yaşadığı korkulara bir nebze çare olsa da hamileliğin sevincini bekleyenlerin aksine, onun için açlıkla başa çıkma korkusu daha baskındır. Bu durum, evliliğin ve anneliğin romantikleştirilmiş yönlerinden uzak, gerçek yaşamın sert gerçeklerini yansıtmaması bakımından son derece düşündürücüdür.

“Ben Erzincan’dan gelin getirildim buraya. Annemi özledim diye ağlamaktan hamile olduğumun farkına bile varmamışım. Hamile olduğumu anladığımda bebem 5 aylık olmuş karnımda. Karnım ortaya çıkınca elim fark etti. Annemin yanına bebem de olursa gidemem diye çok ağladım, çok üzüldüm. Senin anlayacağın anne olmak değil anneme gitmek derdindeydim. Öyle olunca da sevinmedim üzüldüm. Ölü doğdu o bebem. Annelik hissiyatı da gelmedi içimden o bebemde. İkinci bebemde biraz biraz annelik hissiyatım başladı ama. Belki öbürü öldü diye de olabilir.” (67 yaşında, 15 yaşında anne olmuş). Bu görüşme, kadının memleketinden uzaklaştırılıp yeni bir aileye entegre olması ve hamileliğin farkına varmasının üzerine odaklanmaktadır. Anneden uzaklaşmanın acısı, hamilelikle birleştiğinde, duygusal bir çatışmaya dönüşmüştür. Çünkü anneye ihtiyaç duyan, onun desteğine, varlığına ihtiyaç duyan bir çocuktan anne olmasını beklemek, annelik duyguları ile hareket etmesini beklemek, kaldıramayacağı kadar ağır bir yükün altına girmesini beklemek anlamına gelmektedir.

“Çok sevindim hamile olduğumu anlayınca. Artık yalnız kalmam diye düşündüm. Kocam işe gidince evde yalnız kalırdım. Bazan haftalarca gelmezdi. Kamyon şoförüydü o zamanlar. Ev de gecekondtu. Çok korkardım. Ondan sebep çok sevindim. Annelik değil de yalnızlıktan kurtulmak diyelim biz ona.” (48 yaşında, 15 yaşında anne olmuş). Bu kadının hikâyesi, hamileliğin beklenmedik bir sevinçle karşılandığını, ancak aslında annelik hissiyatı yerine yalnızlık hissiyatının öne çıktığını gösterir. Eşi isteyken evde yalnız kalmaktan duyduğu korku, hamilelikle gelen beklenmedik bir rahatlama sağlar. Bu durum, kadının annelikle ilgili beklentileri ve gerçek yaşam deneyimleri arasındaki çatışmayı vurgulamaktadır. Çünkü anne-baba ve aile sıcaklığına ihtiyaç duydukları bir dönemde onları yalnız bırakmak, oyuncakları ile

oynayacakları bir dönemde, hamilelik ve çocuk büyütme sorumluluğu yüklendiğinde gerçek ile oyunu ayırt edememelerine neden olmaktadır. Görüşmeler sırasında pek çok kadının oyun oynama şansının kendilerine tanınmadığından şikâyetçi oldukları dikkati çekmiştir.

Görüldüğü üzere erken yaşta evlenmiş ve hamile kalmış kadınların yaşadığı duygusal karmaşıklıklar yaşadıkları ortaya çıkmaktadır. Evlilik, hamilelik ve annelik deneyimleri genellikle romantikleştirilmiş toplumsal normlardan uzaktır. Bu nedenle kadınların yaşamış olduğu bu deneyimlerin yaşamlarını nasıl etkilediğinin tam olarak anlaşılması için ilk annelik deneyimlerine de yer verilecektir.

İlk Annelik

Küçük yaşta anne olan kadınlara ilk kez anne olduklarında neler hissettikleri sorulduğunda alınan cevaplardan bazıları aşağıda verilmiştir:

“Sanki ben anne olmamıştım. Doğurdum ama çok zor doğurdum. Belki üç gün kendimde değilmişim. Çocuk da erken doğmuş. Küçücük. Ben bakamazdım. Kaynanam baktı Allah razı olsun. Ben sanki ablasıydım. Kaynanam çok iyiydi dedim ya. Ben sokağa çıkar ip atlardım çocuklarla. Çocukla alakam yoktu. Kaynanamın çocuğu gibi hissettim. Sonra da hep onun çocuğu gibiydi o kızım. Hala çok sıcak değil bana.” (53 Yaşında, 14 yaşında anne olmuş). Bu görüşmecinin de söylediği gibi görüşmeler sırasında pek çok kadın ilk çocuklarına yeteri kadar annelik yapamadıklarını, bunun vicdani yükünü halâ taşıyor olduklarını belirtmiş olmaları son derece manidardır.

“Ben evcilik oynamayı çok severdim. Hep de anne olurum evcilik oynarken. Evlenirken de evcilik oynar gibi evlendim. Allah var, ne ağladım ne de sızlandım. Soran yok tabi evlenir misin diye ama olsun. Az öncekiler gibi ağladım sızladım diyemem ben. Güle oynaya evlendim. Ama Akşam olup adamla o odaya girdik ya anladım o zaman oyun olmadığını, oyuna benzemediğini. Doğumu sorma, hiç ama hiç sorma. Çok zordu. Ah bacım karılar zor doğururken çocuk nasıl doğursun (ağladığı belli olmasın istiyor). Sen de 20 gün, ben diyem 30 gün oturup kalkamadım. Çocuğu kaynanam yanıma getirirdi emzireyim diye ama o zaman da canım acırdı. Kaynanam baktı çoğucası. Ama biraz ayaklanınca oyuncak gibi onunla oynadım. Benim için oyuncaktı, olmayan oyuncagımdı. Hep babamdan kocaman gelin bebek istemiştım. Almamıştı tabi. İlk çocuğum kız oldu. Onu gelin yapardım. Perdenin altına sokardım. Perdeyi çekiştire çekiştire yırtmıştım. Kayınvalidem Allah rahmet etlesin, nur içinde yatırsın. Bigün sandıktan kendi duvağını çıkarmış, getirip verdi. Al bunla bebeğini gelin yap. Perdeyi de rahat bırak. Ama sadece oynama, ona iyi bak. Yoksa duvağı alırım.” dedi. Ne acı değil mi?” (77 yaşında, 13 yaşında anne olmuş). Kadının kendisinin de belirtmiş olduğu gibi çocuğun oyun hakkını elinden

alarak, taşınması mümkün olmayan gerçeklerle vaktinden çok önce tanışmalarını sağlamak insanlık suçu olarak kabul edilmeli. Görüşmeci kadınların, oyun çocuğu oldukları zaman anneliğin sorumluluğunun altından genellikle kayınvalide ve ehtilerinin yardımı ile kalkabildiklerine vurgu yaptıkları dikkati çekmektedir. Bu görüşmeci kadın *“Kayınvalidem de benim gibi ilk anne olduğunda çocuđuna bakmakta zorlanmış. Kayınvalidem 12'sine girdiğinde anne olmuş garip. Halden anlardı o yüzden.”* diyerek kadınlar arasında bir dayanışmanın da olduğundan bahsetmektedir. Ancak kendisi de aynı sıkıntıları yaşayan bir insanın bu kadar küçük yaşta bir kızı neden gelin olarak aldığı, ondan neden anne olmasını istediğini sorgulamak kadının aklına gelmiyor gibi görünüyor.

“Kaç yaşında olursan ol anne olmak kadının hoşuna gidiyor bence. Ben hep çocuklarım olduğunda, hamile olduğumu öğrendiğimde çok sevindim. Ama çok zor anne olmak. Nasıl doğuracam diye çok korktum hep. 15 yaşında anne oldum ilk. Allah var daha 12-13 yaşında doğuranlar kadar küçük değildim. Ama hamilesin dedi ebe. Ağlamaya başladım. Nasıl doğuracam diye. Çok ağladım. Hatta kaynanam “Ben doğuruverem bari.” diye çok güldü. Önceleri güldü ama benim korkum geçmeyince kızmaya başladı. Birgün ben yine ağlarken kafama kafama vurdu. “Tek doğuracak sen misin? Kimin karnında kalmış da senin karnında kalacak.” demişti. Söylediği doğru ama korkuyor insan. Çok korktum ama çocuđumu da çok sevdim. Hepsini çok severim çocuklarımın. Ama bu yaşa geldim halâ korkarım doğumdan. 6 tane doğurdum. İki yaşamadı. Dördü şükür sağ. Korkmasam daha doğururdum. Hamileliğimin sefasını korkudan hiç süremedim. Hala korkarım dedim değil mi?” (65 yaşında, 15 yaşında anne olmuş). Çocuđun korunup kollanması gerekirken doğumun acısı ile yüzleşmesini beklemek veya bu süreci normalleştirmesini beklemek gerçekçi olmayacaktır. Görüşmeler sırasında çocuk yaşta doğumun acısı ile karşılaşmalarının kadınlarda travmalara sebep olduğuna sık sık vurgu yaptıkları dikkati çekmiştir. Çocuđun bedenine hamilelik süreci, doğum ve annelik son derece ağır gelmektedir. Yetişkin olmadan, çocuk yaşta, biyolojik, psikolojik, sosyal gelişimini tamamlamadan bir kadından annelik süreci, doğum ve anneliğin sorumluluđunu beklemek, olası travmalara zemin hazırlamaktadır. Kadınların ifadelerinin de bunu ortaya koyduđu dikkati çekmektedir.

Erken Yaşta Anne Olmanın En Önemli Sakıncası

Erken yaşta anne olan görüşme grubundaki kadınlara erken yaşta anne olmanın en önemli sakıncasının ne olduğuna sorulduğunda görüşme grubunda üç farklı cevabın olduğuna fark edildi. Birinci grup anneler anneliklerini yaşayamamış olmalarının erken yaşta anne olmanın en

önemli sakıncası olduğunu söylemiş. Bu yönde cevaplar veren kadınların ifadelerinden ikisi aşağıda verilmiştir:

“Anneliğimi yaşayamadım. Nokta. Yazık değil mi bana? Yazık değil mi çocuğuma. Sonra doğanlar da akli başında bir anne bulamadılar ki.” Anam, babam, kocam dahil hepsinden hak alcam nokta.” (55 yaşında, 14 yaşında anne olmuş).

“El yordamıyla annelik yaptık. Yazık bize. Şimdi okulu bile var anneliğin. Benim gelinim 31 yaşında anne oldu. “Okulu var anne gidecem” dedi. Kocam da kaynanamlar da “Bu yaşta anne olmayı öğrenememiş mi? Sen el kadardın doğurduğunda onun kocasını. İzin verme.” dediler ama ben “Git kızım. Arkanda ben varım.” dedim. Hem kendisi hem çocukları için gitsin tabi. Uğraşmasınlar şu kadınlarla. Adamlar erken evlenip kendileri doğursunlar. Çok kızıyorum ben kadınları çok eziyorlar. Feminik mi ne öyle bişey diyo benim oğlum bana. Neyse neyim. Çeksinler ellerini bizden. Çocuktan kadın olur mu? En önemli sakıncası bu. Yaz, yaz. Çocuk çocuktur. Çocuktan hamile de olmaz, gelinde olmaz, anne de olmaz. Hahhhh yaz işte öyle. Çocukları güzelce bi büyütsünler. Hiç bi kadın 25’inden önce evlenmesin.” (51 yaşında, 14 yaşında anne olmuş).

Bu grupta cevaplar veren kadınlar, çocukluklarını yaşayamadan anne olmak zorunda kaldıklarını, böylece hem çocukluklarını yaşayamadıklarını hem anneliğe hazır olmadan anne oldukları için anneliklerini yaşayamadıklarını hem de çocuklarına anne olarak görevlerini yerine getiremediklerine dikkat çekmektedirler. Her seviyenin olması gerektiği şekilde yaşanamaması durumunda her üç bileşenin de olumsuz yönde etkilenmesinden dolayı olumsuzlukların genişleyerek devam ettiğine vurgu yaptıkları görülmektedir.

İkinci grup anneler, erken yaşta anne olmanın en önemli sakıncasının eğitim seviyesi düşük anne olmak olduğunu söylemiş. Bu yönde cevaplar veren kadınların ifadelerinden ikisi aşağıda verilmiştir:

“Ben ne biliyordum ki çocuklarıma ne öğreteyim. İlkokulu bitirdim. Dünya eskisi gibi değil ki. Çocuğuma şimdi derslerinde bilem yardım edemem. Çok üzücü. Kızım “ Arkadaşlarımmın anneleri derslerini birlikte yapıyormuş. Senin söylediklerin yanlış çıkıyor hep.” diyor. Çok üzülüyorum. İnan ki çok uğraşıyorum ama bilemiyorum üniversite bitirmiş anne ile aynı olur muyum hiç. Komşuların çocuklarına felan soruyorum ama “Yine yanlış yaptırdın ödevimi” diye dönecek eve diye yürek tutuyorum akşama kadar.” (32 yaşında, 14 yaşında anne olmuş).

“Öyle zor ki cahil anne olmak. Çocuğuna mahcup oluyorsun. İnsanın çocuğundan daha değerlisi var mı? Üç bebem olduğunda bir de karnımda vardı. İlk oğlum okula başladı. Çok

utandım. Anneler bilgili hep çevrede. Biz kapıcıyız. Oturduğumuz yerin eğitim seviyesi yüksek. Baktım çocuğum da eziliyor. Ben bilmediğimi çocuğuma nasıl öğreteyim. Apartmanda bir abla Allah razı olsun bana yardım etti. Açıktan okumaya başladım. Çocuklarımla okudum. Beş dakika boşluk olsa okudum. Yerde kağıt bulsam okudum. Sınavlar için hazırlanırken öğrendiklerimi çocuklarıma öğrettim. Yüksek okul bitirdim böyle böyle. Şimdi kadınlara haklar da veriyorlar ya ben de üniversiteye devam etsem diyorum eşime. “Çocuklar okudu yeter artık.” diyor ama ben devam etmeyi düşünüyorum. Torunlarımmın anneannesi, babaannesi cahil olmasın. Onlara da örnek olayım. Hele kızlar çok güçlü olsun istiyorum. Erkenden benim gibi evlenmesinler.” (gülüyor) (51 yaşında, 14 yaşında anne olmuş).

Bu gruptaki anneler, anne olarak en önemli görevlerinin çocuklarını hayata karşı yetiştirmek, güçlü bireyler haline getirmek olduğuna inandıklarını ancak bunu başarabilecek kendilerinin bilgi seviyelerinin olmadığını belirtmektedirler. Kendileri erken yaşta evlendirildikleri için eğitim alamadıklarını, eğitimlerini yarıda bırakmak zorunda kaldıklarını, bu sebeple de kendi ifadeleri ile “cahil” oldukları için çocuklarına yardımcı olamadıklarını belirtmektedirler. Hatta bir anne, “*Cahil annesi olacağına hiç annesi olmasa daha iyi.*” diyerek eğitilmiş anne olmanın önemine vurgu yaparak, eğitilmiş annenin çocuğun hayatındaki önemine vurgu yapmıştır.

Üçüncü grup anneler, erken yaşta anne olmanın en önemli sakıncasının çocuklarını kaybetmek olduğunu söylemiştir. Bu yönde cevaplar veren kadınların ifadelerinden üçü aşağıda verilmiştir:

“9 ay on gün karnında taşı ölsün. Zaten çocuksun. Zor taşımışsın. Sonra kaybet. Her ziyarete gelen bi de “Küçük ya kimbilir ne yanlışlar yaptı.” demez mi? Öl artık, sen de öl.” (42 yaşında, 14 yaşında anne olmuş.)

“Hangi kadın çocuğu ölsün ister sorarım sana. Küçücüksün. Anasının kıyamadığısın, ama hamile oluyorsun. Hamileyken de sana kendine iyi bak demiyorlar ki. Benim kaynanangibiydi. Bu bizim soyumuzu sürdürecekt demezdi. Daha yük yüklerdi sırtına. Büyük elim beni biraz korurdu. O bana analık yaptı. Bir de bir hafta sonra bebem öldü mü? Kaynanam iki şaplak attı bana. Yere yapıştım. Bebeğim ölmüş ona mı üzüleyim. Küçük de olsan annesin sonuçta. Boşver artık anlatmayayım. İnsan yerine konmamışız.” (39 yaşında, 15 yaşında anne olmuş).

“Şimdinin kadınlarını çok kıskanırım ben. Nasıl kıskanmayayım. Kocaları el üstünde tutuyo hamileler diye. Elleri karınlarında geziniyolla. Ben hamileyken hep bayılırdım. İçim geçiverirdi. Kaynanam “Bundan karı da olmaz, ana da olmaz.” derdi. Gözümü açtım mı bağırmağa başladı. Akşam kocam gelince bi de ona şikâyet ederdi. Allah var o çok kızmazdı.

Bebem ölünce “Bi bebeyi doğuramadın.” diye diye beni yedi bitirdi. Çocuğum ölmüş zaten. Çocuğum zatı beni nazlatsan olmaz mı? Sen de kadınsın. Küçük de olsan annesin ama. Çok üzüldüm, çok ağladım. Ama nafile. Zor, zor, Allah başa vermesin. İki bebemi arka arkaya kaybettim. Çok zor.” (ağlıyor) (69 yaşında, 14 yaşında anne olmuş).

Küçük yaşta da olsa anne olmak her kadın için çok özel bir an, çok özel bir deneyim. Ancak ilk olarak biyolojik gelişimi cinsel ilişkiyi, hamileliği kaldırabilecek düzeye gelmeden hamile kalan kadınlar arasında ölü doğum veya doğumda ölme oranları son derece yüksek gerçekleşmektedir. Biyolojik, psikolojik ve sosyal gelişimini tamamlayamadan 9 ay hamilelik geçirip de zor şartlarda doğum yapan kadınların çocuklarını kaybetmeleri onlarda çok büyük travmalara dönüşebilmektedir. Çocukken anne olmak zorunda kaldıklarında büyük bir gayretle çocuklarını büyütme çabı yaparken çocuklarının ölmesi kendi dünyalarına büyük bir başarısızlık olarak yansımaktadır. Bir de çevrenin çocuklarını koruyup kollayamadıkları, yaşamalarını sağlayamadıkları yönündeki ima ve suçlamaları, bu süreci çok daha zor yaşamalarına sebep olduğunu görüşmeciler kadınların ifadeleri ve görüşmeler sırasında yapılan gözlemlere dayanarak söylemek mümkün.

Çocukları ile İlişkileri

Erken yaşta anne olan kadınların çocukları ile ilişkilerinin nasıl olduğu sorulduğunda alınan cevapları iki grupta toplamak mümkün oldu. Çocukları ile iletişimlerinin iyi olduğunu söyleyen annelerin ifadelerinden birkaçı aşağıda verilmiştir:

“İnsanın çocuğu ile itişmesi kötü olur mu hiç. Sen annesin tabi ki iyi olacak ilişkin. Onlar hata yapar. Ben çocukluğumu yaşayamadım bari onlar yaşasınlar. İyi şükür. Çok iyi.” (33 Yaşında, 14 yaşında anne olmuş).

“Bebelerimden başka kimim var? Ben çocukluğumu yaşayamadım onlar yaşasın diye canımı veririm. Öyle erken felan da evlendirmem. Herşeyin bir zamanı var. Ben onların hep arkasındayım. Hiç kötü değil. Çok iyiyiz.” (55 yaşında, 15 yaşında anne olmuş).

“Onlar benim yurdum. Onlar benim evim, ocağım. Allah acılarını göstermesin. Okula gittiklerinde okulun bahçesinde beklerdim onları. Kendilerini yalnız hissetmesinler diye. Birşeylere ihtiyaçları olsa hemen koşayım isterdim. Şimdi evli barklılar, bir gün telefonla seslerini duymasam kafalarımı yerim. Allah var onlar da bana çok düşkünler.” (42 yaşında, 14 yaşında anne olmuş).

“Onlar için yaşadım ben, onlar için de ölürüm. O nasıl soru? Onlar da benim için ölürler. Niye çektim bunca derdi ben? Çok iyiyiz çok şükür.” (43 yaşında, 16 yaşında anne olmuş).

Kadınların ifadelerinden de anlaşılacağı gibi çocukları ile güçlü ilişkileri olduğunu söyleyen bu grup kadınlar hayatlarını çocuklarına adanmışlar. Çocukları onların yaşama gayesi, onları ayakta tutan en önemli unsur olmuş. Birlikte büyüdükleri için aralarındaki ilişki, anne otoritesinden çok arkadaşlık ilişkisine dönüşmüş. Görüşmeler sırasında yapılan gözlemlere dayanarak bu gruptaki annelerin çoğunun çocukları ile bağıllık değil bağımlılık ilişkisi geliştirmiş olduklarını söylemek yanlış olmayacaktır. Çocukları için öleceklerini, çocuklarının da onlar için öleceğini söylemeleri, bu düşünceyi pekiştirmektedir.

Çocukları ile iletişimlerinin iyi olmadığını söyleyen annelerin ifadelerinden, ilişkilerini olumsuz yönde nelerin etkilediğini düşünüyor oldukları sorulduğunda vermiş oldukları cevaplardan birkaçı aşağıda verilmiştir:

“Ben kendim çocuktum o zamanlar. Çocuk nasıl bakılır ne bilemedim. Oyun oynarken nasıl canın ister bakarsın bebeğine, istemez bakmazsın. Ben o şekildeydim. Çocuk ağlayınca bakmazdım. Kaynanam bakarsa bakar bakmazsa bakmazdım. Canım oyun isterse oynardım. Ama altını değiştirmek hiç istemezdim, iğrenirdim, öğürürdüm. Hele kusunca. İnan annelik hissetmediğim için. Çocuklar da öyle değil mi? Sonraki çocuklarıma öyle yapmadım. Belki de kaynanama yıkmak istedim. Benim gözüm hep dışarı çıkıp ip atlamaktaydı. Sonraki çocuklarımda kendi evimiz vardı. İlk çocuğumu da kaynanama bıraktık. O garibim ana baba evinde hiç kalmadı desem yalan olmaz. Şimdi ev bark sahibi oldu kızım. Elini ayağını öpüyom ama nafile. Öbürleri ile aram iyi ama.” (68 yaşında, 15 yaşında anne olmuş).

“Çocuklar benim için oyun arkadaşım. Annelik hissetmedim onlara karşı. Hissettim aslında da nasıl annelik yapacağımı bilemedim. Ben çocuktum, nasıl anne olsaydım? Ama yine de anne olmak için çok çalıştım, inan bana. Çocuklarımla aramda sorun yok aslında ama aramız serin. Anne çocuk gibi değiliz.” (65 yaşında, 16 yaşında anne olmuş).

“Bilemedim annelik yapmayı. Duygularım içimde vardı ama onları yansıtamamışım kuzularıma. Belki de ben soğuk bir insanımdır. Ama böyle sınımsız bir duygumuz olmadı.” (53 yaşında, 14 yaşında anne olmuş).

“Üç bebem öldü. İyi olsa bebelerim ölür müydü? Bakamadım kuzularıma diye hep üzülür, ağlarım. Doğup büyüyenleri de sevdim sandım, boğmuşum. Seninki sevmek değil benim çocuklar. Annelikte iyi değilim. Çok eleştiriyorlar beni. “Pimpiriksin, boğuyorsun, beni bana bırakmıyorsun” diye en küçükleri. Hep onlara bir şey oluvercek diye korkarım. Ondan memnun olmuyorlar. Doğru olabilir söyledikleri ama üç bebem öldü. Bunlarıııııı (ağlıyor).”

Çocukları ile ilişkilerinin çok iyi olmadığını söyleyen bu gruptaki annelerin, ilişkilerinin iyi olmamasının sebebi olarak çocuklarını değil kendilerini suçladıkları dikkati çekmektedir.

Küçük yaşta anne oldukları için çocuklarına nasıl annelik yapmaları gerektiğini bilemediklerini ya çok ilgi gösterip boğduklarını, onları kendilerine bağımlı yaptıklarına ya da anneliği nasıl yapacaklarını bilemedikleri veya sorumluluk alamadıkları için çocukları ile gerekli ve sağlıklı iletişimi sağlayamadıklarına vurgu yaptıkları anlaşılmaktadır. Kendilerinin ilgiye, bilgiye, yardıma ihtiyaçları olduğu bir dönemde, bilmediklerini çocuklarına öğretmelerinin mümkün olmadığı anlaşıldığında sorun çözülecek, bu çocuklardan ne eşlik ne de annelik beklenecektir.

Sonuç

Çocukluk, çok özel bir dönem olup, çocuğun hayata hazırlanmasında son derece önemli bir süreçtir. Birey bu süreçte ne kadar donanımlı hale getirilirse bir sonraki süreci o oranda kaliteli sürdürme şansı elde etmektedir. Ancak özenle büyütüleceği, hayatın zorluklarına karşı donanımlı hale getirileceği dönemde, bu donanımı sağlanmadan anne babasından, kendisini emniyette hissedeceği ortamdaki uzaklaştırılarak evlendirilen bu kız çocukları savunmasız kalmaktadırlar. İlgiye muhtaç oldukları bu süreçte anne olmanın sorumluluğunu almaları istendiğinde ya sorumluluklarını olması gereken şekilde yerine getiremedikleri ya da bu sorumlulukları yerine getirmeye çalışırken kendi hayatlarını yaşayamadıkları, olması gerekenden fazla yük taşımak zorunda kaldıkları ya da hem kendilerine hem de sorumluluk alanlarındakilere karşı haksızlık yaptıkları görülmektedir.

17 erken yaş evliliği yapmış ve erken yaşlarda anne olmuş kadınlarla yapılan görüşme verileri ve bu görüşmeler sırasındaki gözlemlere dayanarak çocuk yaşta anne olmaları, annelik sorumluluğunu üzerlerine almaları beklenen bu kız çocukları ve onların çocuklarına karşı insanlık suçunun işlendiğini söylemek yanlış veya iddialı olmayacaktır. Çocuklara nasıl sorumluluk alacakları, nasıl sevecekleri, hayat mücadelelerini nasıl sürdürecekleri, kendi ayakları üzerinde nasıl kalabilecekleri, kısacası nasıl birey olacakları öğretilmeden birey olmayı öğretmelerini istemek mantıklı değildir. Eğer ısrarcı davranılırsa da aksaklık ve yanlışlıkların olacağını bilmek gerekir.

Hiç bir insana kaldırabileceğinden fazla yük yüklenemez. Kadın da olsa erkek de olsa her bireyin kendi süreçlerini olması gerektiği şekilde yaşamasına izin verilmeli, hatta özel destekler verilmeli ki kendilerine yüklenen sorumlulukları olması gerektiği şekilde yerine getirebilsinler. Aksi halde bu donanımı sağlamalarına izin verilmeden, sorumluluk almalarını beklemek hem onlara hem gelecek kuşaklara hem de içinde yaşadıkları topluma karşı haksızlık olacaktır.

Abstract

Shape memory polymers (SMP) are known as smart materials that can return to their original shape from their deformed shape when exposed to an external effect such as temperature, pH and light. In recent years, SMPs have had a wide range of applications, especially in biological studies such as drug release and enzymes, food packaging, radiation shielding, and smart electronic devices. In this study, a blend film consisting of SMPs such as poly lactic acid and poly ethylene glycol was prepared by solvent casting method. Different amounts of Er₂O₃ (rare earth element) were added to the prepared blend solutions and PLA-PEG blend/Er₂O₃ composite films were obtained. Firstly, functional group analyzes of polymer blend / Er₂O₃ composite films were performed with ATR-IR. Then, thermal characterization was carried out by thermogravimetric analysis (TGA) and Differential scanning calorimetry (DSC). Surface morphologies were examined by scanning electron microscope (SEM) and investigated the shape memory properties of polymer composite films doped with Er₂O₃.

Keywords: Poly (lactic acid), Poly (ethylene glycol), Rare earth element, Composite, Thermal

Introduction

Shape memory polymers (SMP) are at the top of the class of smart materials that can regain their shape when exposed to an external effect such as heat, light, pH and magnetic field [1]. In recent years, SMPs have been frequently used in medical and biological applications such as drug delivery systems and smart textiles due to their features such as low cost, recyclability, easy processability and biocompatibility [2, 3].

Poly lactic acid (PLA), poly ϵ -caprolactone (PCL), poly vinyl alcohol and poly hydroxy alkanoate are among the most commonly used SMPs. PLA is a biocompatible aliphatic polyester derived from corn and sugar cane [4]. In addition to the advantages of PLA, it cannot be directly turned into a product that requires toughness and flexibility because it is quite brittle [5]. Therefore, in order to obtain a more flexible product, it is possible to obtain a new polymer type with low cost and very good properties by blending it with a good plasticizer and biocompatible polymer such as PEG [6, 7].

Rare earth elements (REEs) have many uses, such as LED bulbs, cars, airplanes and televisions [8]. Especially Erbium (Er), one of the REEs, is considered one of the basic REEs due to its important optical properties and radiation properties [9, 10].

In this study, composite films were obtained by adding Er_2O_3 , one of the REEs, to PLA/PEG blend by solution casting method. Functional group analyzes of the obtained composite films were performed with Attenuated Total Reflectance infrared spectroscopy (ATR-IR). The shape memory properties of PLA-PEG/ Er_2O_3 composite films, which were thermally characterized by thermogravimetric analysis (TGA) and differential scanning calorimetry (DSC), were also examined.

Experimental

Preparation of Er_2O_3 doped PLA/PEG Blends

Initially, it was aimed to prepare PLA/PEG blend composite films containing 2% Er_2O_3 by solution casting method. First of all, 0.01 g Er_2O_3 nanoparticles were dispersed in 5 mL chloroform for 1 hour. In a separate beaker, mixing continued until 0.25 g PLA and 0.25 g PEG were completely dissolved in 5 mL chloroform at a ratio of 1:1 (w:w). The PLA/PEG solution, which was mixed in a magnetic stirrer for 2 hours, was added to the Er_2O_3 solution and continued to disperse for another 15 minutes. At the end of the period, the resulting solution was poured into the petri dish and dried in a vacuum oven at 40 °C. Using the same procedure, PLA/PEG blend composite films containing 4%, 8% and 12% Er_2O_3 were prepared.

Result and Discussion

The weak signals at 2940 and 2880 cm^{-1} belong to aliphatic asymmetric and symmetric $-\text{CH}_3$ stretching vibrations, respectively [11]. The signal belonging to the characteristic $-\text{C}=\text{O}$ stretching vibration of PLA at 1762 cm^{-1} is clearly seen in the PLA/PEG blend composite film containing 2% Er_2O_3 [12]. However, as the Er_2O_3 percentage increased, it was determined that the characteristic signal of PLA decreased in intensity as expected. Signals of C-O-C stretching vibrations appeared at 1180 and 1090 cm^{-1} [13]. While the signal of the Er-O bond in the ATR-IR spectra was seen at 560 cm^{-1} , it was observed that this signal increased as the Er_2O_3 percentage increased [14].

Figure 1. ATR-IR graphs of PLA-PEG / Er_2O_3 composites

DSC curves of pure PLA/PEG blend and Er_2O_3 composite films are given in Figure 2. Since the melting temperature (T_m) of PEG and the glass transition temperature (T_g) of PLA are very close to each other, the signal at 66.5 $^{\circ}\text{C}$ can be considered to belong to these two temperatures [15, 16]. The signal at 176.8 $^{\circ}\text{C}$ can be attributed to the T_m of PLA [17]. After adding Er_2O_3 , both T_g and T_m decreased, but it was observed that they started to increase with the increasing percentage of Er_2O_3 . In fact, it was determined that the T_g value of PLA in the PLA/PEG blend composite film containing 12% Er_2O_3 was 67 $^{\circ}\text{C}$. This can be interpreted as Er_2O_3 reducing the free volume between polymer chains.

Figure 2. DSC curves of PLA-PEG / Er₂O₃ composites

Figure 3 shows the TGA curves of PLA/PEG blend composite films with different amounts of Er₂O₃ added. It can be seen that all TGA curves undergo single-step degradation. While the initial degradation temperature (T_i) value of the pure PLA/PEG blend film was observed to be 237 °C, it was determined that the T_i value increased up to 250 °C with the addition of Er₂O₃. We can interpret this situation as Er₂O₃ increasing the thermal stability of the pure blend. In addition, it was observed that the residue rate in the films increased with the increasing percentage of Er₂O₃, which has good thermal stability.

Figure 3. TGA curves of PLA-PEG / Er₂O₃ composites

The shape memory properties of PLA/PEG blend composite films containing 2% and 12% Er₂O₃ were examined in Figure 4. For this, firstly the composite films were cut into strips. Then, the films were immersed in hot water and shaped into spirals. It was observed that the films cooled to room conditions maintained their spiral state. The polymeric composite films, which were immersed in hot water again, turned into strips, which were their initial state. However, it was determined that increasing the Er₂O₃ percentage decreased the shape memory properties of polymer blend composite films.

Figure 4. Shape memory cycle of PLA-PEG / Er₂O₃ composites

Conclusion

PLA and PEG, which have shape memory properties, were mixed in a 1:1 ratio (w:w), and Er₂O₃ was added at different rates to the resulting blend solution. PLA-PEG blend / Er₂O₃

composite films were prepared by solution casting method. In the ATR-IR spectra of Er₂O₃-doped polymer blend composite films, it was observed that the characteristic signal of Er₂O₃ at 560 cm⁻¹ increased with increasing percentage. The fact that Er₂O₃ increases the T_i value of the pure PLA/PEG blend film can be interpreted as the thermal stability of the composites being higher. Finally, it was determined that Er₂O₃ did not contribute positively to the shape memory effect and further increased the shape cycling time.

Özet

Ebeveyn-çocuk arasında gerçekleştirilebilecek en eğlenceli etkinliklerden birisi kitap okumadır. Her evde uygulanabilir bir etkinlik türü olması nedeni ile kitap okuma sürecinin zenginleştirilmesini sağlamak ve çocukların dil becerilerine katkısını ortaya koymak, ebeveynlerin ve eğitimcilerin çocuklarla kitap okumalarına teşvik oluşturması bakımından önemli görülmektedir. Bu çalışmanın amacı, ebeveynlerin okul öncesi dönemde olan çocukları ile kitap okumalarının, çocukların dil gelişimine etkisini, yapılan güncel araştırmaların sonuçları ışığında incelemektir. Bu çalışmada, nitel yöntemlerden sistematik derleme tekniği kullanılmıştır. Çalışma kapsamında, okul öncesi dönem çocuklarının ebeveynleri ile kitap okuma etkinliklerinin dil gelişimlerine etkisini inceleyen araştırma makalelerine ulaşılmıştır. Bu amaçla, Gazi Üniversitesi kütüphanesi aracılığıyla erişim sağlanabilen Scopus, Taylor&Francis, ERIC, Sage, Springer, TR Dizin ve Dergipark veri tabanında, 10.11.2022-11.12.2022 tarihleri arasında tarama yapılmıştır. Tarama shared reading/paylaşımlı okuma, dialogic reading/etkileşimli/etkileşimli okuma ve preschool/okul öncesi anahtar kavramlarıyla sınırlandırılmış ve tarama sonucunda belirlenen kriterlere uyan 31 araştırma makalesi çalışmaya dahil edilmiştir. Çalışma kapsamındaki makalelerden elde edilen veriler incelendiğinde, ebeveyn ile birlikte yapılan kitap okuma etkinliklerinin çocukların özellikle sözcük dağarcığı, hikâye anlama-anlatma ve dilbilgisi olmak üzere genel dil gelişimi becerilerini desteklediği; ebeveyn-çocuk birlikte kitap okuma sürecinde, ebeveynin kullandığı okuma yönteminin, çocuğun dil becerileri gelişiminde etkili olduğu; çocuğun süreçteki etkileşimini artıran ve aktif katılımını sağlayan etkileşimli okuma yönteminin geleneksel okuma yöntemine göre çocuğun dil gelişimini daha çok desteklediği; ebeveynin birlikte kitap okuma etkinliklerinde farklı özellikteki kitaplar ve okuma tekniğindeki uyarlamalar ile çocukların dil gelişim alanlarının farklı boyutlarını destekleyebileceği; risk altında bulunan ve dezavantajlı koşullara sahip çocukların dil becerilerini desteklemede ebeveynlere verilen kitap okumaya ilişkin eğitimlerin, etkili bir müdahale aracı olduğu, sonuçlarına ulaşılmaktadır.

Anahtar Kelimeler: paylaşımlı okuma, okul öncesi dönem, dil gelişimi

**THE EFFECT OF BOOK READING PROCESSES WITH PARENTS ON
LANGUAGE DEVELOPMENT OF PRESCHOOL CHILDREN**

Abstract

One of the most enjoyable activities that can be carried out between parent and child is book reading. Since it is a type of activity that can be applied in every home, enriching the book reading process and revealing its contribution to children's language skills are considered important in terms of encouraging parents and educators to read books with children. The aim of this study is to examine the effect of parents' reading books with their preschool children on children's language development in the light of the current researches. In this study, systematic review technique from qualitative methods was used. Within the scope of the study, research articles examining the effect of book reading activities of preschool children with their parents on their language development were accessed. For this purpose, Taylor&Francis, ERIC, Sage, Springer, TR Index and Dergipark databases, which can be accessed through Gazi University library, were searched between 10.11.2022- 11.12.2022. The search was limited to the key concepts of shared reading, dialogic reading, dialogic/interactive reading and preschool, and 31 research articles that met the criteria determined as a result of the search were included in the study. When the data obtained from the articles within the scope of the study were examined, it was found that book reading activities with parents support children's general language development skills, especially vocabulary, story comprehension and narration, and grammar; the reading method used by the parent in the parent-child co-reading process is effective in the development of the child's language skills; the dialogic reading method, which increases the interaction of the child in the process and provides active participation, supports the child's language development more than the traditional reading method; the parent can support different dimensions of children's language development areas with books with different characteristics and adaptations in reading technique in shared reading activities; it is concluded that trainings on book reading given to parents are an effective intervention tool in supporting the language skills of children who are at risk and have disadvantaged conditions.

Keywords: shared reading, preschool period, language development

Giriş

Kitap, çocuğun yaratıcılığını, bilişsel becerilerini, alıcı ve ifade edici dil becerileri, okumaya yazmaya hazır bulunuşluğunu geliştirmede etkin bir materyal olarak kullanılmaktadır (Sheridan, 2000). Ebeveynlerin çocukları ile sık sık kitap okumaları, okuma sürecinde çocuğun etkileşimine izin vermeleri ve kitabı bir eğitim materyali, olarak görmeleri, çocukların doğal okumaya geçişini destekleyen unsurlar olarak görülmektedir (Anbar, 2004). Ebeveyn ile paylaşımlı kitap okuma süreci, ideal olarak çocukların temel sözcükleri anlamasını, metin üzerinden çıkarım yapmasını kolaylaştıran, metin ve resimler hakkında paylaşımları içeren nitelikli etkinliklerden biridir ve çocukların bu paylaşımından beklenen anlamı çıkarabilmeleri ve bu etkinliklerde aktif katılımları açısından kritik öneme sahiptir (Wander Woude, Kleeck ve Wander Ween, 2009).

Çocukla birlikte okuma süreci yetişkinin ve çocuğun okumadaki rolü ve etkileşimine göre değişebilmektedir. *Geleneksel okuma*, ebeveynin anlatıcı, çocuğun edilgen bir dinleyici olduğu, daha çok ebeveynin sözel aktarımını içeren kitap okuma yöntemi olarak tanımlanabilmektedir. Geleneksel okuma sırasında genellikle çocuklar pasif konumdadır ve süreçte çok fazla sorulara yer verilmez (Dolunay Sarıca, 2016). *Paylaşımlı kitap okuma*, ebeveynin çocuğu ile birlikte süreci yürüttüğü, çocuğun da okuma etkinliğine aktif olarak katıldığı, dil temelli bir aktivite olarak görülen kitap okuma yöntemidir. Paylaşımlı kitap okuma süreci, çocuğun müdahalelerine ve etkileşimine izin veren esnekliktedir (Justice ve Kaderavek, 2002; Karaman Benli, 2021). *Etkileşimli kitap okuma*, paylaşımlı kitap okuma yöntemlerinden birisi olarak görülen etkileşimli kitap okumanın (etkileşimli okuma/diyaloğa dayalı okuma), özellikle son zamanlarda araştırmacıların üzerinde çalıştığı konulardan birisi haline geldiği görülmektedir (Doğan ve Keskinılıç, 2022; Turan ve Topçu, 2018). Etkileşimli kitap okuma etkinliğinde, ebeveyn ve çocuk bazen değiştirir, çocuk aktif bir anlatıcı ebeveyn ise hikâyeyi dinleyen konumuna geçmektedir. Süreci yöneten genellikle çocuk olmaktadır. Ebeveynler gerektiğinde sorular sorarak, çocukları soru sormaları için cesaretlendirerek, gerektiğinde açıklamalar yaparak, çocuğun keşif sürecine, olayların yaşamla bağını kurmasına rehberlik etmektedir (Akoğlu, 2016; Whitehurst ve Lonigan, 1998). Etkileşimli kitap okuma etkinliğinde ebeveynler süreci derinleştirmek için PEER (prompt, evaluate, expand, repeat) basamaklarını kullanabilmektedir. Çocuğun etkinliğe aktif katılımını sağlamak için teşvik etme (prompt), uygun geri bildirimlerle değerlendirmeyi sağlama (evaluate), çocukların ifadelerini genişletme (expand) ve öğrendiklerini günlük yaşama aktararak tekrar edilmesini sağlama (repeat),

ebeveynlerin etkileşimli kitap okuma sürecini nitelikli hale getirmesine yardımcı olabilmektedir (Zevenbergen ve Whitehurst, 2003).

Alan yazında, yetişkin ile etkileşimli kitap okumanın çocuğun sözel dil becerileri başta olmak üzere, sosyo-duygusal gelişimi, erken okuryazarlık ve yaratıcı düşünme becerilerinin gelişimine katkıda bulunduğunu gösteren araştırmalar dikkat çekmektedir (Işıtan, Saçkes ve Biber, 2020; Yıldız Bıçakçı, Er ve Aral, 2018; Zevenbergen, Worth, Dretto ve Travers, 2018). Yıldız Bıçakçı, Er ve Aral (2018), 46-62 aylık çocuklarla ve ebeveynleriyle yaptıkları çalışmada, anne-babaların çocukları ile etkileşimli kitap okuma uygulamalarının, çocuğun dil gelişimini anlamlı düzeyde desteklediğini belirtmektedir. Dil gelişiminin bileşenlerinden olan sözcük dağarcığının gelişimi için ebeveynlerin nitelikli bir sözel dil alanı oluşturması önemli görülmektedir. Etkileşimli kitap okuma, süreci ebeveynlere ihtiyaç duyulan zengin dil deneyimleri için gerekli ortamı sunmaktadır (Otto, 2021; Walpole, 2012).

Okul öncesi dönemde sözel dil gelişimi, çocukların okuryazarlık deneyimlerini, okul başarısını, sosyo-duygusal gelişimini olumlu etkileyen önemli bir bileşen olarak görülmektedir. Sözcük dağarcığı, dilbilgisi, sözcük dizimi farkındalığı, anlam bilgisi ve sözel iletişim becerileri çocuklarda geliştirilmesi hedeflenen sözel dil becerilerinden bazılarıdır (Carroll, Bowyer-Crane, Duff, Hulme ve Snowling, 2011; Otto, 2021; Rohde, 2015). Çocukların dil alanında gelişimlerinin en önemli göstergelerden birisi sahip oldukları sözcük dağarcıklarıdır. Sözcük dağarcığı, en geniş anlamıyla kişinin anlamını ve söylenişini bildiği tüm sözcükleri ifade etmektedir (Carrol, Bowyer-Crane, Duff, Hulme ve Snowling, 2011). Bennet Armistead, Duke ve Moses (2005)'a göre ise sözcük dağarcığı, bireyin duyduğunda anlayabildiği ve kendisini ifade ederken kullanabildiği sözcüklerin tamamıdır.

Bebekler çevresindekilerle ilk sesli iletişimini ağlama yoluyla kurmaktadır. Daha sonra sözcüklerin anlamalarını ve ifade edilişlerini öğrendikçe dil gelişimleri hızlı bir şekilde ilerlemekte ve sözlü iletişimi aktif bir şekilde kullanmaya başlamaktadırlar (Küçükkaragöz, 2002). Öncelikle seslerin ve hecelerin kullanılmasıyla başlayan ifade edici dil 12. aya doğru yerini sözcüklere bırakmaktadır. Bebeklerin sözcüklerin anlamalarını keşfetme, dağarcığına yeni sözcükler eklemesinde çevresindeki yetişkinler tarafından desteklenmesi gerekmektedir. Bebeklerin ilk sözcüklerini genellikle, çevresinde en çok duyduğu kişilerin isimleri, hayvanlar, yiyecekler, sevdiği oyuncaklar vb. oluşturmaktadır. Yetişkinlerin bebekle iletişim kurarken ortak dikkati sağlaması, göz teması kurması, bebeğin taklit edebileceği özellikte sözcükler seçmesi, bebeğin denemelerini takdir ve teşvik etmesi oldukça önemlidir (Machado, 2013; Otto, 2021; Senemoğlu, 2020). Bebekler on sekiz aylıktan itibaren haftada yaklaşık olarak iki sözcük

öğrenmektedir. Çocukların kullanabildiği sözcük sayısının iki yaşa geldiğinde hızlıca arttığı görülmektedir. Bu dönemde çocuklar bildikleri sözcükleri birleştirerek iki sözcüklü cümleler kurmaya başlamaktadır. Çocukların üç yaşa gelmesiyle artık anlamını bildiği ve ifade ettiği sözcük sayısı bine yaklaşmaktadır (Morrow, 2014). Okul öncesi döneme gelindiğinde artık çocuğun sözcük dağarcığının çarpıcı bir şekilde arttığı görülmektedir. İlk okula başlama düzeyinde bir çocuğun bildiği sözcük sayısının ortalama 14 bine yaklaştığı belirtilmektedir (Carol vd., 2011). Ayrıca bu dönemde çocuklar kelimeleri birleştirerek çok daha karmaşık yapılarda cümlelerle düşüncelerini aktarabilmektedir (Santrock, 2021).

Çocukların bildiği sözcük sayısının artması ve bu sözcüklerin temsilini anlamlandırabilmesi birçok alanda da gelişimini desteklemektedir. Sözcük dağarcığının artması çocuğun ileriki zamanlarda okuduğunu ve dinlediğini anlama becerilerini de artırmaktadır. Okuma, yazılı sembollerden sözcükler aracılığıyla anlam çıkarma işidir. Okunan sözcüğün çocuğun dünyasında bir karşılığı olmadığında okuma amacına ulaşamaz. Böyle durumlar, çocukların okumaya karşı motivasyonunu azaltması nedeniyle zararlı olabilmektedir (Whitehurst ve Lonigan, 1998). Hemphill ve Tivnan (2008), yaptıkları boylamsal çalışmada, okuduğunu anlama becerisinin en güçlü yordayıcısının sözcük dağarcığı olduğunu bildirmektedir. Juel (1988) ise yaptığı çalışma sonucunda, sözcük dağarcığı yeterince gelişmemiş çocukların okumaya karşı isteklerinin daha az olduğunu ve düşünce geliştirmekte zorlandıklarını belirtmektedir.

Çocuklarda sözcük dağarcığının sağlıklı bir şekilde gelişebilmesi, sözcükleri anlama ve konuşma becerisine sahip olabilmesi için sinir sisteminin bazı yeterliliklere sahip olması gerekmektedir. Ayrıca vokal donanımlarının sağlıklı ve işler durumda olması, özellikle ifade edici dil gelişiminde önemli rol oynamaktadır (Otto, 2021; Santrock, 2021). Yapılan araştırmalar, ailenin sosyoekonomik düzeyi, öğrenim durumu, çocuğun cinsiyeti, aile içi ilişkilerin niteliği, ev içerisinde iki dillilik olma durumu, ailenin oyun oynama, kitap okuma vb. etkinliklerle çocuğu konuşmaya teşvik etme gibi çevresel etmenlerin çocukların sözcük dağarcığı üzerinde etkili olduğunu göstermektedir (Tümkeya, 2010). Anne babaların, çocuklarıyla sözel iletişim içerisindeyken çocuğun kullandığı sözcükleri *başka kelimelerle ifade etme*, söylediği sözcükleri cümleler oluşturacak şekilde *genişletme* ve çevresindeki nesnelere adını öğrenebilmesi için *etiketleme* davranışlarını göstermesi, çocukların sözcük dağarcığını olumlu etkilemektedir. Ayrıca zengin dil olanakları sunan nitelikli bir kitap aracılığıyla yapılabilecek okuma etkinlikleri, çocukların dil gelişimlerini, hikâye anlatma becerilerini geliştirmektedir (Bredkamp, 2015; Otto, 2021; Santrock, 2021). Çocukların sahip olduğu dil

becerileri, buldukları gelişim dönemini ve sonraki gelişim süreçlerini etkilemesi açısından oldukça önemlidir. Bu nedenle çocuğun bulunduğu ortamların dil becerilerini geliştirecek deneyimler sunması gerekmektedir. Özellikle çocuğun okul öncesi eğitim kurumuna devam edemediği durumlarda, çocuğa sunulan ev ortamının özellikleri çok daha değerli olmaktadır. Bu durum, yakın zamanda yaşadığımız covid-19 pandemi sürecinde daha çok hissedilmiştir. Ebeveynlerin, çocuklarının gelişimlerini etkileyebilme potansiyellerini fark etmesi, oluşturacakları eğitim fırsatlarını da çeşitlendirebilmektedir. Anne ve babalar, doğru materyalleri temin ederek, olumlu model olarak, gelişim dönemine uygun oyun ve etkinlikleri kullanarak çocuklarının beceri gelişimini destekleyebilmektedir. Ebeveyn-çocuk arasında gerçekleştirilebilecek en eğlenceli etkinliklerden birisi kitap okumadır. Her evde uygulanabilir bir etkinlik türü olması nedeniyle, kitap okuma sürecinin zenginleştirilmesini sağlamak ve çocukların dil becerilerine katkısını ortaya koymak, ebeveynlerin ve eğitimcilerin çocuklarla kitap okumalarına teşvik oluşturması bakımından önemli görülmektedir. Bu çalışmanın amacı, ebeveynlerin okul öncesi dönemde olan çocukları ile kitap okumalarının, çocukların dil gelişimine etkisini, yapılan güncel araştırmaların sonuçları ışığında incelemektir.

YÖNTEM

Bu çalışmada, nitel yöntemlerden sistematik derleme tekniği kullanılmıştır. Sistematik derleme, belirli bir konu çerçevesinde yapılan çalışmaları, belirlenen kriterler çerçevesinde inceleyerek, çalışmalardan elde edilen verilerin sentezlenmesi olarak tanımlanabilmektedir (Lasserson, Thomas ve Higgins, 2019). Çalışma kapsamında, okul öncesi dönem çocuklarının ebeveynleri ile kitap okuma etkinliklerinin dil gelişimlerine etkisini inceleyen araştırma makalelerine ulaşılmıştır. Bu amaçla:

1. Gazi üniversitesi kütüphanesi aracılığıyla erişim sağlanabilen Scopus, Taylor&Francis, ERİC, Sage, Springer, TR Dizin ve Dergipark veri tabanında, 10.11.2022- 11.12.2022 tarihleri arasında tarama yapılmıştır.
2. Tarama shared reading/paylaşımlı okuma, dialogic reading/etkileşimli/etkileşimli okuma ve preschool/okul öncesi anahtar kavramlarıyla gerçekleştirilerek makaleler aşağıdaki kriterlere uygunluğuna göre seçilmiştir:
 - a. 2017-2022 yılları arasında yayınlanmış olması,
 - b. Çalışma içerisindeki çocukların 3-6 yaş grubunda olması,
 - c. Makalelerin Türkçe veya İngilizce dillerinde yazılmış olması,

- d. Ebeveyn-çocuk kitap okuma sürecini içermesi,
- e. Çocukların dil gelişimine ilişkin sonuçlar içeren araştırma makalesi olması (tez ve derleme makaleleri hariç tutulmuştur).

3. Tarama sonucunda kriterlere uygun olarak 31 makale çalışmaya dahil edilmiştir (Ek-1).

Çalışmaya dahil edilen makalelerin dili incelendiğinde 28 makalenin İngilizce, 3 makalenin Türkçe dillerinde yazıldığı görülmektedir. Araştırmalarda kullanılan yöntemler incelendiğinde ise; 24 makalenin nicel, 4 makalenin nitel ve 3 makalenin de karma desenle gerçekleştirildiği belirlenmiştir. Nicel yöntemle gerçekleştirilen 10 araştırmanın tarama, 14 araştırmanın ise deneysel desenle oluşturulduğu görülmektedir. Çalışılan konu ile ilgili olarak nitel ve karma yöntemle yapılan çalışmaların azlığı dikkat çekmektedir.

Bu çalışma içerisinde, shared reading/paylaşımlı okuma, dialogic reading/etkileşimli/etkileşimli okuma ve preschool/okul öncesi anahtar kavramları ile taranarak çalışmaya dahil edilen araştırmaların sunduğu bulgular ve sonuçları doğrultusunda “Ebeveynlerin Kitap Okuma Davranışının Çocukların Dil Gelişimine Etkisi”, “Kitap Okuma Sürecindeki Uyarlamaların Çocukların Dil Gelişimine Etkisi” ve “Kitap Okumaya İlişkin Aile Eğitimi İçeren Müdahalelerin Etkisi” temaları oluşturulmuştur. Oluşturulan temalar, incelenen araştırmalar ve ilgili alan yazın ile birlikte tartışılmıştır.

Araştırmanın Etiği

Çalışma sürecinde “Yükseköğretim Kurumları Bilimsel Araştırma ve Yayın Etiği Yönergesi” çerçevesinde tüm kurallara uyulmuş ve etik ihlali olarak nitelendirilebilecek eylemlerden kaçınılmıştır.

BULGULAR VE TARTIŞMA

Çalışmanın bu bölümünde elde edilen bulgular, oluşturulan temalar doğrultusunda yorumlanmış ve tartışılmıştır.

Ebeveynlerin Kitap Okuma Davranışının Çocukların Dil Gelişimine Etkisi

Birlikte kitap okuma, ebeveynlerin çocuklarının dil gelişimlerini desteklemek için kullanabilecekleri en etkili yöntemlerden birisidir (Otto, 2021; Whitehurst ve Lonigan, 1998). Alanyazında yapılan araştırmalar, ebeveynlerin çocukları ile gerçekleştirdikleri kitap okuma süreçlerinin, çocukların sözcük dağarcığını, hikayeleri anlama ve anlatma becerilerini, dilbilgisini ve karışık cümle yapılarını kullanabilmelerini ve sesbilgisel farkındalıklarını desteklediğini göstermektedir:

Adinarayanan, Nambi, Krishnan ve Vijayaraghavan (2022), Hindistan'da 4-6 yaş arası 210 çocuk ve ailesi ile yaptıkları deneysel çalışmalarında, ebeveyn-çocuk birlikte kitap okuma süreçlerinin çocukların hikâye anlatma becerilerini önemli derecede artırdığını belirtmektedir. Anne ile çocuk arasında paylaşımlı okuma sürecinin niteliğinin değerlendirildiği başka bir çalışmada da gözlem sonrası analizleri, paylaşımlı okumanın niteliğinin arttıkça çocuğun hikâye anlatma becerilerinin de niteliğinin arttığını bildirmektedir (Marjanovič-Umek, Hacin ve Fekonja, 2019). Anderson, Atkinson, Swaggerty ve O'Brien (2018), Amerika'da 5-6 yaş çocuğu olan 152 ebeveyn ile yaptığı çalışmada, ebeveynlerin çocukları ile birlikte kitap okuma sıklığının ailenin geliri ve ebeveynleri eğitim düzeyi ile pozitif yönde ilişkili olduğunu; kitap okuma sıklığının da çocukların hikâye anlama ve anlatma becerileri ile pozitif yönde ilişkili olduğunu belirtmektedir. Bir sözel dil becerisi olarak hikâye anlatma, hikâyenin anlaşılması, hatırlanarak bellekten geri çağırılması ve uygun sözcüklerle ifade edilmesi gibi bir takım farklı becerileri de içermektedir. Hikâye anlama ve anlatma becerisi, çocukların okuryazarlığa geçtiği dönemde okuduğunu anlama becerisini de etkilemektedir (Hogan, Adlof ve Alanzo, 2014; Kargın, Güldenoğlu ve Ergül 2017).

Dil gelişiminin önemli göstergelerinden birisi olan sözcük dağarcığı, ebeveynlerin ev içerisindeki etkinlikleri ile desteklenebilmektedir. Sözcük dağarcığının zenginliğinin, çocukların okuduklarını anlama, düşünce geliştirme ve okuma motivasyonunu artırdığı düşünüldüğünde oldukça önemli görülmektedir (Hemphill ve Tivnan, 2008; Juel, 1988). Çalışma kapsamında incelenen makaleler de ebeveynlerin çocukları ile birlikte kitap okuma etkinliklerinin çocukların sözcük dağarcığını olumlu etkilediğini göstermektedir. Knauer, Jakiela, Ozier, Aboudd ve Fernald (2019), Kenya kırsallarında 2-7 yaş arasında 510 çocuk ve ailesi ile yaptıkları çalışmalarında, etkileşimli okuma etkinliklerinin çocukların sözcük dağarcığını artırmada önemli bir araç olabildiğini ortaya koymaktadır. Bir başka deneysel çalışmada da 69 ebeveyne çocukları ile kitap okurken kullanabilecekleri kelime öğretimi uygulamalarını içeren bir eğitim sunulmaktadır. Bu eğitim sonrasında ebeveynlerin okuma etkinliklerinde bu uygulamaları kullandıkları ve bu durumun çocukların sözcük dağarcığını etkilemede önemli olduğu belirtilmektedir (Requa, Chen, Irey ve Cunningham, 2022).

Çocuklar okul öncesi dönemle birlikte dil becerilerini, dilbilgisi kurallarını konuşma içerisinde kullanmaya başlayacakları şekilde geliştirmektedir (Otto, 2021; Santrock, 2021). Söz dizimini edinme, farklı görevdeki sözcük ve cümleleri uygun kullanma; düşüncelerini ifade edebilme ve genişletebilme becerilerini edinebilmeleri bakımından önemlidir. Lenhart, Suggate ve Lenhard

(2022), beş çalışmadaki 643 çocuktan elde edilen verileri sentezledikleri çalışmasında, ebeveynlerin çocukları ile kitap okumaya başladıklarındaki çocuğun yaşı ve kitap okuma sıklığı değişkenlerinin, çocukların dilbilgisi ve sözel dil becerilerini açıkladığını belirtmektedir. Ebeveyn-çocuk kitap okumaya başlamada çocuğun yaşı düştükçe ve birlikte kitap okuma sıklığı arttıkça, çocuğun dil becerilerinin de arttığı belirtilmektedir. Işıkoğlu ve Şimşek (2022) da 48-72 aylık 302 ebeveynin katılımı ile gerçekleştirdikleri çalışmalarında, çocuğa ilk kitap alma yaşı ile birlikte kitap okuma sıklığının, çocukların dil gelişimlerini açıklamada anlamlı etkisi olduğunu ifade etmektedir.

Çalışma kapsamında incelenen makalelerin sonuçları, ebeveynlerin çocukları ile birlikte yaptıkları kitap okuma etkinliklerinin, çocukların hikâye anlama ve anlatma becerilerini, dilbilgisi kullanımlarını, sözcük dağarcıklarını ve genel olarak sözel dil gelişimlerini desteklediğini; bu desteğin seviyesinin ailenin sosyoekonomik düzeyi, kitap okuma sıklığı ve okumaya başlamadaki çocuğun yaşı gibi özelliklerden etkilendiğini göstermektedir. Elde edilen sonuçlar alan yazından elde edilen önceki bilgiler ile tutarlı görülmektedir (Bredenkamp, 2015; Santrock, 2021; Tümkaya, 2010).

Kitap Okuma Sürecindeki Uyarlamaların Çocukların Dil Gelişimine Etkisi

İncelenen çalışmalar, ebeveyn-çocuk birlikte kitap okuma sürecinde ebeveynin okuma sırasında kullandığı yöntemlerin, farklı uygulamaların ve okumada kullanılan materyallerin özelliklerinin, çocukların dil gelişimini etkilemede ayırıcı etkisi olduğunu göstermektedir.

Dicataldo, Rowe ve Roch (2022), İtalya’da 40 okul öncesi dönem öğrencisi ve ailesi ile yaptığı deneysel çalışmada, ebeveynlerin normal kitap okuma süreçleri ile etkileşimli okuma süreçlerinin çocukların dil gelişimi üzerindeki farklı etkilerini araştırmaktadır. Çalışmanın sonuçları, etkileşimli okumanın çocukların alıcı-ifade edici dil ve sözel çıkarım becerilerini desteklemekte daha etkili bir yöntem olduğunu ortaya koymaktadır. Knauer, Jakiela, Ozier, Aboudd ve Fernald (2019), 510 çocuk ve ebeveyn ile yaptıkları çalışmalarında, ebeveynleri 4 gruba ayırarak, bir gruba sadece kitaplar verip diğer gruplara değişen düzeyde etkileşimli okuma eğitimleri vermiştir. Ebeveynlerin çocuklarla birlikte okuma etkinliklerinden önce ve sonra yapılan ölçümler, çocukların müdahale öncesine göre dil becerilerinde gelişme görüldüğünü, özellikle ebeveyne verilen etkileşimli okuma eğitimleri arttıkça çocukların dil becerilerindeki gelişimin de arttığı görülmüştür. Araştırmalar kitap okumanın çocukların dil gelişimine katkılarını göstermekle birlikte etkileşimli okuma yönteminin bu gelişimi daha çok desteklediğini de ortaya koymaktadır. Etkileşimli okuma yönteminin, dili etkin kullanmaya

dayanan, dilin kullanımını teşvik eden stratejileri içermesinin ve çocuğun aktif katılımını destekleyen yapısının (Zevenbergen ve Whitehurst, 2003), kitap okuma etkinliğini çocukların dil gelişimini doğrudan destekleyen bir uygulamaya dönüşmesini sağladığı düşünülmektedir.

Riordan, Reese, Das, Carroll ve Schaugency (2022), Yeni Zelanda’da 69 çocuk ve ebeveyni ile yaptıkları deneysel çalışmada, ebeveynlere kitap okumaya ilişkin iki farklı yaklaşımla eğitimler sunmaktadır. Bir grubun eğitiminde okuma sırasında hikâye hakkında sohbet ederek okuma etkinliği odağa alınırken diğer grubun eğitiminde sözcüklerin sesleri hakkında konuşarak kitap okuma odak haline getirilmektedir. Müdahale sonrasında, hikâye ile ilgili sohbet ederek okuma yapılan çocukların anlam odaklı konuşma, konu ile ilgili ayrıntılı konuşabilme becerileri artarken diğer gruptaki çocukların ses odaklı konuşmalarının ve ses bilgisel farkındalıkların arttığı görülmektedir. Bu çalışma sonucu, farklı uyarlama ve yaklaşımları kullanarak kitap okuma sürecinin çıktılarının kontrol edilebildiğini ve hedef odaklı olarak düzenlenebildiğini göstermesi açısından önemli görülmektedir. Riordan, Reese, Rouse ve Schaugency (2018), 45 ebeveyn ile yaptıkları başka bir çalışmalarında, ebeveynlerin çocukları ile kafiyeli ve kafiyesiz kitaplarla yaptıkları okuma etkinliklerinin çıktılarını incelemektedir. Çalışma sonucunda elde edilen veriler kafiyesiz kitaplarla okuma yapıldığında ebeveyn-çocuk arasında daha çok hikâye odaklı ve çıkarımsal konuşmalar yaptıkları; kafiyeli kitap okuma sürecinde ise konuşmaların ses odaklı olduğu görülmektedir. Her iki kitap okuma sürecinin de çocukların dil gelişimini desteklediği, kafiyeli kitapların ek olarak çocukların erken okuryazarlık beceri gelişimine daha fazla katkı sağladığı belirtilmektedir. Çocukların sözcüklerdeki kafiyeleri fark etmesi ve kendi kafiyeli sözcüklerini oluşturabilmesi, ses bilgisel farkındalığının gelişiminin önemli göstergelerinden birisi olarak görülmektedir (Rohl, 2000). Kitap okuma etkinliklerinde ve hazırlanan müdahale programlarında kafiye içeren kitapların da kullanılmasının faydalı olabileceği düşünülmektedir. Yetişkinlerin çocukları ile gerçekleştirdikleri kitap okuma sürecindeki uyarlamaları, sözel dil becerilerini desteklemede niteliği artırmaktadır (Karaman Benli, 2019).

Kitap Okumaya İlişkin Aile Eğitimi İçeren Müdahalelerin Etkisi

Yapılan aile eğitim çalışmalarının genellikle, çocuklar için dezavantajlı olan durumlara yönelik müdahaleler içerdiği ve temel amacının dezavantajlı durumların çocuklara olumsuz etkilerini ortadan kaldırmak olduğu görülmektedir (Dere Çiftçi ve Aksoy, 2018). İncelenen araştırmalar, ebeveyn-çocuk kitap okuma uygulamalarının, çocuğun özel gereksinimli olma, ailenin düşük

sosyoekonomik kořullara sahip olması ve göçmenlik gibi çocukların dil gelişimlerini olumsuz etkileyebilecek durumlarda müdahale amacıyla kullanılabileceğini ortaya koymaktadır.

Westerveld, Wicks ve Paynter (2021), otizm spektrum bozukluğu tanılı 16 çocuk ve ebeveyni ile yaptığı çalışmada, ebeveynlere çocukları ile kitap okuma davranışlarını geliştirmek amacıyla oluşturulmuş, bir eğitim oturumu, ev ziyaretleri ve telefon görüşmeleri ile gerçekleştirilen bir koçluk programı uygulanmaktadır. Ebeveynlerin çocukları ile sürdürdüğü 8 haftalık müdahalenin ardından yapılan ölçümler, çocukların kitap okuma sürecindeki sözel katılımlarının ve kullandıkları farklı sözcüklerin arttığını göstermektedir. Nelson, Stoddard, Fryer ve Muñoz (2019), okul öncesi dönemde işitme yetersizliği bulunan 4 çocuğun ve annesinin dahil edildiği çalışmada, anneye kitap okuma sırasında anne ve çocuk arasındaki etkileşimi artırmaya ilişkin stratejileri içeren kısa bir eğitim sunulmaktadır. Verilen eğitim sonrasında gerçekleştirilen birlikte okuma süreçlerinde annelerin ilgi çekici sorularının arttığı ve genel ölçümlerde çocukların ifade edici dil becerilerinde gelişmelerin olduğu görülmektedir. Akamoglu ve Meadan (2019), serebral palsi ve otizm spektrum bozukluğu tanıları olan iki çocuk ve annesi ile gerçekleştirdikleri deneysel çalışmada, annelere çocukları ile kitap okuma süreçlerini daha kaliteli hale getirebilecek stratejilerin öğretimini içeren ve haftada ortalama 2-3 kere olmak üzere toplamda 12 hafta süren eğitim koçluğu desteği vermektedir. Eğitim sonrasında anneler, çocuklarının okuma sırasında daha fazla iletişime girmeye başladığını ve birlikte kitap okuma süreçlerinin çocuklarının iletişim becerilerini artırdığını ifade etmektedir. Özel gereksinimli bir çocuğa sahip olma, zaman zaman ebeveynlerin ihtiyacı olan sosyal desteği alamama, çocuğun gelişimini desteklemede yeterli bilgiye sahip olamama gibi farklı konularda sorunlar yaşamasına sebep olabilmektedir (Fareo, 2015). Çocukluk çağında görülen yetersizlikler, sendrom ve bozukluklar incelendiğinde, genellikle bu durumların dil gelişiminde gecikme ve bozukluklara neden olduğu görülmektedir (DSM-IV-TR, 2001). Çalışma kapsamında incelenen arařtırmalar, bu risk faktörü ile baş etmede ebeveynlerin kitap okuma etkinliklerini kullanabileceğini göstermektedir.

Ev ortamında çocuğa sunulan uyanların niceliği ve niteliği çocukların dil gelişimini desteklemekte oldukça etkilidir. Ailenin düşük sosyoekonomik düzeyde oluşu, ev içerisinde bulunan kitap sayısının, niteliğinin ve kitap okumaya ilişkin bilgi ve beceri düzeyinin de düşüklüğü ile ilişkilendirilebilmektedir (Can ve Ginsburg-Block, 2016; Niklas ve Schneider, 2013). Bu durum, düşük sosyoekonomik kořullara sahip olan ailelerin çocuklarının gelişimsel açıdan dezavantajlı olma olasılığını artırmaktadır. Chacko, Fabiano, Doctoroff ve Fortson

(2018), ekonomik geliri düşük olan 126 baba ve okul öncesi dönemdeki çocuğu ile yaptığı çalışmada babalar, haftada 90 dakika olmak üzere toplamda 8 hafta süren, paylaşımlı kitap okumaya ilişkin hazırlanmış bir eğitim programına katılmaktadır. Babalar aracılığıyla uygulanan müdahale sonrasında çocukların genel dil becerilerinde önemli derecede artışların olduğu belirtilmektedir. Dias-Broensa ve Steensel (2022), Hollanda’da düşük sosyoekonomik düzeye sahip 176 ebeveyne ve çocukları ile yaptıkları deneysel çalışmada, ebeveynlere birlikte okumayı geliştirmeye ilişkin eğitim ve rehberliğin yapılması için ev ziyaretleri (5-20 kez) düzenlenmektedir. Müdahaleler sonrasında çocukların gelişimine ilişkin veriler incelendiğinde, müdahalenin çocukların hikâye anlama becerilerinde önemli derecede artışları sağladığı görülmektedir. Ancak müdahale sonrasında çocukların alıcı dil becerilerinde ve sözcük dağarcıklarında beklenen gelişimin görülemediği belirtilmektedir. Bu durum aile eğitimlerinin ve müdahale programlarının hazırlanmasında çalışılan grubun özellikleri, çalışma süresi ve eğitimin içeriği gibi konuların, beklenen etkinin ortaya çıkmasında önemli etkisi olduğunu düşündürmektedir.

SONUÇ

Çalışma kapsamına alınan güncel araştırmalardan elde edilen veriler incelendiğinde;

Ebeveyn ile birlikte yapılan kitap okuma etkinliklerinin çocukların özellikle sözcük dağarcığı, hikâye anlama-anlatma ve dilbilgisi olmak üzere genel dil becerilerini desteklediği; bu desteğin seviyesinin ailenin sosyoekonomik düzeyi, çocuk ile gerçekleştirdikleri okuma sıklığı, okumaya başladıklarındaki çocuk yaşı gibi çevresel etmenlerden etkilendiği,

Ebeveyn-çocuk birlikte kitap okuma sürecinde, ebeveynin kullandığı okuma yönteminin, çocuğun dil becerileri gelişiminde etkili olduğu; çocuğun süreçteki etkileşimini artıran ve aktif katılımını sağlayan etkileşimli okuma yönteminin geleneksel okuma yöntemine göre çocuğun dil gelişimini daha çok desteklediği,

Ebeveynin birlikte kitap okuma etkinliklerinde farklı özellikteki kitaplar ve okuma tekniğindeki uyarlamalar ile çocukların dil gelişim alanlarının farklı boyutlarını destekleyebileceği,

Risk altında bulunan ve dezavantajlı koşullara sahip çocukların dil becerilerini desteklemede ebeveynlere verilen kitap okumaya ilişkin aile eğitimlerinin, etkili bir müdahale aracı olduğu, sonuçlarına ulaşılmaktadır.

Bu sonuçlar, gelecekte kitap okuma ile ilgili yapılması planlanan çalışmaların bebeklik döneminde başlanmasının ve yöntem çeşitliliğinin artırılmasının gerekliliğini ortaya koymaktadır.

Abstract

Climate change has made sustainable water management efforts, which aim to protect water resources and use water efficiently, important. Water productivity is a parameter by which the relationship between water and agricultural products is analysed and the amount of product per unit of water is determined. In this study, the water productivity values of oil olives in Aydın, Denizli, İzmir, Manisa and Muğla provinces in the Aegean Region between 2012 and 2021 were calculated by using Cropwat and Aquacrop models. The climate data of the region, the olive production data and the crop data for oil olives were taken from the Turkish State Meteorological Service, the Turkish Statistical Institute and the General Directorate of Agricultural Research and Policies, respectively. In addition, the change of water productivity over time and space was also analysed. According to the study findings, the average water productivity values with Cropwat and Aquacrop models were calculated as 0.35 and 0.49 kg/m³ in Aydın, 1.13 and 1.23 kg/m³ in Denizli, 0.44 and 0.52 kg/m³ in İzmir, 0.65 and 0.73 kg/m³ in Manisa, and 0.32 and 0.37 kg/m³ in Muğla, respectively. As a result, it was found that Denizli province had the highest olive production amount per unit water.

Key words: Aquacrop, Cropwat, Evapotranspiration, Olive, Water productivity.

Introduction

Climate change, population and production/consumption are factors that directly affect water resources. The pressure on freshwater resources increases with the population, and climate change reduces freshwater resources. Increasing production activities affect water resources by both using clean water and polluting the water resources with the wastewater. Domestic and industrial water use reduces the amount of water left for agricultural production. In cases where rainwater is not sufficient in agricultural production, the need for blue water increases the cost. For these reasons, it is important to conduct research on the efficient use of fresh water and to develop irrigation policies (Molden et al., 2010). Water productivity studies aim to increase the amount of product without increasing the amount of water used or to reduce the amount of water for the same amount of product (Descheemaeker et al., 2013). It is one of the values examined in order to obtain more products with less water and to ensure sustainability. Agricultural water productivity is the ratio of the amount of product to the amount of water used for production. There are many studies on the relationship between water and crops. Water consumption of olive, which is a drought-resistant crop, is also one of the subjects studied.

According to 2021 data, 23 million tons of olives were produced in approximately 10.3 million hectares of land in the world. Olives are grown mostly in countries bordering the Mediterranean Sea such as Spain, Italy, Greece, Turkey, Tunisia, Syria, Morocco, France and Portugal. According to 2023 data, approximately 93% of the world's olive trees were located in these countries (FAO, 2023). When the countries with the most olive-cultivated areas in the world are examined, it is seen that Turkey ranks 5th (Table 1). It has been reported that there are 194.5 million olive trees in an area of approximately 9 million decares in Turkey in 2022, and 74% of these trees are olive trees for oil (TÜİK, 2023).

Table 1. Amount of olive cultivated area in the world (thousand ha)(FAO, 2023)

Country/Year	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021
Spain	2504	2507	2516	2351	2522	2555	2579	2602	2624	2623
Tunisia	1811	1823	1589	1625	1646	944	2995	1281	3660	1281
Italy	1125	1147	1157	1148	1145	1142	1142	1139	1146	1129
Morocco	968	922	947	1006	1008	1021	1045	1073	1069	1104

Greece	808	797	818	821	798	793	963	903	906	819

In this study, the water productivity of oil olives produced in Aydın, Denizli, İzmir, Manisa and Muğla provinces in the Aegean Region was calculated for the 2012-2021 period by using evapotranspiration values.

MATERIAL AND METHOD

Study Area

The area of the study includes the provinces of Aydın, Denizli, İzmir, Manisa and Muğla where oil olives are grown in Turkey (Figure 1).

Data

Meteorological Data

In the Aquacrop and Cropwat programs, daily maximum and minimum temperature ($^{\circ}\text{C}$), wind speed (m/s), relative humidity (%), sunshine duration (hours) and rainfall (mm) for between 2012 and 2021 years were used. These data were obtained from the Turkish State Meteorological Service. Total rainfall was converted to effective rainfall using the USDA SCS method (Allen, Pereira, Raes, & Smith, 1998) (Figure 2).

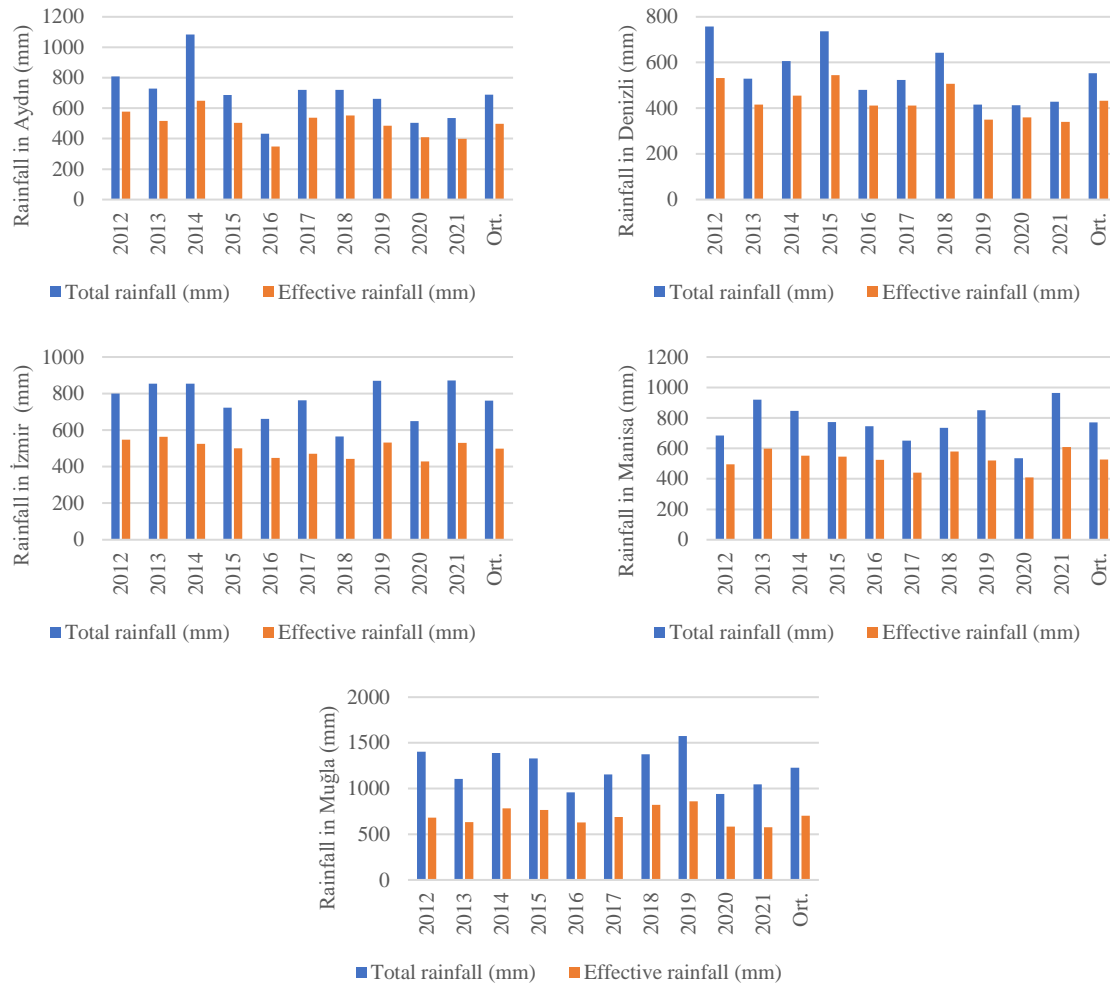

Figure 2. Total and effective rainfall values

Plant Data

Plant Data Used in the Cropwat Program

In the study, the crop coefficient values (K_c), plant development stages, sowing-planting time, harvest time data required to calculate the water consumption of olives with the Cropwat model were obtained from the guide titled "Plant Water Consumption of Irrigated Plants in Turkey" prepared by TAGEM. Root depth (1.70 m), critical depletion fraction (0.65), yield response factor (0.2), plant height (4.00 m) data were taken from FAO (Table 2) (FAO, 2023; TAGEM, 2017).

Table 2. Crop coefficients of olives, development periods and sowing-planting times (TAGEM, 2017)

Province	Crop coefficient			Development stages (days)					Sowing-planting time
	K_{c1}	K_{c3}	K_{c4}	I	II	III	IV	Total	
Aydın	0.48	0.69	0.63	30	85	55	85	255	April I
Denizli	0.48	0.70	0.61	30	90	60	90	270	April I
İzmir	0.47	0.73	0.66	30	85	55	85	255	March III
Manisa	0.48	0.71	0.62	30	90	60	90	270	April I
Muğla	0.59	0.73	0.64	30	90	60	90	270	March III

The expressions I, II and III indicate the 10-day periods of the month.

Plant Data Used in the Aquacrop Program

Development stages of mature olive trees were adjusted using TAGEM data. The average diameter of the tree was taken as 4 m at the beginning of the season and 5 m in the middle of the season. For the plant density calculation, the olive tree was calibrated by considering it as small plants, each covering an area of 200 cm² (Poppe, 2016). The number of plants in a hectare was calculated as "initial plant density". The base temperature was taken as 6.0 °C, the upper temperature was 40.0 °C, the plant root depth was 1.70 m, and the water content was 45%. Region-specific data were given in Table 3. Earlier studies were used to determine other inputs (Hunink & Droogers, 2010; Poppe, 2016).

Table 3. Plant data used in the calibration of the Aquacrop program

	Tree density (tree/ha)*	Tree yield (kg olive/tree)*	Initial plant density (plant/ha)	CC _{ini} (%)	CC _x (%)	HI (%)	Planting date**	Harvest date**
Aydın	150	12.80	94248	18.85	29.45	9	3 April	13 December
Denizli	280	19.47	175980	35.19	54.96	20	1 April	26 December
İzmir	190	14.13	119415	23.88	37.29	11	30 March	9 December
Manisa	190	16.93	119000	23.88	37.29	12	1 April	26 December

Calculating Water Productivity (WP)

Depending on the subject of the research, the amount of water can be evapotranspiration, the total amount of water supplied to the production area, or the amount of polluted water (Molden et al., 2010). ET values were used in this study.

WP of olive was calculated using Cropwat and Aquacrop models. For to calculate, the product yield obtained from the Aquacrop model was divided by the ET values obtained from both programs (Equation 1).

$$WP = \frac{\text{yield (ton/ha)}}{ET (m^3/ha)} \quad \text{Equation 1}$$

WP shows the amount of product obtained per unit amount of water consumed.

RESULT AND DISCUSSION

The WP change of 5 provinces in the Aegean Region of Turkey between 2012 and 2021 was observed. The year with the highest WP in Aydın province was 2020 according to both models (0.38 and 0.53 kg/m³ with Cropwat and Aquacrop, respectively). The year had the lowest value was 2012-2016 with 0.34 kg/m³ WP according to the Cropwat model, and 2012 with 0.45 kg/m³

WP for the Aquacrop model. According to Cropwat model calculations, WP varies between 0.34-0.38 kg/m³, and for Aquacrop model calculations it varies between 0.45-0.53 kg/m³ (Figure 3).

The most efficient year in WP in Denizli province was 2020, which had the highest olive productivity for two models (1.56 and 1.55 kg/m³ with Cropwat and Aquacrop models, respectively). The year with the lowest WP was 2012 in accordance with both models (0.96 and 1.07 kg/m³ with Cropwat and Aquacrop models, respectively) (Figure 3). The years 2012 and 2013 have approximately the same olive yield. However, the higher ET value calculated for 2012 reduced the WP of the same year. Unlike most years, the effective parameter was the ET value.

Figure 3. WP for Aydın and Denizli provinces

The highest WP in Izmir was observed in 2014, which had the highest olive yield according to both models (0.51 and 0.57 kg/m³ with Cropwat and Aquacrop, respectively). The lowest WP was observed in 2016 and 2021 (0.37 kg/m³) for the Cropwat model and in 2012 and 2021 (0.47 kg/m³) for the Aquacrop model (Figure 4). The years 2016 and 2021 had the lowest olive yield. 2012 is the year in which both the lowest ET and WP were calculated with the Aquacrop model. The highest WP in Manisa was experienced in 2021 with two models (0.77 and 0.87 kg/m³ with Cropwat and Aquacrop, respectively). This year has been the second highest year in olive yield. At the same time, since it has a low ET value, it has the highest value in WP. The lowest WP was observed in 2016 with the Cropwat model (0.55 kg/m³) and in 2012 with the Aquacrop model (0.63 kg/m³) (Figure 4). As with the highest value, 2012 and 2016 also had low values in WP because they were the years when the lowest olive yield was observed.

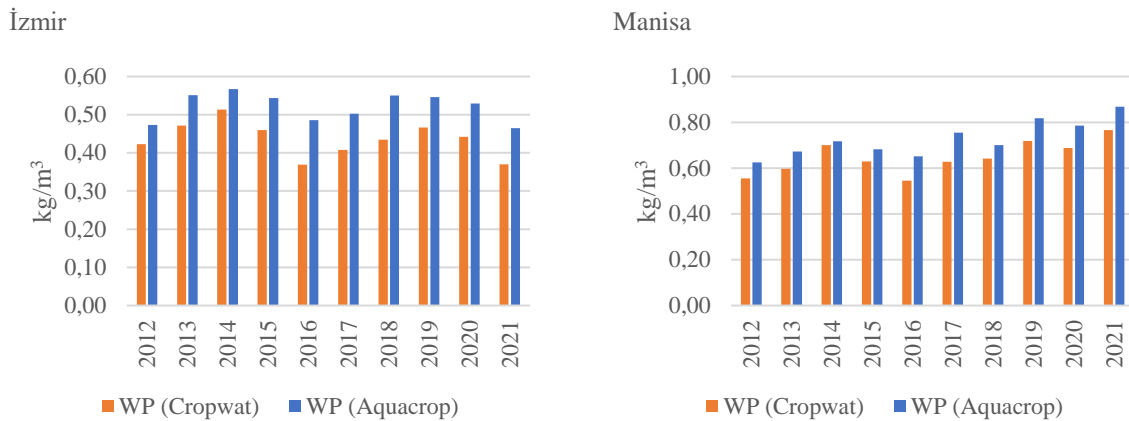

Figure 4. WP for İzmir and Manisa provinces

The highest WP in Muğla province was calculated as 0.38 and 0.43 kg/m³ with two models, Cropwat and Aquacrop, respectively, in 2020. The lowest WP was calculated as 0.28 kg/m³ in 2016 with the Cropwat model and 0.33 kg/m³ in 2013 and 2016 with the Aquacrop model (Figure 5). The WP in Muğla province could not be explained by olive yield and/or ET values. 2020 is the year with the second lowest ET value for both models and ranks fifth in olive yield. Since years with higher olive yields also have higher ET values, their WP decreased. The opposite situation is seen at the lowest WP. The year 2016 has an above-average ET value according to the two models and is the third lowest year in olive productivity. In other words, since olive yield was low and the amount of water consumed by the plant was high, it reduced the WP.

Figure 5. WP for Muğla province

The average WP with Cropwat and Aquacrop models were calculated as 0.35 and 0.49 kg/m³ in Aydın province, 1.13 and 1.23 kg/m³ in Denizli province, 0.44 and 0.52 kg/m³ in İzmir province, 0.65 and 0.73 kg/m³ in Manisa province and 0.32 and 0.37 kg/m³ in Muğla province, respectively. Standard deviation values with Cropwat and Aquacrop models were 0.015 and 0.025 kg/m³ for Aydın province, 0.172 and 0.129 kg/m³ for Denizli province, 0.043 and 0.035 kg/m³ for İzmir province, 0.068 and 0.073 kg/m³ for Manisa province and 0.029 and 0.032 kg/m³ for Muğla province, respectively. The average WP value calculated with both models

was observed to be highest in Denizli and lowest in Muğla. In general, WP values calculated with the Cropwat model were lower than the values calculated with the Aquacrop model (Figure 6). The reason for this is that the ET values obtained with the Aquacrop model were lower.

Figure 6. Average WP values of all provinces

This study showed how WP values for olives changed in 10 years in case of no irrigation. It was seen that previous studies had investigated the effect of regulated deficit irrigation (RDI) on water efficiency (Ahumada-Orellana, Ortega-Farías, Searles, & Retamales, 2017; Alcaras, Rousseaux, & Searles, 2021; Arampatzis et al., 2018; Serman, Orgaz, Starobinsky, Capraro, & Fereres, 2021).

Naoum et al. irrigated the olive trees at rates varying between ET*40-100%. Researchers reported that they achieved the highest water use efficiency in irrigation, which was ET*65%. (Naoum et al., 2016). Alcaras et al. carried out a study lasting 3 seasons in which irrigation was applied at ET*100, 66, 33 and 0% rates after olive harvest. It was reported that water efficiency was higher in 0% than other treatments in the first season, 0% was higher than 100% in the second season, but no difference in water efficiency was observed between irrigation levels in the third season (Alcaras et al., 2021). Serman et al. studied seven different irrigation rates (ET*120, 100, 90, 80, 70, 60 and 40%) for olive trees. It was reported that WP was 3.4 kg ha⁻¹ mm⁻¹ at maximum yield, and 4.0 and 2.8 kg ha⁻¹ mm⁻¹ at 715 and at 390 mm irrigation, respectively. Researchers indicated that there was a decrease in yield due to decreased irrigation after the first year (Serman et al., 2021).

CONCLUSION

According to the results of the study, the average WP with Cropwat and Aquacrop models were calculated as 0.35 and 0.49 kg/m³ in Aydın province, 1.13 and 1.23 kg/m³ in Denizli province, 0.44 and 0.52 kg/m³ in İzmir province, 0.65 and 0.73 kg/m³ in Manisa province and 0.32 and 0.37 kg/m³ in Muğla province, respectively. Standard deviation values with Cropwat and Aquacrop models were 0.015 and 0.025 kg/m³ for Aydın province, 0.172 and 0.129 kg/m³ for Denizli province, 0.043 and 0.035 kg/m³ for İzmir province, 0.068 and 0.073 kg/m³ for Manisa

province and 0.029 and 0.032 kg/m³ for Muğla province, respectively. Denizli was the province with the highest WP value. It was seen that WP increased when increased crop yield was supported by lower water use. The WP of years changed depending on climatic conditions although the same amounts of olives are produced. Distribution of rainfall throughout the year was more important than the total or effective rainfall. In addition, the Aquacrop model was more affected by meteorological data and, in general, the Aquacrop WP was higher than the Cropwat WP.

Özet

Metalik malzemeler korozyon adı verilen bir süreçle kendiliğinden çözünür ve bu durum önemli mali ve güvenlik kayıplarına neden olur. Alüminyum ve alaşımları çeşitli koşullarda korozyon direnci gösterdiğinden çok sayıda önemli endüstriyel uygulamada kullanılmaktadır. Açıkta kalan yüzeylerde kompakt ve yapışkan bir pasif oksit filmin ilk oluşumu korozyon direncine neden olur. Ancak metalin parçalanmasını başlatan klorür iyonları gibi iyonların varlığında koruyucu oksit kaplama lokal olarak hasar görebilir. Ticari, havacılık ve savunma uygulamaları için hafif alaşımlarda korozyonun önlenmesi şu anda önemli bir araştırma alanıdır. Doğal veya yapay eylemler korozyonun başlamasına neden olabilir. Bir dizi endüstriyel proseste metalik korozyonun önlenmesine büyük önem verilmiştir. Düşük sentez maliyetleri, büyük etkinlikleri ve kullanım basitlikleri nedeniyle sentetik korozyon inhibitörleri şu anda mevcut olan en yaygın kullanılan ve etkili yaklaşımdır. -OH, -NO₂, -OCH₃, -COOH, -NH₂, -COOC₂H₅, -CONH₂, vb. gibi polar fonksiyonel gruplar formunda çoklu heterotrofların yanı sıra bağlanmayan ve π -elektronların varlığı kapsamlı konjugasyon biçimi, organik inhibitörlere etkinlik kazandıran şeydir.

ORGANIC CORROSION INHIBITORS FOR ALUMINUM AND ITS ALLOYS

Abstract

Metallic materials spontaneously dissolve through a process called corrosion, which causes significant financial and safety losses. As aluminium and its alloys display corrosion resistance in a variety of conditions, they are used in numerous significant industrial applications. The initial formation of a compact and adherent passive oxide film on the exposed surfaces is what causes the corrosion resistance. However, the protective oxide covering can be locally damaged in the presence of ions, such as chloride ions, which starts metal breakdown. For commercial, aerospace, and defence applications, corrosion avoidance in light-weight alloys is currently a key field of research. Natural or artificial actions may cause corrosion to start. Significant attention has been paid to the prevention of metallic corrosion throughout a number of industrial processes. Because of their low cost of synthesis, great effectiveness, and simplicity of use, synthetic corrosion inhibitors are the most widely used and efficient approach currently available. The existence of multiple heteroatoms in the form of polar functional groups, such as -OH, -NO₂, -OCH₃, -COOH, -NH₂, -COOC₂H₅, -CONH₂, etc., as well as non-bonding and π -electrons in the form of extensive conjugation, is what gives organic inhibitors their effectiveness.

Keywords: Aluminum, Aluminum alloys, Corrosion, Organic corrosion inhibitors,

Introduction

Aluminium is widely used nowadays because of its exceptional adaptability and corrosion resistance, which make it appropriate for a variety of items from household foil to armour plate and the primary building material for previous generations of aircraft and spacecraft. The biggest motivation for alloy development and corrosion research, which is still ongoing, has come from aerospace applications, which call for strength, toughness, corrosion resistance, and low weight. A wide network of power transmission lines, building cladding for various types of structures, and the adaptable extruded section used in glass house construction have all been made possible by durable aluminium. In order to reduce emissions from the huge and quickly growing number of cars and trucks on the planet, it is becoming more and more popular to use lighter metals. With the right combination of composition, temper, and manufacturing method, aluminium and its alloys can be exactly suited to the requirements of any application. They offer a wide range of desirable characteristics. Aluminium can be cast directly into shaped products or extruded through dies of various shapes and then rolled, forged, slit, sheared, and formed. Its other key characteristics are excellent thermal and electrical conductivity, heat and light reflection, cryogenic compatibility, nonferromagnetic property, low density, strong corrosion resistance, and sanitary and nontoxic properties for food contact applications. Aluminium is exceptional in that it is highly recyclable, which can offset the high energy cost of its initial manufacturing. Modern economies depend on aluminium, which frequently replaces steel and plastics in building and automotive applications, as well as copper in the production and transmission of electricity, magnesium, titanium, composites and plastics in aerospace and defence, steel, plastics and glass in packaging and wood and vinyl in the building and construction industries (Scamans et al., 2010).

CORROSION RESISTANCE OF ALUMINUM

Among all metals, aluminium is one of the most widely used. An effective thin passive oxide layer is suggested to form on the aluminum surface in aerated environments. This oxide layer protects the aluminium surface from additional corrosion since it is inert, stable, and adherent. This oxide layer deteriorates in conditions with a higher or lower pH. Thus, strong alkaline solutions and mineral acids are both extremely corrosive to aluminium. Acidic solutions, in particular HCl, are frequently used to pickle and clean aluminium in corrosive ways. Several studies on the prevention of corrosion of aluminium in HCl solutions have been conducted (Alqarni et al., 2022).

Due to the development of a resistant oxide layer, aluminium exhibits good corrosion resistance

in various aqueous conditions and the atmosphere. The corrosion products are also non-toxic and colourless. Aluminium is one of the most desirable materials for a variety of applications, such as packaging for food, beverages, and pharmaceutical items, sacrificial anodes, automotive, marine, and aerospace parts. This is due to a combination of these attributes and other factors. The most frequent forms of corrosion for aluminium, irrespective of the corrosive environment, include general, galvanic, pitting, stress-corrosion cracking, intergranular, and exfoliation (Winston Revie, 2011).

The most hazardous type of aluminium corrosion is pitting corrosion. On the surface of the metal, it appears as irregularly shaped holes and pits. The type of material, the corrosive medium, and the characteristics of the environment to which aluminium and its alloys are exposed determine the diameter and depth of the pits. In aerated chloride solutions, aluminium typically experiences pitting corrosion. Commercially available wrought aluminium alloys can be divided into two groups based on the method of strengthening. While series 2xxx, 6xxx, and 7xxx alloys can be heat-treated, series 1xxx, 3xxx, 4xxx, and 5xxx alloys cannot. In comparison to heat treatable alloys, non-heat treatable alloys have superior corrosion resistance to general corrosion. However, series 6xxx alloys containing the Al-Mg₂Si system also show considerable resistance to general corrosion. The presence of appreciable amounts of soluble alloying elements, such as copper, magnesium, silicon, and zinc, will make these alloys susceptible to stress-corrosion cracking. The same is observed for the heat treatable alloys (Xhanari & Finsgar, 2019).

CORROSION PREVENTION OF ALUMINUM

The fundamental tactic for reducing electrochemical corrosion of aluminium and its alloys is to successfully isolate the metal from corrosion agents. Corrosion inhibitors can be used to accomplish this. One of the most well-known strategies for preventing corrosion is the use of inhibitors. The majority of effective acid inhibitors are organic molecules with a structure predominately made up of nitrogen, sulphur, or oxygen atoms. Organic substances that are utilised as inhibitors function by adsorbing on surfaces. Therefore, an inhibitor's effectiveness also depends on the inhibitor's internal structure, which takes into account factors like the number of adsorption active centres present in the molecule, their charge density, the molecular size, the mode of adsorption, the formation of metallic complexes, and the projected area of the inhibitor on the metal surface (Okafor and Zheng, 2009; Abdallah et al., 2012).

In various conditions, a variety of techniques and their combinations have been employed to reduce the corrosion of aluminium and its alloys. Anodizing, coatings (conversion, inorganic,

organic, or organic-inorganic varieties), and inhibitors (inorganic and organic) are some of the most often tried protective techniques (Domingues et al., 2003, Lundvall et al., 2007, Niknahad et al., 2010, Harvey, 2013, Golru et al., 2015).

In the aircraft industry, where strength-to-weight ratio and reasonably low cost are valued highly, aluminium alloy AA-2024-T3 is widely utilised. The behaviour of the alloying elements, primarily copper, during surface treatments is generally connected with the 2000 series alloys' sensitivity to localised corrosion. The alloy is protected by two successive procedures in order to comply with the necessary level of corrosion resistance: anodizing or conversion coating in acid electrolytes containing chromate species, followed by application of epoxy primers and paint coatings. The chromate base treatments encourage a scalloped film-electrolyte interface (in the case of anodizing a porous anodic film and in the case of conversion coating), ensuring effective adherence of primers and coatings. The resulting organic coating gives the aluminium alloy exceptional corrosion resistance since it has a low water permeability and a minimal fall in fatigue strength. However, because of their hazardous and carcinogenic characteristics, chromate species are now the focus of increased environmental regulation. Thus, both the commercial and academic sectors have investigated a number of alternative treatments (Lundvall et al., 2007).

Currently, the aerospace sector uses chromic acid anodizing (CAA) to form oxide layers on high strength aluminium alloys such as Al 2024-T3. Traditional sulphuric acid baths shouldn't be used for these treatments because they reduce the material's fatigue life. Incorporating some Cr(VI) and Cr(III) into an Al₂O₃ film is recommended by CAA. The produced film may either be utilised unsealed as a base for painting or adhesive bonding, or it might be sealed in hot water to provide the alloy considerable corrosion resistance. Despite the good properties of the films obtained with this process, the use of Cr(VI)-containing treatments is unadvised from a health and environmental point of view, since it is toxic and carcinogenic (Domingues et al., 2003).

Organic compounds have been extensively used as corrosion inhibitors for aluminum and its alloys due to the fact that they contain several heteroatoms (N, S, O and P) which serve as adsorption centers (Xhanari and Finsgar, 2016). Natural compounds, also known as green corrosion inhibitors, have been extensively used to protect aluminum materials (Abiola and Tobun, 2010, Abdallah et al., 2012, Gerengi, 2012, Chaubey et al., 2017). Furthermore, corrosion inhibitor research for aluminum and its alloys have been also presented in several patents.

CORROSION INHIBITORS

Corrosion inhibitors are widely used to stop or at least slow down the corrosion process of metals in a variety of industries, from the construction industry to the preservation of cultural heritage. A corrosion inhibitor is defined as a "chemical substance that, when present in the corrosion system at a suitable concentration, decreases the corrosion rate, without significantly changing the concentration of any corrosive agent." In small concentrations, it typically works. This does not include any chemical that causes a significant pH fluctuation reduction in corrosion rate or oxygen or hydrogen sulphide scavengers that remove hostile species from the solution. Depending on whether their major effect is to delay the cathodic or anodic reaction of the corrosion process or both of them, corrosion inhibitors can be categorised as cathodic, anodic, or mixed. As a result, they either significantly keep the metal's corrosion potential more or less constant or they cause it to shift in one of two directions towards either the cathodic or the anodic directions. The lowering of a metal's active surface area and/or a change in the activation energy of the oxidation or reduction process in corrosion can both result in the inhibition of anodic or cathodic corrosion reactions. Improved protection and lower inhibitor concentrations are frequently determined by the combination of cathodic and anodic corrosion inhibitors. No matter which activity the corrosion inhibitor hinders, it will interact with the metal/solution interface by generating a film, which can take one of three different forms: (a) passivating film; (b) precipitation film; or (c) adsorption film. The 30-200 nm thick passivating oxide layers provide good corrosion protection. The use of traditional oxidising inhibitors like chromates and nitrites has been mostly discontinued because of toxicity issues, with the exception of situations where corrosion might seriously endanger human safety (such as the aerospace industry and construction). This group of inhibitors also includes nonoxidizing compounds like tungstates and molybdates, which only have a passivating action in aerated solutions. Precipitation film-type inhibitors are substances that react with soluble species in the environment to form insoluble protective films, such as phosphonates and polyphosphates when exposed to calcium ions in solution, or with protected metal ions when exposed to copper-benzotriazole (BTA) salt film. These films may have pores and be less than completely adherent, although in this instance, the corrosion protection is still fairly effective. Most adsorption protective film inhibitors are organic compounds. A hydrophilic group that can form a connection with the metal surface and a hydrophobic portion of the molecule that extends towards the bulk of the solution are common features of their molecular structure. Adsorbed inhibitor molecules reduce water and oxygen access to the metal surface, slowing the rate of

corrosion (Monticelli, 2018).

In factories, corrosion inhibitors are frequently used to slow down the rate of corrosion of metals and alloys that come into contact with harsh conditions. In order to prevent corrosion on metal surfaces, a protective coating is formed by the adsorption of inhibitors; as a result, the metal surface and the inhibitor are in contact with one another. Corrosion inhibitors come in two varieties: inorganic and organic. The formation of an oxide film or a salt that is barely soluble on the metal surface is related to the protective action of inorganic inhibitors. On the other hand, organic inhibitors' protective function is derived from their adsorption on oxide coatings. According to Ogurtsov et al. (2004), amino acids, hydroxy carboxylic acids, various organic compounds with polar groups, including oxygen, sulphur, and nitrogen, and heterocyclic compounds with functional groups and conjugated double bonds can all be utilised as corrosion inhibitors. Chromates are the most popular inorganic inhibitors used for aluminium or aluminium alloys. However, there is a lot of interest in their replacement due to the high toxicity of chromate. Despite the abundance of organic molecules, new corrosion inhibitors are always required. In order to use a suitable natural source as a corrosion inhibitor in diverse corrosive solutions, great efforts have been carried out in this direction (Rosliza & Nik, 2010). The development of nontoxic substitutes for the inorganic and organic inhibitors currently used has received attention due to growing ecological awareness, stringent environmental regulations, as well as the ineluctable drive towards sustainable and environmentally friendly processes. Numerous studies have examined the effectiveness of natural compounds as corrosion inhibitors in a variety of harsh conditions (Abdel-Gaber et al., 2008; Gerengi, 2012).

ORGANIC COMPOUNDS AS CORROSION INHIBITORS FOR DIFFERENT ALUMINUM AND ALUMINUM ALLOYS

Some of different organic compounds as corrosion inhibitors for different aluminum and aluminum alloys in various alkaline solutions are: Fluorescein, Adipic acid, Polyvinyl alcohol, Gelatin, Carboxymethylcellulose, Methyl cellulose, Polyethylene glycol, Thiourea, Tartrate, Phenyl thiourea, Polyaniline, Polyacrylic acid, Polymethylmethacrylate, Cetyl trimethylammonium chloride, 3-hydroxy flavone, 3-hydroxy flavone + quaternary ammonium bromide, 3-hydroxy flavone + quaternary ammonium iodide, Succinic acid, Glutaric acid, Bismark brown dye, Crystal violet dye, Congo Red dye, L-cysteine, 4-carboxy phenyl thiourea, 2-propanol, and 3-methylpyridine.

Some of different organic compounds as corrosion inhibitors for different aluminum and

aluminum alloys in various chloride solutions are: Sulfathiazole, Ferrous gluconate, Citric acid, Monoethanolamine, Vanillin, Phthalic acid, Anthranilic acid, Triisopropanolamine, Diisopropyl thiourea, Calcium gluconate, Cerium dibutylphosphate, Salicylaldehyde, Quinaldic acid, Benzotriazole, 2-mercaptobenzothiazole, Cerium diphenyl phosphate, Cerium dibutyl phosphate, Mischmetal diphenyl phosphate, Sodium dodecylbenzenesulfonate, 8-hydroxyquinoline, Benzotriazole, Tryptophan, Dodecylbenzenesulphonic acid, Sodium lauryl sulfate, Potassium sodium tartrate, 8-aminoquinoline, 8-nitroquinoline, Sinapinic acid, Gentisic acid, Tolyltriazole, Benzotriazole, Thiophenol, 2-mercaptobenzothiazole, Cerium(III) acetate, Sodium benzoate, Benzamide, and Thioacetamide.

Different aluminum and aluminum alloys were used as material in these studies were: Pure, 99%, 98%, 95%, 57S (97.7% Al), AA1060, AA5052, A5754, AA6061, AA6063, AA20556 (92.47% Al), AA2024, AA2024-T3, AA2198, AA3003, AA5052, AA7022, AA7050, AA7075, Al-2.5Mg, Al-0.8Mg, Al-8%Si-3%Cu, Al-4%Cu, Al-12%Cu, Al-12%Cu-4%Fe, AA7075-T6, and ADC12.

Edrah and Hasan (2010) investigated the ability of thiourea, phenyl thiourea, and 4-carboxy phenyl thiourea to suppress aluminium corrosion in solutions containing 0.3–1.0 M NaOH at 21 °C. The researchers came to the conclusion that these compounds considerably reduce aluminum's corrosion in a NaOH solution. The maximum recorded inhibitory effectiveness was 28.3%, which is too low of a result to justify their claim. Data indicated that as NaOH concentration was raised, the efficiency of the inhibition reduced. With the exception of the sample submerged in 0.3 M NaOH solution, phenyl thiourea was shown to be the best inhibitor in all the tested solutions. In a 0.3 M NaOH solution, 4-carboxy phenyl thiourea showed the greatest efficiency as an inhibitor. Through adsorption, this substance formed a coating that shielded the aluminium surface.

As a corrosion inhibitor for the aluminium alloy AA2024-T3 in 0.05 M NaCl solution, cerium tartrate was synthesised by Hu et al. (2015) and tested. According to the investigators, this substance exerted an impact on both cathodic and anodic corrosion processes and quickly formed a protective film on the surface of the alloy. Following the first inhibition of the dealloying of the Al₂CuMg phase by this protective coating, surface characterisation showed that cerium ions changed into cerium oxide/hydroxides and appeared at the Al₂CuMg phase, preventing further corrosion at those corrosion sites.

Using the weight loss (WL) and potentiodynamic polarisation (PDP) techniques, Dhayabaran et al. (2004) investigated the effectiveness of fluorescein, a synthetic organic compound with

the IUPAC name 3',6'-dihydroxyspiro[2-benzofuran-3,9'-xanthene]-1-one, as a corrosion inhibitor for commercially pure aluminium in 1.0 N NaOH solution at 30 °C. Fluorescein's ability to suppress growth improved when concentration was increased. The efficiency of the inhibition was further improved by adding CaO to the fluorescein-containing solutions. The authors claimed that fluorescein functioned as an anodic-type inhibitor based on the PDP measurements.

Polyvinyl alcohol was investigated by Umoren et al. (2007) utilising the WL and hydrogen evolution (HE) procedures as a corrosion inhibitor for the AA1060 aluminium alloy in 0.1 M NaOH solution at 30 and 40 °C. When the concentration of the inhibitor was increased, the efficiency of the inhibition increased and performed better at 30 °C than it performed at 40 °C. The inhibitory efficacy values obtained using the two approaches displayed a reasonable correlation, but the values were modest (the highest was 34%). It was reported that adding potassium halides (KI, KBr, and KCl) produced a synergistic effect. The suggested mechanism for this chemical was physisorption.

Using the PSP, EIS, and cyclic voltammetry (CV) techniques, Abdallah et al. (2016b) examined the inhibitive behaviour of gelatin as a corrosion inhibitor for pure aluminium and two aluminium alloys, particularly AA6063 and AA20556 (92.47% aluminium), in 0.1 M NaOH solution at 30–60 °C. The efficiency of the inhibition increased as the concentration of gelatin increased, but it dropped when the temperature and Si content of the alloys increased. The researchers noted that pure aluminium > AA6063 > AA20556 was the order in which gelatin's ability to block reduced. The authors claim that this resulted from gelatin's reduced propensity to adsorb on silicon compared to aluminium. They claimed that gelatin forms a barrier film on the surface of aluminium and aluminum-silicon alloys, shielding them from damage.

Using the WL and thermometric techniques, Umoren et al. (2009) investigated the synergistic effect of potassium halides (KI, KCl, and KBr) and polyethylene glycol (PEG) in the corrosion of aluminium in 1 M NaOH solution at 30 and 60 °C. With higher PEG concentrations and higher temperatures, the inhibition was more effective. The synergistic effect of adding potassium halides to PEG was highlighted by the authors. Comparing KI with PEG to KBr and KCl, this combination produced the most efficient inhibition. As a potential PEG adsorption mechanism, the authors proposed chemisorption.

Using the WL method, Edrah and Hasan (2010) investigated the ability of thiourea, phenyl thiourea, and 4-carboxy phenyl thiourea to prevent the corrosion of aluminium in solutions containing 0.3–1.0 M NaOH at 21 °C. The researchers came to the conclusion that these

compounds considerably reduce aluminum's corrosion in a NaOH solution. The maximum recorded inhibitory effectiveness was 28.3%, which was too low of a result to justify their conclusion. Data indicated that as NaOH concentration was raised, the efficiency of the inhibition reduced. With the exception of the sample submerged in 0.3 M NaOH solution, phenyl thiourea was shown to be the best inhibitor in all the tested solutions. In a 0.3 M NaOH solution, 4-carboxy phenyl thiourea showed the greatest efficiency as an inhibitor. Through adsorption, this substance formed a coating that shielded the aluminium surface.

Chitosan's unfavourable characteristic as a corrosion-mitigating coating film is its propensity to absorb an excessive amount of moisture from the air before forming a hydrogel. As a result, the focus of previous studies has been on using chemical or bioorganic substances to change the molecular structure of chitosan. Al-6063 samples coated with modified chitosan films offered reduced moisture sensitivity, improved pore resistance by an order of magnitude greater than those of the single chitosan coatings, and conferred salt-spray resistance for 720 hours. The modified chitosan films were generated from a precursor solution with a chitosan/dextrine ratio of 70/30. The inherent ability of CH to adsorb metal ions, which has been exploited to remove various metallic cations from ground and waste water, is another technique to change the structure of chitosan. The ability of chitosan to absorb metals is influenced by a variety of variables, including pH, ion concentration, temperature, percentage of deacetylation, interaction time, and chain length. The amines on chitosan are bound by the metallic cations. The amino and N-acetylamino groups have nitrogen electrons that can form dative bonds with transition metal ions. These biopolymers' hydroxyl groups may serve as donors and be engaged in the coordination of metal ions. At a neutral pH, the metal ions should be more closely coordinated because low pH would encourage protonation of the amino sites and dramatically reduce the capacity of chitin and chitosan to chelate metals. To explain the mechanism of coordination in the formation of complexes, various models have been presented out. In the so-called "bridge" scenario, the metallic ion is considered to be attached to a number of nitrogen atoms from the same or separate chains. In the so-called pendant model, the metallic ions are believed to be suspended from the amino group (Lundvall et al., 2007).

Using the EIS, linear sweep voltammetry (LSV), and WL methods, Jevremovic and Miskovic-Stankovic (2012) investigated the inhibitory efficiency of monoethanolamine (MEA) in the corrosion of 99.7% aluminium in 3 wt% NaCl solution saturated with CO₂ at 20 °C. Up to 5 mM, MEA's concentration improved its ability to block, but as concentration grew, its efficiency reduced. The polarisation measurements revealed that the corrosion potential shifted

towards more positive values with the addition of MEA without significantly altering the anodic and cathodic Tafel slopes. The authors hypothesised that MEA physisorbed on the aluminium surface in accordance with the thermodynamic calculations.

Phthalic acid, o-phenylenediamine, and anthranilic acid were investigated using the PDP method by Banerjee et al. (2011) as corrosion inhibitors for 99.15% aluminium alloy in 0.6 M NaCl solution at 30 °C. According to the authors, the efficiency of all three compounds' inhibition first increased with rising compound concentration before declining at a specific concentration. Phthalic acid, o-phenylenediamine, and anthranilic were the sequence in which the inhibition was most effective. This, however, was only accurate for the ideal concentration (4.105 M), not for the values of lowest or greatest concentration. The N-O donor atom combinations in the molecules were attributed by the authors for the compounds' inhibitory order.

Lamaka et al. (2007) studied the inhibition effectiveness of eleven organic compounds, i.e., salicylaldoxime (SAL), 2-mercaptobenzothiazole, 8-HQ, thioacetamide, quinaldic acid, α -benzoionoxime, 2-(2-hydroxyphenyl) benzoxazole, dithiooxamide, cuprizone, and cupferron, in the corrosion of AA 2024-T3 aluminium alloy in 0.05 M NaCl solution. Salicylaldoxime, 8-HQ, and quinaldic acid demonstrated the highest levels of inhibitory efficacy. The passivation of active intermetallic zones and the development of a chelate layer on the alloy surface, according to the authors, were both factors in the inhibitory effect. The authors claim that complexes, including active S-phases (intermetallic zones that make up around 60% of all intermetallic inclusions and are made of Al₂MgCu), chemisorb and precipitate on the alloy surface. They demonstrated how these substances functioned as inhibitors of mixed types.

Using the WL, PDP, and AC impedance techniques, Hakeem et al. (2014) investigated the efficiency of calcium gluconate as a corrosion inhibitor for 95% aluminium in aqueous solution containing 60 ppm Cl⁻ (pH = 11) with and without the addition of Zn²⁺. The efficiency of the inhibition increased as calcium gluconate concentration increased. The Zn²⁺ addition resulted in an additional improvement in the efficiency of the inhibition, as evidenced by the WL measurements.

COATINGS FOR ORGANIC–INORGANIC HYBRID ALUMINUM ALLOYS

As a new functional material, organic-inorganic hybrid materials have attracted a lot of attention recently. In most cases, the hydrolysis and condensation of organically modified silicates with conventional alkoxide precursor results in the formation of the hybrid material. These substances have tremendous attention since they contribute both organic and inorganic

properties. Chemical bonds that join the organic and inorganic components together hide the boundaries between them. The hybrid coating material's surface gains hydrophobic properties with the aid of organic functional groups. A covalent bonding of the single bond forms dense, highly adherent coatings on steel and aluminium. Hybrid films made from sol-gel can make a single bond with the surface of aluminium or steel. In addition, water-based systems are easily capable of producing thin films formed from sol-gel, which emits far fewer volatile organic compounds (VOC) than systems based on solvents. These characteristics make it possible to produce coatings that are environmentally friendly in place of chromate conversion coatings. Chou et al. (2001) used potentiodynamic polarisation curve analysis (PDS) to examine the corrosion resistance behaviour of thin films made from sol-gel that were applied over stainless steel. In order to assess the corrosion-protective traits of hybrid organic-inorganic coatings on 2024-T3 aluminium alloys, Metroke et al. (2002) used EIS and salt spray analysis; they discovered that the hydrolysis water ratio, organic content, curing mechanism, and solvent dilution had an impact on the structure and corrosion resistance properties of the examined Ormosil thin films.

CONCLUSIONS

Aluminium alloys are strong yet lightweight materials that have been widely employed in the industry. They are, nevertheless, prone to corrosion, particularly localised corrosion. The many types of localised corrosion, including as pitting corrosion, crevice corrosion, and stress corrosion cracking, can frequently result in unexpected and catastrophic failures and are challenging to detect. Because of this, there has been a great deal of interest in understanding and predicting localised corrosion of aluminium alloys for a long time.

Organic compounds have been extensively used as corrosion inhibitors for aluminum and its alloys due to the fact that they contain several heteroatoms (N, S, O and P) which serve as adsorption centers. Organic coating gives the aluminium alloy exceptional corrosion resistance since it has a low water permeability and a minimal fall in fatigue strength. A strong covalent bonding anchoring to the surface appears to be necessary for both organic molecule adherence and electronic level stabilising of the oxidised surface. Once functionalized, the ultrathin oxide's electrical states resemble those of the bulk oxide. The presence of the organic layer can give to the system a more insulating character than that of the bulk oxide itself.

Abstract

When it is desired to produce products with different properties in different areas of the industry, the additives, fillers and chemicals used to produce products must be selected correctly. Thickening additives are one of them. Synthetic hydrophilic amorphous silica called Aerosil is used as viscosity adjuster, thickener and strength enhancer in unsaturated polyester resins, silicone rubbers, industrial paints/coatings, lubricants and adhesives. In this experimental study, the viscosity and mechanical properties of pure unsaturated polyester resin and thermoset polyester composites filled with different ratios (1-3wt.%) of synthetic hydrophilic amorphous silica called Aerosil were investigated. Composites containing polyester resin and thickener Aerosil silica were first mixed in a mechanical mixer and then produced in molds using the resin casting technique. The composites were subjected to viscosity measurement, hardness and flexure tests. The properties such as hardness, flexural strength, flexural modulus and deformation rate in bending of the composite materials shaped in molds were investigated. As a result, some changes were observed in the mechanical performance of the composite materials depending on the Aerosil additive ratio added to the thermoset polyester. Compared to pure polyester resin, the hardness and deformation rate of the composites containing Aerosil additives decreased, while the flexural strength values and flexural modulus values first increased and then decreased. The highest Flexural modulus was 3510 MPa and the highest flexural strength was 122 MPa in polyester composite with 1wt.% Aerosil additive. The highest hardness was obtained in pure polyester with a hardness of 45 Barcol. Viscosity increased with increasing Aerosil silica content. The microstructure of the samples used in the experiment was examined using scanning electron microscopy.

Keywords: Unsaturated polyester, Aerosil, mechanical properties, composite, thermoset

Introduction

Unsaturated polyester resin (UPR) is a versatile thermoset polymer widely used in various industries due to its excellent combination of properties and ease of processing. It is formed through a polycondensation reaction between a diol and a diacid or anhydride, resulting in a polymer with unsaturated reactive sites. UPR is a thermoset resin, meaning it undergoes irreversible curing when exposed to a catalyst or initiator, typically in combination with a reactive monomer such as styrene. Cured UPR exhibits very good mechanical properties, including high strength and stiffness, making it suitable for structural applications. In addition, UPR exhibits resistance to many different chemicals, making it suitable for applications where there is exposure to corrosive substances. In addition, UPR formulations can be designed to have low shrinkage during curing, contributing to the dimensional stability of moulded parts. Furthermore, polyester resin shows good adhesion to various substrates, allowing composite materials with strong bonds to be produced. Unsaturated polyester can be formulated to have good weather resistance, making it suitable for outdoor applications. Additives with different properties are added to polyesters to achieve different properties [1-21]. One of these is resin thickening additives.

Thickening additives are a type of fumed silica, a fine, white powder composed of microscopic amorphous silica particles. It is commonly used as a thickening or strengthening agent in a variety of materials, including adhesives, sealants, paints, coatings, and plastics. Chemically, it is actually a structure composed of amorphous silicon dioxide (SiO_2) and is produced by hydrolysis of silicon tetrachloride (SiCl_4) in a high-temperature flame. Aerosil particles are very fine, with a typical average particle size in the nano-meter range. The small particle size contributes to its effectiveness in a variety of applications. In addition, fumed silica materials such as Aerosil typically have a high surface area. The surface of Aerosil particles can be modified to improve its compatibility with different matrices or to achieve specific performance characteristics in the final product.

Aerosil additives are also a thickening agent. It can significantly increase the viscosity of liquids, making it useful in controlling the flow properties of formulations. It is also often used as a reinforcing filler in plastic, rubber and elastomer compounds, improving mechanical properties. In addition, it is also widely used as a reinforcing filler to improve the mechanical properties of unsaturated polyester resins. The addition of Aerosil to unsaturated polyester formulations has a positive effect on the properties of the composite material. In other words, adding Aerosil to unsaturated polyester can increase the strength of the composite. It also plays

an important role in increasing the flexural strength of unsaturated polyester composites and can contribute to increased impact and wear resistance.

Aerosil or fumed silica is commonly used as a thickening agent in unsaturated polyester resins. Adding Aerosil to unsaturated polyester resin can significantly affect the viscosity of the resin system. The primary role of Aerosil additive in unsaturated polyester resin is to increase viscosity. The fine particles of the Aerosil additive act as a thickening agent by forming a three-dimensional network within the resin. This network restricts the flow of the resin, resulting in higher viscosity. Aerosil also imparts thixotropic behaviour to the resin system. Thixotropy refers to the property of a material to become less viscous under shear stress and return to a higher viscosity when the stress is removed. This property is desirable in applications where controlled flow is required, such as vertical applications. By using Aerosil additives at different ratios in polyester resins, the consistency of the viscosity of the liquid resin is achieved at the desired values. There is a possibility that other fillers added to the polyester material may precipitate in the liquid resin at the end of mixing. In order to prevent this situation and to adjust the resin viscosity, a certain amount of thickener is added to the resin. A transmission electron microscope image of a typical thickener (Aerosil 200) is shown. In Figure 1a, the TEM image shows thickener particles and agglomerated silica. Figure 1b shows the effect of Aerosil additive added to different liquids on viscosity. In the figure, as the Aerosil ratio increases, the viscosity increase depending on the type of liquids. Figure 1c shows the effect of Aerosil additive added to different liquids on viscosity. In the figure, as the Aerosil ratio increases, the viscosities increase depending on the type of liquids.

When Aerosil thickener fumed silica is dispersed in a liquid, it interacts directly with the silanol groups on the surface or indirectly through the liquid molecules. This can be attributed to hydrogen cross-linking and a temporary three-dimensional network is formed. This structure becomes macroscopically "visible". If subjected to mechanical loads (in the form of intense stirring or shaking), the network breaks down again and the viscosity of the system is reduced. When static, the Aerosil particles interact, and the viscosity returns to its original value. This process is called thixotropy. There are few studies on fumed silica doped polyester composites with nanoparticle sizes in the literature [23-25].

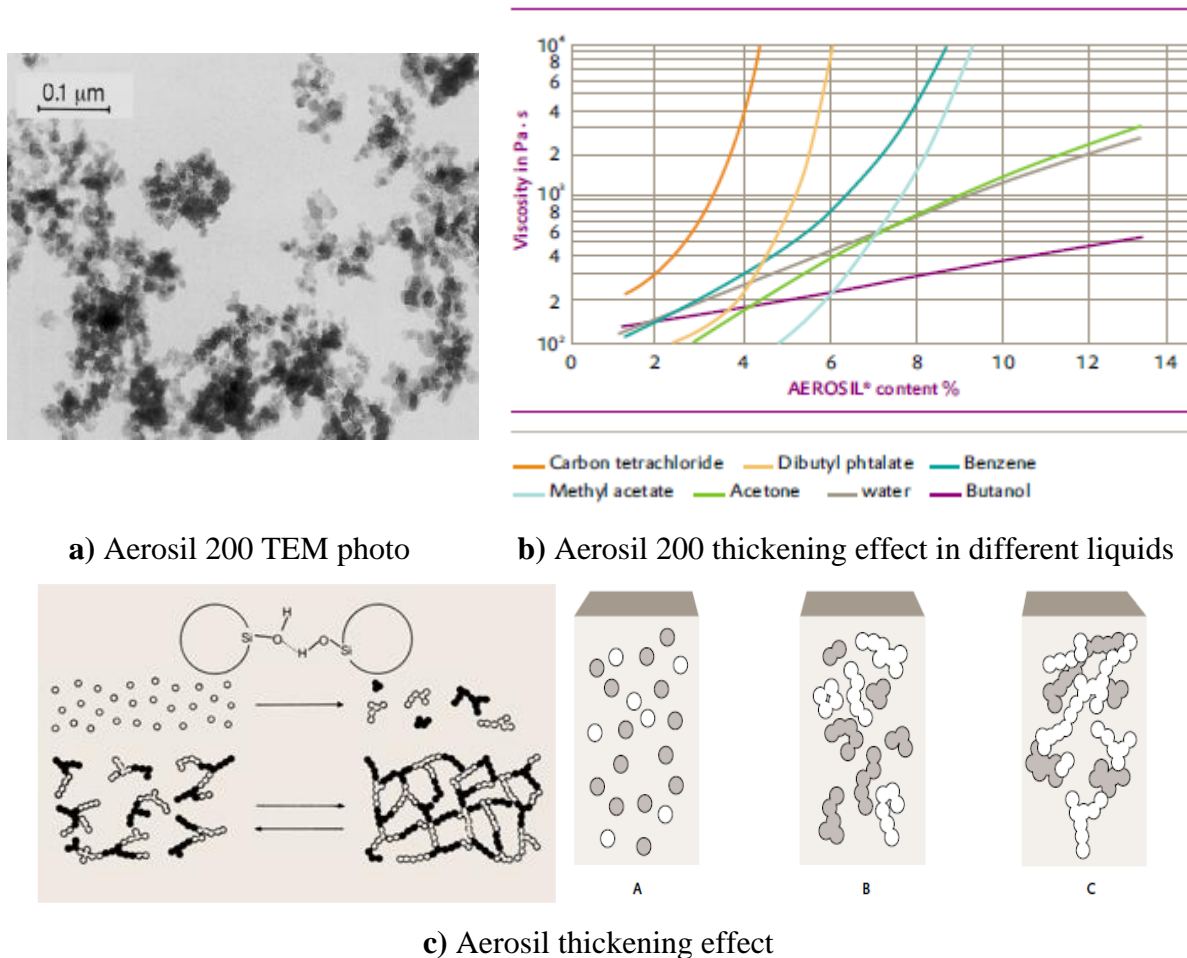

Figure 1. TEM photograph of Aerosil 200 thickener and thickening effect in different liquids [22]

In this experimental study, the effect of Aerosil additive on the mechanical properties of industrial materials manufactured with polyester matrix material was investigated and it was aimed to shed light on the properties of Aerosil doped composites in the literature. For this purpose, composites were produced by resin casting method by adding 1wt.%, 2wt.% and 3wt.% Aerosil by weight and their mechanical properties were investigated. Scanning electron microscopy was used to examine the fracture surfaces of the composites.

Experimental

Materials And Methods

Materials

Unsaturated polyester resin is a liquid that solidifies when hardener is added. This resin is a thermoset based resin formulated to cure at room temperature conditions. The unsaturated polyester resin used in the study was obtained from Boytek/ Istanbul. In order to harden and

cure the thermoset resin, hardener is added in certain proportions. The hardener used in this study is Methyl Ethyl Ketone Peroxide (MEKP). Aerosil additive is a colloidal silica with a density of 2.2 g/cm^3 , high purity (99.8% SiO_2 content) colloidal white powder, surface coated with silane. This product is a thickening fumed silica produced by Wacker with a BET surface area of $200 \text{ m}^2/\text{g}$. It was obtained from Plasto Company in Gebze/Istanbul. The polyester resin (Figure 2a), thickener Aerosil powder (Figure 2b) and particles (Figure 2c) used in the experiments are given in Figure 2 below.

Figure 2. Visuals of the materials used in the experiments.

Preparation Of UP Based Composites

In the production of the specimens using the resin casting technique, pure polyester resin was first poured into moulds. The inorganic additives added to the liquid resin in the production of polyester-based Aerosil-added composite test specimens precipitate in the liquid resin due to the density difference. This is undesirable and a homogeneous distribution in the main polymer matrix is desired. For this reason, the fluidity of the liquid polyester resin needs to be adjusted. In order to achieve the desired viscosity, Aerosil was added to the resin at different ratios (1-3% by weight) and mixed in a mechanical mixer for 30 minutes. After mixing, each resin was immediately poured into moulds made of silicone rubber. The test specimens were kept at room temperature for at least 24 hours to produce polyester composites. The flexure and hardness test specimens were then placed in an oven at 70°C for 1 hour for complete curing. The test specimens were then conditioned in a room temperature of 23°C and 50% humidity for 3 days. The prescription of Aerosil fumed silica composite materials used in the experiments is given in Table 1 below. In the present study, the unsaturated thermoset polymer composites filled with fumed silica at different ratios by weight were first examined by scanning electron

microscope microstructure and EDS analysis was also performed. In the experimental study, the flexural and hardness properties of the composites produced in the following formulations were investigated.

Table 1. Composition of composite materials used in the experiments.

Test No	Material Compositions	Abbreviation
1	Pure unsaturated polyester resin	UP
2	1wt.% aerosil filled unsaturated polyester resin composite	UP/1%A
3	2wt.% aerosil filled unsaturated polyester resin composite	UP/2%A
4	3wt.% aerosil filled unsaturated polyester resin composite	UP/3%A

Mechanical Tests

Viscosity

Viscosity measurements of UP composites containing pure unsaturated polyester and different ratios (1-3wt.%) of thickener Aerosil were carried out in a Brookfield brand DV2T model rotary viscometer. Depending on the ambient conditions, the resin was brought to 25 ± 0.5 °C using the oven and refrigerator and mixed in a container for 30 seconds at a speed of 50 rpm and the viscosity value was determined.

Measurement

Hardness Test

Hardness measurements of UP-based composites containing Aerosil were performed in terms of Barcol hardness measurement. Hardness measurements were made in accordance with ASTM D2583 (TS EN 59) standards. Hardness measurements were taken from at least ten different points on the samples and the Barcol hardness of the sample was determined by averaging the hardness values taken from ten points.

Flexural Test

Three-point bending tests of UP/Aerosil doped composites were performed on a Zwick Roell Z250 tensile testing machine. Bending tests were performed by replacing the heads in the upper and lower jaws of the tensile testing machine with heads suitable for bending. Flexure test specimens were prepared in accordance with ISO 14125 (ISO178) standards. The schematic picture of the flexure test machine is given in Figure 3. Bending tests were performed at a test speed of 5mm/min. At least five test specimens were subjected to bending tests and the data obtained were recorded in the computer environment. Then the arithmetic means of the data obtained was taken.

Figure 3. Schematic test setup for three-point bending test (ISO14125)

The flexural strength of composite materials with Aerosil thickener additives was calculated by the formula below.

$$\sigma = \frac{3PL}{2bh^2}$$

In the above mentioned equation:

σ is the flexural strength (MPa), P is the applied load (N), L is the distance between supports (mm), b is the width (mm) and h is the thickness (mm).

In addition, the deformation rate during the flexural test was calculated by the following formula.

$$\varepsilon = \frac{6Dh}{L^2}$$

Where ε is the strain in bending (deformation rate), D is the maximum bending of the centre of the specimen (mm), h is the specimen thickness (mm) and L is the span between the two supports.

SEM Microstructural Investigations

JEOL JSM-6060LV scanning electron microscope (SEM) was used to examine the fracture surface of the composite test specimens after the bending test. It was performed under a voltage of 15KV. In order to get good images from the fracture surface of the test specimens, each test specimen was sputter coated with gold in a gold plating device prior to SEM examinations. At the same time as the SEM images were taken, EDS analysis was performed to characterize the specimens.

Results And Discussion

The data obtained from the viscosity measurements of UP composites containing pure unsaturated polyester resin and Aerosil thickener at different ratios (1-3wt.%) using a

Brookfield/DV2T brand and model rotary viscometer are given in Table 2. As the rate of Aerosil thickener added to the matrix increased, the stirrer shaft speed was also reduced as the resin condensed or its fluidity decreased. As can be seen in Table 2, while the viscosity of unsaturated polyester base matrix was 1134 mPa.s, the viscosities of the composite resins were 1734, 2797 and 6860 mPa.s when the Aerosil thickener ratio added to the base matrix was increased by 1wt.%, 2wt.% and 3wt.%, respectively. When the increases in viscosity were compared with pure polyester viscosity, increases of 52.9%, 146.6% and 504.9% were observed for UP/1wt.% resin, UP/2wt.% resin and UP/3wt.% composite resin.

Table 2. Viscosity values of composite materials used in the experiments.

Test No	Material Compositions	Rpm	Viscosity, mPa.s	Rising in Viscosity (%)
1	UP resin	50	1134	-
2	UP/1% A composite resin	50	1734	52.9
3	UP/2% A composite resin	30	2797	146.6
4	UP/3% A composite resin	10	6860	504.9

Scanning electron microscope image and EDS analysis of UP composite containing 2wt.% aerosil are given in Figure 4. Figure 4a shows the broken surface SEM image of the sample. EDS analysis was taken from certain points on the figure. The EDS analysis of the polyester composite containing Aerosil is given in Figure 4a and the EDS analysis taken over the SEM image is given on the right side of the image. EDS analysis was performed at points 1, 2 and 3 on the surface. At points 1 and 2, EDS analysis was performed, and it was determined that the carbon (C) peak was effective. In other words, it is understood from this result that the main matrix is pure unsaturated polyester polymer. In Figure 4d, the Aerosil additive added to the polyester polymer is nanoparticle sized fumed silica and since it is inorganic, it is determined that Silicon is effective in EDS analysis.

The stress-strain relationship between unsaturated polyester and composites with different percentages of Aerosil additives are given in Figure 5a-d. Figure 4a shows the stress-strain curves of pure unsaturated polyester, Figure 5b shows UP composite with 1% Aerosil, Figure 5c shows UP composite with 2wt% Aerosil, Figure 5c displays UP composite with 3wt.% Aerosil. At least five specimens were tested in the experiments. In the graphs drawn, the arithmetic means of the data obtained was used.

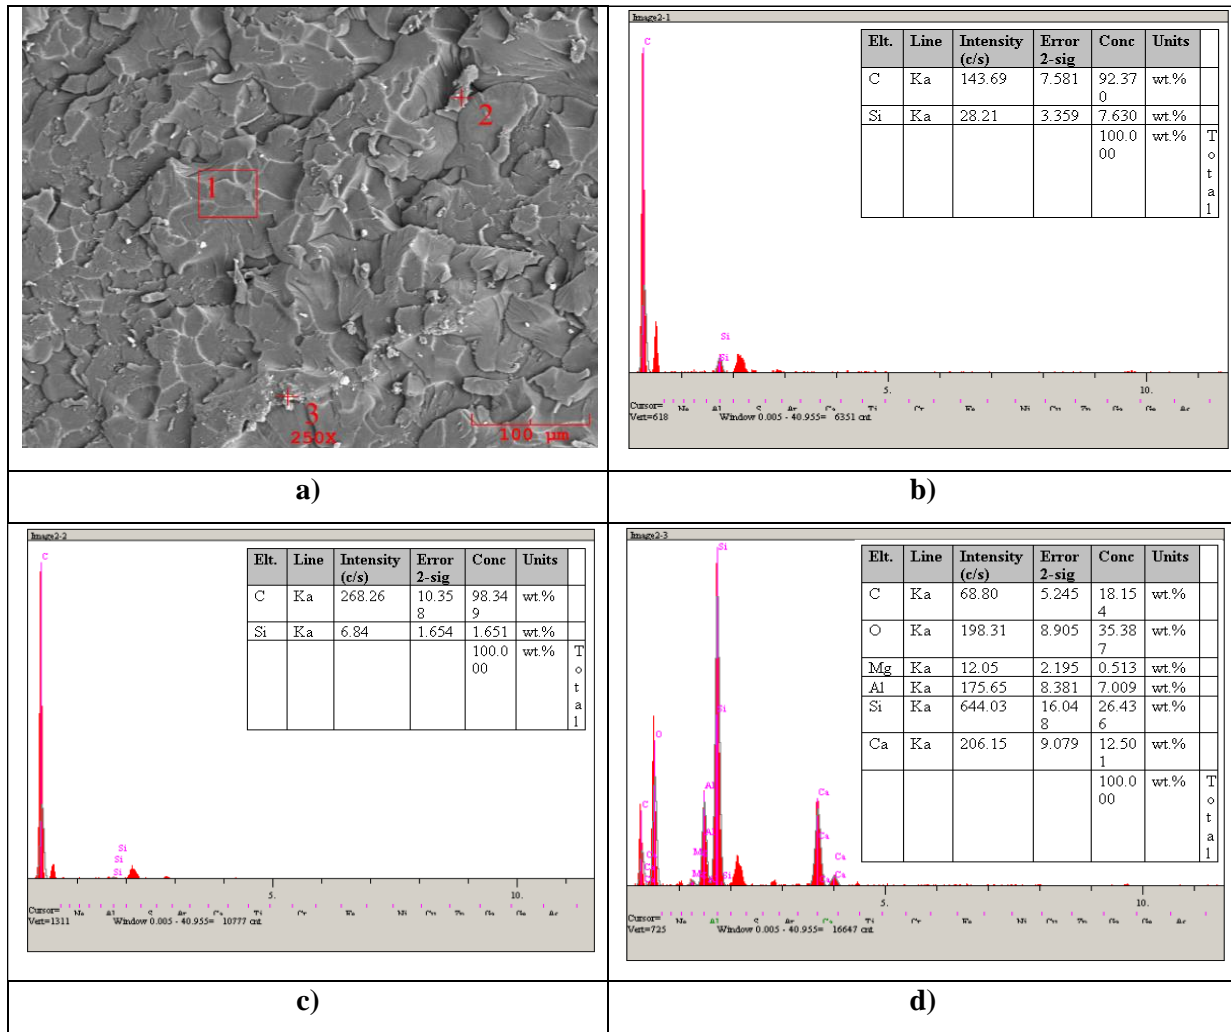

Figure 4. Scanning electron microscope image and EDS analysis of UP composite containing 2wt.% aerosil

Figure 6 shows the variation of flexural strength of unsaturated polyester composites containing 1, 2 and 3 wt% Aerosil additives. The flexural strength of the pure polyester was determined as 105 MPa. The highest flexural strength (122 MPa) was obtained in the composite containing 1% Aerosil, which is clearly seen in the figure. Compared to the flexural strength of pure polyester the flexural strength of the composite with 1wt.% Aerosil increased by 16.1%. As the Aerosil additive rate increased (2 and 3 wt.%), the flexural strengths of the composites were 116 and 92 MPa, respectively. In other words, the flexural strength values increased less than pure polyester. An increase in flexural strength of 10.4% was observed in Polyester composite with 2wt.% Aerosil additive. At 3wt.% Aerosil additive content, a decrease in the flexural strength of the composite was detected and decreased by approximately 12.3%. Sequeira et al [21] observed an increase in flexural strength of glass fibre reinforced and fumed silica filled (1% and 2% FS) polyester composite. An increase of 45% and 59% in flexural strength was

obtained by increasing the fumed silica content from 1% to 2%. These results are consistent with this study. However, Majeed et al [26] in their study with fumed silica observed that the flexural strength of UP/FS composites decreased with increasing fumed silica (from 1% to 2%).

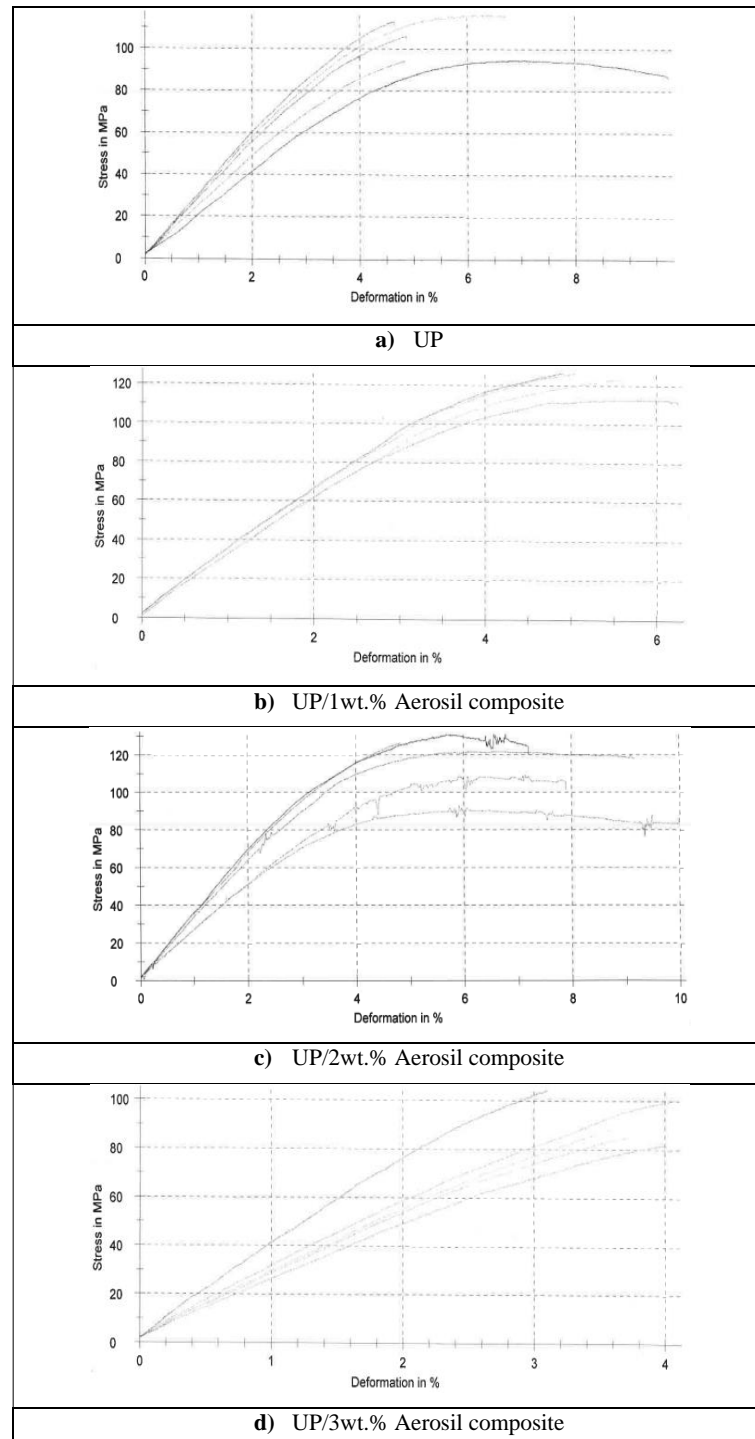

Figure 5. Stress and strain relationship in bending of unsaturated polyester composites filled with Aerosil at different ratios.

Figure 6. Effect of Aerosil thickener on flexural strength of unsaturated polyester resin

The variation of the flexural modulus of depending on the composition of unsaturated polyester composites containing Aerosil additives at different ratios (1, 2 and 3 wt%) is given in Figure 7. The flexural modulus of the pure polyester was determined as 2330MPa. The graph showing the flexural modulus is like the graph showing the flexural strength. In other words, as seen in the figure, 1wt.% Aerosil additive increased the flexural modulus of the composite and even reached the highest value (3510 MPa). Compared to the flexural modulus of pure Polyester, the flexural modulus of the composite with 1wt.% Aerosil additive increased by 50.6%. The flexural moduli of the composites were found to be 3340 and 2970 MPa as the Aerosil additives increased (2 and 3 wt%). When the flexural modulus was compared with the flexural modulus of pure polyester, the flexural modulus of UP composites containing 2wt.% and 3wt.% Aerosil increased by approximately 43.3% and 27.4%, respectively.

Figure 7. Effect of Aerosil thickener on the Flexural modulus of unsaturated polyester resin

When the results obtained are examined, Aerosil thickener added to the unsaturated polyester resin was an important factor in increasing the flexural modulus of the composites. Sequeira et al [21] investigated the mechanical properties of fumed silica filled (1% and 2% FS) composites with glass fibre reinforcement to polyester resin. In their study, they found that the flexural strength and flexural modulus of the composites increased. The reason was explained by the large surface area of fumed silica (particle size of approximately 12 nm), which allowed it to bond well with the matrix and increased the load carrying ability of the composite.

Figure 8 shows the variation of the deformation rate in bending of unsaturated polyester composites with 1,2 and 3 wt% Aerosil thickener additions according to the Aerosil additive ratio. When the figure is examined, the deformation rate of unsaturated polyester resin in bending is observed as 5.5%, while the deformation rates of composites containing 1,2 and 3wt.% Aerosil are observed as 5.4%, 6% and 3.7%, respectively.

The variation of hardness values of unsaturated polyester composites with 1, 2 and 3 wt.% aerosil thickener additions according to Aerosil additive ratio is given in Figure 9. In the figure, the hardness value of pure unsaturated polyester resin is 27.4 Barcol. However, it is seen that the hardness of the composites decreases with Aerosil additive added to the polyester matrix compared to pure polyester. Compared to the hardness of the pure polyester matrix, the hardness of the composites with 1, 2 and 3wt.% Aerosil thickener added decreased by 28.8%, 20.8% and 18.6%, respectively. However, while the hardness of the composite with 1wt.% Aerosil additive was 19.5 Barcol, when 1wt.% and 2wt.% Aerosil was added, hardness values increased by 11.2% and 14.3% compared to UP-1wt.%A composite hardness. Majeed et al[26] determined the Shore D hardness of unsaturated polyester as approximately 65 in their study with fumed silica, while the hardness values were determined as approximately 85, 85 and 75 with the addition of 1wt.%FS, 2wt.%FS and 3wt.%FS.

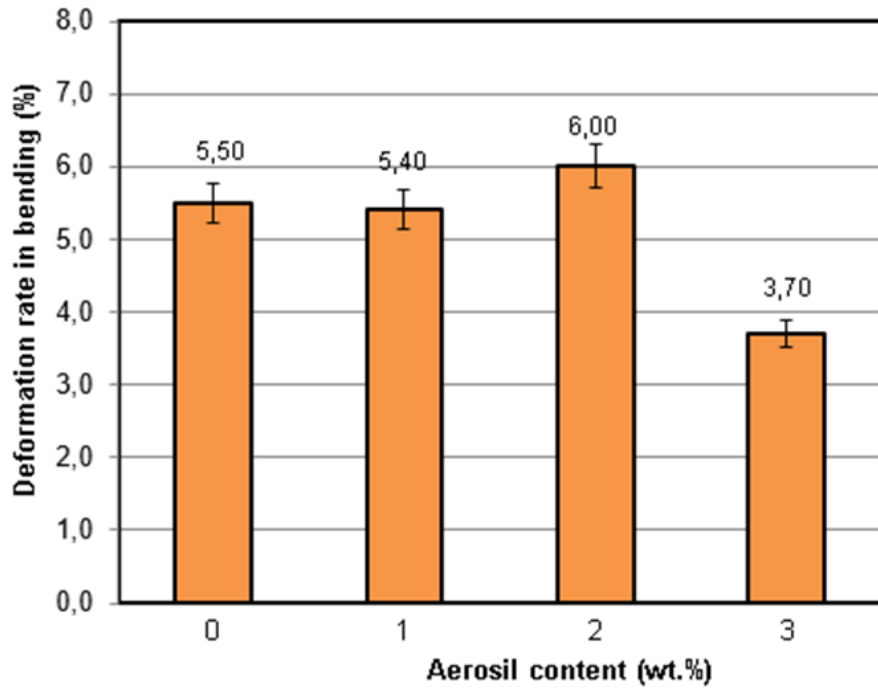

Figure 8. Effect of Aerosil thickener on the deformation rate of unsaturated polyester resin in bending

Figure 9. Effect of Aerosil thickener on the hardness of unsaturated polyester composites

Figure 10. Scanning electron microscope image of the fracture surface of unsaturated Polyester composites filled with Aerosil at different ratios after bending test.

Figure 10 shows the fracture surface scanning electron microscope images of polyester composites filled with different ratios of Aerosil thickener. Figure 10a shows the fracture surface images of pure polyester, Figure 10b shows 1wt.% Aerosil composite, Figure 10c shows 2wt.% Aerosil composite and Figure 10d shows 3wt.% Aerosil filled composite. While almost similar deformed structure is observed in the images given in Figure 10a,b,c, in the microstructure image given in Figure 10d, it is observed that there are both pores in the matrix and embrittlement, that is, a smoother surface is formed.

Conclusions

The following conclusions were drawn from the study investigating the mechanical properties of UP/Aerosil composites.

1. The highest flexural strength (122 MPa) was obtained in UP/1wt.%erosil composite. Compared to the flexural strength of pure polyester, a 16.1% increase in flexural strength was observed.
2. UP/1wt.%Aerosil composite, the highest flexural modulus (3510 MPa) was obtained. Compared to the flexural modulus of pure Polyester, the flexural modulus of the composite with 1wt.% Aerosil additive increased by 50.6%.
3. The deformation rate of UP/1wt.%A and UP/2wt.%A composites with pure polyester varied between 5.4% and 6%, while the deformation rate of UP/3wt.%A composite was determined as 3.7%.
4. An increase in hardness values was observed when the Aerosil thickener additive ratio was increased by 1wt.%, 2wt.% and 3wt.%. Hardness values were determined as 19.5, 21.7 and 22.3 Barcol, respectively, depending on the increase in the additive ratio. However, the hardness values obtained with Aerosil additive are lower than the that of pure polyester (27.4 Barcol).
5. Aerosil additives of 1wt.%, 2wt.% and 3wt.% added to the main matrix decreased the fluidity of the resin and caused a significant increase in viscosity.
6. Scanning electron microscope examinations revealed both a smooth surface and pores in the matrix indicating brittleness in the UP/3wt.% Aerosil composite.

Abstract

Thermoset-based composites are encountered in many stages of daily life and in industry. Among these, polyester and epoxy polymers show themselves in many areas from the aircraft and space industry to the construction industry, energy and maritime applications. However, composites are produced by adding some reinforcements and fillers to improve their weak properties. The additives added to the matrix structure in composites have a significant effect on the properties of the composite material. In this experimental study, the effect of basalt powder and silica fillers added to the unsaturated polyester (UP) resin as filling material on the mechanical properties of the composite was investigated. Basalt powder with a particle size of 250 μm and silica filler with an average particle size of 250 μm were added to the unsaturated polyester base matrix at 20 and 30 wt%. Basalt and silica added composites were produced by resin casting method. The mechanical properties of basalt and silica filled composite materials such as flexural strength, flexural modulus, deformation rate in bending and hardness were investigated. As a result, an increase was observed in the flexural modulus and hardness values of the composites depending on the basalt and silica filler content, while a decrease was observed in the flexural strength and deformation rates in bending. When the basalt filler was compared with the mechanical properties, higher flexural strength, flexural modulus and hardness values were obtained with silica filler. Lower values were obtained in the deformation rate in bending. Fractured surface microstructure investigations of silica and basalt filled UP composites were carried out using scanning electron microscopy.

Introduction

Polymer materials are one of the indispensable materials of daily life with their lightness, ease of production, resistance to chemicals, colourability, transparency, and price/performance features. However, they also have disadvantages such as low mechanical properties, low thermal resistance, and low mould shrinkage. To improve these disadvantages, various additives are added to polymer matrix materials. These are sometimes fibres (such as glass fibre, carbon fibre, aramid fibre, etc.) and sometimes mineral additives (glass bead, talc, kaolin, CaCO_3 , silica, basalt, mica, etc.). Composite materials are produced by adding reinforcements, additives, and fillers to the main matrix at different ratios. Composites are the modern engineering materials of recent years. Compared to polymer, metal, and ceramic materials, they stand out in the industry with their low density, good mechanical properties, light weight, high wear resistance and resistance to chemicals. Composites consist of at least two components. One of them is the matrix and the other is the reinforcement, additive or fillers. The size, shape, distribution, and properties of additives affect the properties of composites [1,2].

Basalt is an environmentally friendly material and is non-toxic to living things [3-7]. Basalt has almost no heat conduction and is resistant to acidic, alkaline, and salty environments. The physical and chemical stability of basalt powder (BS) against the biological environment does not adversely affect the environment and does not harm live things [8]. In general, the hardness and high temperature (900°C) resistance of basalt probably comes from the silica in its structure. In addition, it has sound resistance and sufficient toughness. While there are many studies on silica filled polymers, there are also many studies on basalt fibre [9-17], but there are few studies on basalt powder fibre [18-21]. This experimental study was carried out to shed more light on the literature and to investigate the effect of basalt powder and silica filling on the mechanical properties of the composite produced when added to the polyester matrix.

In this experimental study, the mechanical properties of polyester composites with 20% and 30% basalt powder and the same proportions of silica additives were investigated. Bending strength, flexural modulus, stiffness, and deformation rate properties were investigated.

Experimental

Materials

In the study, basalt powder and silica were used as additives while unsaturated polyester (UP) thermosetting resin was used as the main matrix material. The matrix material is terephthalic based unsaturated polyester resin which is widely used in the pipe industry. The unsaturated

polyester resin used in the experiments is in liquid form and was purchased from Boytek/Istanbul,Türkiye. The silica used as additive material has an average particle size of 250 µm and was purchased from Kumsan Company from Istanbul. The sieve analysis of the silica additive was performed, and the results of the sieve analysis are given in Table 1 below.

Basalt powder used as a different additive material has an average particle size of 250µm. Sieve analysis of the basalt powder additive was also performed, and the results of the sieve analysis are given in Table 2 below. Basalt powder was obtained from Aydınlar Mining/Bursa/Turkey. Methyl Ethyl Ketone Peroxide (MEK-P) crosslinked agent was added to the resin at the rate of 2% to produce thermoset based composite. In addition, 1% cobalt octoate was added to accelerate crosslinking.

Preparation of UP based composites

UP based thermosetting polymer composites with different proportions (20wt% and 30wt.%) of basalt and silica powder additives were produced using silicone mould casting technique. For this purpose, first a thickener was added to the polyester resin and then basalt powder and silica additives were added at 20% and 30% by weight. Table 3 shows the recipe of the materials used in the experiments. The viscosity of liquid polyester resin in its pure form is around 400 mPa.s. To use it in composite production, the viscosity of the liquid polyester resin needs to be adjusted. For this purpose, a 2wt.% thickening additive was added to the resin and mixed in a mechanical mixer.

The viscosity of the liquid polyester resin with added thickener reached around 900 mPa.s. Basalt powder and SiO₂ were added to the prepared resin at different ratios and mixed in a mechanical mixer rotating at 650 rpm for 60 minutes. Methyl-ethyl ketone-peroxide (MEK-P) was added to the resin for crosslink formation and mixed for 30 seconds. The prepared mixture (with the addition of silica and basalt powder) was immediately cast into silicone moulds to prevent the polyester resin from settling. Flexure and hardness test specimens were produced by casting into moulds prepared in accordance with ISO standard. The cast specimens were kept at room temperature for about 8-10 hours. The composite production stages in the experiments are schematically shown in Figure 1. The test specimens were kept in an oven at 80 °C for 5 hours to complete crosslinking. Before the tests, the test samples were conditioned in a climate-controlled environment for 3 days.

Mechanical Tests

Flexural Tests

Test specimens for flexural tests were made in accordance with ISO 14125 (ISO178) standards. Flexural tests of silicon dioxide doped unsaturated polyester composites were carried out on a Zwick Roell brand Z250 model universal tensile testing machine. A schematic view of the flexure test rig is given in Figure 2. Bending tests were carried out under ambient conditions at a bending speed of 5 mm/min. At least five test specimens were tested in flexural tests. The data obtained because of the test were recorded in computer environment. The data used in the experiments are the arithmetic mean of the data obtained in the bending test of five test specimens. Standard deviations were also determined. The figures in the experimental results section of the study are drawn according to the average values obtained on the device. The flexural strength of the composite materials produced was calculated using the formula below. All distances in the formula are taken in mm.

$$\sigma = \frac{3PL}{2bh^2}$$

In the equation given above, P is the load applied to the test specimen (N), L is the distance between two supports (span), b is the specimen width and h is the specimen thickness.

In addition, the deformation rate of composite materials during bending test was calculated using the following formula.

$$\varepsilon = \frac{6Dh}{L^2}$$

In the above equation, all distances are given in mm. In the equation, ε is the deformation rate or strain rate (%) in bending, D is the maximum amount of bending of the centre of the test specimen, h is the thickness of the test specimen and L is the span or distance between the two supports.

Figure 2. Schematic test rig for three-point bending test (ISO14125)

Flexural tests were carried out in a climate-controlled test environment under room temperature of 23 °C and 50% humidity conditions.

Hardness Test

Hardness test was performed in accordance with ASTM D2583 standards. Hardness measurements were measured in terms of Barcol hardness. Hardness measurements were made from at least ten different points of the test specimens and Barcol hardness was measured by taking the arithmetic mean of these values.

SEM Microstructural Investigations

The fracture surface microstructure examinations of the specimens taken after the test specimens were broken because of the bending test were carried out using a JEOL scanning electron microscope (SEM). The fractured surfaces were saw cut to the appropriate dimensions for SEM and then coated with gold by spraying method in a thin layer in the coating device.

After coating, microstructure examinations were carried out in the SEM device at an accelerating voltage of 10KV.

Results And Discussion

Figure 3 shows the variation of flexural strength of unsaturated polyester composites filled with different ratios of basalt powder and silica as a function of silica and basalt powder filler ratio. As can be seen in the figure, very little change was observed in the flexural strength of composites with 20wt.% and 30wt.% silica additives. In other words, compared to the flexural strength of pure polyester, the flexural strength of 20wt.% and 30wt.% silica filled polyester composites decreased slightly by 2.2% and 0.1%. However, the flexural strength of polyester composites filled with 20wt% and 30wt.% basalt powder decreased by 16.9% and 18.9%.

Flexural modulus of unsaturated polyester composites filled with 20wt% and 30wt.% basalt powder and silica is given in Figure 4. As can be clearly seen in the figure, the modulus of elasticity values of the composites produced increased significantly due to the increase in both basalt powder and silica additive ratio. The highest increase in flexural modulus was observed in SiO₂ filled composite material. Compared to pure polyester, the increase in flexural modulus was 65.8% and 155.9% for composites filled with 20wt% and 30wt.% SiO₂, respectively. Flexural moduli increment of basalt powder filled composite material was lower than SiO₂ filled composite material. Compared to the flexural modulus of pure polyester, the increase in flexural modulus was determined as 40% and 61.8% for composites with 20wt.% and 30wt.% basalt powder additives, respectively. In other words, when the flexural modulus changing of basalt powder filled composites and SiO₂ filled composites were compared, the flexural modulus values of the composites containing basalt powder were lower. This decrease was 15.5% and 36.9% for 20% and 30% filling rates, respectively.

Figure 3. Variation of flexural strength of unsaturated Polyester composites containing different proportions of silica and basalt powder

Figure 4. Variation of flexural modulus of unsaturated polyester composites filled with different proportions of silica and basalt powder.

Figure 5 shows the variation of the deformation ratio of unsaturated polyester composites filled with silica and basalt powder at different ratios with respect to silica and basalt powder filler ratio compared to pure polyester. As can be seen in the figure, the change in the deformation

ratio in the silica filled composite decreased with increasing SiO₂ filling ratio. This decrease was 37.9% and 55.1% for 20% and 30% SiO₂ filler, respectively. The change in deformation rate in basalt powder doped composites first decreased and then increased depending on the basalt powder filler rate. Compared to pure polyester, the decrease in deformation rate for 20wt.% basalt powder filled composite was 27.5% while the decrease in deformation rate for 30wt.% basalt powder filled composite was 13.8%. The maximum reduction in deformation rate was obtained in the SiO₂ doped composite. Compared to the basalt powder filled composite, the change in deformation rate for composites with 20wt.% and 30wt.% SiO₂ filler was 14.2% and 48% respectively. The composite materials become brittle as the SiO₂ and basalt powder added to the polyester resin increases. UP/SiO₂ composite was more rigid than UP/BP composite.

Figure 5. Variation of deformation rate in bending of unsaturated polyester composites filled with different proportions of silica and basalt powder.

Figure 6. Variation of hardness of unsaturated polyester composites doped with different proportions of silica and basalt powder.

The variation of hardness of unsaturated polyester composites filled with different ratios of SiO₂ and basalt powder with respect to silica and basalt powder filler ratio is given in Figure 6. The hardness of composites filled with SiO₂ and basalt powder at different ratios of 20wt.% and 30wt.% increased proportionally. Compared to the hardness of unsaturated polyester, the hardness of basalt powder filled composite increased by 12.1% and 22% for 20wt.% and 30wt.% basalt filled composites, respectively. The hardness of SiO₂ filled composites increased by 25.8% and 46% for 20wt.% and 30wt.% SiO₂ filled composites, respectively. The SiO₂ filler added to the polyester caused the hardness of the composite to increase more. Compared to the hardness of the basalt powder filled composite, the hardness increases of the SiO₂ filled composites were 12.2% and 19.6% for 20wt.% and 30wt.% filler rates, respectively. The mechanical properties of 20wt.% and 30wt.% basalt and SiO₂ filled composites are given in Table 4.

Table 4. Mechanical properties of basalt and silica filled composites.

Materials	Flexural strength, MPa	Flexural Modulus, MPa	Deformation ratio (%)	Hardness (Barcol)
UP	63.9±16.3	2020±424	2.9±0.55	26.3±2.3
20BP/UP	53.1±8.9	2830±634	2.1±0.39	29.5±2.9
30BP/UP	51.8±11.9	3270±959	2.5±0.51	32.1±2.4
20Si/UP	62.5±5.2	3350±213	1.8±0.19	33.1±2.8
30Si/UP	63.8±6.6	5170±786	1.3±0.28	38.4±3.1

The fracture surface microstructure investigations of 20wt.% SiO₂ and basalt powder filled polyester composites were carried out by scanning electron microscopy and the microstructure images are given in Figure 7. Figure 7a,b shows the microstructure images of SiO₂ filled unsaturated polyester composite and Figure 7c,d shows the microstructure images of basalt powder filled unsaturated polyester composite. In Figure 7b, further magnification was used to investigate whether the SiO₂/polyester composite has good silica bonding to the polyester matrix. As seen in the figure, although there is good interfacial bonding in some regions, it is observed that the interfacial bonding is not good in some regions.

Figure 7. Scanning electron microscopy surface image of the fractured surface of UP composite filled with 20% SiO₂

Conclusions

The following conclusions were drawn from the study investigating the mechanical properties of UP/SiO₂ and UP/BP composites.

- Compared to pure polyester, the flexural strengths of 20wt.% and 30wt.% silica filled polyester composites decreased by 2.2% and 0.1%. However, the flexural strength of 20wt.% and 30wt.% basalt powder filled polyester composites decreased by 16.9% and 18.9%.
- The flexural modulus values of basalt powder filled composites were lower than SiO₂ doped composites. This decrease was 15.5% and 36.9% for 20wt.% and 30wt.% doping rates, respectively.
- The maximum reduction in deformation rate was obtained in the SiO₂ filled UP composite. Compared to the basalt powder filled composite, the change in deformation rate for composites with 20wt.% and 30wt.% SiO₂ filler was 14.2% and 48% respectively.

- The hardness of the composites filled with SiO₂ and basalt powder at different rates of 20wt.% and 30wt.% increased proportionally. Compared to the hardness of basalt powder filled composite, the hardness increases of SiO₂ filled composites were 12.2% and 19.6% for 20% and 30% filler rates, respectively.

Özet

Kültür, bir toplum içerisinde bulunan duyuş, düşünüş birliğini oluşturan, gelenek durumundaki yaşantısını aktaran yapının genel adlandırmasıdır. Bu yapı aynı ortamı paylaşan bireylere kendi içinde çeşitli roller vererek topluluğa dahil eder. Birey, çevrenin ona verdiği rollere uyum sağlar. Aksi durumda -toplumun normlarının dışına çıktığında- toplumsal bir dışlanma ile karşı karşıya kalır. Çalışmanın metin örneklerinin kullanıldığı köy oda oyunları, geleneksel köy hayatında bireyin toplum içinde yapamayacağı şakaları, söz ve davranışları Freud'un terimiyle "id" ini ortaya çıkarma ve rahatlama alanının yaratıldığı ortamlardır. Her türlü resmi konum alaşağı edilir ve hiyerarşi tepetaklak edilir. Oyuna katılmak gönüllülük gerektirir. Oyun kurallarını kabul etmeyen ve oyun yöneticisi tarafından seçilmeyen oyuncular oyuna dahil edilmez. Böylece oyun yeri ve oyuncular bağlamdaki oyuna özel hale getirilir. Oyun an'ı ve normal hayat birbirinden ayrılır. Kolektif bilinç, bireyin baskıladığı duygu ve dürtülerini günlük yaşamda sergilemesine müsaade etmez. Ancak oyunların mekânsal bir sınırlılığının olması, bireyin oyun mekânında rahatlamasına imkân verir. Toplumsal normlar "ego" ve "süperego" ile bireyin kişiliğini sıkıştırır ve ona geleneğin kuralları çerçevesinde bir yaşam sunar. Buradan hareketle, çalışmada köy oda oyun metinlerindeki cinsellik, id ego ve süperego kavramları Freud'un psikanalitik çözümleme yöntemine göre incelenecektir. İncelenecek olan oyun metinleri Ezgi Metin Basat'ın *Köy Oda Oyunları ve Folklorun Tiyatrallığı* başlıklı çalışmasından alınacaktır.

Anahtar Kelimeler: Köy Oda oyunları, id, ego, süperego, psikanaliz.

**EVALUATION OF GULEF AND MUSALLAR VILLAGE CHAMBER GAMES IN
THE CONTEXT OF ID, EGO, SUPEREGO***

Abstract

Culture is the general designation of the structure that creates the unity of perception and thought in a society and conveys its traditional life. This structure includes individuals who share the same environment in the community by giving them various roles. The individual adapts to the roles given to him by the environment. Otherwise, when he goes beyond the norms of the society, he is faced with social exclusion. Village chamber games, in which the text samples of the study will be used, are environments where the jokes, words and behaviors of the individual in the traditional village life are created in Freud's term, "id" and relaxation area is created. The fact that the games are played in different environments for "female" "male" brings spatial comfort. The sexist approach of the society does not allow the suppressed emotions and impulses of the individual to come to the surface. The social structure always compresses the personality of the individual with the "ego" and often the "superego". In this study, the concepts of sexuality, id, ego and superego in the village room play texts will be examined according to Freud's psychoanalytic analysis methods.

Keywords: Village Chamber games, id, ego, superego, psychoanalysis

Giriş

Psikanaliz kavramı 19. yüzyılda Sigmund Freud tarafından ortaya çıkarılmıştır. Psikanaliz kelime anlamı olarak ruh (psyhke) ve çözümleme (analysis) anlamına gelmektedir. Psikanalizin temel amacı kişiliğin gelişim sürecindeki basamakları incelemektir. Gelişimdeki bu basamaklarda meydana gelen değişimler ve anormal tepkilerin kökeninde yatan sebepleri araştırır.

Psikanalitik kuramda öne çıkan bazı kavramlar vardır. Bu kavramlar kişiliğin gelişiminde oldukça önemlidir. Kavramlar, bilinç, ön bilinç, bilinçdışı, İd, Ego ve Süper Ego'dur. Freud, kişiliğin gelişimini evrelere ayırarak incelemiştir. Bunlar, Oral dönem, Anal Dönem, Fallik dönem, Latent dönem ve Genital dönemdir. Birey, kişiliğin gelişiminde bu dönemlerden herhangi birinde bir sıkıntı yaşarsa bazı savunma mekanizmaları geliştirir. Freud, edinilen savunma mekanizmalarının çocukluk döneminde ortaya çıktığını belirtmiştir. Çünkü bu dönemde çocuk, ebeveynlerine karşı bazı yönelimlerde bulunur. Kız çocukları anneyi rakip olarak görmekte ve babaya karşı bir hayranlık beslemektedir. Erkek çocukları ise anneye hayranlık duyup babayı kendisine rakip olarak görmektedir.* Ancak çocuğun içinde bulunduğu toplumsal yapı onun bu tür yönelimlerini hoş karşılamayacaktır. Çocuk da bu duygularını ego ve süper egonun gölgesinde tutarak bastırma yolunu tercih eder. Bu bastırma işlemi ancak kendisine rahatlamak için uygun bir mekân bulduğu anda tekrar eder. Bastırmanın ortadan kalktığı anları Bakhtin, karnaval tanımıyla açıklamıştır: Her türlü resmi konum ve ciddiyete yönelik alay, tüm hiyerarşilerin tepetaklak edilmesi, davranış kurallarının küfür, müstehcenlik, aşağılama, kabalıkla ihlali, bedensel iştahlara yönelik tüm aşırılıkların kutlanması biçiminde kendini dışa vuran bir halk bilincinin mekânıdır karnaval meydanı. (2001: 24).

Toplumsal baskılamanın yoğun olduğu kolektif yaşam ortamı olan köylerde, karnavalvari rahatlamamanın adresi köy oda oyunlarında bulunmaktadır. Kadınların ve erkeklerin ayrı ayrı oynadıkları ve oyun mekânının sadece hemcinslerine açık olması kadınlarda ve erkeklerde bastırılan dürtülerin açığa çıkacağı bir alan açmaktadır. Çalışmada bu oyunların içeriği psikanalitik bakış açısıyla değerlendirilecektir.

Psikanaliz Nedir?

Psikanaliz kavramı S. Freud tarafından kullanılmıştır. Psikanaliz, kişiliğin gelişimini ve bu gelişim aşamalarını inceler. Freud, psikanaliz kuramının temellerini hastalarıyla yaptığı

görüşmeler sonucunda atmıştır. Hastaların patolojik davranışlarının altında yatan sebepler, psikanaliz kuramının gelişimine destek olmuştur.

Psikanaliz, ruh (psykhe) ve çözümleme (analysis) sözcüklerinden oluşup, “ruh çözümlemesi” anlamına gelmektedir. Kavram için çeşitli tanımlamalar şöyledir: S. Freud tarafından 19. yüzyılın sonlarında ileri sürülen ve giderek yaygın kullanım alanı bulan; serbest çağrışım, telkin ve aktarım yöntemiyle nevrozların iyileştirilmesi temeline dayanan psikolojik tedavi yöntemidir. (Acar- Demir 1997:187).

Felsefe sözlüğünde Ahmet Cevizci ise psikanalizi: Özel olarak, Freud’un düşünce, çalışma ve eserleriyle birleştirilen psikoloji ve ruhsal tedavi anlayışı, genel olarak da Breuer ve Freud’un 1880 ve 1890’lı yıllardaki araştırma ve düşüncelerinden ortaya çıkan psikoloji akımı (1999:716) olarak tanımlamıştır.

Freud, ruhun topolojik yapısını incelemiştir. Zihni ilk olarak iki bölümden oluştuğunu ifade etmiştir. Bunlar, “bilinç” ve “bilinçdışı”dır. Freud, bu kavramlara Olgu Öykülerinde “Sıçanadam” olarak adlandırdığı nevrozlu hastasını incelerken ulaşmıştır. Daha sonraki incelemelerinde ruhsal aygıtı üç bölüme ayırır: Bilinç, ön bilinç ve Bilinçdışı. Freud’ a göre bilinç, bireyin o an farkında olduğu her türlü duyum ve yaşantılarının bulunduğu yerdir. Freud’a göre ruhsal yapı bir buzdağına benzemektedir. Buzdağında suyun üst kısmında görülen ve buzdağının ufak bir kısmını oluşturan yer bilinçtir. Suyun altında kalan ise bilinçdışıdır. (2022:76-77). Bu açıdan bakıldığında ruhun en önemli yeri bilinçdışıdır. Bireyin farkında olmadan sakladığı anı ve duyguların bulunduğu yer burasıdır. Bu kısımda istekler, dürtüler, korkular kısacası “id” in hâkim olduğu bir alandır. Bu alandaki duygular rüya yoluyla ortaya çıkar. Çünkü bastırılan bu dürtülerin günlük yaşamda ortaya çıkması bireyi olumsuz etkileyecektir.

Freud, incelemesini bir adım daha ilerletir ve kişiliğin yapısını üç ayrı evreye ayırır: İd (Haz İlkesi), Ego (Gerçeklik İlkesi) ve Süper Ego (Ahlak İlkesi).

İd (Haz İlkesi)

Bilinçaltında bulunan, bireyin içgüdülerini kapsayan, doğuştan gelen dürtüleri içerir. Nasıl ki bir bebek davranışlarının doğru mu, yanlış mı olduğunu sorgulamazsa id de bu tür sorgulamalara girişmez. Bireyin bu güdüleri kaybolmaz, doyurulmak ister. Çünkü bu bölümde boşalım arayan bir enerji vardır. Ancak bu boşalım gerekli şartlar sağlandığında ortaya çıkar. Freud, *dış gerçekliğin direnciyle sınırlandırılmayan, çaresizlik taleplerine kayıtsız, hiçbir mantık hatasıyla hükmedilemeyen id, esas olarak üretilen içgüdüleri doğrudan ifade eden*

birincil süreç olarak adlandırdığı şey tarafından yönetilir (2022:22) söylemiyle id'e bir açıklama getirir.

Freud, kültürel olayları incelemesine olanak sağlayan temel öncülü "süblimasyon" olarak adlandırır. Freud, bireydeki bastırılmış dürtülerin saklanması bu kavramla açıklamıştır. Süblimasyon, engellenmiş, sosyal açıdan doğru olarak kabul edilmeyen arzu ve isteklerin toplumsal yönden kabul edilebilir kanallara yönlendirilerek tatmin edilmesidir. Köy Oda Oyunları'nda, sosyal yaşam alanlarında sergilenemeyecek tavır ve davranışlar oyun anında meydana çıkar. Oyuncuların bu tavır ve davranışlarını Huizinga'nın oyun kavramına atıf yapılarak değerlendirilebilir: *Oyunun mekânsal sınırlılığı, zamansal sınırlılığından da çarpıcıdır. Her oyun ister maddi veya hayali ister keyfe göre saptanmış veya zorunlu olmuş olsun, önceden belirlenmiş kendi mekânsal alanının sınırları içinde cereyan eder.* (2006:27). Bu özel mekân içerisinde oyun başlar başlamaz gerçek yaşamdan kopuş yaşanır ve oyundaki her davranış "oyun" ve "oyunlaştırılmış mekâna" özel hale gelir. İd, bu mekânda istediğini yapma özgürlüğü kazanır. Çünkü oyuncular şöyle der: "*Oyunda küslük olmaz*". Yani her şey oyunun bir parçası gibi algılanmalıdır. Bastırılan dürtüler açığa çıkar ve oyun bitene kadar devam eder. Sosyal ortam davranışı yargılamaz. Oyunun bir parçası kabul eder. Oyunlarda yapılan esprilerin bilinçdışı ilişkisine bakıldığında da oyunlarda yapılan esprilerin alt metninde *esprili yargının içimizde ürettiği psikolojik tepki ve komedi duygusu, gerçeğin keşfedilmesi zincirine bağlıdır* (2022:12) açıklaması aranmalıdır. Bilinçdışının bastırıldığı, özellikle oyunlarda açığa çıkan cinsiyet ve cinsellik üzerine söylenen esprilerin olduğu görülür. Yapılan bu espriler bastırılmış (bilinç dışının) duygunun dışı vurumu olarak değerlendirilebilir.

Ego (Gerçeklik İlkesi)

Ego, Latince de "ben" demektir. Ego, İd ve dünya arasında arabulucu niteliğe sahiptir. Mantığa dayalı kararlar verir. Kimliğe hitap eden zevk ilkesine aykırı gerçeklik ilkesi olarak adlandırılır. Kendini korumak için hazzı geciktirme ihtiyacı, yerine getirilmeyen arzuların yarattığı endişeyi engellemek amacıyla yavaşça öğrenilir. Freud'un savunma mekanizmaları olarak adlandırdığı şey, olası çatışmalarda başa çıkmak için ego tarafından geliştirilir. (2022:23).

Köy Oda Oyunları bağlamında değerlendirilirse, birey kolektif yaşamında farklı cinsel yönelimlerini ve tercihlerini açıkça ifade edemez. Yönelimlerini ve dürtülerini "ego" ile kontrol altında tutar.

Süper Ego (Ahlak İlkesi)

Süper Ego yani üst ben, kişiliğin doğru ve yanlışları hakkında sosyal çevreyi izleyen bir yapıya sahiptir. Süper Ego, dünya görüşünün, normlarının anne ve babaların ve çevresinin yapıp

etmelerini erken yaşta içselleştirmesi üzerine kurulur. Bu son bileşen toplumun ahlaki emirlerinin içselleştirilmesiyle gelişim gösterir. Sadece kısmen bilinçli olan süperego, kimliğinde egoya karşı içe dönük olan ve suçluluk duygusu oluşturan belirli agresif unsurları ödünç alarak cezalandırma gücünün bir kısmını kazanır (2022:24).

İncelenen köy da oyunlarının, oyuncularını kolektif bilincin hâkim olduğu, bilinçdışının sürekli baskılandığı bir ortamda gerçekleşir. Bu durumda süper ego fazlasıyla gelişmiştir. Oyunlara, karşı cinsten kimse katılamaz/izleyemez. Mekân kapalı bir alandır. Çünkü toplum oyundaki davranışları “ayıp” olarak değerlendirir ve oyun bittiğinde aynı davranışlar sergilense kabul edilir olmaktan çıkacaktır.

Kısaca tanımları verilen kavramlar, oyun metinlerinde tespit edilen noktalarla örneklendirilerek açıklanacaktır.

Köy Oda Oyunları, şimdiki an’ı oyun mekânına dönüştürür. Mekânın kişiliğinin bastırılan bölümünü nasıl rahatlattığını Victor Turner “eşik” kavramı ile açıklamıştır: *eşiksellik toplumsal yapının, “yapısız”, hatta “antiyapı” alanıdır. Anti- yapı”nın ayinselleşmiş “kaos”u, “normal” kimlik ve rollerin tersyüz edilmesini gerektirir.* (Metin Basat 2022:56).

Fotoğraf24: Yüzük Oyunu’ndan sonra kurulan beş ayaklı masa¹*Yüzük Saklama Oyunu:*

Oyun bir nesnenin saklanması ve bulunması üzerine kurgulanmıştır. Oyun sırasında Tahir Ahmetbeşeoğlu, elindeki sopayla seyircilere ve yüzük arayanlara vurur. “Beş ayaklı masa oluşsun hemen” diyerek bağırdı ve yenilen grubun sedirde oturan oyuncularını hızlı bir biçimde kendilerini yere atıp sırtlarını birleştirerek bir masa oluşturdular. (...) Bu arama beş ayaklı masayı oluşturan oyuncularını sazı olarak kullanmasıyla bitti. Sazını akort yapmak için sırtlarına

bindiği oyuncuların kulaklarını bükerek ayar sesi yaptı. Bazen oyuncuların canlarını yaktı. (Metin Basat 2022:108). Eril bir ortamda oynanan bu oyunda erkeklerin vücutsal temasları, şiddetin ön planda olması ve bu davranışların komik unsur haline gelmesi özel alanda ortaya çıkan bastırılmış dürtülerin açığa çıktığının bir göstergesidir.

Duvar Örne Oyunu: Muhtar rolündeki oyuncu duvar örmek ister. Oyuncular arasından taş rolünü alacak kişiler seçilir ve duvar örme işlemi yapılır. Bu arada taşları oluşturan oyuncuların boyları farklı olduğu için çırağına “bu taşı biraz kaldıralım” dedi ve ayakları ve kalçası arasına tahtalar konuldu. Bu oyuncuların canını acıttı. Arada “bu taş biraz uzun” diyerek çekiçle tahtanın üzerinden oyuncuların kafasına vurdu. (Metin Basat 2022:109). Duvar örme oyununda da “insan bedeni üzerinden yapılan şakalar” ön plandadır. Köyün sosyolojik yapısı insan bedenini özgürce tanımak için imkân vermemektedir. Ne var ki bastırılan dürtüler rahatlama anında ilksel formda ortaya çıkmaktadır.

Fotoğraf 20: Kız Satma/Kız Kaçırma Oyunu²

Kız Satma/Kaçırma Oyununda, köyde yoksul bir adamın karısı öldükten sonra kızlarını zengin kişilerle evlendirme macerasını konu alır. Elindeki süpürgeyi saz olarak kullandı. Kadın kılığına giren iki erkek oyuncu gelinleri canlandırdı. Erkek oyuncular etek giyiyor; kendilerine balon, elma gibi nesne ve meyvelerden göğüs yapıyor ve başlarına başörtüsü bağlayıp yüzlerini kapatıyorlardı. (...) Sonra birden kadınlar seyirciler arasında gözlerine kestirdikleri kişilerin kucağına oturdular. (...) Burada gelinlerin aniden seyircinin kucağına oturması seyirci tarafından büyük bir kahkahayla izlendi. (Metin Basat 2022:111). Kız Satma oyununda bastırılmışlığın ortaya çıkmasının yanı sıra cinsel yönelimde de bir farklılık söz konusudur.

Freud'un Cinsellik Üzerine adlı yapıtında çocukluk döneminden gelen cinsel yönelimlerdeki farklılığın/ sapmanın oyun kişilerinde de olabileceğinin belirtisini veren davranışlar sergilenmektedir.

Fotoğraf 26: Ahır Satma oyunu³

Yine *Berber Oyunun* da köpek rolündeki oyuncular, havlamalar eşliğinde sedirde oturan seyircileri bacaklarından yakalayarak yere düşürürler. (Metin Basat 2022: 111). Kadın oyunlarından *Dam Satma* oyununda kadınların para vermek yerine genital bölgelerini ve kalçalarını göstererek “önüm arkam kapı” (Metin Basat 2022:118) söylemleri sosyal hayatta yapamayacakları bir esprinin oyun mekânında ortaya çıktığını gösterir.

SONUÇ

Köy Oda Oyunları, bedensel dönüşümün performansla sunulduğu tiyatral özellikler gösteren bir türdür. Bedenin değiştirilip dönüştürülmesi tiyatral yapı için anormal bir şey değildir. Ancak oyunların cinsiyet bağlamında ayrı ayrı mekânlarda oynanması, oynanan alana karşı cinsten birinin dahil olmasına izin verilmemesi oyunlara ve bir anda oyun mekânına dönüşen mekâna psikanalitik bir yaklaşımı beraberinde getirmiştir. Çünkü içinde bulunulan toplum çocukluk döneminden itibaren “süper ego” nun gelişmesini destekler niteliktedir. Fakat bireyin kişiliğinin bir parçası olan “id” hep onunladır. Uygun bir an, mekân bulduğunda ortaya çıkmaya hazırdır. Çıkmaya da ihtiyacı vardır. Freud'un da ifade ettiği gibi bir “enerji”dir ve akış bulduğu yerde ortaya çıkamaya hazırdır.

Özet

Bu araştırmanın amacı ilkököl 2. sınıf öğrencilerine simülasyon destekli materyal ile öğretimin matematik dersi başarısına etkisini araştırmaktır. Bu araştırmanın yöntemi nicel araştırma yöntemlerinden yarı deneysel araştırma yöntemidir. Çalışma gruplarına ön test-son test deseni uygulanmıştır. Çalışma gruplarını, 2023-2024 sezonu Yozgat ili Aydıncık ilçesinde bulunan Şehit Bekir Şimşek İlkokuluna devam eden 2/A sınıfındaki 16 öğrenci ve 2/B sınıfındaki 22 öğrenci ile Samsun ili İlkadım ilçesi Maarif İlkokulu'na devam eden 2/A sınıfına devam eden 30 öğrenci ve 2/B sınıfına devam eden 33 öğrenci oluşturmaktadır. Her iki okulun 2/A şubelerinin ön test ortalaması 2/B şubelerine göre düşük olduğundan, 2/A şubeleri deney grubu, 2/B şubeleri ise kontrol grubu olarak seçilmiştir. 'Toplamı 100'e kadar olan doğal sayılarla eldesiz ve eldeli toplama işlemini yapar' adlı kazanımını deney grubunda simülasyon yöntemi ile, kontrol grubunda ise müfredatın önerdiği öğretim yöntemi kullanılmıştır. MEB matematik ders kitaplarında bulunan sorulardan seçim yapılarak dört alt başlık halinde bir başarı testi oluşturulmuştur. Bu başarı testi çalışma gruplarına bir hafta aryla tekrar uygulanmıştır. Veriler SPSS programı ile analiz edilmiş olup araştırma sonucunda simülasyon materyali ile öğrenim gören deney grubunun başarısının, müfredatın önerdiği yöntem ile öğrenim gören kontrol grubunun başarısına göre anlamlı düzeyde daha yüksek olduğu görülmüştür. Bu bulgular sonucunda MEB'in müfredatına simülasyon destekli materyal kullanımının eklenmesi önerilmektedir.

THE EFFECT OF SIMULATION TECHNOLOGY ON PRIMARY SCHOOL MATHEMATICS

Abstract

The purpose of this research is to investigate the effect of teaching simulation-supported material to primary school 2nd grade students on their mathematics course success. The method of this research is the semi-experimental research method, one of the quantitative research methods. Pretest-posttest design was applied to the study groups. The study groups consisted of 16 students in class 2/A and 22 students in class 2/B attending Şehit Bekir Şimşek Primary School in Aydıncık district of Yozgat province for the 2023-2024 season and 30 students in class 2/A attending Maarif Primary School in İlkadım district of Samsun province. and 33 students attending 2/B class. Since the pre-test average of 2/A branches of both schools was lower than that of 2/B branches, 2/A branches were chosen as the experimental group and 2/B branches were chosen as the control group. The learning outcome named 'Makes addition with and without carry with natural numbers whose sum is up to 100' was used with the simulation method in the experimental group, and the teaching method recommended by the curriculum was used in the control group. An achievement test was created under four subheadings by selecting questions from the MEB mathematics textbooks. This achievement test was re-applied to the study groups with a one-week interval. The data were analyzed with the SPSS program, and as a result of the research, it was seen that the success of the experimental group, which learned with the simulation material, was significantly higher than the success of the control group, which learned with the method recommended by the curriculum. As a result of these findings, it is recommended to add the use of simulation-supported materials to the curriculum of the Ministry of Education.

Keywords: Simulation, primary school, mathematics, technology

Giriş

Dünya'nın hemen hemen her yerinde öğrencilerin genelini matematik dersinde zorlandığı bilinmektedir. 1970 yılından itibaren Feierabend gibi bazı araştırmacılar öğrencilerin matematik dersine ait tutumlarını ölçmek için çalışsa da bu çalışmalar ayrıntılı olarak yapılmamıştır(García, Juárez, 2011). Türkiye eğitim sisteminde matematik öğretiminin amaçlarından biri de öğrencilerin matematiksel düşünme becerilerini geliştirip, genelleme, problem çözme, ilişkilendirme, akıl yürütme ve iletişim kurma gibi basit matematiksel becerileri ve bu becerilerle ilgili yeteneklerini gerçek hayatta karşılaştıkları problemlerinde kullanmalarını sağlamak yer almaktadır (Milli Eğitim Bakanlığı, 2013).

Türkiye de eğitim sistemine bakıldığında bu amaçların öğrencilere yeteri kadar kazandırılmadığı görülmektedir. Hangi yaşta ve sınıfta olursa olsun öğrencilerin özellikle matematik dersinde başarılı olamadıkları görülmektedir(Duran, Özden, & Yeşilyurt, 2023). 15 yaş öğrencilerin temel alanlarda öğrendiği kazanımları değerlendiren ve 2018 yılında gerçekleştirilen PISA (Programme For International Student Assessment) sonuçları bunu doğrulamaktadır. Araştırma sonuçlarına bakıldığında, OECD (Organization for Economic Cooperation and Development) ülkeleri arasında Türkiye matematik kazanımlarında yapılan sıralamaya göre 8 basamak ilerlese de 42. Sırada kendine yer bulabilmiştir (Milli Eğitim Bakanlığı, 2019). Öğrencilerin ülkemizde kazanım değerlerine bakıldığında ise 2023 yılı YKS sonuçlarına göre 2023-TYT'de sınava giren öğrencilerin temel matematik doğru cevap sayısı ortalamaları 8,218 ve AYT'de sınava giren öğrencilerin matematik testinin ortalaması 7,576 olarak belirtilmiştir. (Öğrenci Seçme ve Yerleştirme Merkezi, 2023).

Tüm bu sonuçlar karşısında son yıllarda Milli Eğitim Bakanlığı'nın bazı projeler ortaya koyduğu görülmektedir. Hızla gelişen teknolojinin eğitim öğretimi etkilemesi ve eğitim projelerinde yer alması kaçınılmaz bir durum haline gelmiştir. Matematik dersi öğretilirken kavramların soyut olmasından dolayı gerçek hayatta bu kavramların öğretilmesine yönelik uygun örnekler verilmesi güç olup teknolojinin ilerlemesi ile bu güçlük her geçen gün ortadan kalkmaktadır(Gök, 2019). Çünkü teknolojinin kullanım amacı eğitim öğretim gibi belirli bir durumun karmaşıklığını basitleştirmektir(Ulaşılmasının kolay olması ve maliyetinin düşük ve bazen de ücretsiz olmasından dolayı simülasyonlar eğitimde teknolojinin kullanımının en iyi örneklerinden biridir. Hızla gelişen teknoloji ile birlikte eğitim-öğretim metodlarındaki yeni arayışlar, matematik öğretiminin geleneksel yöntemlerle değil de animasyon ve simülasyonların kullanıldığı yöntemleri alternatif olarak ortaya çıkarmıştır (Gürbüz, 2007).

Ayrıca öğrenci merkezli olan simülasyon destekli yöntem uygulaması öğrencileri gerçek hayata hazırlayan ve hazırlarken de kazanımları yaparak ve görerek öğrencilere kazandıran ve öğrencilerin ilgisini artıran bir öğrenme ortamı sağlar(Demirel,2004; Miller,1987). Bu durumdan hareketle bu araştırmada öğrenci merkezli olan simülasyon destekli eğitimin öğrenci başarısına etkisi araştırılmıştır.

YÖNTEM

Araştırmanın Deseni

İlkokul 2. sınıf öğrencilerine simülasyon destekli materyal ile öğretimin matematik dersi başarısına etkisini araştırmak için yapılan bu araştırmada nicel araştırma yöntemlerinden ön test-son test modeline uygun yarı deneysel desen kullanılmıştır. Simülasyon ile desteklenen eğitim yöntemi ve Milli Eğitim Bakanlığı'nın önerdiği müfredatta yer alan yöntem bağımsız değişken olup öğrencilerin matematik başarısı bağımlı değişkendir.

Tablo 1: Araştırma Deseni

Gruplar	Ön Test	Uygulama	Son test
Kontrol Grubu	Başarı Testi	Meb Müfredat Yöntemi	Başarı Testi
Deney Grubu	Başarı Testi	Simülasyon Yöntem	Destekli Başarı Testi

Evren ve Örneklem

Araştırmanın çalışma gruplarını, 2023-2024 sezonu Yozgat ili Aydıncık ilçesinde bulunan Şehit Bekir Şimşek İlkokuluna devam eden 2/A sınıfındaki 16 öğrenci ve 2/B sınıfındaki 22 öğrenci ile Samsun ili İlkadım ilçesi Maarif İlkokulu'na devam eden 2/A sınıfına devam eden 30 öğrenci ve 2/B sınıfına devam eden 33 öğrenci oluşturmaktadır. Her iki okulun 2/A şubelerinin ön test ortalaması 2/B şubelerine göre düşük olduğundan, 2/A şubeleri deney grubu, 2/B şubeleri ise kontrol grubu olarak seçilmiştir.

Veri Toplama Aracı

Başarı testi soruları 4 alt başlık halinde Milli Eğitim Bakanlığı 2. Sınıf ders kitaplarından 'Toplamları 100'e kadar olan doğal sayılarla eldesiz ve eldeli toplama işlemi yapar' adlı kazanım konusundaki sorulardan seçilerek araştırmacılar tarafından başarı testi hazırlanmıştır.

Verilerin Analizi

Verileri analiz ederken SPSS programı kullanılmış ve ortalama, standart sapma, t-Testi ve f-Testi sonuçlarına bakılmıştır. Anlamlılık düzeyi 0.05 olarak belirlenmiştir.

BULGULAR

Öğrencilere uygulanan ön test sonuçlarına t-Testi uygulanmış olup veriler aşağıdaki tabloya aktarılmıştır.

Tablo 2: Ön Test T Testi Sonuçları

Okullar	Değişken	Gruplar	N	X	S	t	df	p
Şehit Bekir Şimşek İlkokulu	Başarı Testi	Deney Grubu1	16	48,56	28,46	-1,16	23,344	,258
		Kontrol Grubu1	22	57,90	17,74			
Maarif İlkokulu	Başarı Testi	Deney Grubu2	30	59,00	19,71	-1,13	61	,259
		Kontrol Grubu2	33	64,69	19,93			

Bağımsız örneklem T-Testi ön test sonucuna göre **birinci** örneklemden deney grubunun (ort.=48,56 ,SS.=28,46) ön test puanlarının aritmetik ortalaması kontrol grubuna(ort.=57,90 , SS.=17,74) göre daha düşük olduğu ve iki grup arasında anlamlı bir fark olmadığı sonucuna varılmıştır($p>,05$). İkinci örneklemden bağımsız T-Testi sonucuna göre ise deney grubunun (ort.=59,00 ,SS.=19,71) ön test puanlarının aritmetik ortalaması kontrol grubuna(ort.=64,69 , SS.=19,93) göre daha düşük olduğu ve iki grup arasında anlamlı bir fark olmadığı sonucuna varılmıştır($p>,05$).

Öğrencilere uygulanan son test sonuçlarına t-Testi uygulanmış olup veriler aşağıdaki tabloya aktarılmıştır.

Tablo 3: Son Test T Testi Sonuçları

Okullar	Değişken	Gruplar	N	X	S	t	df	p
Şehit Bekir Şimşek İlkokulu	Başarı Testi	Deney Grubu1	16	80,00	12,51	2,31	36	,027
		Kontrol Grubu1	22	69,09	15,55			
Maarif İlkokulu	Başarı Testi	Deney Grubu2	30	84,73	19,16	2,79	61	,007
		Kontrol Grubu2	33	70,33	21,56			

Bağımsız örneklem T-Testi son test sonucuna göre birinci örneklemdaki deney grubunun (ort.=80,00 ,SS.=12,51) son test puanlarının aritmetik ortalaması kontrol grubuna(ort.=69,09 , SS.=15,55) göre daha yüksek olduğu ve iki grup arasında anlamlı bir fark olduğu sonucuna varılmıştır($p<,05$). İkinci örneklemdaki son test bağımsız T-Testi sonucuna göre ise deney grubunun (ort.=84,73 ,SS.=19,16) son test puanlarının aritmetik ortalaması kontrol grubuna (ort.=70,33 , SS.=21,56) göre daha yüksek olduğu ve iki grup arasında anlamlı bir fark olduğu sonucuna varılmıştır($p<,05$).

Tablo 4. Ön Test Değişkenli Anova Testi Sonuçları

Değişken	Varyansın Kaynağı	Kareler Toplamı	sd	Kareler Ortalaması	F	p	η^2	Anlamlı Fark
Başarı Testi	Gruplararası	2840,186	3	946,729	2,148	,099	0,06	4>3>2>1
	Gruplarıçi	42750,725	97	440,729				
	Toplam	45590,911	100					

1=kontrol grubu1, 2=deney grubu1, 3=kontrol grubu2, 4=deney grubu2

Yukarıda öğrencilerin ön test puanlarının ANOVA sonuçları verilmiştir. Yapılan anova analizine göre yapılan ön test sonuçları arasında anlamlı bir ilişki olmadığı sonucuna varılmıştır, $F(3,97)=2148$, $p>0,05$

Tablo 5. Son Test Değişkenli Anova Testi Sonuçları

Değişken	Varyansın Kaynağı	Kareler Toplamı	sd	Kareler Ortalaması	F	p	η^2	Anlamlı Fark
Başarı Testi	Gruplararası	4652,309	3	1550,770	4,564	,005	0,12	3>1>4>2
	Gruplarıçi	32959,018	97	339,784				
	Toplam	37611,327	100					

1=kontrol grubu1, 2=deney grubu1, 3=kontrol grubu2, 4=deney grubu2

Yukarıda öğrencilerin son test puanlarının ANOVA sonuçları verilmiştir. Analiz sonuçlarına göre öğrencilerin son test sonuçları arasında anlamlı bir fark olduğu sonucuna varılmıştır, $F(3,97)=4,56$, $p<,05$. Yani öğrencilerin matematik başarıları verilen yönteme bağlı olarak anlamlı bir şekilde değişmektedir.

SONUÇ VE ÖNERİLER

Öğrencilere ‘Toplamları 100’e kadar olan doğal sayılarla eldesiz ve eldeli toplama işlemini yapar’ adlı kazanım kazandırılmak istenmiştir. Araştırmada simülasyon teknolojisinin kullanıldığı yöntem ile ders gören öğrencilerin, MEB müfredatının önerdiği yöntem ile ders gören öğrencilerden daha başarılı olduğu ve anlamlı bir farklılık olduğu görülmüştür. Buradan da anlaşıldığı üzere çoğu öğrencinin zorlandığı matematik dersini, öğrencilere teknolojik simülasyonlarla somutlaştırarak ve oyunlaştırarak çok daha kolay ve eğlenceli bir şekilde öğretmenin mümkün olduğu görülmüştür.

Bu sonuçla birlikte araştırmada şu öneriler yapılabilir ;

İlkokul matematik müfredatında simülasyon etkinliklerinin desteklenmesi ve artırılması sağlanmalıdır.

Sınıf öğretmenlerine simülasyon destekli eğitimle ilgili hizmet içi eğitimler verilmelidir.

EBA içeriklerinde simülasyon çeşitliliğinin tüm kademelerde artırılması sağlanmalıdır.

Özet

Bu araştırmanın amacı simülasyon destekli materyallerin ilkökul 4. sınıf öğrencilerinin fen bilgisi dersindeki başarıları üzerine etkisini araştırmaktır. Araştırma yöntemi nicel araştırma yöntemlerinden yarı deneysel araştırma yöntemidir. Araştırmanın yapılacağı çalışma grupları Van'ın Özalp ilçesi Yukarı Tulgalı ve Aşağı Tulgalı köyü ilkokullarında 2023-2024 eğitim öğretim yılında 4. sınıfta bulunan öğrenciler olarak belirlenmiştir. Araştırmada Yukarı Tulgalı ilkokulunda bulunan 23 öğrenci, Aşağı Tulgalı ilkokulunda bulunan 15 öğrenci yer almaktadır. Gruplara uygulanan ön test sonuçları doğrultusunda iki grup arasında anlamlı bir farklılık olmadığı anlaşılmıştır. Araştırmada deney grubu olarak ön test sonuçları ortalaması daha düşük olan Yukarı Tulgalı İlkokulu öğrencileri, kontrol grubu olarak Aşağı Tulgalı İlkokulu öğrencileri belirlenmiştir. Araştırmada fen bilgisi dersinde yer alan “Kuvvetin, cisimlere hareket kazandırmasına ve cisimlerin şekillerini değiştirmesine yönelik deneyler yapar.” kazanımı deney grubunda simülasyon yöntemi ile kontrol grubunda ise müfredatın önerdiği yöntem kullanılarak işlenmiştir. Araştırmada uygulanan başarı testi MEB fen bilimleri ders kitabında yer alan sorular kullanılarak oluşturulmuştur. Başarı testi öğrencilere bir hafta ara ile uygulanmıştır. Başarı testinden elde edilen sonuçlar SPSS programı ile analiz edilmiştir. Araştırmadan elde edilen sonuca göre deney grubunun başarısının kontrol grubuna göre anlamlı derecede daha yüksek olduğu gözlenmiştir. Bulgular sonucunda simülasyon destekli materyal kullanımının teşvik edilmesi önerilmektedir.

Anahtar kelimeler: Fen bilimleri, simülasyon, ilkökul

EFFECTS OF SIMULATION TECHNOLOGIES ON PRIMARY SCHOOL SCIENCE COURSES

Abstract

The purpose of this research is to investigate the effect of simulation-supported materials on the success of 4th grade primary school students in science lessons. The research method is a semi-experimental research method, one of the quantitative research methods. The study groups in which the research will be conducted were determined as students in the 4th grade in the 2023-2024 academic year at Yukarı Tugalı and Aşağı Tugalı village primary schools in Özalp district of Van. The research included 23 students from Yukarı Tugalı primary school and 15 students from Aşağı Tugalı primary school. According to the pre-test results applied to the groups, it was understood that there was no significant difference between the two groups. In the research, the students of Yukarı Tugalı Primary School, whose pre-test results average was lower, were determined as the experimental group, and the students of Aşağı Tugalı Primary School were determined as the control group. In the research, "He conducts experiments on the force causing objects to move and changing the shapes of objects" in the science course. The acquisition was processed using the simulation method in the experimental group and the method recommended by the curriculum in the control group. The achievement test applied in the research was created using the questions in the Ministry of Education science textbook. The achievement test was administered to the students one week apart. The results obtained from the achievement test were analyzed with the SPSS program. According to the results obtained from the research, it was observed that the success of the experimental group was significantly higher than the control group. As a result of the findings, it is recommended to encourage the use of simulation-supported materials.

Key words: Science, simulation, primary school

Giriş

Teknoloji hayatımızın her alanında neredeyse bir zorunluluk haline gelmiştir. Bireyler iletişim kurmak, sosyalleşmek, günlük işlerini yapmak, keyifli vakit geçirmek, alışveriş yapmak, bilgiye ulaşmak için teknolojiyi kullanmaktadırlar. Günümüzde dijitalleşen dünyanın bir zorunluluğunu oluşturan teknoloji bütün alanlara dahil olduğu gibi eğitim ve öğretim etkinlikleri kapsamında da geniş bir yere sahiptir (Ünal & Yeşilyurt, 2021; Akar & Yeşilyurt, 2020; Turhan & Yeşilyurt, 2020). Dolayısıyla teknoloji bu kadar hayatımızın içindeyken eğitimi teknolojiden bağımsız düşünmek neredeyse imkansızdır. Teknolojinin bu kadar hızlı gelişimi eğitimde de gelişmeyi beraberinde getirmektedir. Artık teknolojinin eğitimin içinde olması bir seçenekten çok zorunluluk haline gelmektedir (Çetin & Karataş, 2020).

Son dönemlerde teknolojinin ilerlemesine paralel olarak okullarda, bilgisayar destekli öğretim faaliyetlerin yer almakta; öğretmenler tarafından sık sık kullanılmaktadır (Yeşilyurt, 2021; Yüksel, Yılmaz & Yeşilyurt 2022). Dolayısıyla farklı branşlarda kullanılan teknolojik araç ve gereçler, bilgisayar destekli öğretim yöntemleri, simülasyonlar sayesinde çocukların ilgili derse karşı olan motivasyon ve tutumlarının arttığı gözlemlenmektedir. Bu sebeple eğitimin her alanında teknoloji kullanımı hızlı bir şekilde katlanarak ilerlemektedir ve dijital araçlar ve gereçler kullanılarak işlenen derslerin sayısı artmaktadır. Dolayısıyla kullanılan bu araç ve gereçler çocuklara yaparak ve yaşayarak öğrenme imkanı sunmaktadır (Duyar & Altaş & Yeşilyurt, 2023). Ayrıca bilgisayar destekli öğretim yöntem ve teknikleri ile çocuklar bireysel öğrenme hızlarına uygun olarak kendi kendilerine de öğrenme imkanı bulmaktadırlar (Uşun, 2000). Okullardaki derslere güncel teknolojilerin dahil edilmesi büyük önem taşımaktadır (Güven & Sülün, 2012).

Simülasyonlar, gündelik yaşamda karşılaşılabileceğimiz karışık ve anlaması zor olan olay ve durumları daha kolay bir şekilde algılamamızı sağlamaktadır. Simülasyonlar sayesinde çocuklar yaparak yaşayarak öğrenme deneyimi yaşayacakları için karşılaştıkları problemlerde daha etkili ve kalıcı çözümler geliştireceklerdir (Bozkurt, 2008). Nitekim simülasyondan faydalanarak işlenen derslerde çocukların akademik olarak başarılarının yükseldiğini gösteren çalışmalarda mevcuttur (Sezgin, 2002; Tezcan & Yılmaz, 2003; Yang et al, 2003). Ayrıca Fen Bilimleri dersi kapsamı düşünüldüğünde simülasyonun avantajları oldukça önemli boyuttadır. Örneğin, derslerin güvenli bir şekilde işlenmesi, olayları hızlandırıp/yavaşlatabilme seçeneklerinin olması, günlük hayatta öğrencinin karşılaşma ihtimalinin çok küçük olduğu bir olayı gözlemleyebilmeleri, karışık olay veya durumların daha basitleştirilerek aktarılması bu avantajlardan bazılarını oluşturmaktadır (Roblyer, 2003). Simülasyon sayesinde çocuklar

vakitten de kazanıp, kendi bireysel öğrenme hızlarına göre öğrenme fırsatı yakalayabilmektedirler (Hegarty,2004). Simülasyonlar Fen bilimleri dersinde, kavranılması zor olan konuları basitleştirerek çocukların seviyelerine indirip öğrenme şansı tanımaktadır (Minaslı, 2009).

Dünyadaki ülkeler arasında bilim ve teknoloji alanında oluşan rekabetin, son dönemlerde fen eğitimin önemini de arttırdığı vurgulamaktadır (Çepni & Çil, 2016; Bayrak & Erden, 2007). Dolayısıyla teknoloji ile bilimdeki gelişmeleri takip edebilmek için ülkelerin fen eğitiminde farklı yöntemler geliştirmeyi hedefledikleri görülmektedir (Bayram, Patlı & Savcı, 1998). Bunun yanında önemli teknolojik gelişmelere imza atan ülkeler arasında bulunmanın okullardaki fen eğitimin niteliğine de bağlı olduğunu fark eden ülkelerin eğitim sistemlerinde ve programlarında çeşitli yöntemler araştırdıkları söylenmektedir (Çepni & Çil,2016). Kuvvetli bir toplum yaratabilmek için şüphesiz bireylerin nitelikli bir fen eğitimi almaları gerekmektedir (Eş & Sarıkaya, 2010). Fen eğitimin niteliğini arttırabilmek için de derslerde teknolojik destekli materyallere yer verilmelidir. Bu sayede çocuklar fen bilimleri dersini daha dikkatli dinleyecekleri için kalıcı öğrenme sağlanacaktır. Doğası gereği yaşamla iç içe olan fen bilimleri derslerine teknolojiyi entegre etmek çocuklar için oldukça faydalı olacaktır.

2.YÖNTEM

Bu bölümde araştırmanın modeli, evreni, örnekleme, veri toplama aracı ve verilerin analizi bulunmaktadır.

2.1.Araştırmanın Modeli

Yapılan araştırmada nicel araştırma yöntemlerinden, Ön Test -Son Test kullanılarak kontrol ve deney grubu belirlenerek, yarı deneysel araştırma yöntemi kullanılmıştır. Araştırmada çalışılan gruplar seçkisiz atama yöntemi ile belirlenmiştir. Gruplar belirlendikten sonra gerçekleştirilen ön test sonuçlarından ortalaması daha düşük olan şube deney grubu; ortalaması daha yüksek olan şube kontrol grubu olarak belirlenmiştir (Tablo 1). Kontrol grubunda eğitime müfredata göre genel yöntemlerle devam edilmiştir. Deney grubunda ise öğrencileri daha aktif tutacak, görsel anlamda destekleyecek ve ilgilerini çekecek etkileşimli etkinliklerle eğitime devam edilmiştir. Kullanılan etkileşimli etkinliklerde EBA platformundan yararlanılmıştır.

Tablo 1:Ön Test Ortalamaları

Okul	Gruplar	Ön Test	N	X
Yukarı İlkokulu	Tulgalı 1	Başarı Testi	23	27,608
Aşağı İlkokulu	Tulgalı 2	Başarı Testi	15	35,666

2.2.Araştırmanın Örnekleme

Araştırmada çalışma grubu, 2023-2024 eğitim-öğretim yılı içerisinde Van'ın Özalp ilçesinin Yukarı Tulgalı ve Aşağı Tulgalı İlkokullarında bulunan 38 dördüncü sınıf öğrencisinden oluşmaktadır. Bu öğrenciler araştırmanın çalışma şartları, ulaşım kolaylığı gibi sebeplerden dolayı kolay ulaşılabilir örnekleme yöntemi ile belirlenmiştir.

2.3.Veri Toplama Aracı

Araştırmada veri toplama aracı olarak kullanılan başarı testi EBA platformunda bulunan dördüncü sınıflar Fen Bilgisi dersi “kuvvetin etkisi” konusunun alıştırma testlerinden faydalanılarak oluşturulmuştur. Başarı testi toplamda 14 sorudan oluşmaktadır ve araştırmacılar tarafından ön test ve son test olarak deney ve kontrol grubuna uygulanmıştır.

2.4.Verilerin Analizi

Başarı testi sonucunda elde edilen veriler SPSS programına girilmiş ve analizler bu program üzerinden gerçekleştirilmiştir. Ön test verileri elde edildikten sonra iki grup arasında anlamlı bir fark olup olmadığına bakılmıştır. İki grup arasında anlamlı bir fark olmadığı gözlenmiştir ($p>0.05$). Son test sonuçları elde edildikten sonra başlangıç durumları ve son durum arasındaki farkı görmek için T testi yapılmıştır.

BULGULAR

Araştırma kapsamında elde edilen ön test verileri ile gerçekleştirilen t testi sonuçlarına Tablo 2’de yer verilmiştir.

Tablo 2: Ön Test Bağımsız T Testi Sonuçları

Okullar	Değişken	Gruplar	N	X	SS	t	df	p
Yukarı İlkokulu	Tulgalı Ön Test	Deney	23	27,608	12,601	-1,768	36	,085
Aşağı İlkokulu	Tulgalı Ön Test	Kontrol	15	35,666	15,337			

Ön test sonuçlarından elde edilen verileri incelediğimizde iki grup arasında ortalamaları bakımından ciddi bir fark olmadığı ve başlangıçta grupların seviyelerinin birbirine yakın olduğu görülmektedir. Bağımsız T testi sonucunda elde edilen verilerden de görüldüğü gibi p değeri 0,05’den büyüktür yani iki grup arasında anlamlı bir farklılık bulunmamaktadır ($p=,085$).

Araştırma kapsamında elde edilen son test verileri ile gerçekleştirilen t testi sonuçlarına Tablo 3’te yer verilmiştir.

Tablo 3: Son Test Bağımsız T Testi Sonuçları

Okullar	Değişken	Gruplar	N	X	SS	t	df	p
Yukarı İlkokulu	Tulgalı Son Test	Deney	23	79,130	7,485	9,387	77	,000
Aşağı İlkokulu	Tulgalı Son Test	Kontrol	15	54	8,904			

Tablo 3’te verilen bilgiler incelendiğinde deney ve kontrol grubunun son test sonuçları arasında anlamlı bir farklılık olduğu görülmektedir($p=,000$). Bu duruma göre deney grubu öğrencilerinin incelenen kazanım konusunda daha yüksek bir akademik başarıya ulaştıkları ortaya çıkmıştır.

TARTIŞMA, SONUÇ VE ÖNERİLER

Araştırma kapsamında simülasyon materyallerinden EBA’nın ilkokul dördüncü sınıf öğrencilerinin fen bilimleri dersindeki akademik başarıları üzerine etkileri incelenmiştir. Bu doğrultuda gerçekleştirilen ön test sonuçlarına göre başlangıç durumunda iki grup arasında anlamlı bir farklılık bulunamamıştır. İki gruptan ön test sonucu ortalaması daha düşük olan grup

deney grubu diğerk grup ise kontrol grubu olarak belirlenmiştir. Başlangıç durumları benzeşik olan bu gruplarda iki farklı şekilde öğretim gerçekleştirilmiş olup sonrasında son test uygulanmıştır. Deney grubunda öğretim EBA platformu desteği ile yapılırken kontrol grubunda öğretim müfredata uygun şekilde ve simülasyon materyalleri kullanılmadan gerçekleştirilmiştir. Bunun sonrasında gerçekleştirilen son test sonuçlarına bakıldığında iki grup arasında anlamlı bir farklılık olduğu gözlenmiştir. Deney grubunun akademik başarısında ciddi bir artış olmuş, kontrol grubuna nazaran daha yüksek bir akademik başarı seviyesine ulaştıkları görülmüştür. Buna göre EBA platformu desteği ile gerçekleştirilen eğitimin simülasyon kullanılmadan gerçekleştirilen eğitime göre daha etkili bir öğretim sağladığı ortaya çıkmıştır.

Araştırma sonucunda ulaşılan bilgi literatürde bu konuda gerçekleştirilmiş diğerk araştırmaları destekler niteliktedir. Teknolojik materyaller kullanılarak gerçekleştirilen öğretim öğrenciler üzerinde daha etkili olmakta, öğrencilerin derse daha çok ilgilerini çekmekte, derste daha aktif olmalarını sağlamakta ve daha yüksek bir akademik başarıya ulaşmalarını sağlamaktadır. Tüm bunlar göz önünde bulundurularak öğretmenlerin;

- öğretim esnasında mümkün olduğunca teknolojik materyalleri kullanmaya özen göstermeleri,
- öğrencileri teknolojik materyalleri kullanmaya teşvik etmeleri önerilmektedir.

Aynı zamanda teknolojik materyaller konusundaki bilgi eksikliğini gidermek amacıyla Halk Eğitim Merkezleri veya Milli Eğitim bünyesinde bu alandaki kursların artırılması, bu kurslara ulaşımın kolaylaştırılması ve katılımın teşvik edilmesi önerilmektedir.

Abstract

One naturally occurring antioxidant that is produced by living things is coenzyme Q10 (Coq10). "Q" stands for quinone group and "10" for the quantity of isoprenyl units at the end. In all cells, Coq10 performs a variety of essential roles in both mitochondria and extramitochondrial processes. The coenzyme is known to directly mediate the expression of numerous genes and functions as a fat-soluble antioxidant. Coq10 can shield cell function from oxidative stress because of its strong free radical scavenging action, which has been shown to preserve mitochondrial membrane potential and prevent DNA damage and protein oxidation. It is mostly found in high-energy-requiring organs like the liver, kidney, and heart, where there are lots of mitochondria. It is a redox agent that helps with the creation of ATP in these organs. One significant fat-soluble antioxidant is coenzyme Q10. Their job is to shield membranes from free radical-induced oxidative damage. Coq10 has the ability to successfully stop oxidation of lipids and proteins as well as damage to DNA. The majority of the daily required quantity of Coq10 is generated by the body, with small amounts coming from the diet. The liver seems to be the primary location of Coq10 biosynthesis in the body when taking into account tissue Coq10 levels and organ weight. All cells' metabolism depends heavily on Coq10, and a lack of it is linked to the etiology of certain diseases. General information on coenzyme Q10 is provided in this article.

Keywords: Coq10, Oxidative Stress, Coq10 Deficiency, Antioxidant

Introduction

Natural antioxidants like Coenzyme Q10 (Coq10) are produced by living things (Ulla et al., 2017). The quinone group is denoted by the letter "Q," and the number of isoprenyl units at the tail end is indicated by the letter "10." This is a 1,4-benzoquinone (Lee et al, 2013). In all cells, Coq10 performs a variety of essential roles in both mitochondria and extramitochondrial processes. Coq10 is a fat-soluble antioxidant that plays a significant role in fatty acid, pyrimidine, and lysosomal metabolism in addition to its critical role in mitochondrial oxidative phosphorylation. It also directly regulates the expression of numerous genes, including those linked to inflammation (Hargreaves et al., 2020). Although CoQ10 is frequently referred to be similar to vitamins, it is not a vitamin by definition because it is made by different bodily tissues (Acosta et al., 2016). The liver, kidney, and heart—organs with high energy needs—are home to a large number of mitochondria, which is where coq10 is mostly found. As a mobile redox agent, Coq10 contributes significantly, along with other molecules, to the movement of electrons along the electron transport chain in the mitochondria, which leads to the generation of ATP (Bhagavan and Chopra, 2006). Furthermore, Coq10 has the ability to shield cell function from oxidative stress due to its strong free radical scavenging action, which maintains mitochondrial membrane potential by reducing DNA damage and protein oxidation. (Ulla et al., 2017; Bhagavan and Chopra, 2006; Noh et al., 2013). In addition to serving as an electron carrier in the respiratory chain of the mitochondria during the generation of ATP, reduced (ubiquinol) Coq10 is a significant antioxidant. Coq10 shields membranes from oxidative damage brought on by free radicals and is found in both cellular and intracellular membranes, such as those found in mitochondria, lysosomes, peroxisomes, and endoplasmic reticulum (Crane, 2001). The only antioxidant that is fat-soluble and produced internally is coenzyme Q10 (Mantle and Hargreaves, 2023).

OXIDATIVE STRESS

The imbalance between reactive oxygen species (ROS) and antioxidant enzyme levels is known as oxidative stress (Silva et al., 2022). Antioxidant-rich compounds like Coq10 help lessen the cellular imbalance brought on by elevated ROS. Because Coq10 protects mitochondrial functioning and has antioxidant action, it plays a role in controlling redox homeostasis.

As a significant lipid-soluble antioxidant, coenzyme Q10 guards against oxidative stress brought on by free radicals in both mitochondrial and extra-mitochondrial (Golgi apparatus, lysosomes, endoplasmic reticulum, and peroxisomes) cellular membranes (Hargreaves, 2003). By boosting the cellular defense system, dietary substances with antioxidant capacity can lower

oxidative stress and prevent oxidative damage and related disorders (Valko et al., 2007; Petrou and Terzidaki, 2017).

According to De Barcelos and Haas (2019), Coq10 can successfully stop oxidation of lipids and proteins as well as damage to DNA. Numerous plants, animals, and other living things contain the vital vitamin component coq10 (Dimozi et al., 2015; Kim et al., 2019). In humans and other mammals, ubiquinone is the most prevalent oxidized form of Coq10. However, its quickly reduced active form, ubiquinol, functions as an antioxidant by scavenging free radicals to guard against lipid peroxidation by regenerating tocopherol, thereby averting oxidative stress-induced cell damage (Yasukazu et al, 2006; Martin et al, 2007). Additionally, Coq10 serves as an oxidative inhibitor of proteins and DNA, a cofactor in the synthesis of ATP, a membrane stabilizer, and a crucial component in the transport of oxidative phosphorylation in mitochondria (Ayer and Macdonald, 2015)

Because Coq10 is lipophilic, it absorbs more readily when consumed with fatty meals and does so in a manner akin to that of lipids in the gastrointestinal system (Raizner, 2019). Pancreatic and bile secretions assist in its absorption in the small intestine. Coq10 is converted to ubiquinol after absorption and then carried to the liver (Bhagavan and Chopra, 2006).

All tissues have different quantities of Coq10; tissues with high energy needs or metabolic activity, such as the heart, kidney, liver, and muscle, have the highest concentrations of Coq10 (Taylor, 2018). According to Qu et al. (2018), Coq10 is mainly found in these tissues as ubiquinol and is mainly concentrated in mitochondria, indicating its significance in mitochondrial activity.

While the exact daily requirement for Coq10 is unknown, estimates suggest that it is roughly 500 mg/day based on a 2000 mg total body pool and a four-day average tissue turnover period (Weber et al, 1997). The majority of the daily requirement for Coq10 is produced by the body, with a little amount (about 5 mg) coming from the diet (Weber et al, 1997). While Coq10 is produced in a variety of tissues, the kidney, heart, skeletal muscle, and liver are the main places where it is present in large concentrations (Martelli et al, 2020). Nonetheless, based on organ weight and tissue Coq10 levels ($\mu\text{g/g}$ tissue), the liver seems to be the primary location of Coq10 production in the body (Hargreaves et al, 2020).

COQ10 DEFICIENCY

Primary and secondary Coq10 deficiencies are the two main categories of Coq10 deficiency (Potgieter et al, 2013). Mutations in genes related to the Coq10 biosynthesis pathway result in primary Coq10 deficit (Salviati et al, 2017). According to Salviati et al. (2017), a mutation in

any one of these genes can lead to a shortfall in Coq10 status. At least 10 genes are necessary for the production of functioning Coq10.

Thus far, mutations in the following ten genes have been found in humans: Coq4 (Bosch et al., 2018), Coq5 (Malicdan et al., 2018), Coq6 (Doimo et al., 2014), Coq7 (Freyer et al., 2015), Coq8A (Chang et al., 2018), Coq8B (Feng et al., 2017), and Coq9 (Duncan et al., 2009).

Mutations in genes unrelated to the Coq10 biosynthesis pathway or non-genetic factors linked to a variety of illnesses are the causes of secondary coenzyme q10 deficiency (Yubero et al, 2018). Mutations in the APTX gene, which encodes the protein aprataxin in ataxia oculomotor aprataxin 1 disorder, and in the BRAF gene, which encodes the serine/threonine-protein kinase B-Raf enzyme in cardiofaciocutaneous syndrome, are two examples of secondary Coq10 deficiency resulting from such genes (Castellotti et al, 2011; Aeby et al, 2011). 2007).

Certain pharmacotherapies, including statins and the antidepressant amitriptyline, have also been linked to a secondary deficiency in Coq10 status (Neergheen and Hargreaves, 2018). According to Hargreaves et al. (2005), statins selectively block HMG-CoA reductase, the enzyme that limits the manufacture of cholesterol, with the aim of targeting the liver. Given that the routes for the manufacture of cholesterol and Coq10 are similar, a reduction in HMG-CoA reductase activity may hinder the biosynthesis of Coq10.

Due to their high energy requirements, primary Coq10 insufficiency can affect any area of the body, however it most commonly affects the brain, muscles, and kidney tissues. The symptoms differ in terms of intensity and duration (Salviati et al, 2017). A variety of additional neurological symptoms, including ataxia, can result from a lack of Coq10 in the brain tissue. Coq10 deficiency in cardiac tissue causes heart muscle weakness, which is a feature of hypertrophic cardiomyopathy, and in renal tissue causes nephrotic syndrome and renal failure (Salviati et al, 2017).

Chronic kidney disease (Hargreaves et al., 2019), liver disease (Hargreaves and Mantle, 2019), cardiovascular disease (Mantle, 2015), type II diabetes (Mantle, 2017), mitochondrial myopathies (Hargreaves, 2014; Yubero et al., 2016), and critical illnesses (Mantle and Hargreaves, 2019) are among the conditions that commonly cause secondary Coq10 deficiencies.

CONCLUSION

All cells' metabolism depends heavily on Coq10, and a lack of it is linked to the etiology of certain diseases. Elevations in oxidative stress may lead to Coq10 depletion. It is not surprising that Coq10 loss is linked to a wide range of illnesses given the significance of Coq10 in cell

function (Hargreaves et al, 2020). There have been reported randomized controlled trials that support Coq10 in several illnesses, with varying degrees of success (Mantle et al., 2023). This could be connected to several unresolved concerns that are still being investigated, including the best way to administer the supplement and the various tissues' capacities to absorb Coq10 following its absorption from the digestive system (Mantle and Dybring, 2020). The hypothesis that Coq10 may lower morbidity and death and enhance quality of life is supported by research findings. Some studies' conclusions, meanwhile, were derived from preclinical or clinical research using different endpoints. Future attention to this matter is required. Lastly, more randomized research should be done to assess if COQ10 supplementation affects survival.

Özet

Modern imalat sistemlerinde, ürünler; farklı imalat rotalarını takip ederek, delme, kesme, boyama vb. çeşitli işlemlerin ardından nihai ürün haline gelmektedir. Esnek imalat sistemleri olarak sınıflandırılan bu sistemlerde hızlı, güvenilir, kaliteli ve ekonomik üretim koşulları elde edilmektedir. Genel olarak bir esnek imalat sistemi; bilgisayar kontrollü makinelerin, konveyör bantların, endüstriyel robotların, mobil robotların ve diğer cihazların birleşiminden meydana gelmektedir. Çeşitli imalat tekniklerine kolaylıkla uyarlanabilen esnek imalat sistemleri; üretim verimliliğini de artırmaya yardımcı olmaktadır. İmal edilen ürün çeşitlerinin artması ve imalat senaryolarının değişmesine kolayca uyum sağlaması nedeniyle bu sistemler, klasik imalat sistemlerine göre büyük avantaj sağlamaktadırlar. Fabrikalar, depolar, dağıtım ve aktarma merkezleri gibi parça taşımının yoğun olduğu alanlarda, mobil robot olarak tanımlanan Otomatik Yönlendirmeli Araçlar yaygın biçimde kullanılmaktadır. Üretime entegre mobil robotların kontrolünde üretim planlamasını dikkate alan rota organizasyonunun yanı sıra ilgili robotun batarya durumu ve şarj senaryolarının da göz önünde bulundurulması gerekmektedir. Bu çalışmada, laboratuvar ortamında bir imalat sistemi ile entegre edilmiş Robotino mobil robotu kullanılarak deneysel çalışmalar gerçekleştirilmiştir. İlk olarak belirlenen örnek bir yörüngede mobil robot sabit bir hızla hareket ettirilerek, enerji tüketiminin belirlenmesine yönelik robot bataryasının elektriksel parametreleri ölçülmüştür. Deneysel imalat sistemi ve mobil robot belirlenen bir üretim senaryosu çerçevesinde çalıştırılmıştır. Mobil robotun hareket ve kontrol görevlerini yerine getirirken enerji tüketimi dikkate alınarak, bu değer belirlenen kritik seviyeye ulaşması durumunda mobil robotun şarj istasyonuna geri dönmesi sağlanmıştır. Şarj istasyonuna dönen robot, şarj edildikten sonra görevini kaldığı yerden tamamlamaktadır. Gerçekleştirilen çoklu denemelerde robot kontrolünün planlandığı biçimde gerçekleştirildiği gösterilmiştir.

Anahtar Kelimeler: Mobil Robot, Kontrol, Enerji Tüketimi, Batarya Modelleme

EXPERIMENTAL INVESTIGATION OF THE ENERGY CONSUMPTION OF A MOBILE ROBOT INTEGRATED WITH MANUFACTURING SYSTEMS

Abstract

In modern manufacturing systems, goods become final products after various processes such as drilling, cutting, painting, etc. by following different manufacturing routes. In these systems, which are classified as flexible manufacturing systems, fast, reliable, high-quality, and economical production conditions are achieved. In general, a flexible manufacturing system consists of a combination of computer-controlled machines, conveyor belts, industrial robots, mobile robots, and other devices. These manufacturing systems that can be easily adapted to various manufacturing techniques also help increase production efficiency. They provide a great advantage over classical manufacturing systems as the variety of products produced increases and they easily adapt to changing manufacturing scenarios. Automated Guided Vehicles, defined as mobile robots, are widely used in areas where parts transportation is intense, such as factories, warehouses, distribution centers, and transfer centers. In the control of mobile robots integrated into production, in addition to the route organization that takes production planning into account, the battery status and charging scenarios of the relevant robot must also be taken into consideration. In this study, experimental studies were carried out using the Robotino mobile robot integrated with a manufacturing system in a laboratory environment. First, the robot was moved at a constant speed in a determined sample path, and the electrical parameters of the robot battery were measured to determine energy consumption. The experimental manufacturing system and robot were operated within the framework of a determined production scenario. While executing the motion and control tasks, the mobile robot takes into account its energy consumption. In the event that this consumption reaches a predetermined critical level, the robot is programmed to return to the charging station. Upon returning to the charging station, the robot completes its task from where it left off after being recharged. Multiple experiments have demonstrated that the robot control is executed as planned.

Keywords: Mobile Robot, Control, Energy Consumption, Battery Modeling

Giriş

Endüstriyel robotlar, otonom veya önceden programlanmış görevleri yerine getirebilen elektromekanik cihazlardır. Güncel tanımı ile robotlar, elektronik ve mekanik birimlerden oluşan, algılama yeteneğine sahip olan ve programlanabilen cihazlardır. Robotlar, mevcut yapılarına, çalıştıkları ortamlara veya görevlerine göre gruplandırılmaktadır. Özellikle mobil robot olarak adlandırılan, yani hareket edebilen ve parça taşıma görevini yerine getirebilecek robotların yörünge veya rota olarak adlandırılan hareket planlanması önemli bir araştırma konusudur.

Mobil robot entegrasyonu gerçekleştirilmiş bir üretim sisteminde, üretim planlama en önemli problemdir. Wiendahl vd., (2015); üretim planlamanın temel amacını, daha büyük dağıtım kapasitesi arayışı olarak mümkün olan en düşük lojistik ve ürün ile güvenilirlik maliyeti olarak formüle edilebileceğini belirtmişlerdir. Literatürde, parça taşımayı etkin olarak yerine getirecek üretim planının oluşturulmasına yönelik, birçok teorik optimizasyon algoritması önerilmiştir. Üretim hattında kullanılması gereken robot sayısı ve zaman gecikmelerini en aza indirmek için bir matematik model önerilmiştir. Bu çalışmada dinamik araç paylaşımı için sezgisel bir algoritma da önerilmiştir (Huisman vd., 2004). İm ve arkadaşları tarafından otomatik olarak araç engelleme ve dağıtım sürelerini en aza indiren malzeme taşıma sistemleri için etkili bir araç gönderme kuralı önerilmiştir (Im vd., 2009). Başka bir çalışmada ise verimliliği artırmak, dağıtım maliyetini en aza indirmek, makinelerin ve Otomatik Yönlendirmeli Araçların eşzamanlı programlanması için yerçekimsel bir arama algoritması tasarlanmıştır (Nageswararao vd., 2017). Bu tür problemleri çözmek için genetik algoritma (Baker vd., 2003), benzetilmiş tavlama algoritması (Tavakkoli-Moghaddam vd., 2006), karınca kolonisi optimizasyonu (Donati vd., 2008) ve kombinasyonu çoklu sezgisel algoritmaların analizi (Tan vd., 2006) gibi birçok algoritma önerilmiştir. Dal-sınır ve dinamik programlama gibi kesin algoritmalar, küçük ölçekli üretim planlama optimizasyon problemleri için iyi bir çözüm kalitesine sahiptir, ancak ölçek arttığında hesaplama karmaşıklığı da katlanarak artmaktadır. Akıllı algoritmalar karmaşık ve büyük ölçekli problemlerin çözümünde iyi bir performansa sahiptir. Bununla birlikte, her algoritmanın kendi eksiklikleri vardır. Örneğin, genetik algoritma erken yakınlaşmaya yatkındır ve hesaplama etkinliği düşüktür; karınca kolonisi algoritması ise yakınsaklıkta yavaştır ve yerel optimum içine düşmek kolaydır. Bu nedenle, en iyi çözümü elde etmek için algoritmaları geliştirmek gerekmektedir.

Üretim planlama optimizasyon teorileri ile ilgili yukarıdaki çalışmalar geleneksel üretim hatlarındaki malzeme dağıtım sorunlarına odaklanmaktadır. Modern imalat sistemlerinde, Endüstri 4.0 ve nesnelerin interneti (IoT) konseptine uygun olarak, veri toplama, prosesin ve üretim verimliliğinin izlenmesi, mobil robotların konumlarının ve görevlerinin izlenmesine imkan sunan sistem konfigürasyonlarına ihtiyaç duyulmaktadır. Bu yeni konsept uygun olarak yapılan bir çalışmada, her türlü üretim kaynağını görsel olarak yönetmek ve kontrol etmek için kablosuz sensör ağlarına ve Radyo Frekansı ile Tanımlamaya (Radio Frequency Identification - RFID) dayalı bir gerçek zamanlı konum sistemi (Real Time Location System - RTLS) önerilmiştir (Zhong vd., 2012). Huang ve arkadaşları; boyalı gövde depolamasının görselleştirilmesini ve kontrol edilebilirliğini geliştirmek için bir RFID etkin gerçek zamanlı izleme sistemi geliştirmiştir (Huang vd., 2017). Diğer bir çalışmada ise üretim planlama verisinin toplanması ve lojistik durum bilgisinin çıkarılması için bir yöntem önerilmiştir Atölye lojistiğinin sağlıklı durumu, istasyon ve malzemelerin lojistik verilerinin tespiti ile değerlendirilmiştir (Tang vd., 2014). Min ve arkadaşları, imalat sistemlerindeki enerji tüketiminin planlanması ile çevresel faydalar elde edileceğini belirtmişlerdir (Min vd., 2014). İmalat sistemlerini “temiz imalat” olarak isimlendirebilmek için atık ve emisyon oranı düşük, ürün çıktısı çok ve çevre dostu olması gerektiğine değinilmiştir. IoT ile birlikte imalat sanayinin akıllı sensörler, RFID vb. tekniklerle enerjiye duyarlı üretim planlaması yapılabilmektedir (Ma vd., 2019).

Mobil robot entegrasyonunda bir diğer önemli konu ise robotun enerji depolama sistemi ve bu sistemin yönetimidir. En yaygın kullanılan enerji depolama sistemleri bataryalar olmakla beraber bu sistemlerin karakteristiklerini belirlemede maliyet, kullanım ömrü, boyut, bakım ve enerji yoğunluğu ön plana çıkmaktadır (Rashid vd., 2018). Batarya enerji yönetiminde batarya modelleme büyük bir önem taşımaktadır. Bataryaların şarj ve deşarj durumlarında kapasiteleri değiştikçe çıkış gerilimleri de değişiklik göstermektedir (Jongerden vd., 2009). Geçtiğimiz yıllarda literatürde çeşitli batarya modelleri önerilmiş ve geliştirilmiştir. Genel olarak bu modeller; kimyasal modeller, ampirik modeller, stokastik modeller, elektrik devre modelini içeren soyut modeller ve hibrit modeller olarak sınıflandırılabilir (Tao vd., 2017). Bu modeller batarya davranışını simüle etmeyi ve kullanılabilir batarya kapasitesi, gücü vb. özellikleri doğru şekilde tahmin etmeyi sağlamaktadır (Jongerden vd., 2008). Bu sayede mobil robotlar, mobil cihazlar, elektrikli araçlar gibi batarya kullanan teknolojilerde oluşturulan modeller ile tüketimler belirlenmekte ve bu tüketimler doğrultusunda batarya enerji ve şarj yönetimi

yapılmaktadır. Çalışma kapsamında FESTO FMS ve Robotino (Festo, 2021) mobil robotu kullanılarak deneysel batarya modeli oluşturulmuş ve batarya durumuna göre hareket kontrolü gerçekleştirilmiştir.

2. MATERYAL VE YÖNTEM

Çalışma kapsamında Bursa Teknik Üniversitesi, Mekatronik Mühendisliği laboratuvarlarında yer alan esnek imalat sistemi ve Robotino mobil robot kullanılmıştır. Şekil 1’de ilgili laboratuvarda bulunan Festo Didactic tarafından geliştirilen esnek üretim sistemi görülmektedir (Festo, 2021).

Şekil 1. Festo MPS500 esnek üretim sistemi (Festo, 2021).

Genel olarak bir esnek üretim sistemi; bilgisayar kontrollü makinelerin, konveyör bantların, endüstriyel robotların, mobil robotların ve diğer cihazların birleşiminden oluşmaktadır. Çeşitli imalat tekniklerine kolaylıkla adapte edilebilen esnek üretim sistemleri; üretim hızını, kalitesini ve verimliliğini de artırmaya yardımcı olmaktadır. İmal edilen ürün çeşitlerinin artması ve üretim senaryolarının değişmesine kolayca uyum sağlaması nedeniyle, klasik üretim sistemlerine göre büyük avantaj sağlamaktadırlar. Şekil 2’de Festo Didactic tarafından geliştirilen ve taşıma işlemlerini gerçekleştiren Robotino mobil robotu görülmektedir (Festo, 2021).

Şekil 2. Robotino mobil robotu (Festo, 2021).

Robotino mobil robotu, Festo Didactic tarafından eğitim, simülasyon ve araştırma amaçlarıyla üretilmiştir. Yüksek hassasiyeti ve üstün hareket kabiliyetleri sayesinde endüstride otomatik yönlendirmeli araç olarak da kullanılabilir. Birçok mekanik sistemin ve çeşitli sensörlerin rahatlıkla entegre edilebilmesi, kullanıcı dostu programlama arayüzü ve kontrol imkanı sağlamasından dolayı endüstride ve eğitimde oldukça talep görmektedir. Basic ve Premium olarak iki çeşidi bulunan bu mobil robot; çeşitleri arasında işlemci hızı, motor gücü, desteklenen sensör sayısı ve montaj kulesi gibi farklılıklar göstermektedir.

3. ROBOT BATARYASININ ENERJİ TÜKETİMİ

Robot içerisinde Leoch LP12-9 marka ve modelinde 12 V değerinde iki adet seri bağlı kurşun-asit yapılı batarya sistemi bulunmaktadır. Bataryaların nominal kapasitesi 9 Ah'dir (Leoch, 2021). Negatif yüklü elektrodunda süngersi kurşun kullanılırken pozitif elektrotta kurşun dioksit (PbO₂) kullanılan kurşun-asit bataryalar, gelişmiş teknolojilerinin yanı sıra yaygın olarak kullanılan düşük maliyetli enerji depolama birimidir. Kurşun-asit bataryalar güvenli çalışma bandında çalışabilmesi için nominal kapasitesinin %20'sine kadar deşarj edilmesi uygundur (Jongerden vd., 2008, Tezde ve Okumuş, 2018)

Batarya sisteminin kapasitesini belirlemek için Şekil 3'te gösterilen 6500 mm uzunluğundaki güzergahta robot; sabit 250 mm/s hızda çalıştırılmıştır. Şekil 4'te deney süresi boyunca robotun, batarya sisteminden çektiği akım, gerilim, güç ve enerji ifadeleri gösterilmektedir. Şekle göre robotun başlangıç durumunda batarya devresinin uç gerilimi 25 V olarak ölçülmüştür. Batarya devresinin uç gerilimi 24,5 V olduğunda robot bekleme (stand-by) durumuna geçmektedir. Bu süre boyunca robot 17,32 Wh'lik ($6,235 \times 10^4$ Ws) enerji tüketimi gerçekleştirmiştir.

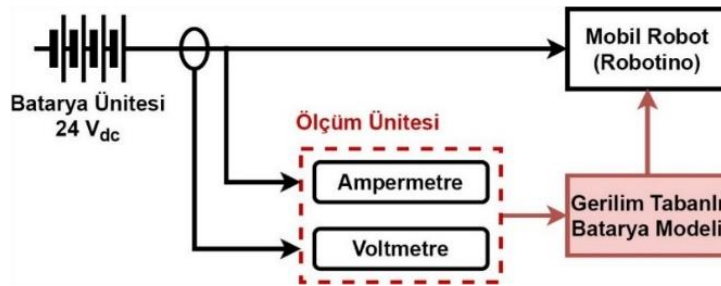

Şekil 3. Robotino test güzergahı.

Şekil 4. Robotun hareket testi boyunca (a) akım (b) gerilim (c) güç (d) enerji değişimi.

Kurşun-Asit bataryaların kapasitesini belirlemek için kullanılan temel yöntemlerden gerilim tabanlı kapasite belirleme yöntemi, batarya deşarj oldukça gerilimin de düşmesi prensibine dayanmaktadır (Khaligh ve Li, 2010). Genel olarak bataryanın elektromotor kuvveti, terminal gerilimine eşit sayılmaktadır. Ancak kapasite sifıra yaklaştığında terminal gerilimi aniden düşmektedir (Sato vd., 2002). Bu çalışmada ise gerilim ve enerji tüketimi ilişkisi prensip alınmıştır. Böylece tüketilen enerjiye karşılık gelen anlık gerilim değerleri ölçümler sonucu Şekil 4'te elde edilen değerler doğrultusunda modellenmiştir. Ayrıca belirli bir kesme gerilimi ayarlanarak kapasitenin sifıra düşmesi engellenmiştir. Şekil 5'te oluşturulan modelin blok şeması gösterilmektedir. Ayrıca, oluşturulan bu modelde gerilimin enerji tüketimine göre değişimi de Şekil 6'da gösterilmektedir.

Şekil 5. Batarya modeli blok şeması.

Şekil 6. Bataryanın enerji durumuna göre gerilim değerleri.

Bataryalar aşırı şarj/deşarj edildiklerinde plakalarında aşınma gerçekleşebilir ve bunun sonucunda kimyasal değişimler meydana gelerek bataryanın şarj kapasitesi düşmektedir (Tezde ve Okumuş, 2018). Bataryanın derindeşarjının önlenmesi ve robotun tekrar şarj istasyonuna en uzak mesafede dahi ulaşmasını sağlamak için gerilim 24,55 V'a düştüğünde robot şarj istasyonuna gitmektedir. Gerilimin sürekli olarak değişmesi dikkate alınarak, robot batarya sisteminin gerilimi 10 s boyunca 24,55 V altında çalışması durumunda robot şarj istasyonuna gitmeye karar vermektedir. Ayrıca, Şekil 7'de robotun test süresi boyunca deneysel olarak gözlemlenen gerilim değişimi ve modelleme sonucu elde edilen gerilim değişimi gösterilmektedir.

Robot, 17,32 Wh'lik enerji tüketimi süresince 250 mm/s sabit hızla çalıştığında $5,69 \times 10^5$ mm'lik bir mesafe boyunca hareket etmektedir. Şekil 8'de enerji durumuna göre robotun alabileceği mesafe gösterilmektedir. Ayrıca enerji durumu ve mesafe arasındaki ilişki matlab "curve fitting" uygulamasının kullanımı ile birinci dereceden polinom şeklinde modellenmiştir. Burada; P enerji kapasitesi olup birimi Ws'dir. d ise alınan mesafe olup birim mm'dir.

$$P = -0,1092 \times d + (6,23 \times 10^{-4})$$

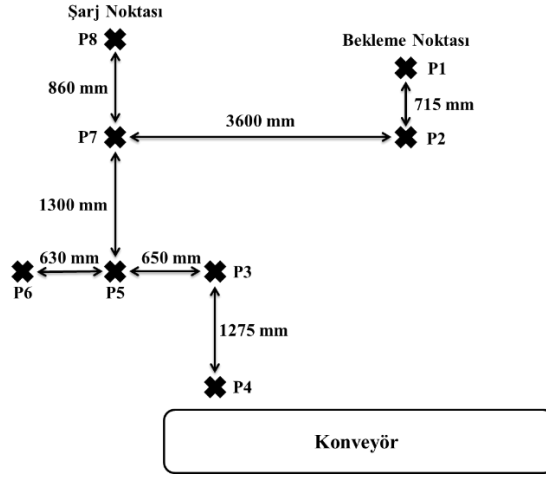

Şekil 7. Bataryanın deneysel ve benzetimsel gerilim değişimi.

Şekil 8. Enerji durumuna göre alınan mesafe.

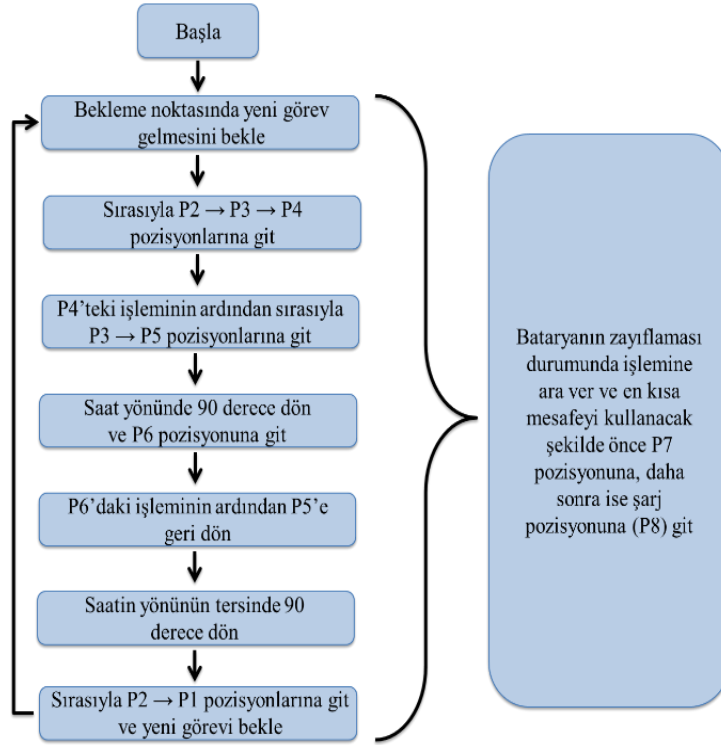

4. ÜRETİM SİSTEMİNE ROBOT ENTEGRASYONU

Çalışmada gerçekleştirilecek üretim senaryoları için, Robotino mobil robotunun yörünge planlaması hazırlanmıştır. Robotino'nun hareketlerinin kontrolünü sağlamak için, Robotino View programı içerisindeki "Odometry" bloğu kullanılmıştır. Odometry, mobil robotun hareketi esnasında, robotun x ve y eksenlerindeki mesafe değişimleri ile kendi eksenine etrafındaki rotasyon açısındaki değişiminin bilgilerini veren bir sensördür. Robotun ortamdaki hareketini gerçekleştirmesi için laboratuvar içinde sekiz adet pozisyon belirlenmiştir. Bu pozisyonların temsili görünümü Şekil 9'da verilmiştir.

Şekil 9. Laboratuvardaki pozisyonlar ve mesafeler.

Belirlenen pozisyonlara göre Robotino'nun Odometry sensöründen gelen verilerle mesafe değişimleri belirlenerek, her bir pozisyona ulaşıldığında Odometry sıfırlanmış ve robotun gideceği rotaya göre hangi yönde ne kadar hareket edeceği programlanmıştır. Robotino, bataryalarının doluluk oranına göre ya şarj noktasına gidip kendini şarj etmeli ya da gerçekleştireceği görevlerini tamamlayıp bekleme noktasına gitmelidir. Bu işlemler için oluşturulmuş algoritma Şekil 10'da görülmektedir. Robotino için oluşturulan algorithmada, robot ilk olarak başlangıç pozisyonunda beklemektedir. Yeni bir görev bilgisi alındıktan sonra, robot bu işlemi gerçekleştirmek için ilgili konuma gider, burada işlemi tamamlar ve bekleme noktasına geri döner. Robotino içerisindeki bataryaların durumu, hareketin her aşamasında kontrol edilmektedir. Bataryalarda düşüş tespit edildiği anda, robot bulunduğu konumdan şarj ünitesinin bulunduğu konuma hareket eder ve burada şarj işlemi tamamlanana kadar bekler. Şarj işlemi bittikten sonra ise işlemine en son kaldığı yerden devam ederek görevini tamamlar.

Şekil 10. Robotino hareket algoritması.

Robotino mobil robotu için oluşturulan hareket algoritmasına uygun olarak Robotino View yazılımında kontrol programı oluşturulmuştur. Programda yer alan “batarya” bloğu ile Robotino'nun bataryaları her adımda kontrol edilirken, diğer adımlarda ise robotun gerçekleştireceği görevler ve hareketler bulunmaktadır. Robotino View yazılımında oluşturulan program sonucunda, robotun çalışması esnasında gerçekleştirdiği hareketler Şekil 11’de sunulmuştur. Robotun bataryalarının ideal şekilde çalıştığı durumda, robot şarj noktasına uğramadan hareketini tamamlar ve bekleme noktasına geri döner.

Mobil robotun bataryalarında düşüş algılandığında, robot bulunduğu konumdan Şekil 12’de görülen şarj istasyonuna gider ve bataryalarını doldurduktan sonra ise işleme kaldığı yerden devam eder.

Şekil 11. Robotun çalışması esnasındaki hareketleri.

Şekil 12. Robotun şarj edilmesi.

5. SONUÇLAR

Sanayide dijital dönüşümün hızlanması ile uzaktan erişimin arttığı, üretimin anlık izlenerek üretim verimliliğinin maksimuma ulaştırıldığı akıllı fabrikalar için kontrol, otomasyon ve yönetim sistemlerinin oluşturulması konuları önem kazanmıştır. Bu kapsamda, esnek imalat sistemleri ve bu sistemlerle bütünleşik çalışan mobil robotların kontrolü hem sanayiden hem de akademiden yoğun ilgi çekmektedir. Modern üretim tesisleri için bir diğer önemli konu ise enerji tüketimi ve enerji verimliliği konularıdır. Sunulan çalışmada deneysel bir esnek üretim

sisteminin bulunduđu laboratuvar ortamındaki mobil robotun, üretim sisteminde montajı tamamlanmış parçaları alma, depoya bırakma ve şarj istasyonu noktaları arasındaki hareketi planlanmıştır. Mobil robot için enerji tüketimi deneysel olarak modellenmiştir. Enerji tüketimini dikkate alan hareket planlamasına yönelik algoritma gerçekleştirilmiş ve başarılı olarak çalıştığı gözlemlenmiştir.

6. TEŞEKKÜR

Bu çalışma Bursa Teknik Üniversitesi BAP Komisyonunca desteklenmiştir. Proje numarası: 191N016.

ÖZET

Karagöz oyunu, kendine has perdesi, perdenin arka tarafında yanan mumdan oluşan bir ışığı ve renklendirilmiş bir deriden yapılmıştır. Bir çubukla beraber ışığın önünde hareket eden figürleriyle ve birçok aksesuarıyla dikkat çekmektedir. Somut Olmayan Kültürel Miras içerisinde bulunan Karagöz oyunu, hem tasavvuf ile bağlantılı hem de dünyevi olaylar ile ilgisi bulunmaktadır. Bir ışık kaynağının can üflediği tasvir olarak karşımıza çıkan Karagöz oyunu tasvirlerin canlanmasıyla beşeri özellikler göstermektedir. Oyunun başlangıcında da bu perdenin ibret perdesi olduğundan bahsedilmektedir. Bu açıdan bakıldığında Karagöz perdesinin beşeri bir dünyaya dönüştüğü görülmektedir. Bu dünya ise tüm sanatsal biçimlerin ve içeriklerin belirlendiği gibi dönemini mekân ve zamanını yansıtan önemli bir bağlamdır. Burada İstanbul mahallelerinin yaşam biçimleri, insanları, ekonomik durumları, okur-yazarlık oranları, kadın-erkek ilişkileri ve farklı milletlerden insanların bir arada yaşamları aktarılmaktadır. Bu yönüyle düşünüldüğünde Karagöz oyunu sırlı bir ayna gibi görülmektedir. Bir tarafında tasavvufi bir anlamla yüz yüze gelirken bir diğer tarafta tamamen beşeri yüzünü göstermektedir. Tam da bu çift yönlülüğü ile Karagöz oyunu dünyevi ve kutsal arasında bir arayüz özelliği kazanmaktadır. Karagöz oyununa bir arayüz olarak dünyevilik ve kutsallık arasında bir ara mekân özelliği taşımaktadır. Aslında gölge oyunu halk bilimsel çalışmalarda geleneksel tiyatro türleri üzerinden çözümlenirken bir taraftan da tasavvuf ile olan bağları üzerinden de irdelenmektedir. Özellikle bir ışık kaynağı tarafından ruhları oluşan tasvirlerin tasavvufi düşüncenin “özden var olma” ve “öze dönüş” fikirlerini görselleştirmesi bu açıdan dikkate değerdir. Bu düşünce temelinde Karagöz oyununun biçim ve içeriği bir yanıyla kutsal diğer yanıyla beşeri olduğundan hareketle bir arayüz olarak incelenmiştir.

Anahtar Kelimeler: Karagöz oyunu, perde, arayüz, mekân, dünyevi, kutsal

EXAMINATION OF THE KARAGÖZ SCREEN AS AN INTERFACE

Abstract

The Karagöz play has its own curtain, a light made of a burning candle behind the curtain, and is made of colored leather. It attracts attention with its figures moving in front of the light with a stick and many accessories. Karagöz play, which is included in the Intangible Cultural Heritage, is related to both Sufism and worldly events. Karagöz play, which appears as a depiction of a light source breathing life, shows human characteristics with the animation of the depictions. At the beginning of the play, it is mentioned that this curtain is a lesson curtain. When viewed from this perspective, it can be seen that the Karagöz screen has transformed into a human world. This world is an important context that reflects its period, space and time, as well as determining all artistic forms and contents. Here, the lifestyles of Istanbul neighborhoods, their people, their economic situation, literacy rates, male-female relations and the coexistence of people from different nationalities are conveyed. When considered from this aspect, the Karagöz play is seen as a glazed mirror. While it faces a mystical meaning on one side, it shows its completely human face on the other side. With this duality, Karagöz play becomes an interface between the secular and the sacred. As an interface to the Karagöz play, it has the feature of an intermediate space between worldliness and holiness. In fact, while shadow play is analyzed through traditional theater types in folkloric studies, it is also examined through its ties with Sufism. It is noteworthy in this respect that the depictions, whose souls are formed by a light source, visualize the ideas of "existence from the essence" and "return to the essence" of Sufi thought. On the basis of this idea, the form and content of the Karagöz play was examined as an interface, considering that it is sacred on one side and human on the other.

Keywords: Karagöz game, curtain, interface, place, earthly, sacred

Giriş

Karagöz, Türk halk zekâsının bir temsili olarak karşımıza çıkmaktadır. Türk halkında olaylardan sürekli komedi oluşturma yeteneği, dram yaratma yeteneğinden üstündür. Karagöz’de Türk halkının bu komedi zekâsını sahneye yansıtmaktadır. Bu zekâ, insanların topluluk hayatından kaptıkları gülünç huyları ustalikle perdeye aksettirmesidir. Karagöz; dalkavukluk, kurnazlık, sahte kahramanlık, menfaatçilik, kavgacı vb. rolleriyle devamlı komik sahneler üreten bir tiptir. Karagöz aynı zamanda saf ve temiz ruhlu, olayların gülünç taraflarını büyük ustalikle yakalayan, zeki fakat okumamış, âlim değil ama irfan sahibi Türk halkının temsilidir. Hacivat ise iyi eğitim görmüş, bilgili, insanlar arasında arabuluculuk yapan, dilde yabancı kalmış kelimelere yer veren, her bakımdan maddeci ve çıkarıcı hüviyettir. Karagöz ve Hacivat özellikleri bakımından birbirlerine zıt tiplerdir (Sevilen, 1986).

Karagöz oyununda karşımıza çıkan bu tiplerin bir arayüz olarak dünyevilik ve kutsallık arasında bir ara mekân olarak bakılması amaçlanmaktadır. Aslında gölge oyunu halk bilimsel çalışmalarda geleneksel tiyatro türleri üzerinden çözümlenirken bir taraftan da tasavvuf ile olan bağları üzerinden de irdelenmektedir. Özellikle bir ışık kaynağı tarafından ruhları oluşan tasvirlerin tasavvufi düşüncenin “özden var olma” ve “öze dönüş” fikirlerini görselleştirmesi bu açıdan dikkate değerdir. Somut Olmayan Kültürel Miras içerisinde bulunan Karagöz oyunu hem tasavvuf ile bağlantılı hem de dünyevi olaylar ile ilgisi bulunmaktadır. Karagöz oyunlarının bu yönden önemi oldukça fazladır. Bir ışık kaynağının can üflediği tasvir olarak karşımıza çıkan Karagöz oyunu tasvirlerin canlanmasıyla beşeri özellikler göstermektedir. Oyunun başlangıcında da bu perdenin ibret perdesi olduğundan bahsedilmektedir. Bu yönden Karagöz oyunlarının günlük yaşantımızdaki ibret olayları içermesi ve benzerlik göstermesi onun önemini göstermektedir.

Bu çalışmada, Özgür Taburoğlu’nun “*Dünyevi ve Kutsal*” adlı eserinden Dünyevi ve Kutsal üzerine inceleme yaptıktan sonra Karagöz’ü çeşitli yazarlardan okuyarak bilgi sahibi olunmuştur. Karagöz’de tasavvuf ve dinî konuları ile dünyevi hâldeki konular karşılaştırılmıştır. Karagöz’ün her iki arada kalması ve sosyal mesajlar vermesi incelenmiştir.

2. ARAŞTIRMA VE BULGULAR

Karagöz oyununa bir arayüz olarak dünyevilik ve kutsallık arasında bir ara mekân olarak bakılması amaçlanmaktadır. Aslında gölge oyunu halk bilimsel çalışmalarda geleneksel tiyatro türleri üzerinden çözümlenirken bir taraftan da tasavvuf ile olan bağları üzerinden de irdelenmektedir. Özellikle bir ışık kaynağı tarafından ruhları oluşan tasvirlerin tasavvufi

düşüncenin “özden var olma” ve “öze dönüş” fikirlerini görselleştirmesi bu açıdan dikkate değerdir.

Somut Olmayan Kültürel Miras içerisinde bulunan Karagöz oyunu hem tasavvuf ile bağlantılı hem de dünyevi olaylar ile ilgisi bulunmaktadır. Karagöz oyunlarının bu yönden önemi oldukça fazladır. Bir ışık kaynağının can üflediği tasvir olarak karşımıza çıkan Karagöz oyunu tasvirlerin canlanmasıyla beşeri özellikler göstermektedir. Oyunun başlangıcında da bu perdenin ibret perdesi olduğundan bahsedilmektedir. Bu yönden Karagöz oyunlarının günlük yaşantımızdaki ibret olayları içermesi ve benzerlik göstermesi onun önemini göstermektedir.

3. BİR ARAYÜZ OLARAK KARAGÖZ PERDESİ

Bu çalışmada daha çok Özgür Taburoğlu'nun *Dünyevi ve Kutsal* isimli kitabında tartıştığı ara biçim kavramı üzerinden Karagöz oyunu incelenecektir. Araştırmada biçim ve içerik olarak Karagöz'ün kutsallık ve dünyevilik arasında bir ara biçim olduğu fikri üzerinden durulacaktır. Özgür Taburoğlu sosyal bilimler literatüründe dünyeviliği, çoğunlukla kutsal olanın dışında kalan dindışı alan olarak tarif eder. Dünyevilik kutsal olmayandır. Kutsallıktan uzaklaşma gayretinin sonucudur. Oysa dünyeviliğin ve kutsallığın sınırları bu kadar kolay belirlenemez. Bu kavram çifti ara bir bölgede Agamben'in kullandığı anlamda istisnai bir mekânda birbirine karışır. Bu karşılaşmanın sonucunda ara biçimler çıkar. Hem kutsal hem de dünyevi varlıklar olan ara biçimlerin bir yüzü yere, diğeri ise sonsuzluğa, kutsallığa değer (Taburoğlu, 2008).

Bu çalışmada da yukarıda alıntılanan fikirden hareketle gölge oyununa bir arayüz olarak dünyevilik ve kutsallık arasında bir ara mekân olarak bakılması amaçlanmaktadır. Aslında gölge oyunu halk bilimsel çalışmalarda geleneksel tiyatro türleri üzerinden çözümlenirken bir taraftan da tasavvuf ile olan bağları üzerinden de irdelenmektedir. Özellikle bir ışık kaynağı tarafından ruhları oluşan tasvirlerin tasavvufi düşüncenin “özden var olma” ve “öze dönüş” fikirlerini görselleştirmesi bu açıdan dikkate değerdir. Bu nedenle bazı fetvalarda karşımıza çıkan gölge oyununun olumlanması fikri de aslında bu kaynaktan beslenmektedir

Teknik açıdan bakıldığında bir ışık kaynağının can üflediği tasvirler olan Karagöz oyunu, tasvirlerin canlanmasıyla beşeri özellikler kazanmaktadır. Henüz oyunun giriş kısmında bu perdenin bir ibret perdesi olduğu ve anlayanlar için önemli değerler barındırdığı vurgulanmaktadır. Bu açıdan bakıldığında Karagöz perdesinin beşeri bir dünyaya dönüştüğü görülmektedir. Bu dünya ise tüm sanatsal biçimlerin ve içeriklerin belirlendiği gibi dönemini mekân ve zamanını yansıtan önemli bir bağlamdır. Burada İstanbul mahallelerinin yaşam biçimleri, insanlarını, ekonomik durumlarını, okur-yazarlık oranlarını, kadın-erkek ilişkilerini, farklı milletlerden insanların bir arada yaşamları aktarılmaktadır. Bu yönüyle düşünüldüğünde

Karagöz oyunu sırlı bir ayna gibi düşünülebilir. Bir tarafında tasavvufi bir anlamla yüz yüze gelirken bir diğer yüzünde tamamen beşeri yüzünü gösterir. Tam da bu çift yönlülüğü ile Karagöz oyunu dünyevi ve kutsal arasında bir arayüz özelliği kazanmaktadır.

Taburoğlu'na göre ara biçimlerin bir yüzü kutsallıkta diğer yüzü zındık, dünyevi taraftadır. Bir tarafı sonsuzluktayken diğer tarafı şimdi ve buraya bakar. Ara biçimler yer ve ötesi arasında dururlar. Bu yönden de hayaletlere benzerler. Hem şimdi ve burada gibidirler hem de değildirler. Ara biçim ne kutsaldır ne zındık ne de tam olarak maneviyat alanına aittir. Geçirgendir ama tam olarak maddesiz, cisimsiz de değildir. Ara biçimlerin bu arada kalmış varlığı, kutsal ve dünyevi ikiliğini, karşıtlığını geçersizleştirir (Taburoğlu, 2008). Karagöz'e bu yönüyle bakıldığında tam da bu arada kalma haliyle karşılaşmak mümkündür. Çünkü bir ibret perdesi olan ve ışığın gücünden can bulan suretler bir anlamda olabildiğince manevi alana aitlerken diğer taraftan Karagöz'ün bir türlü iş bulamayışı, karısının onu evden atışı ve sırf para kazanabilmek uğruna "görmüş geçirmiş" Hacivat'ın arkadaşına türlü oyunlarla iş buluşu olabildiğince dünyevi konulardır. Bu aradalık ise söz konusu oyuna güçlü bir yapı kazandırmaktadır. Her ne kadar bu oyunların günümüzdeki metinlerinde eleştirel düşüncenin izleri kolaylıkla silinemese de bu oyunların oynandığı bağlam düşünüldüğünde kahvehane gibi politik ve cinselliğin rahatça dile getirildiği eril alanlar olduğu dikkati çeker. Bu yönüyle Karagöz'ün derdinin yalnızca bir iş bulma sorunu olamayacağı da açıktır. Bu oyunların bağlamları tam da dünyevilik ve kutsallık arasında gidip gelen diyalogların döndüğü ve arayüzlerin hayat bulduğu sosyal mekânlardır. Çünkü Taburoğlu'nun da ifade ettiği gibi dünyevi kültürün öznesi, taşıyıcısı kalabalıklar ya da halktır. Halk toplumsal bir özne olarak ilk karşılaşmada çok belirsiz, eğreti ve fazlaca büyük görünür. Örneğin Bahtin Rönesans boyunca çok kısa bir süre kendi yaşam biçimi ve politik tasavvuruyla ortaya çıkmış, sonra geri çekilmiş bir dönemin insanından söz eder. Bu insan türü ya da tiplene halk adamıdır (Taburoğlu, 2008). Buradaki dünyevilik mevzusunun kesişim noktalarından birisi ise Bahtin'in karnavalesk kavramıdır.

Karagöz oyununa bu açıdan bakıldığında Taburoğlu'nun bahsettiği dünyeviliğin öznesi olan halk ya da taşıyıcı kalabalıkla daha Hacivat ve Karagöz'ün ilk diyaloglarından itibaren karşılaşılır. Bu Karagöz'ün karşılaştığı her tip üzerinden hatta bazı oyunlarda sadece sesini duyduğumuz karısı üzerinden anında dikkat çekmektedir.

Karagöz'ün kutsal yanı başka bir ifadeyle aynanın sırlı tarafında ise onun tasavvufi özelliği dikkat çekmektedir. Sabri Esat Siyasvuşgil'in Karagöz ile ilgili düşünceleri kutsal yönüne işaret etmesi açısından oldukça önemlidir:

“Bizde ve umumiyetle bütün şarkta hayal oyunlarının ekser seyircileri garbın kukla tiyatrolarını dolduranlar gibi, sadece güllüp eğlenmek ve hoşça vakit geçirmekle iktifa etmezler; bilakis kendilerini mistik bir havayı nesim’i içinde hissederek perdeden yaradılışın sırrı, cüz’i irade ve kader, maverai alem gibi insanın ruhunu kıvrandıran muammaların herhangi bir şekilde halini beklerler” (Siyavuşgil, 2002).

Siyavuşgil’in ifadeleri göz önünde tutularak perdenin aslında bir anlamda mistik bir havanın yaşandığı ancak bu mistizmin dünyevi sorunlarla bütünleşerek aktarıldığını söylemek mümkündür. Buradaki bu ikilik ise tam da kendisinin bir ara biçim olarak değerlendirilmesini sağlamaktadır. Diğer tarafta Hacivat’ın “Huzuru hazıran,vakti sefayı merdan,hıncırdı, kafidir, laindir şeytan. Şeytanın dinsizliğinden rahmanın birliğine, Şevketlû, kudretlû Efendimizin eriki devletine” diyerek yere kapanışı da onun oyunun kutsallığına yaptığı vurgu biçiminde okunabilir. Bütün bunların yanı sıra tasavvuf düşüncesinin sembolik kavramlarının da karagöz oyununda sıkça kullanıldığı görülmektedir. Pakize Aytaç, “*Karagöz’ün Perde Gazellerinde Tasavvuf*” isimli makalesinde bu sembolleri değerlendirir. Ona göre ayna, tecelli, perde, nur, çerağ, suret, hayal gibi tasavvufi sembollerin hepsini karagöz perde gazellerinde bulmak mümkündür. (Aytaç, 2006) Örneğin “Cihan’a benzedüp Şey Küşteri bu perdeyi kurmuş\Müşabih eylemiş ecnâsa tasviri ne dikkattir” dizeleri kutsallık ve dünyevilik arasındaki bağı açıklaması açısından dikkat çekicidir. Bu dizelerden de anlaşıldığı gibi Hayalilerin piri olarak kabul edilen Şey Küşteri dünyaya benzeterek kurduğu perde de yaratılmış her şeyi büyük bir dikkatle tasvir etmiştir.

Gölge tiyatrosunun tasavvufi yönü sebebi ile bazı din adamlarının da Karagöz oynatımına cesaret ettikleri, üstelik 16. asır da din adamlarından Şeyh Şâzili’nin “*İnsanların ahlaki terbiyeleri bakımından Karagöz’ü çok lüzumlu bularak vaazdan daha faydalı bir telkin aracı olduğuna inandığı*” yazılı kaynaklarda belirtilmektedir (Sevin, 1968). Karagöz’ün kurucusu olarak kabul edilen Şeyh Küşteri’de bu konuya örnek olarak verilebilir. Şeyh Küşteri’nin Karagöz oyunu sayesinde insanların doğru yolu bulmaları için “âlemin yaratılışı ve yaratılanların hayatı” en iyi şekilde canlandırarak gösterileceğini ileri sürmüştür. Şunu da belirtmek gerekir ki İslâm dini tiyatroya en baştan beri bütün olarak karşı değildir. Ancak tiyatro gösterilerinin İslâm’ın gerektirdiği hususlara karşı olmaması gerekmektedir.

Karagöz oyunu ilk gösterisinden itibaren kendini dini görüş ve kontrollerin içinde bulmuştur. Karagöz oyunları, daha rahat gösteri yapabilmesi ve gelişebilmesi için tasavvufi, dini ve ibret karakterini gözle görülebilir şekilde genişletmek zorunda kalmıştır. Bundan dolayı uzun zamanlar süren bu akış içinde Karagöz’ün kendine mahsus bir gösteri kalıbına girdiği millilik,

ruh, renk ve estetik kazandığı görülmektedir. Perdeye çıkan ilk figür olan Hacivat, gösteriyi tasavvuf mesajlı ve Şeyh Küşteri'yi anmalı perde gazeli ile açıp bitiş kısmında da dualara yer vermektedir. Her oyunun başında Hacivat'ın kullanmış olduğu "Hay Hak!" girişi üzerinde durulacak bir husustur. "Hayy" ve "Hak", İslam dininde Allah'ın isimlerinden ikisidir (Oral, 1996). Hacivat'ın Hayy ve Hak sözleri kimi araştırmacılar tarafından sofiyane çılgılığı ve İslâmiyet'in taassubuna karşı bir savunma olarak görülürken kimileri ise gösterideki seyircilere karşı mahcup olmamak için Allah'tan yardım istemek olarak düşünmüşlerdir.

Gölge oyunlarındaki perde gazellerinde, açılıştaki dualarda, muhavereler ve bitişlerde hemen hemen hepsinde ibret motiflerini, tasavvuf ve din açısından bağlantısız ve ilgisiz görmek nerdeyse mümkün değildir. Bu oyunların din ile görünür derecede bir ilgisi bulunmasa dâhi perdelerdeki gösterilerin dünyanın bir aynası olarak görülmesi tasavvuf bağlantılı, dini görüş ve düşüncelerden ayırmanın mümkün olmayacağı muhakkaktır.

Karagöz oyununun dünyevilik yüzüne bakıldığında ise ilk olarak gündelik hayatın bir sunumu çıkmaktadır. Gündelik hayatın sunumunu ise Bahtin'in karnavalesk kavramlarıyla birlikte düşünmek mümkündür. Bahtin'e göre karnaval gülüşü tüm halkın gülüşüdür. İkincisi bu gülüşün ufku evrenseldir. Yeni karnavala katılan katılmayan herkese yönelen gülüştür. Üçüncüsü ise bu gülüş müphemdir. Başka bir ifadeyle hem neşeli ve zafer dolu hem alaycı ve taklitçidir. Söyler ve inkâr eder, gömer ve hayat verir. Gülüşü olumsuz olan modern yergici kendini alay nesnesinin yukarısında bir yere yerleştirirken ona karşıdır. Dünyanın komik yüzünün bütünselliği böylece yıkılır ve komik olarak ortaya çıkan şey kişisel bir tepki haline gelir. Halbuki halkın komik müphem gülüşü tüm bir dünyanın bakışını ifade eder ve ona gülen adam aynı zamanda onun bir parçasıdır (Bahtin, 2005). Bahtin'in ifadeleri göz önünde tutularak karnaval gülüşünün izleri karagöz oyununda kolayca takip edilebilir. Gerek Karagöz ve Hacivat'ın birbirini tersinlediği gerek ters yüz olmuş bir dünya varlığını bu oyunlarda da göstermektedir. Örneğin zaman zaman Karagöz'ün kadın kılığına girmesi ve hatta Ters Evlenme oyununda Neredeyse Tuzsuz Deli Bekir'le evlenmek zorunda kalışı karnavalesk unsurlara örnek olarak gösterilebilir.

Osmanlı coğrafyasından bugüne kadar oynanan bu oyunlar en geniş şekliyle insan hayatlarına etki etmiştir. Bu oyunlardaki tipler ve olaylar toplum içindeki çarpıklıklara değinerek alay ve gülünç durumlar ortaya çıkarmıştır. Oyunlarda insanların belli başlı zaafaları ibret için abartılarak gülünç hâle getirilmiş ve seyirciye aktarılmıştır. Karagöz oyunları ile günümüz gündelik hayatımızda cereyan eden olaylar arasında benzerlikler görülmektedir. Mesela "*Kanlı Nigar*" adlı oyunda Nigâr isimli bir kadın bir mahalleye yerleşir. Nigar, yerleştiği bu

mahalledeki bütün erkekleri soymaktadır. Oyunda bu olay karikatürize edilerek erkeklerin düştüğü durum ve Nigar gibi kadınların ahlaksızlıkları alaya alınmaktadır. Osmanlı döneminde de İstanbul kadısına giden bir arzuhâlde Arap Fatma adındaki bir kadının ahlâksız hâl ve tutumları bütün İstanbul halkına ve İstanbul erkeklerine “İllallah” ettirmiş, bulunduğu evden kendisini çıkarmak isteyen kişilere ağıza alınmayacak hakaretler ettiği anlatılmaktadır. Aynı olay 17. yüzyılda Nefi'nin Siham'ı Kaza adlı eserinde de rastlanılmaktadır. Karagöz'deki Kanlı Nigar tipi Nefi'de Kirli Nigar olarak adlandırılarak karşımıza çıkmıştır (Töre, 2016).

4. SONUÇ

Geleneksel Tiyatromuz içerisinde önemli bir yere sahip olan Karagöz oyununu bir arayüz olarak dünyevilik ve kutsallık arasında bir ara mekân hüviyetinde incelenmiştir. Karagöz perdesi halk bilimsel çalışmalar arasında bir yandan geleneksel tiyatro türleri üzerinden değerlendirilirken diğer yandan da tasavvuf ile olan bağlantısı üzerinde durulması gerekmektedir. Karagöz perdesine her ne kadar Osmanlı döneminde devlet tarafından sıcak bakılmamış olsa da bir o kadar da değer görmüştür. Bunun nedeni bir ışık kaynağı tarafından oluşan ruhların tasvirlerindeki özden var olma ve öze dönüş fikirleri şeyhülislam tarafından verilen fetvalarda Karagöz oyunlarının olumlanması sonucunu ortaya çıkarmıştır.

Karagöz oyunu bir nevi yaşanan gerçek hayattan izler taşımaktadır. Bu izler şaka, gülünç, komik ve alaylı yollarla perdede sahnelenmiştir. Karagöz oyunları her ne kadar dönemsel şartların kurbanı olmuşsa da kendi öz benliğini korumaya çalışmıştır. Bazı dönemlerde çeşitli cinsel ve küfürlü şakalardan, insanların çalışma zamanlarını Karagöz izlemekle geçirmesinden, dine uygun olmayan olaylardan ötürü vb. yollardan karşı çıkmış olsa da her dönem kendinden bahsettirmeyi sağlamıştır. Kutsal ile dünyeviliği bir arada yaşayan Karagöz oyunu zaman zaman bir aradalık içerisinde de kalmıştır. Karagöz oyunu bu aradalık içerisinde her zaman güçlü çıkmayı bilmiş ve sosyal mesajlarını her iki arada da devam ettirmiştir. Karagöz oyunu, Somut Olmayan Kültürel Mirası Temsili Listesi'ne adını 2009 yılında yazdırmış ve bundan sonraki süreçlerde de çocuklara ve yetişkinlere çeşitli eğlenceler ve içerikler sunacaktır.

Özet

Okulöncesi dönem, insan yaşamında tüm gelişim alanlarında hızlı bir ilerlemenin ve büyümenin yaşandığı, yetişkinlik döneminde de insanlarla uyumlu yaşayabilmenin ve ruh sağlığının, uyum becerilerinin yerinde olmasının temellerinin atıldığı önemli bir dönemdir. Bu dönemde çocuklarda gelişimsel beklendik davranışlar dışında bazı uyumu zorlaştıran davranış problemleri görülebilmektedir. Bu davranış problemlerinden “saldırganlık” bireysel ve toplumsal hayat boyutunda kritik öneme sahiptir. Çocuğun hayatında sürekli hale gelebilecek saldırganlık yönelimi ve saldırganlık davranışının temeli okul öncesi dönemde başlamaktadır. Bu dönemdeki çocukların akranlarına uyguladıkları fiziksel ve ilişkisel saldırgan davranışların çeşitli değişkenlerle ilişkili olarak ortaya çıktığı görülmektedir. Bu bazı değişkenlerinde etkisiyle çocuk saldırgan davranışlara yönelim gösterebilmekte ve bunu ileriki yaşlarında da devam ettirip kalıcı hale getirebilmektedir. Bu araştırmanın amacı, Türkiye’de okulöncesi çağındaki çocuklarda saldırganlık davranışı üzerine etki eden faktörleri ele alan deneysel, yarı deneysel ve deneysel olmayan araştırma deseni kullanılarak yapılan çalışmaların incelenmesidir. Araştırma modeli sistematik gözden geçirmedir. Literatür taraması için Ulakbim ve Google Akademik veri tabanlarından yararlanılmıştır. 2013-2023 yıllarında yayınlanan Türkçe makalelerde tarama belirlenen anahtar kelime olarak belirlenen beş tarama kriteri olan “Çocuk, Okulöncesi, Saldırganlık, Problem davranışlar, Öfke kontrolü” kullanılarak gerçekleştirilmiştir. Veri tabanlarından ulaşılan çalışmalar dâhil etme ve dışlama kriterlerine göre indirgenerek toplam on iki çalışma belirlenmiş ve bu çalışmalar sistematik gözden geçirme yöntemi çerçevesinde incelenmiştir. Okulöncesi dönemde çocuklarda görülen saldırgan davranışlarda; ebeveyn tutumlarının etkisi, teknoloji kullanımı ve buna bağlı olarak dijital oyun bağımlılığı ve oyun çeşitlerinin etkisi, çocukların temel sosyal beceri düzeyleri içinde yer alan çocuğun duygu ifade becerisi ve duygularını düzenleme beceri düzeyleri, okulöncesi dönem çocuklarının mizaç özellikleri ve çocukların cinsiyet farklılığı gibi birçok faktörle ilişkisi olduğu belirlenmiştir.

Anahtar Kelimeler: Okul öncesi, Çocuk, Saldırganlık, Problem davranışlar, Öfke kontrolü

**SYSTEMATIC REVIEW OF THE FACTORS AFFECTING AGGRESSIVE
BEHAVIOR IN CHILDREN DURING THE PRESCHOOL PERIOD**

Abstract

Preschool period is an important period in human life where rapid progress and growth is experienced in all areas of development, and the foundations of being able to live in harmony with people and having good mental health and adaptation skills in adulthood are laid. During this period, children may experience some behavioral problems that make adaptation difficult, apart from developmentally expected behaviors. "Aggression", one of these behavioral problems, is of critical importance in individual and social life. The basis of aggression orientation and aggressive behavior, which can become permanent in the child's life, begins in the preschool period. It is seen that the physical and relational aggressive behaviors that children in this period apply to their peers occur in relation to various variables. With the influence of some of these variables, the child may tend to engage in aggressive behavior and may continue this behavior in later years and make it permanent. The purpose of this research is to examine the studies conducted using experimental, quasi-experimental and non-experimental research designs on factors affecting aggressive behavior in preschool children in Turkey. The research model is systematic review. Ulakbim and Google Scholar databases were used for literature review. The screening of Turkish articles published between 2013 and 2023 was carried out using the five screening criteria "Child, Preschool, Aggression, Problem behaviors, Anger management" as the determined keywords . A total of twelve studies were identified by reducing the studies obtained from the databases according to the inclusion and exclusion criteria , and these studies were examined within the framework of the systematic review method. Aggressive behaviors seen in children in the preschool period; It is related to many factors such as the effect of parental attitudes, technology use and the resulting effect of digital game addiction and game types, the child's emotional expression ability and emotion regulation skill levels, which are among the basic social skill levels of children, temperament characteristics of preschool children and gender differences of children. has been determined.

Keywords: Preschool, Child, Aggression, Problem behaviors, Anger management

Giriş

Okulöncesi dönem (erken çocukluk dönemi), tüm gelişim alanlarında hızlı bir ilerlemenin yaşandığı gelişimsel açıdan oldukça kritik, önemli ve büyüleyici bir dönemdir (Kandır & Alpan, 2008; Major vd., 2020; Oruç vd., 2011). Bu dönem kişiliğin, karakterin, ilgilerin kısaca yetişkinlik yaşamının temellerinin atıldığı dönemdir. Bu dönemde gelişim görevlerini olumlu bir seyrinde tamamlanması, yetişkinlik yaşamında kalıcılığı olacağından oldukça önemlidir. Uzun yıllara dayalı araştırmalarda çocukluk yıllarında kazanılan davranışların büyük bir kısmının yetişkinlikte, bireyin kişilik yapısını, tavır, alışkanlık, inanç ve değer yargılarını biçimlendirdiği gözlenmiştir. Bu açıdan okulöncesi dönemdeki eğitim, çocuğun ileriki yaşamını etkileyecek önemli bir süreçtir (Oktay, 1999).

Bu dönemde doğru olmayan disiplin ve eğitim yöntemleri, çocuğun davranış problemleri geliştirmesine neden olacaktır. En genel tanımıyla davranış problemi ise, çocuğun büyümesini ve gelişim sürecini olumsuz etkileyen, çevreyle olan uyumunu zorlaştıran, işlevsel olmayan ya da zarar verici olan ve çok sıklıkla görülen davranışlar olarak tanımlanmakta (Woolfolk vd., 2010, Cooper, 2011'den; İşmen Gazioğlu vd., 2018). Bu davranış problemlerinden en önemlisi de saldırganlıktır. Çünkü saldırganlık, Freud'un da belirttiği gibi, doğuştan getirilen bir dürtü olsa da, kontrol edilmezse tehlikeli bir hale dönüşerek insanın hem kendisine, hem de çevresine çok zarar verir.

Saldırganlığın doğuştan gelen bir özellik olduğunu bilsek de, bazı etkenlerin bu davranışta etkili olduğu da gözlemlenmektedir. Saldırganlığın nedenlerine yönelik çalışmalar, saldırganlığı içgüdüsel, genetik, öğrenmeye dayalı ve çevresel etmenlerle de etkilendiği görülmektedir. Saldırganlıkla ilgili çalışmalarda saldırganlıkla ilgili sınıflandırmalar yapılmaktadır. Ancak okulöncesi döneme baktığımızda ise en çok fiziksel ve ilişkisel saldırganlık gözlenmektedir. Fiziksel saldırganlık türünde; tekme atma, vurma, itme, tokat atma gibi daha çok gözlenebilen, fiziksel olarak gerçekleşen ve zarar verici bir saldırganlık türüdür (Crick ve Grotper, 1995). İlişkisel saldırganlık ise davranışı gösteren kişinin, başka kişinin ilişkilerine zarar vermek amacıyla bilinçli olarak yaptığı yalan söyleme, dışlama, dedikodu yapma, iftira atma, yok sayma, uzak durma ve başkalarına dışlatma, sır yayma, oyunlarına ve etkinliklerine almama gibi davranışlardır (Crick ve Grotper, 1995).

Çocukta gözlemlenen saldırgan davranışı tanımlanma süreci davranışla ilgili yapılacak müdahalenin etkinliği açısından oldukça önemlidir. Problem olarak ortaya çıkan bu davranışın

“problem” olup olmadığını belirleyebilmek için davranışın “altı aydan daha uzun bir sürede görülüyor olması” kriterinin göz ardı edilmemesi gerekmektedir (İşmen Gazioğlu vd., 2018). Çocukta gözlenen saldırgan davranışları tek bir neden üzerinden değerlendirmek doğru değildir. Çocuğun saldırgan davranışlarının gerçek nedenlerinin ne olduğu, çocuğun bu davranıştan ne elde etmeye ya da neyden kaçınmak için kullanmaya çalıştığına anlamak önemlidir. Her yaşta saldırgan davranışlarla mücadele etmek önemli olmakla birlikte okulöncesi dönem, yetişkinliğin temellerinin atıldığı kritik bir dönem

olduğundan bu davranışların kalıcı olmaması adına saldırgan davranışlara neden olan etkenlerin belirlenmesi oldukça önemlidir.

Yukarıda belirtilen hususlar göz önüne alındığında okulöncesi (erken çocukluk dönemi) dönem yetişkinlik döneminde bu davranışların kalıcı olması ihtimalinden dolayı kritik öneme sahiptir. Bu noktada, çocuklarda saldırgan davranışlara etki eden etmenleri belirlemek çalışmaya değer bulunmaktadır.

Bu çalışmanın amacı, Türkiye’de okulöncesi çağındaki çocuklarda saldırganlık davranışı üzerine etki eden faktörleri araştırmak üzere yapılan deneysel, yarı deneysel ve deneysel olmayan çalışmaların incelenmesidir. Bu amaçtan yola çıkarak bu araştırmada aşağıdaki sorulara yanıt aranmaktadır:

1. Okulöncesi dönemde saldırgan davranışların ortaya çıkmasının çocukların duygu ifade etme ve duygu düzenleme becerileriyle ilişkisi var mıdır?
2. Okulöncesi dönemde çocukların saldırgan davranışlarıyla cinsiyet arasında bir ilişki var mıdır?
3. Okulöncesi dönemde saldırgan davranışların ortaya çıkmasının dijital oyun bağımlılığı ve oyun türleriyle ilişkisi var mıdır?
4. Okulöncesi dönemde saldırgan davranışların ortaya çıkmasında ebeveyn tutumlarının etkisi var mıdır?
5. Okulöncesi dönemde saldırgan davranışların ortaya çıkmasında mizaç özellikleriyle arasında bir ilişki var mıdır?

ARAŞTIRMA

STRATEJİSİ

Bu çalışma, Türkiye’de okulöncesi çağındaki çocuklarda saldırganlık davranışı üzerine yapılan deneysel, yarı deneysel ve deneysel olmayan çalışmaların Prizma analiz yöntemli Sistematik review yöntemi inceleyen bir çalışmadır. Literatür taraması için Google Akademik ve Ulakbim kullanılarak 2013-2023 yıllarında yayınlanan Türkçe makaleler ve tezler belirlenen anahtar

kelimeler (çocuk, okulöncesi, saldırganlık, problem davranışlar, öfke kontrolü) kullanılarak taranmıştır. Dahil etme dışlama kriterleri uygulanarak toplam on iki çalışma, bu çalışmaya dahil edilmiştir. Bu çalışma herhangi bir gruplandırma yapılmadan incelenmiştir. Bu araştırmada araştırma konusu ve yöntemi belirlendikten sonra şu aşamalarda ilerlemiştir:

DÂHİL ETME VE AYIRT ETME KRİTERLERİ

Bu çalışmada dahil etme kriterleri saldırganlık ile bağlantılı olabileceği düşünülen (1) çocuklarda görülen saldırgan davranışlarda anne-baba tutumlarını inceleyen çalışmalar (2) çocuklarda saldırgan davranışlar üzerinde teknoloji kullanımının etkisi çalışmaları (3) çocuklarda saldırgan davranışlar ve mizaç özelliklerini inceleyen çalışmalar (4) çocuklardaki saldırgan davranışlarda çocukların duygu düzenleme ve sosyal becerilerinin gibi etkisine ilişkin çalışmalar, (5) çocuklarda görülen saldırgan davranışlar ve cinsiyet faktörü arasındaki ilişkiye yönelik çalışmalar gibi anahtar kelimeleri içeren makaleler dahil edilmiştir. Orta çocukluk, ergenlik, lise çağı, ilk yetişkinlik ve orta yaş gibi konunun dışına çıkan anahtar kelimeleri barındıran makaleler ayırt edilmiştir. Ayrıca arama yapılan anahtar kelimelerin sadece bir tanesine sahip birçok araştırma ile karşılaşılmış olup bu makaleler yine yapılan çalışmadan ayırt edilmiştir. Ayrıca araştırma sürecinde zamanın sınırlı olmasından dolayı çeviri yapmanın zaman alacağı düşünülüp yazım dili İngilizce olan makalelerde araştırmaya dahil edilmemiştir.

BULGULAR

Araştırmanın amacı doğrultusunda klinik olmayan okulöncesi dönem çocukları, öğretmenleri ve anne babaları örneklerde okulöncesi dönem çocuklarda saldırgan davranışlara etki eden etmenleri ilişkisel tarama modeli kullanarak inceleyen çalışmaların özelliklerini belirlemek üzere ulaşılan 5 çalışmanın sistematik analiz sonuçları Tablo 1’de verilmektedir.

Tablo 1: Okulöncesi Dönem Çocuklarda Saldırgan Davranışlara Etki Eden Etmenler İlişkisel Tarama Modeli Kullanarak İnceleyen Çalışmaların Özellikleri

Yazar, Yıl, Yer	Araştırılan Tema	Orneklem Grubu	Veri Toplama Aracı	Ulaşılan Sonuç
Ersan, 2017 Denizli/Türkiye	Okul öncesi dönem çocuklarının duygu ifade etme ve duygu düzenleme becerilerinin saldırganlıklarını yordama gücü incelenmiştir.	15 resmi anaokulunda eğitim alan 427 kız ve 436 erkek olmak üzere toplam 863 çocuktan oluşturulmuştur.	“Kişisel Bilgi Formu” “Çocuk Duygu İfade Etme Ölçeği Anne Formu” , “Duygu Düzenleme Ölçeği” “Okul Öncesi Sosyal Davranış Ölçeği Öğretmen Formu”	Okul öncesi çocuklarının olumsuz duyguları ifade ve baş etme düzeyleri ile fiziksel ve ilişkisel saldırganlık düzeyi arasında anlamlı bir ilişki bulunmuştur.
Kaya,2020 İstanbul/Türkiye	Okul öncesi dönemdeki çocukların fiziksel ve ilişkisel saldırganlıkları ile mizaç özellikleri arasındaki ilişkisinin incelenmesidir.	48-72 ay aralığındaki 231 çocuktan oluşmaktadır.	“Kişisel Bilgi Formu” “Okul Öncesi Sosyal Davranış Ölçeği Öğretmen Formu” ve “Çocuklar İçin Kısa Mizaç Ölçeği”	Fiziksel ve ilişkisel saldırganlık ile tepkisellik, sebatkarlık ve ritmiklik mizaç özellikleri arasında anlamlı bir ilişki belirlenmiş olup, sıcakkanlılık mizaç ile saldırganlık türleri arasında bir ilişki gözlenmemiştir.
Uysal ve Dinçer,2013 Ankara/Türkiye	Okul öncesi dönem çocuklarının saldırgan davranışları ile cinsiyet ilişkisinin incelenmesidir.	MEB’e bağlı iki bağımsız anaokulunda yer alan 60-72 aylık 56 erkek 65 kız toplam 121 çocuktan oluşturulmuştur.	“Kişisel Bilgi Formu” ve “Okul Öncesi Sosyal Davranış Ölçeği Öğretmen Formu”(OÖSDÖ-ÖF)	Okulöncesi dönem erkek çocukların fiziksel; kızların ise ilişkisel saldırganlık davranışları sergiledikleri, erkeklerin saldırgan davranışları genel olarak daha fazla gösterdiği gözlenmiştir.

Gölge,2022
İstanbul/Türkiye

Okulöncesi dönem Anaokuluna devam eden 5-6 yaş grubu 249 çocuk ve anne-babaları arasındaki teknoloji kullanımı ilişkisinin yordamasıdır.

“Kişisel Bilgi Formu”
“36-72 Aylık Çocuklara Yönelik Saldırganlık Yönelim Ölçeği”,
“Okul Öncesi Dönem Çocukları Dijital Oyun Bağımlılık Eğilimi Ölçeği (DOBE)” ve
“Çocukların Tercih Ettiği Oyun Türleri Formu”

Dijital oyun ve teknoloji kullanımı ile genel saldırganlık arasında %26,9, fiziksel saldırganlık ile %32, ilişkisel saldırganlık ile %17, nesnelere/eşyalara yönelik saldırganlık alt boyutu ile pozitif yönlü anlamlı ilişki bulunmuştur.

Yıldızbaş ve Şahin Sak,2020
Sakarya/Türkiye

Okul öncesi dönem çocuklarının saldırgan davranışlarıyla ilgili anne baba tutumları arasındaki ilişkiyi incelenmesidir.

3- 6 yaş arası 506 çocuk ve anne- babalarından oluşmaktadır.

“Kişisel Bilgi Formu”
“Ebeveyn Tutumları Ölçeği” (Karabulut Demir ve Şendil, 2008) ve
“Saldırganlık Yönelim Ölçeği”
(Kaynak, Kan ve Kurtulmuş, 2016)

Demokratik anne-baba tutumu ile çocuklardaki saldırganlık yönelimi arasında negatif yönlü, otoriter tutum ve saldırganlık yönelimi arasında pozitif ilişki olduğu görülmektedir.

Sistematik gözden geçirme çalışmamız için koyduğumuz kriterler sonucunda 2013-2023 yılları arasında okulöncesi dönemde saldırgan davranışları ele alan on iki çalışma incelenmiştir.

Birinci problem cümlesi doğrultusunda yapılan çalışmalar incelendiğinde (Ersan,2017) ilişkisel tarama modeline dayanmaktadır. İlişkisel tarama modeliyle iki ya da daha fazla sayıda değişken arasındaki ilişkileri analiz etmek ve neden sonuç ile ilgili sonuçlar elde etmek amaçlanmıştır.

Araştırmada veri toplama araçları olarak; Okul Öncesi Sosyal Davranış Ölçeği-Öğretmen Formu, Çocuk Duygu İfade Etme Ölçeği-Anne Formu ve Duygu Düzenleme Ölçeği kullanıldığı görülmüştür. Çalışmada çocukların saldırganlık düzeyleri fiziksel ve ilişkisel saldırganlık türleriyle; çocukların duygu ifade etme becerileri mutlu, üzgün, öfkeli ve korkmuş duyguları ve bu duyguları düzenleme becerileri; duygu düzenleme ve bunu etkileyen etmenler çerçevesinde incelenmiştir. Araştırmanın örneklemi, 15 resmi anaokulunda eğitim alan 3-5 yaş arası 427 (%49.5) kız ve 436 (%50.5) erkek olmak üzere toplam 863 çocuktan oluşturulmuştur. Araştırmada, çocukların saldırganlık düzeylerine ilişkin etkenler öğretmenlere ve annelere uygulanan ölçeklerle, duygu ifade etme ve duygu düzenleme becerilerine ilişkin ölçeklerle veri toplanmıştır.

Bu çalışmaların analizleri birinci problem cümlesi çerçevesinde incelendiğinde; okul öncesi dönem çocuklarının duygu ifade etme becerilerinden üzüntü ifade etme ve öfke ifade etme becerileriyle ilişkisel saldırganlık düzeyleri arasında anlamlı bir ilişki görülmüştür (Ersan,2017). Okul öncesi dönem çocuklarının üzüntü ifade etme düzeylerinin bu çocuklardaki

ilişkisel saldırganlığı negatif yönde; öfke ifade etme ve başedebilme becerileri ile de pozitif yönde anlamlı bir ilişki olduğu gözlenmiştir. Okul öncesi dönem çocuklarının mutluluk ifade etme, korku ifade etme ve duygu düzenleme beceri düzeylerinin ise çocuklardaki ilişkisel saldırganlık ile arasında anlamlı bir ilişki olmadığı da yapılan çalışmanın sonucunda görülmüştür.

İkinci problem cümlesi çerçevesinde okul öncesi dönemde saldırgan davranışların cinsiyete göre değişkenlik analizleri incelendiğinde; çalışmanın ilişkisel tarama modeline dayandığı görülmektedir. Araştırmada veri toplama araçları olarak; Kişisel Bilgi Formu” ve ”Okul Öncesi Sosyal Davranış Ölçeği Öğretmen Formu”(OÖSDÖ-ÖF) kullanılmıştır (Uysal ve Dinçer, 2013). Okul öncesi dönem çocuklarının fiziksel ve ilişkisel saldırganlık düzeylerinin cinsiyete göre anlamlı şekilde farklılaştığı görülmüştür. Bu Okulöncesi dönem erkek çocukların fiziksel; kızların ise ilişkisel saldırganlık davranışları sergiledikleri, erkeklerin saldırgan davranışları genel olarak daha fazla gösterdiği gözlenmiştir.

Üçüncü problem cümlesi doğrultusunda yapılan çalışmalar incelendiğinde (Gölge,2022; Özcan, Kanmaz ve Tezel Şahin, 2022) teknoloji kullanımı ile saldırgan davranışlar arasındaki ilişki bazı değişkenler açısından analiz edilmesi amaçlandığından nicel araştırma yöntemlerinden ilişkisel tarama modeline dayanmaktadır. Araştırmalarda veri toplama araçları olarak; Demografik Bilgi Formu, Problemler İnternet Kullanımı Ölçeği-Kısa Form (PIKÖ-KF), Sosyal Yetkinlik ve Davranış Değerlendirme-30 Ölçeği (SYDD-30) (Özcan, Kanmaz ve Tezel Şahin, 2022). Kişisel Bilgi Formu, 36-72 Aylık Çocuklara Yönelik Saldırganlık Yönelim Ölçeği, Okul Öncesi Dönem Çocukları Dijital Oyun Bağımlılık Eğilimi Ölçeği (DOBE) ve Çocukların Tercih Ettiği Oyun Türleri Formu (Gölge,2022) kullanılmıştır.

Gölge (2022); Özcan, Kanmaz ve Tezel Şahin (2022)’nin yaptığı araştırma analizleri üçüncü problem cümlesi çerçevesinde incelendiğinde; “Dijital Oyun Bağımlılık Eğilimi” sürekli oynama, yaşantıya katma ve saldırgan davranışlara eğilim alt boyutları cinsiyete göre anlamlı düzeyde farklılık görülmektedir. Erkeklerin dijital oyun bağımlılık eğilimleri kızlara göre anlamlı derecede daha yüksek bulunmuştur. Ayrıca bu çalışmada cinsiyete göre farklılık gösterdiğine ilişkin sonuçlara ulaşıldığı görülmektedir. Erkeklerin başkalarına yönelik fiziksel saldırganlık ve nesnelere/eşyalara yönelik saldırganlık düzeyleri kızlara göre daha fazla olduğu sonucuna ulaşılmıştır. Okul öncesi dönem çocuklarının dijital oyun bağımlılık eğilimi ölçeği genelinin saldırganlık yönelim ölçeği geneli ile %26,9 düzeyinde, başkalarına yönelik fiziksel

saldırganlık ile %32, başkalarına yönelik ilişkisel saldırganlık ile %17, nesnelere/eşyalara yönelik saldırganlık türleriyle ile %25,9 düzeyinde pozitif yönlü anlamlı ilişki bulunmaktadır (Gölge,2022; Özcan, Kanmaz ve Tezel Şahin, 2022). Bu bulgular sonucunda da okulöncesi dönemde erkek çocukların dijital oyun bağımlılığı ve saldırganlık eğilimi daha yüksek olmakla birlikte, dijital oyun bağımlılığı ile saldırgan davranışlar arasında da pozitif yönlü bir ilişki söz konusudur.

Dördüncü problem cümlesi çerçevesinde yapılan çalışmalar incelendiğinde, okul öncesi dönem çocuklarının saldırganlık yönelimleri ile ebeveynlerinin anne baba tutumları arasındaki ilişkiyi incelemek amacıyla ilişkisel tarama modeli kullanılarak hazırlanmıştır. Araştırmalarda veri toplama araçları olarak; Kişisel Bilgi Formu, Ebeveyn Tutumları Ölçeği ve Saldırganlık Yönelim Ölçeği kullanılmıştır (Yıldızbaş ve Şahin Sak, 2020; Çiftci Topaloğlu, 2013; Parsak ve Kuzucu, 2020)

Çalışmaların (Yıldızbaş ve Şahin Sak, 2020; Çiftci Topaloğlu, 2013; Parsak ve Kuzucu, 2020) analizleri dördüncü problem çerçevesinde incelendiğinde; okul öncesi dönem çocuklarının saldırganlık yönelimlerinin ebeveynin yaşı çocuğun saldırganlık yönelimine etki etmemektedir. Okul öncesi dönem çocuklarının saldırgan davranışlara eğilimi anne babalarının eğitim durumu açısından değerlendirildiğinde, ilişkisel saldırganlık, fiziksel saldırganlık ve nesneye yönelik saldırganlık türlerinde anlamlı bir farklılık gösterdiği bulunmuştur. Verilere bakıldığında ebeveynlerin eğitim düzeyi arttıkça çocukta görülen saldırganlık ve türlerine yöneliminin azaldığı görülmektedir. Bu durumun nedeni, ebeveynlerin eğitim düzeyinin artmasıyla çocuğa karşı tutumların önemine yönelik farkındalıklarının artmasının ve çocuklarına daha bilinçli ebeveynlik tutumları göstermelerinin bir sonucu olabilir. Yine analiz sonuçlarına baktığımızda ebeveynlerin anne baba tutum türleri ile çocukların saldırganlık yönelimleri arasında bir ilişki olduğu görülmektedir. Demokratik anne-baba tutumu ile çocuklardaki saldırganlık yönelimi arasında negatif yönlü bir ilişki görülmektedir. Demokratik tutumu benimseyen anne babaların çocuklarıyla etkili ve pozitif iletişimi benimseyerek, çocuğa birey olarak değer vermeleri, buna bağlı olarak da çocukların olumlu davranışlar geliştirmelerinin etkili olduğu söylenebilir. Otoriter durumda da tam tersi bir sonuç görülmektedir. Anne- babanın kuralları koyarak çocukların görüşlerini görmezden geldiği, iletişimin zayıf olduğu ailelerde çocukların olumsuz davranışlar geliştirmeye yöneldiği gözlenmektedir. Bu da bulgularda, otoriter tutum ve saldırganlık yönelimi arasında pozitif ilişki olduğu görülmektedir.

Beşinci problem cümlesi çerçevesinde yapılan çalışmalar incelendiğinde (Kaya, 2020) okulöncesi dönem çocuklarda görülen saldırgan davranışları etkileyen etmenler arasındaki ilişkiyi daha anlaşılabilir hale getirmek için ilişkisel tarama metodu kullanılarak hazırlanmıştır. Araştırmada veri toplama araçları olarak; Kişisel Bilgi Formu, Okul Öncesi Sosyal Davranış Ölçeği-Öğretmen Formu ve Çocuklar İçin Kısa Mizaç Ölçeği kullanılmıştır. Çalışmada elde edilen bulgular; Prior, Sanson ve Oberklaid (1989; aktaran Yağmurlu vd., 2005), 3 ile 8 yaş arasında dört mizaç özelliği olduğu varsayımını öne sürdüğü mizaç özellikleri temele alınarak değerlendirilmiştir. Bunlar; tepkisellik, sebatkârlık, sıcakkanlılık ve ritmiklikdir. Belirli bir uyaran veya olaya tepki vermeye hazır olma durumu, tepkisellik özelliğini tanımlamaktadır. Sebatkârlık ise, dikkati belli bir durum, olay veya etkinlik üzerinde yoğunlaştırabilmeyi tanımlamaktadır. Sıcakkanlı mizaca sahip kişilerin, yeni insan ve ortamlara yaklaşma istekliliği yüksektir. Diğer bir mizaç özelliği olan ritmiklik ise, çocuğun yemek yeme, uyuma gibi günlük rutinlerinin düzenliliğini tanımlamaktadır.

Kaya,(2020) tarafından yapılan çalışmanın analizleri beşinci problem cümlesi çerçevesinde incelendiğinde; Fiziksel ve ilişkisel saldırganlık ile tepkisellik, sebatkârlık ve ritmiklik mizaç özellikleri arasında anlamlı bir ilişki belirlenmiş olup, sıcakkanlılık mizaç ile saldırganlık türleri arasında bir ilişki gözlenmemiştir. Çalışmanın bulgularına göre; fiziksel saldırganlık ile sebatkârlık, mizaç özelliği arasında negatif yönde düşük düzeyde, tepkisel mizaç özelliği ile de pozitif yönde hafif düzeyde anlamlı bir ilişki, ilişkisel saldırganlık boyutunda ise ritmiklik ile ilişkisel saldırganlık arasında negatif yönde düşük düzeyde anlamlı ilişki olduğu görülmektedir.

TARTIŞMA VE SONUÇ

Bu sistematik gözden geçirme çalışması, Türkiye’de yapılan klinik olmayan örneklerde okulöncesi dönem çocuklarında gözlenen saldırgan davranışlara duygu ifade ve düzenleme becerisi, cinsiyet, dijital oyun ve teknoloji kullanımı, anne-baba tutumları ve çocuğun mizacı gibi bazı özelliklerin çocukların fiziksel ve ilişkisel saldırganlıklarına etkisi incelenmiştir. Araştırmaların cinsiyet farklılığının saldırgan davranışlara ilişkin sonuçları, alan yazınlarında da gördüğümüz cinsiyet değişkenine ilişkin bulgularını desteklemektedir. İncelenen araştırmalarda ilişkisel tarama metodu bulguları okulöncesi dönem erkek çocuklarının fiziksel saldırganlığı kızlara göre daha çok kullandığını göstermektedir (Öngören ve Tepeli,2015; Şen, 2009; Uysal ve Dinçer, 2013; Yıldızbaş, 2019; Yırtıcı, 2019). Ersan (2017) çalışmasında fiziksel saldırganlık ile erkek ve kız çocukları arasında anlamlı farklılık belirlemiş olup, ilişkisel

saldırganlık boyutunda kız ve erkek çocukları arasında anlamlı bir bulunmamıştır. Öngören ve Tepeli (2015)'nin okulöncesi dönemdeki çocukların saldırganlık davranışlarını inceledikleri çalışmaya baktığımızda ise erkek çocuklarının fiziksel, kız çocuklarının ilişkisel saldırganlık davranışları gösterme eğiliminde oldukları görülmektedir. Benzer şekilde Uysal ve Dinçer (2013)'in çalışmasında da okul öncesi dönemde erkek çocukların fiziksel saldırganlık davranışlara yönelimlerinin kızlara oranla anlamlı düzeyde farklılaştığını, ilişkisel saldırganlık türünde ise cinsiyete göre herhangi bir farklılaşmanın olmadığını bulmuşlardır. Bu çalışmalara göre, okulöncesi dönem çocuklarının özellikle fiziksel saldırganlık boyutunda cinsiyete göre farklılaşmanın olduğundan bahsedebiliriz. Bu farklılaşma da genetik özelliklerin, ailelerin çocuklarına yansıttıkları toplumsal cinsiyet algıları, annenin aile içinde şiddete maruz kalma durumu ve aile içi kalıplaşmış geleneksel roller gibi etmenlerin etkisi olabilir.

Ele alınan bir diğer etmen olan duygu ifadesi ve başedebilme becerisi ile okulöncesi dönem çocuklarda saldırgan davranışlar arasında özellikle zor duyguların ifade edilebilmesiyle ilgili anlamlı bir ilişki görülmektedir. Özellikle okulöncesi dönem çocuklarının üzüntü, öfke ve korku duygularını ifade etme becerileri ve düzeylerinin fiziksel saldırganlık eğilimleri arasında anlamlı bir ilişki olduğu gözlenmiştir (Ersan,2017). Bu çalışmayı Kayhan ve Aktürk (2015)'in yapmış çalışmanın olduğu okul öncesi dönem çocuklarının duygu düzenleme becerilerindeki zayıflık ile fiziksel saldırganlıkları arasında pozitif yönde bir ilişki olduğu bulgusu desteklemektedir. Bu da gösteriyor ki okullarda okulöncesi dönem çocuklara duygu-okuryazarlığı ve duygulara yönelik becerileri geliştirmeye yönelik çalışmalara ve etkinliklere yer verilmelidir. Ayrıca anne-baba eğitimleriyle de çocukları destekleyebilmeleri adına ailelerin ebeveynlik becerilerinin geliştirilmesi de faydalı olacaktır.

Araştırmanın anne-baba tutumlarıyla ilgili sonuçlarına baktığımızda ise, aile içinde demokratik tutumun benimsendiği ailelerde okulöncesi dönem çocuklarında gözlenen özellikle fiziksel saldırganlık boyutunda negatif yönlü, otoriter tutumuyla yaklaşılan çocuklarda ise yine özellikle fiziksel saldırganlık boyutunda pozitif yönlü anlamlı bir ilişki olduğu görülmektedir (Yıldızbaş ve Şahin Sak,2020). Aynı çalışmanın bulguları aşırı koruyucu ve izin verici aile tutumları ile okulöncesi dönem çocuklarda saldırgan davranışlar arasında anlamlı bir ilişkinin olmadığını göstermektedir. Çalışma sonuçları göstermektedir ki özellikle demokratik tutum gösterilen çocukların ilişkisel, fiziksel, kendine ve nesneye yönelik saldırganlık yönelimleri arasında negatif yönlü bir ilişki vardır. Bulgulardan yola çıkarak anne-babanın etkili iletişim becerilerine

sahip olmasının ve çocuğa birey olarak değer verilmesinin çocuğun olumlu davranış geliştirmesinde oldukça önemli olduğunu görmekteyiz. Bu bilgiler ışında okullarda anne-baba eğitimlerinin ağırlık verilmesinin faydalı olabileceğini söyleyebiliriz.

Okulöncesi dönem çocuklarda saldırgan davranışlar ile teknoloji kullanımı ve dijital oyun kullanımı arasındaki ilişkiyi ele alan çalışmalar, genel saldırganlık ve saldırganlığın alt boyutları arasında pozitif yönlü anlamlı bir ilişki olduğunu göstermektedir. Bu saldırganlık alt boyutlarından özellikle başkasına yönelik fiziksel saldırganlık ile nesneye yönelik saldırgan alt boyutları arasında orta düzeyde pozitif yönlü anlamlı bir ilişki görülmektedir (Gölge,2022). Bulgular, anne-babalara yönelik bilinçli teknoloji kullanımıyla ilgili bilgilendirme çalışmalarının önemini göstermektedir.

Çalışmada son olarak ele alınan bir diğer etmen olan mizaç özellikleri ile okulöncesi dönem çocuklarda saldırgan davranışlar arasında da anlamlı bir ilişki görülmektedir. Çocukların fiziksel ve ilişkisel saldırganlıkları ile fiziksel saldırganlık boyutunda bulguları incelediğimizde, sebatkarlık mizaç özelliği ile negatif yönde düşük, tepkisel mizaç özelliği ile de pozitif yönde hafif düzeyde anlamlı bir ilişki olduğu görülmektedir. İlişkisel saldırganlık boyutunda ise ritmiklik mizaç özelliği ile de negatif yönde düşük düzeyde anlamlı ilişki tespit edilmiştir(Kaya,2020). Bu çalışmayı Uçar(2017)'in çalışmasındaki çocukların fiziksel saldırganlık düzeyi ile sebatkarlık ve ritmiklik mizaç özelliği arasında anlamlı bir ilişkinin olduğu, ilişkisel saldırganlık ile mizaç özellikleri arasında anlamlı ilişki bulunmadığına yönelik bulguları da desteklemektedir. Bu çalışmaların sonucunda diyebiliriz ki okulöncesi dönem çocuklarda saldırgan davranışlara yönelim ile mizaç özellikleri arasında sadece fiziksel saldırganlık alt boyutunda düşük düzeyde negatif yönlü bir ilişki bulunmakta olup, mizaç özelliklerinin saldırgan davranışlar üzerinde büyük bir etkiye sahip değildir.

Çalışmada incelenen araştırmalar göstermektedir ki okulöncesi dönemde çocuklarda saldırgan davranışlara yönelimde organik kökenli etkenlerin dışında çevresel faktörlerde oldukça öneme sahiptir. Bu bağlamda çocuklarda olumlu davranış geliştirme özellikle anne-babanın eğitim, bilgi ve ebeveynlik becerilerini güçlendirmek önemli bir yere sahiptir. Beraberinde Erken çocukluk döneminden itibaren çocuklara duygulara yönelik becerileri geliştirmek ve bilinçli teknoloji kullanımına ilişkin bilgilendirme çalışmalarına yer vermekte faydalı olacaktır.

Abstract

Transportation systems have tended to grow rapidly with developing urbanization and increasing transportation needs and continue to grow. Within the transportation systems, the public transportation structure has enabled the rail system transportation to reach an important point due to reasons such as carrying capacity, clean energy, efficiency, and prevention of sound pollution. In our country, as in many parts of the world, the installation of rail transportation systems appears as unexpected service investments that require high time and cost, are difficult to cover, and are unexpected. These investments made for social service purposes have made it necessary to carry out resource management, monitoring and maintenance operations with good engineering practices, starting from the first moment, in order to reduce the costs of installation and operation to the lowest, risk-free levels. When installing a system, in addition to the costs incurred in procuring and commissioning the product, the costs that the product will incur throughout its life are taken into account. Choosing correct and effective maintenance practices in rail transportation systems and operating employees, materials and processes with the right methods and software supports are the points that increase efficiency. The relationship between efficiency and maintenance is an important issue that needs to be addressed not only in rail transportation systems but also in other sectors. Especially in the field of transportation, it should be evaluated in terms of air transportation, rail systems transportation, ship transportation and road transportation. In terms of efficiency, determining the maintenance types and the affecting maintenance criteria and prioritizing them with the determined methods is an important parameter in choosing the maintenance method to be applied. In this study, the types of maintenance used in rail systems will be examined and the orientation of the applied maintenance methods in terms of maintenance methods in rail transportation systems will be discussed.

Keywords: Rail System, Maintenance, Productivity

Introduction

Transportation systems have tended to grow rapidly with developing urbanization and increasing transportation needs and continue to grow. Within the transportation systems, the public transportation structure has enabled the rail system transportation to reach an important point due to reasons such as carrying capacity, clean energy, efficiency, and prevention of sound pollution. In our country, as in many parts of the world, the installation of rail transportation systems appears as unexpected service investments that require high time and cost, are difficult to cover, and are unexpected. These investments made for social service purposes have made it necessary to carry out resource management, monitoring and maintenance operations with good engineering practices, starting from the first moment, in order to reduce the costs of installation and operation to the lowest, risk-free levels (Özarpa, C., Kinaci, B. F., & Avci, İ, 2022). When installing a system, in addition to the costs incurred in procuring and commissioning the product, the costs that the product will incur throughout its life are taken into account. Choosing correct and effective maintenance practices in rail transportation systems and operating employees, materials and processes with the right methods and software supports are the points that increase efficiency. The relationship between efficiency and maintenance is an important issue that needs to be addressed not only in rail transportation systems but also in other sectors. It is necessary to get support from experts who have worked in this field to determine the most appropriate and sustainable methods by considering the relationship between efficiency and maintenance (Thun, J.H., 2006).

In a study on rail systems, it was revealed that the maintenance practices implemented in the Netherlands in the late 90s, efforts to reduce the cost of maintenance without reducing the amount of maintenance, increased punctuality in trips, and thus, effective practices developed to reduce the cost by not reducing the amount of maintenance gave successful results and increased efficiency. has been placed (Budai, G., Huisman, D. ve Dekker, R., 2004). In other studies on rail transportation systems, smart sub-solutions, management applications and software have begun to be used in order to increase efficiency with technology development. These systems used include RAMS (Reliability, availability, maintenance and security) management application, ERP enterprise resource management software, LCC life cycle cost analysis and Maintenance Prevention applications (Türk Standartları Enstitüsü , 2018), (Kant, B., Odabaş, M.S. , 2019), (International Electrotechnical Commission , 2017).

Maintenance Methods

In fact, safety and punctuality are the most important factors in the use of rail transportation systems. Maintenance practices used to ensure safety and punctuality in rail transportation systems have an important place in reducing and preventing unexpected malfunctions as much as possible. In rail transportation systems, the infrastructure and superstructure as a whole must be evaluated together during the maintenance process and maintenance systems must be implemented. When providing maintenance practices, planning as much as possible with a central network structure has an important place in terms of monitoring and effective operation. Maintenance applications performed centrally with a network structure result in less costly and less disruptive traffic (Budai, G., Huisman, D. ve Dekker, R., 2004), (Kumar, U., Crocker, J., Knezevic, J., El-Haram, M., 2000). Maintenance practices in rail transportation systems are progressing towards becoming systems that require less maintenance, with the developing technology and developments in material science. Additional conveniences such as system management method developments and the implementation of digital maintenance tracking applications make the systems more trackable and efficient. Despite these developments, the maintenance needs of rail systems have not been reset and they continue to be systems that continue to need work.

All systems and subsystems used in rail systems begin to encounter malfunctions from the moment they are put into use and malfunctions continue to occur throughout the life cycle. In Figure 1, the average failure rates of the electrical and electronic systems used during their life cycle, from the moment of installation, are shown graphically.

Figure 1. Failure rates over time throughout the life cycle of electrical and electronic systems

In Figure 2, the average failure rates of the mechanical systems used during their life cycle, from the moment of installation, are shown graphically.

Figure 2. Time-dependent failure rates throughout the life cycle of mechanical systems

Basic maintenance is the maintenance methods that ensure the sustainable management of the system, infrastructure or vehicles in rail transportation systems throughout their lifetime without malfunctions. Existing systems are mostly operated by applying periodic preventive maintenance and corrective maintenance method in case of malfunction or damage. With the impact of developing technology and digitalization, the monitoring method, which is one of the digital maintenance methods, has started to create a maintenance application area, and thus, more cost-effective and efficient applications have been achieved. Complementary maintenance practices applied for the system, infrastructure or vehicles in rail transportation systems are structures that constitute a unique maintenance method or sub-methods of basic maintenance methods. Rail transportation systems require applying many different maintenance layers separately or together. Details about maintenance practices are given below (Thun, J.H., 2006), (Türk Standartları Enstitüsü , 2018), (Alman Standartları Enstitüsü, 2019).

Periodic Preventive Maintenance

It is a type of maintenance in which the basic replacement and repair operations of a system are carried out at certain periods. It is done to prevent the replaced elements from causing malfunction or damage.

Corrective Maintenance

It is a type of maintenance applied to eliminate the damage and restore the system to an operable state in case of a malfunction or any accident that occurs as a result of maintenance practices that are not carried out on time.

Maintenance by Monitoring

It is an innovative maintenance method consisting of various technological and software instruments, also referred to as predictive maintenance application. The personnel to be maintained are monitored with various methods and intervened at the right time to ensure low-cost and trouble-free maintenance.

Opportunity Maintenance

It is the situation where maintenance that is overdue or not yet due, regardless of time, is performed while the system or vehicle is being intervened for another purpose.

Active Maintenance

It is a type of corrective or preventive maintenance performed without requiring maintenance to ensure that a part continues to function.

Healing Maintenance

It is a type of technical operation performed to increase the functionality of a part without changing its original function.

Modification

It is a type of technical operation performed to increase the functionality of a part by changing one or more functions.

Modernization

It is the set of changes and innovations made in order to meet new demands and developments in equipment or parts.

Preventive Maintenance

It is a type of maintenance that is planned in advance to ensure that the functionality of the system or part is sustainable and to prevent malfunctions.

Onsite Maintenance

It is a type of maintenance performed without moving the part from its location to any maintenance center.

Operator Maintenance

It is the type of maintenance activities performed by the operator using the vehicle or device.

Conclusion

In this study, where the maintenance practices used in rail transportation systems are prioritized in the context of transportation efficiency, it has been understood that efficiency is an important issue

due to the problems experienced in energy resources and environmental pollution, and that studies need to be carried out to increase the efficiency levels of existing systems as well as newly established systems. In the research conducted in the literature, it has been determined that there are transportation efficiency studies on rail transportation systems and that there are not enough studies on the maintenance effect specifically on rail transportation systems. In addition, maintenance practices are an important parameter affecting efficiency on rail transportation systems, together with topics such as system procurement criteria, employment of expert personnel, corporate structure, social awareness, use of smart technologies, integration with different systems, innovative orientation, central management, planning and energy technology. It has been determined that . The most important relationship between maintenance methods and efficiency is that they are directly related to the increase in malfunctions that occur in systems over time.

It has been determined that periodic maintenance, monitoring maintenance, corrective maintenance, opportunity maintenance, active maintenance, preventive maintenance, on-site maintenance and operator maintenance methods are generally used in order for rail transportation systems to maintain a comfortable and malfunction-free life.

Karabuk University Rail Systems Engineering

Email: furkankinaci@karabuk.edu.tr

Abstract

Rail transportation systems are among the widely used transportation types due to reasons such as transportation safety and efficient structure. With the developing rail system structure, safe and fast infrastructure systems have gained importance. One of the most important parameters in rail transportation systems is the infrastructure systems used. Infrastructure systems used in regions where rail system lines intersect with highway systems are underpasses, overpasses and grade crossings. Although their use is risky, grade crossings continue to be used because underpasses and overpasses cannot be built at all intersections. Among all these systems, the most used grade crossings have different types of structures. Many studies are carried out in the world and in our country to ensure the safety of grade crossings. Grade crossing awareness days (ILCAD) are held worldwide. Grade crossing safety is a complex structure with many components. The location where the grade crossing is created, its physical interaction with the railway, the warning and warning signs to be used and the perception of all these by the grade crossing users. Besides these main components, many more can be listed. Grouping the components using certain criteria will help safety and maintenance units organize their decision-making processes regarding the safety level of the grade crossing and the measures to be taken. In this study, all infrastructure systems will be examined and information about grade crossings, where accidents and risks are most common, will be detailed.

Keywords: Rail System, Crossing, Underpass, Overpass, Grade Crossing

Introduction

Rail transportation systems need structures that will provide appropriate vehicle movement so that vehicles can travel safely. These structures are basically; It consists of infrastructure and superstructure systems (B.F. Kinaci and C. Özarpa). One of the important parameters of rail transportation systems is infrastructure systems. Grade crossings, which are among the infrastructure systems; It consists of gated barrier grade crossing, automatic barrier system grade crossing and uncontrolled (free) grade crossing types. Grade crossings appear as areas that directly affect the safety of life and property and where serious accidents may occur (Özarpa, C., Kınacı, B. F., & Avcı, İ. , 2022). In this regard, many studies are carried out to ensure the safety of grade crossings both in the world and in our country. Due to the problems that may arise, the use of grade crossings is kept as small as possible, and transportation is attempted to be provided with underpass and overpass structures. Due to the costs and implementation difficulties of underpasses and overpasses, it has become necessary to continue using grade crossings (T.C Devlet Demiryolları İşletmesi Genel Müdürlüğü , Hemzemin Geçitlerin Korunması Bakımı ve Yönetimi İle Geçit Bekçilerinin Görevlerine Ait Yönetmelik. T. C. Resmi Gazete, 22512, 1996), (American Association of State Highway Officials), (Brent D. Ogden, Chelsey Cooper) .

To ensure safety at grade crossings, a complex structure with many components must be created. While evaluating the safety of grade crossings, details such as physical location, interaction of railway and highway, warning and warning signs to be used and level of awareness are examined. When determining the types of grade crossings to be established; Train travel speed ($V < 120$ km/h, 120 km/h $< V < 160$ km/h, $V > 160$ km/h) and travel moment value (multiplying the number of trains passing through the grade crossing daily and the number of road vehicles) are the most important parameters taken into consideration (T.C Devlet Demiryolları İşletmesi Genel Müdürlüğü , Hemzemin Geçitlerin Korunması Bakımı ve Yönetimi İle Geçit Bekçilerinin Görevlerine Ait Yönetmelik. T. C. Resmi Gazete, 22512, 1996), (DB Netze), (Ulaştırma ve Alt Yapı Bakanlığı). Various standards, regulations, application models and reports have been published by different institutions to explain certain basic situations during the implementation of grade crossings (A. Creber).

Rail System Infrastructure Systems

Rail transportation systems need roads that provide appropriate vehicle movement so that vehicles can travel safely. These roads basically consist of infrastructure and superstructure systems. One of the important parameters of rail transportation systems is infrastructure systems. Infrastructure systems include all kinds of work done to ensure the safe navigation of the existing natural ground structure of the rail system vehicle. Infrastructure systems mainly consist of tunnels, bridges, passages and support structures. Figure 1 shows the basic infrastructure and superstructure systems (Ay, İ, 2014).

Figure 1. Infrastructure and Superstructure Systems

Grade Crossing

The structures that enable passage from one side to the other at the points where the railway intersects with the highway are called crossings. In railways, transitions are provided by underpasses, overpasses and grade crossing structures. Grade crossing types are basically; It consists of gated barrier grade crossings, automatic barrier system grade crossings and uncontrolled (free) grade crossings. Figure 2 shows 1-lane and 2-lane highway grade crossings intersecting the railway (Transport Canada).

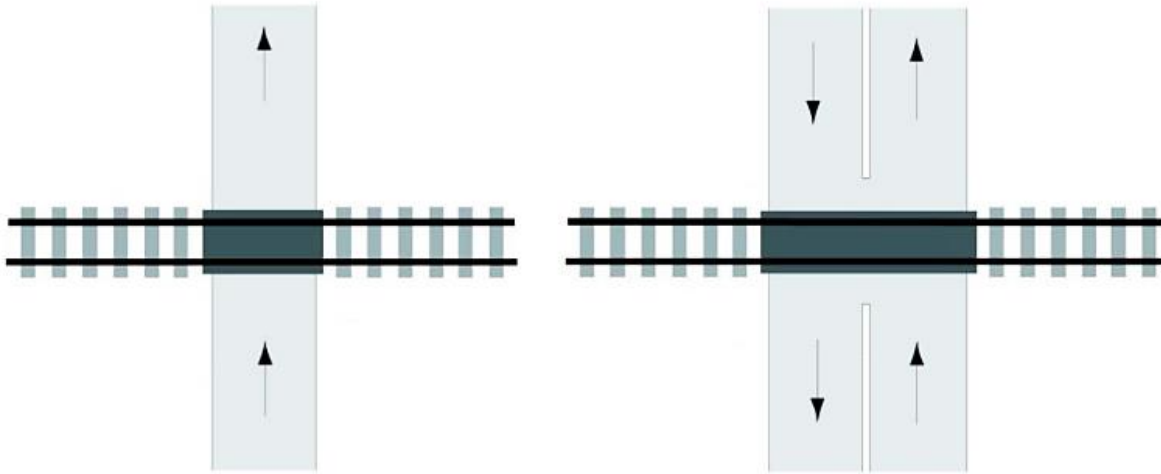

Figure 2. 1-lane and 2-lane Highway Intersecting with Railway

When designing grade crossings, designs are made according to the train speed and travel moment value (the number of trains passing through the grade crossing daily multiplied by the number of road vehicles). Table 1 shows the grade crossing type selection according to train speed and travel moment values (T.C Devlet Demiryolları İşletmesi Genel Müdürlüğü , TCDD Emniyet Yönetim Sistemi El Kitabı (Sürüm No: 1.0). Ankara: TCDD Demiryolu Emniyeti ve Risk Yönetimi Müdürlüğü., 2017).

Table 1. Grade Crossing Selection

Train Speed	Grade Crossing (GC) Moment	GC Type
Train Speed < 120 km/h	Moment < 3.000	Uncontrolled
Train Speed < 120 km/h	3.000 < Moment < 30.000	With Flashing Bell and Automatic Barrier
120 km/h < Train Speed < 160 km/h	Moment < 3.000	With Flashing Bell and Automatic Barrier
120 km/h < Train Speed < 160 km/h	3.000 < Moment < 30.000	With Flashing Bell and Automatic Barrier
Train Speed > 160 km/h	Moment < 3.000	GC Cannot Be Opened
Train Speed < 160 km/h	Moment > 30.000	GC Cannot Be Opened

When designing grade crossings, the section where the crossing is located must be provided with a structure suitable for all railway vehicles and road vehicles. A cross-sectional view of the values

accepted in applications around the world is shown in Figure 3. One of the important details in grade crossing design is the calculation of safe stopping distance.

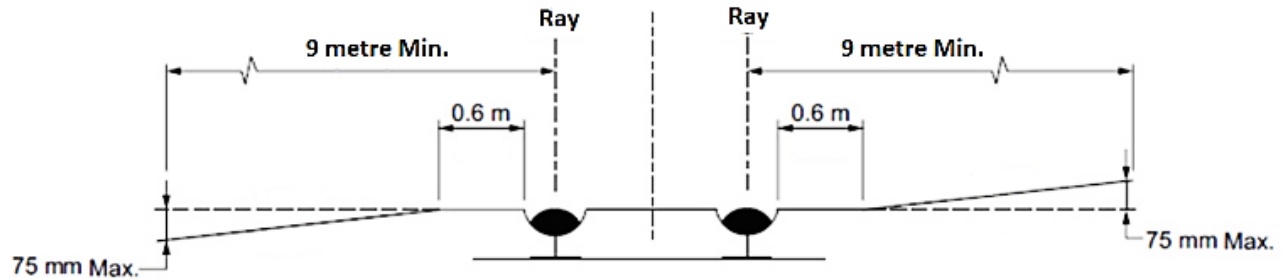

Figure 3. Cross Section View of Grade Crossing

Conclusion

With the developments in rail transportation systems, the number of crossings intersecting with the highway has increased. Grade crossings, which are the most frequently used system among these crossings, have been identified as an area where serious studies are carried out due to accident risks and the effects of these accidents. The geometric designs and risk prevention practices of grade crossings used around the world are specially designed according to the geographical location of the region where the system is used, line capacities, awareness level and technology levels of the systems used. In the study, acceptable geometric design was determined when creating a grade crossing by examining the standards, regulations, application models and reports put forward by many different countries.

Özet

Karbon nanotüpleri (CNT'ler) lüminesans davranış sergiler. Tek duvarlı karbon nanotüplerin (SWCNT'ler) fotolüminesans (PL) spektrumları birçok keskin emisyon bandı sergiler. Yarı iletken kuantum noktalarının doğal dezavantajlarından yoksundurlar. Çift duvarlı karbon nanotüplerin lüminesansı ile ilgili olarak, bazı araştırmacılar iç kabuktan güçlü bir emisyon rapor ederken, bazıları dış kabuktan zayıfladığını, bazıları ise her ikisini de rapor etmektedir. Bu çalışma kapsamında Suzuki-coupling reaksiyonu ile sentezlenen, karakterize edilen ve hidrojen depolama özellikleri belirlenen aril sübstitüe MWCNT bileşiklerinin fotolüminesans özellikleri incelenmiştir. Eklenen grup üzerindeki halka sayısı ve delokalizasyon arttıkça fotolüminesans şiddetinin arttığı tespit edilmiştir.

Anahtar Kelimeler: Fotolüminesans, MWCNT, karakterizasyon.

**INVESTIGATION OF PHOTOLUMINISENCE PROPERTIES OF SOME
SUBSTITUTED MWCNT COMPOUNDS**

Abstract

Carbon nanotubes (CNTs) exhibit luminescent behavior. Photoluminescence (PL) spectra of single-walled carbon nanotubes (SWCNTs) exhibit many sharp emission bands. They lack the inherent drawbacks of semiconductor quantum dots. Regarding the luminescence of double-walled carbon nanotubes, some researchers report a strong emission from the inner shell, some report a weakening from the outer shell, and some report both. Within the scope of this study, the photoluminescence properties of aryl substituted MWCNT compounds synthesized by Suzuki-coupling reaction, characterized and whose hydrogen storage properties were determined were examined. It was determined that the photoluminescence intensity increased as the number of rings and delocalization on the added group increased.

Keywords: Photoluminescence, MWCNT, characterization.

Giriş

Karbon nanotüpler silindirik fulleren tipi yapılardır. İlk kez 1985 yılında sıcak karbon buharının yoğunlaşması sırasında 60 veya daha fazla karbon atomunun bir araya gelmesiyle oluşan futbol topu şeklindeki moleküller olarak keşfedilmişlerdir. Tek duvarlı karbon nanotüpler (SWCNTs) sp^2 karbondan yapılmış çapları 0.5-1.5 nm olan uzun silindirik yapılardır. Çok duvarlı karbon nanotüpler (MWCNTs) sp^2 karbondan yapılmış uzun silindirik nano yapılardır. Nanotüpler dünya çapında pek çok araştırma grubunun üzerinde yoğun çalışmalar yaptığı bir alandır. Artık yaklaşık son 30 yıldır yapılan araştırmaların sonuçları doğrultusunda geleceğe yönelik uygulamaları çok önemli faydalar vaat etmektedir. Nanotüplerin mevcut uygulamaları sınırlıdır ve yaygın olarak kullanılmamaktadır [1].

Heteroatom içeren bileşikler, benzen halkaları içeren bileşikler, naftalin türevleri ve metal içeren inorganik bileşikler, ışıldayan maddelere örnektir. Bir atom veya molekül ultraviyole ışığın (UV) fotonları tarafından uyarıldığında lüminesans olgusu meydana geldiğinde buna fotolüminesans (PL) adı verilir. Fotolüminesans teknolojisi, malzemelerin yüzeyindeki aktif bölgelerin yapısını ve özelliklerini belirlemek için yaygın olarak kullanılan bir yöntemdir. PL teknolojisi yüzeylerdeki reaksiyonları anlamak için kullanılabilir. PL çalışmaları aynı zamanda emisyon tepe dalga boylarını ve kuantum verimlerini belirlemek için de kullanılabilir. Son olarak, eklemeler ve modifikasyonlardan sonra moleküllerin özelliklerini incelemek için kullanılabilir [2–4].

Lüminesans maddelerde her aşamada görülebilir. Heteroatom içeren bileşikler, benzen halkaları içeren bileşikler, naftalin türevleri ve metal içeren inorganik bileşikler, ışıldayan maddelere örnektir. Lüminesans, madde uyarılmış bir durumdan temel enerji durumuna geçtiğinde meydana gelir. Atomik spektrumlar doğrusal iken moleküller bantlar halindedir [5]. CNT bileşikleri üzerine gerçekleştirilen çalışmalarda eklenen fonksiyonel grupların lüminesans şiddetini artırdığı tespit edilmiştir [2, 6, 7].

Bu çalışmada, Suzuki-coupling reaksiyonu ile sentezlenen ve hidrojen depolama özellikleri rapor edilen aril-süstitüe MWCNT'lerin fotolüminesans özellikleri belirlenmiştir. Halka sayısının artması ve eklenen grubun yer değiştirmesi ile fotolüminesansın arttığı bulunmuştur.

MATERYAL VE METOT

Fotolüminesans Çalışmaları

298 K sıcaklığındaki bir kriyostata (yakın) yerleştirilmiş tozlar (MWCNT, D16, D17, D18, D19), 0.01 ve 1.04 W/cm² arasındaki uyarma yoğunlukları üzerinde fotoluminesans ölçümleri

yapılmıştır. Eksitasyon için 349 nm'de frekans üçlü Nd: YLFQ anahtarlamalı puls lazer kullanılmıştır. Lüminesans uygun lenslerle toplanmış ve daha sonra 1200 çizgi/mm ızgara kullanılarak 500 mm'lik bir spektrometre ile dağıtılmış ve ICCD kamera dedektörü tarafından şiddet verileri toplanmıştır (dedektör sıcaklığı -25 °C) [8, 9].

Çizelge 1. Kullanılan aril süstitüe MWCNT'ler [9, 10]

BULGULAR

Bu çalışmada MWCNT, D16 - D19 bileşiklerinin fotolüminesans spektrumları Şekil 2'de verilmiştir.

Şekil 1. Sübstitüsyon içermeyen MWCNT bileşiminin (A) ve D16, D17, D18, D19 bileşiklerinin (B) farklı dalga boylarındaki fotolüminesans ölçümü [9].

TARTIŞMA VE SONUÇ

Bu çalışma kapsamında, ticari olarak satın alınan MWCNT bileşiği ile Suzuki coupling reaksiyonuyla sentezlenen aril sübstitüe MWCNT bileşiklerin optik özelliklerinin tespit edilmesi amacıyla fotolüminesans özellikleri incelenmiştir. İlk olarak 25 °C’de genel bir dalga boyu taraması gerçekleştirilmiş ve maksimum lüminesans tespit edilen dalgaboyları belirlenmiştir.

Şekil 1 A incelendiğinde ticari MWCNT bileşiminin 525 nm dalgaboyunda $5,6 \cdot 10^2$ lüminesans şiddetine sahip olduğu, Şekil 1 B’de ise sırasıyla D16, D17, D18 ve D19 bileşiklerinde ise en yüksek fotolüminesans şiddeti D19 bileşiğine ait (~ 450 nm için $5 \cdot 10^5$ a.u.) olduğu tespit edilmiştir. D19’dan sonra en yüksek fotolüminesans şiddetinin D18 bileşiğine ait olduğu (~ 450 nm için $5 \cdot 10^4$ a.u.), üçüncü en yüksek fotolüminesans şiddetinin D17 bileşiğine ait olduğu (480 nm için $5 \cdot 10^3$ a.u.) ve son olarak en düşük fotolüminesans şiddetinin (500 nm için $1 \cdot 10^3$ a.u.) D16 bileşiğine ait olduğu gözlenmiştir. Bileşiklerin sırasıyla fenil, α -naftil, β -naftil ve 1-pirenil fonksiyonel gruplarını içerdiği düşünüldüğünde aromatik benzen halkasının artmasıyla fotolüminesans şiddetininin yaklaşık 10 kat arttığı tespit edilmiştir.

Bununla beraber ilave edilen benzen halkaları PL değerinin daha kısa dalga boylarına, maviye kaymasına sebep olmuştur. Aynı halka sayısına, fakat farklı bağlanma bölgelerine sahip α -naftil ve β -naftil modifiye MWCNT’lerin fotolüminesans spektrumları incelendiğinde α -naftil bileşiminin diğer konformasyondan daha yüksek fotolüminesansa sahip olduğu tespit edilmiştir.

Spektrumlarda geniş bantların olması geçişlerin daha çok $\pi \rightarrow \pi^*$ geçişleri olduğunu; bileşiklerin konjuge π bağları içermesi sebebiyle $\pi \rightarrow \pi^*$ geçişlerinin gerçekleştiği düşünülmektedir.

Son olarak maksimum PL değerlerine sahip oldukları dalgaboyları karşılaştırıldığında MWCNT > D16 > D17 > D18 > D19 şeklinde olduğu tespit edilmiştir.

TEŞEKKÜR

Özet

Hetereatom içeren bileşikler içerdikleri oksijen, kükürt, azot gibi elektronegatif elementlerden dolayı hidrofilik bir özelliğe sahiptirler. Ayrıca taşıdıkları hidrokarbonlar ile ester, eter, aromatik gruplar gibi fonksiyonel gruplardan kaynaklanan apolar karakterli hidrofobik özellik sergileyen bir esnek yapıya sahiptir. Organik bileşikler içerdikleri bu atomlar ve gruplar sebebiyle, metal iyonları ile olağanüstü seçicilik özellikleri göstermektedir. Bu çalışma kapsamında; seçimli ekstraksiyon ve metal giderimi üzerine çalışmalar gerçekleştirilmiştir. Bu amaçla, metil süstitüe benzotiyoot bileşiklerinin, aynı çözültü içerisinde metal tuzlarını içeren ortamda sergiledikleri metal seçicilikleri yarışmalı ekstraksiyon ile incelenmiştir. Ayrıca mikrodalga sentez yöntemiyle sentezlenen benzotiyoot bileşiklerinin, şebeke, göl ve dere sularından alınan su numuneleri üzerine etkisi yarışmalı sıvı-sıvı iyon çiftleri ekstraksiyonu ile belirlenmiştir. Uygulamanın amacı, sertliğe ve tat-koku-görüntü bozukluklarına yol açabilen bazı metal iyonlarının giderimi araştırılmasıdır. Bağlı bulunan fonksiyonel grupların (değişiminin seçicilik üzerine etkisi incelenmiştir. Gerçekleştirilen çalışmada elde edilen sonuçlar ışığında, su arıtım sistemlerinin iyon değiştirici ya da iyon tutucu reçinelerinde kullanılan bileşiklerin kullanılması olasıdır. Ayrıca, bu bileşiklerin uygulama alanının geliştirilmesi ve geri kazanımlarının artmasıyla endüstride kullanımı olasıdır.

Anahtar kelimeler: Sulardan metal giderimi, yarışmalı metal ekstraksiyonu, metal kompleksleşmesi, içme suyu kalitesi.

**COMPETITIVE EXTRACTION OF SOME ORIGINAL METHYL SUBSTITUTED
BENZOTHIATE COMPOUNDS AND INVESTIGATION OF THEIR METAL
REMOVAL PROPERTIES FROM VARIOUS WATERS**

Abstract

Compounds containing heteroatoms have a hydrophilic property due to the electronegative elements they contain such as oxygen, sulfur and nitrogen. In addition, it has a flexible structure that exhibits non-polar hydrophobic properties resulting from the hydrocarbons it carries and functional groups such as esters, ethers and aromatic groups. Organic compounds show extraordinary selectivity with metal ions due to the atoms and groups they contain. This scope of work; studies on selective extraction and metal removal have been carried out. For this purpose, the metal selectivities of methyl substituted benzothioate compounds in the same solution containing metal salts were examined by competitive extraction. In addition, the effect of benzothioate compounds synthesized by microwave synthesis method on water samples taken from mains and stream waters was determined by competitive liquid-liquid ion pair extraction. The purpose of the application is to investigate the removal of some metal ions that can cause hardness and taste-odor-image disorders. The effect of changing the attached functional groups on selectivity was examined. In the light of the results obtained in the study, it is possible to use compounds used in ion exchange or ion trap resins of water treatment systems. Moreover, it is possible to use these compounds in industry with the development of their application areas and increasing their recovery.

Keywords: Metal removal from water, competitive metal extraction, metal complexation, drinking water quality.

Giriş

Taç eterler içermekte oldukları oksijen, kükürt, azot atomları ve benzen halkaları sebebiyle oldukça ilgi çekicidir [1]. İçerdikleri döner atomlara bağlı olarak okso, azo, tiyo, benzo ve benzo-tiyo, vb. olarak adlandırılmaktadır [2]. Benzo taç eterlerin 1960'lı yıllarda Perderson tarafından sentezinden sonra kükürt içeren üyelerinin sentezleri 1970-1980'li yıllarda gerçekleşmeye başlamıştır [3]. 1972-1973 yıllarında Tanaka ve arkadaşları, 1981'de Buter ve Kellog ile başlayan benzo-tiyo crown eterlerin sentezi 1990'lı yıllarda oldukça artmıştır [4, 5]. Tiyo taç eterler ağır metallere ve değerli metallere karşı taşıdıkları kükürt atomları sebebiyle yüksek ilgi göstermektedir [6]. 2,2'-ditiyosalisilik asit, ilaçların, boyaların, fotokimyasalların ve biyositlerin sentezinde bir ara madde olarak kullanılır [7]. Halkalı bileşiklerin esterifikasyon, amidasyon ve tiyoesterifikasyon reaksiyonları ile sentezi 1970'li yıllara dayanmaktadır. Daha sonraki yıllarda bu bileşiklerin metalurjik özellikleri içerdikleri heteroatomlar, aromatik yapılar ve fonksiyonel gruplar nedeniyle araştırılmıştır [8–15]. Bu çalışmada, tiyoester türevlerinin fonksiyonel gruplarının seçimli metal ekstraksiyonu üzerindeki etkisini araştırmak amacıyla, Zn^{2+} , Mn^{2+} , Cr^{3+} , Fe^{3+} , Co^{2+} , Cu^{2+} iyonları ve sıvı-sıvı iyon çiftleri ekstraksiyonu kullanılmıştır. Ayrıca sıvı-sıvı iyon çiftleri ekstraksiyonuna metal tuzları yerine göl, dere ve şebeke suları uygulanmış ve ppb seviyesinde ekstraksiyonu araştırılmıştır.

MATERYAL VE METOT

Sentez

Şekil 1'de yer alan **1-3** bileşikleri literatüre göre sentezlenmiştir [16].

Şekil 1. 1-3 bileşikleri kompleksleşme şeması

Yöntem

Sıvı-sıvı ekstraksiyonu birbiriyle karışmayan iki sıvının (organik faz ve inorganik faz) yardımıyla inorganik materyellerin organik materyellere taşınmasıdır. Yarışmalı metal ekstraksiyonu ile nispi seçicilik faktörlerinin (S_f) belirlenmesi ve doğal su numunelerinden metal giderimi literatüre göre gerçekleştirilmiştir [9, 17]. Yarışmalı ekstraksiyon için indüktif olarak eşleşmiş plazma – optik emisyon spektroskopisi (ICP-OES) ve yüzey sularından metal giderimi çalışmalarında indüktif olarak eşleşmiş plazma – kütle spektroskopisi (ICP-MS) cihazları kullanılmıştır. Ekstraksiyon denge sabiti (K_{ext}), denge anında organik fazda oluşan kompleksin sulu fazda yer alan metal iyonuna oranı (K_D), ekstraksiyon yüzdesi (%Ext ve $\ln(K_{ext})$) ve ekstraksiyonun serbest Gibbs enerjisi ($-\Delta G_{ext}$) değerleri hesaplanmıştır.

BULGULAR

Yarışmalı ekstraksiyon amacıyla kullanılan 1-3 bileşiklerinin Mn^{2+} , Fe^{3+} , Cr^{3+} , Co^{2+} , Zn^{2+} , Cu^{2+} iyonlarının karışımında elde edilen veriler Çizelge 1’de verilmiştir.

Çizelge 1. 1-3 bileşiklerinin sıvı-sıvı iyon çiftleri ekstraksiyonuyla Mn^{2+} , Fe^{3+} , Cr^{3+} , Co^{2+} , Zn^{2+} , Cu^{2+} iyonlarının karışımından ((kloroform/su (%50), doğal pH ve 25 °C’de) elde edilen ekstraksiyon sabitleri.

TARTIŞMA VE SONUÇ

Bu çalışmada, Mn^{2+} , Zn^{2+} , Cr^{3+} , Co^{2+} , Fe^{3+} , Cu^{2+} iyonlarının, sıvı-sıvı ekstraksiyonu ((kloroform/su (%50), doğal pH ve 25 °C'de) ile **1-3** bileşiklerinin yarışmalı ekstraksiyonu ve metal giderimi incelenmiştir.

Çizelge 1'de yer alan yarışmalı ekstraksiyon sonuçları incelendiğinde **1** bileşiğinin K_{ext} , K_D , %Ext, $\ln(K_{\text{ext}})$ ve $(-\Delta G_{\text{ext}})$ değerlerinin büyük olması ekstraksiyonun yüksek olması anlamına gelmektedir. Ekstraksiyonun en güzel göstergesi olan % ekstraksiyon değerleri incelendiğinde **1**, **2** ve **3** bileşiklerinin en fazla Fe^{3+} iyonunu (sırasıyla %77.77, %77.99 ve %78.11) ekstrakte ettiği

tespit edilmiştir. **1**, **2** ve **3** bileşiklerinin Fe^{3+} iyonunu ekstraksiyonu en yakın iyon (Cu^{2+}) göre yaklaşık 3 kattan daha fazladır. Tüm bileşikler en az Co^{2+} tuzunu (% Ext değeri 3.78-7.56 arası) ekstrakte etmiştir. **1** ve **3** bileşiklerinin % ekstraksiyon değerleri sıralaması $Fe^{3+} > Cu^{2+} > Mn^{2+} > Zn^{2+} > Cr^{3+} > Co^{2+}$ şeklindedir. **2** bileşiğinin % ekstraksiyon değerleri sıralaması ise $Fe^{3+} > Cu^{2+} > Mn^{2+} > Zn^{2+} \approx Cr^{3+} > Co^{2+}$ şeklindedir.

Çizelge 2’de yer alan S_f değerleri incelendiğinde **1** bileşiğinin Fe^{3+} iyonunu; Co^{2+} iyonuna göre 42.77 kat, Cr^{3+} iyonuna göre 25.96 kat, Zn^{2+} iyonuna göre 14.52 kat, Mn^{2+} iyonuna göre 13.08 kat ve Cu^{2+} iyonuna göre 10.57 kat daha fazla tercih ettiği gözlenmiştir. Özetle **1** bileşiği Fe^{3+} iyonunu seçimli olarak ekstrakte etmektedir. Çizelge 3’de yer alan S_f değerleri incelendiğinde **2** bileşiğinin Fe^{3+} iyonunu; Co^{2+} iyonuna göre 56.27 kat, Cr^{3+} iyonuna göre 21.83 kat, Zn^{2+} iyonuna göre 23.16 kat, Mn^{2+} iyonuna göre 13.97 kat ve Cu^{2+} iyonuna göre 11.13 kat daha fazla tercih ettiği gözlenmiştir. Özetle **2** bileşiği Fe^{3+} iyonunu seçimli olarak ekstrakte etmektedir. Çizelge 4’de yer alan S_f değerleri incelendiğinde **3** bileşiğinin Fe^{3+} iyonunu; Co^{2+} iyonuna göre 90.82 kat, Cr^{3+} iyonuna göre 26.94 kat, Zn^{2+} iyonuna göre 25.82 kat, Mn^{2+} iyonuna göre 16.22 kat ve Cu^{2+} iyonuna göre 11.09 kat daha fazla tercih ettiği gözlenmiştir. Özetle **3** bileşiği Fe^{3+} iyonunu seçimli olarak ekstrakte etmektedir. Çizelge 2-4’e göre **1-3** ligandları içerisinde en seçici ligand, **3** numaralı ligand olduğu belirlenmiştir.

Kendiliğinden meydana gelen bir olayın olasılığının bir ölçüsü olan pozitif Gibbs serbest enerji değerleri ($-\Delta G_{ext}$), tüm ekstraksiyonların istemli olduğunu göstermektedir.

Ayrıca Kezer Çayı, İlisu Barajı göl havzası ve çeşme suyu örneklerinde de aynı iyonların Zn^{2+} , Cr^{3+} , Mn^{2+} , Co^{2+} , Fe^{3+} , Cu^{2+} iyonlarının, **1-3** bileşikleriyle sıvı-sıvı iyon çiftleri ekstraksiyonu üzerinden metal giderimi araştırılmıştır. Çizelge 5’e göre su örneklerinin ppb düzeyinde Zn^{2+} , Cr^{3+} , Mn^{2+} , Co^{2+} , Fe^{3+} , Cu^{2+} iyonlarını içermesine rağmen **1-3** bileşikleriyle tarafından %1.4 ile %99.7 oranında bu iyonları ekstrakte ettiği tespit edilmiştir.

Özet

Ticari olarak üç farklı erik türünün yetiştiriciliği öne çıkmakta olup, bu türler içerisinde Japon grubu olarak sınıflanan *Prunus salicina* L., üretim ve tüketim yönüyle en yüksek paya sahiptir. Anavatanı Çin ve çevresi olan bu tür, Japonya’da yayılım göstermiş, ilerleyen süreçte Japon eriği ıslahının öncüsü olarak bilinen Luther Burbank tarafından Amerika’ya getirilmiştir. Bu ekip tarafından 1884 yılında Kaliforniya’da başlatılan ıslah çalışmaları günümüzde en gelişmiş ıslah programları arasında bilinmekte ve o dönem elde edilen çeşitlerden bazıları halen ticari olarak kullanılmaktadır. Bu türde hem tür içi hem de türler arası melezleme ıslahı çalışmaları yoğun olarak devam etmektedir. Melezleme, kendileme ve serbest tozlanma çalışmaları doğrultusunda çok sayıda çeşit geliştirilmiştir. Seleksiyon çalışmaları da varyasyonun önemli bir parçası olarak karşımıza çıkmaktadır. Ayrıca farklı mutajenler ile yeni genotipler geliştirilmiştir. Günümüzde ABD başta olmak üzere, Çin, Güney Afrika, İspanya, İtalya, Brezilya, Türkiye ve Şili’de farklı hedefleri barındıran ıslah programları devam etmektedir. Meyve türlerinde ıslah çalışmalarının, tescile yansımaları uzun zaman aldığından, ıslahçıların hedef parametreleri belirleyip doğru yöntem ile yoluna devam etmesi oldukça önemli hale gelmektedir. Genel olarak Japon eriklerinde ıslah hedefleri; verim, şarkaya dayanıklılık, kendine verimlilik, hasat sonrası uzun süreli muhafazaya uygunluk, erkencilik-geçcılık ve yüksek meyve kalitesi (irilik, sertlik, koyu meyve kabuk rengi, aroma) şeklinde karşımıza çıkmaktadır. Genel hedeflerin dışında, tüketici tercihleri ve ihracat hedef ülkeleri doğrultusunda da ıslah çalışmalarının, farklı meyve et ve kabuk rengi bazında şekillendiği görülmektedir. A.B.D ‘de koyu kabuk rengi, İspanya’da sarı kabuk rengi, koyu kabuk rengi-kırmızı meyve et rengi, Türkiye’de ise kabuk ve et rengi açısından geniş bir varyasyon oluşturulmuştur.

Anahtar Kelimeler: Japon eriği, kalite, kendine verimlilik, dayanıklılık.

RECENT BREEDING TARGETS IN JAPANESE PLUM (*Prunus salicina* L.)

Abstract

Commercial cultivation of three different plum species stands out, and among these species, *Prunus salicina* L., classified as the Japanese group, has the highest share in terms of production and consumption. This species, whose homeland is China and its surroundings, spread in Japan and was later brought to America by Luther Burbank, known as the pioneer of Japanese plum breeding. The breeding studies initiated by this team in California in 1884 are known as among the most advanced breeding programs today, and some of the varieties obtained at that time are still used commercially. Both intraspecific and interspecific hybridization studies in this species continue intensively. Many varieties have been developed through hybridization, self-pollination and open-pollination studies. Selection studies also appear as an important part of variation. Additionally, new genotypes have been developed with different mutagens. Today, breeding programs with different goals continue in the USA, China, South Africa, Spain, Italy, Brazil, Türkiye and Chile. Since breeding efforts in fruit species take a long time to be reflected in the registration, it becomes very important for breeders to determine target parameters and continue with the correct method. In general, breeding targets for Japanese plums are; yield, resistance plum pox virus, self-compatibility, suitability for long-term storage after harvest, early-late maturing and high fruit quality (largeness, hardness, dark fruit skin color, aroma). Apart from general targets, it is seen that breeding studies are shaped on the basis of different fruit flesh and shell colors in line with consumer preferences and export target countries. There is a wide variation in terms of dark skin color in the USA, yellow skin color in Spain, dark skin color-red fruit flesh color, and skin and flesh color in Türkiye.

Keywords: Japanese plum, quality, self-fertility, resistance.

JAPON ERİKLERİ HAKKINDA GENEL BİLGİLER

Japon erikleri (*Prunus salicina* L. $2n=2x=16$)'nin orjin merkezi Çin'dir ve bu nedenle bazı kaynaklarda Çin eriği olarak da geçmektedir (Yoshida, 1987). Anavatanı Çin'de, çok geniş bir coğrafi yayılım gösterdiği ve 1.000'den fazla yerli Japon eriği çeşidinin bulunduğu ve bunlardan 700'den fazlasının Ulusal Erik ve Kayısı Germplazm (NGRPA)'da muhafaza edildiği bildirilmektedir (Zhang, 1990; Wei vd., 2020). Ayrıca 2.000 yıldır bilinen "Zhui Li" çeşidinin halen Çin'de üretimi yapılmakta ve tüketiciler tarafından tercih edilmektedir (Chen vd., 1981). Japon erikleri çoğunlukla taze tüketimde kullanılmaktadır (Okie ve Weinberger 1996; Chen vd., 1981; Bolat vd., 2015; Şahin vd., 2022), ancak yapılan ıslah çalışmaları sonucunda elde edilen SÇKM miktarları yüksek çeşit adaylarının kurutmalık özellikleri ile de ön plana çıktığı ve bu amaçla da kullanılabilirliği düşünülmektedir (Şahin vd., 2022).

Günümüzde daha çok Japon eriği olarak bilinen bu türün, Japonya'ya gelişi üzerine iki farklı görüş bulunmaktadır. Birinci görüş doğal yollarla Kore yarımadası üzerinden Japonya'ya geldiği yönünde iken, diğer bir görüş ise Çinli bir keşiş tarafından ağaçların İmparator'a hediye olarak getirildiği yönündedir (Matsumado, 1977). Amerikalı tarım delegesi Norman J. Colman'ın 1887 yılında yayınladığı raporda, 1870 yılında Hough tarafından ilk Japon eriklerinin Kaliforniya'ya ithal edildiği ve komşusu John Kelsey tarafından üretildiğinden bahsetmektedir (USA Department of Agriculture, 1889). Sonraki yıllarda ise Japon eriği ıslahının öncüsü olarak bilinen Luther Burbank tarafından 1884 yılında Japonya'dan Kaliforniya'ya getirilen Japon eriği çeşitleri ile ABD'de ıslah çalışmaları başlamıştır (Okie ve Weinberger 1996).

JAPON ERİKLERİNDE ISLAH ÇALIŞMALARI

Japon eriği ıslahında geleneksel ıslah yöntemleri yaygın olarak kullanılmakta ve bunlara fonksiyonel genomik, mutasyonlar, in vitro teknikler ve moleküler belirteçler dahil olmak üzere yenilikçi biyoteknolojik yöntemler dahil edilmektedir (Carrasco vd., 2013). Melezleme ıslahı çalışmaları kapsamında türler arası ve tür içi karşılıklı melezleme, serbest tozlanma, ve kendileme uygulamaları yapılmaktadır (Bellini vd., 2008; Ruiz vd., 2019).

Yapılan ıslah programları incelendiğinde, Burbank tarafından Amerika'da başlatılan ıslah programlarının halen aktif olarak devam ettiği ve günümüzde en gelişmiş ıslah programlarının Kaliforniya olduğu görülmektedir (Okie ve Ramming, 1999). Bu programlara ek olarak Çin, Güney Afrika, İspanya, İtalya, Brezilya, Türkiye ve Şili'de farklı ıslah hedeflerine yönelik programlar

devam etmektedir (Hartmann ve Neumüller, 2009; Topp vd., 2012; Liu vd., 2013; Ruiz vd., 2019; Çavdar vd., 2017; Şahin vd., 2022).

Burbank tarafından Amerika'da başlatılan ilk ıslah çalışmaları ile Japon eriği × Japon eriği ve Japon eriği × yerli Amerika erikleri arasında melezleme çalışmaları gerçekleştirmiştir (Howard, 1945; Crow, 2001). Bu program kapsamında tescil edilen çeşitlerden bazıları halen günümüzde kullanılmakta ve ıslah çalışmaları devam etmektedir (Milošević ve Milošević, 2018). En önemli çeşitlerin başında gelen Angeleno ve Black Diamond çeşitleri serbest tozlanma sonucunda elde edilen ve üretimi çok yaygın olan çeşitler olarak karşımıza çıkmaktadır. Kaliforniya'da yaklaşık 200 Japon erik çeşidi ticari üretimde olmasına rağmen, siyan dış kabuk rengine sahip olan Friar, Angeleno ve Black Amber, çeşitleri Kaliforniya'nın toplam Japon eriği üretiminin yaklaşık %40'ını oluşturmaktadır (Okie ve Ramming 1999; Milošević ve Milošević 2018).

İtalya'da 1989 yılında Black Gold × Burmosa arasında yapılan melezlemeler sonucunda, Dofi-Sandra çeşidi tescil edilmiştir ve bu çeşit erkenci ve koyu kabuk rengi ile ön plana çıkmaktadır (Bellini ve Nencetti, 2002). Yine aynı ülkede, 1996 yılında başlatılan ıslah çalışmasında sarı kabuklu, dayanıklı, sertliği yüksek ve yüksek verimli Japon eriklerinin ıslahı amaçlanmıştır. T.C. Sun × Golden Plum, T.C. Sun × Shiro ve T.C. Sun × Byrongold kombinasyonları kullanılmış ve 989 melez birey elde edilmiştir (Bellini vd., 2008).

Çin'de yedi farklı ili kapsayacak şekilde devam eden Japon eriği ıslah programı bulunmaktadır. Ana hedefler, yedi il için adaptasyon yeteneği yüksek, iri meyveli, meyve sertliği yüksek ve yeme kalitesi yüksek çeşitlerin geliştirilmesidir ve dört çeşit adayı ön plana çıkmıştır (Topp vd., 2012). Tayvan'da ise küçük bir ıslah programı bulunmakta ve iri meyve özelliği ve düşük soğuklanma ihtiyacı olan beş çeşit adayı üzerine çalışmalar devam etmektedir (Wen ve Sherman, 2003; Wen ve Liu, 2004).

İspanya'da, CEBAS-CSIC ve IMIDA ortaklığı ile yüksek verimli, şarkaya (Plum pox virus, PPV) dayanıklı, erkenci, kendine verimli ve meyve kalitesi yüksek Japon eriği ıslahı çalışmaları 2011 yılında başlamıştır. Kayısı × Japon eriği gibi türler arası melezlemeleri de içeren 50 farklı kombinasyonda melezleme çalışmaları gerçekleştirilmiş ve 4.500 melez birey elde edilmiştir. Fenotipleme işlemlerine devam edildiği ve ümitvar çeşit adaylarının belirlendiği bildirilmektedir (Ruiz vd., 2019). 2020 yılında ise Myrtea® serisi ile piyasaya güçlü bir giriş yapılmış ve Black Splendor'un serberst tozlanmasıyla Lucia myrtea ve Victoria myrtea çeşitleri tescil edilmiştir

(Guevara vd., 2021; Ruiz vd., 2021). Lucia myrtea kendine verimsizdir ve tozlayıcı olarak kendine verimli olan Victoria myrtea çeşidi önerilmektedir (Guevara vd., 2021).

Türkiye’de bu türde ıslah çalışmaları, 2013 yılında Tarımsal Araştırmalar ve Politikalar Genel Müdürlüğü’ne bağlı Ege Tarımsal Araştırma Enstitüsü’nde Çavdar vd., (2017) tarafından başlatılmıştır. Amaç farklı olgunlaşma zamanları, farklı meyve kabuk ve et renklerine sahip, verimli ve kaliteli çeşitlerin geliştirilmesidir. Kendileme, serbest tozlanma ve melezleme çalışmaları sonucunda elde edilen tohumlar, embriyo kültürü yöntemi ile çimlendirilerek melez bitkiler elde edilmiştir. Toplamda 12 kombinasyondan elde edilen 2.854 melez bireyden yapılan değerlendirmeler sonucunda 36 tanesi seçilerek seleksiyon II parselinde değerlendirmeye alınmak üzere fidanları yetiştirilmiştir (Çavdar vd., 2017; Şahin vd., 2022). Çoğu ıslah programında olduğu gibi bu çalışmada da kendine verimliliğin aktarımı amacıyla Methley ve Black Diamond çeşitleri kombinasyonlarda kullanılmıştır. Bu ıslah programında, Black Diamond, Black Amber ve Angeleno çeşitlerinin serbest tozlanmasından elde edilen 8 çeşit adayının kendine verimlilik durumları arazi koşullarında belirlenmiş ve Black Diamond’un serbest tozlanmasından elde edilen 18-26 nolu çeşit adayının ana ebeveyni gibi Se alleli içerdiği düşünülmekle birlikte kısmen kendine verimli olduğu tespit edilmiştir (Şahin vd., 2023).

JAPON ERİKLERİNDE GÜNCEL ISLAH HEDEFLERİ

Dünya çapında yapılan Japon eriği ıslah çalışmaları ve tarihçesi incelendiğinde, ıslah hedeflerinin çok farklılık göstermediği görülmektedir. Genel ve güncel ıslah hedefleri;

- Yüksek verim,
- Plum pox viruse (şarka) dayanıklılık,
- Kendine verimlilik,
- Hasat sonrası uzun süreli muhafazaya uygunluk,
- Erkencilik-geçcilik
- Yüksek meyve kalitesi (irilik, sertlik, koyu meyve kabuk rengi, aroma)

olarak karşımıza çıkmaktadır. Genel hedeflerin dışında, tüketici tercihleri ve ihracat hedef ülkeleri doğrultusunda da ıslah çalışmalarının, farklı meyve et ve kabuk rengi bazında şekillendiği görülmektedir. A.B.D ‘de koyu kabuk rengi, İspanya’da sarı kabuk rengi, koyu kabuk rengi-kırmızı meyve et rengi, Türkiye’de ise kabuk ve et rengi açısından geniş bir varyasyon oluşturulmuştur.

Özet

Türkiye, Dünya ayva üretimine liderlik ederken, armut üretiminde ise dördüncü sırada yer almaktadır. Her iki türün üretimdeki en önemli sorunların başında, ateş yanıklığı hastalığı gelmektedir. Gram negatif yapıya sahip, *Erwinia amylovora* Burril. etmeninin sebep olduğu bakteriyel kökenli bu hastalık, bitkilerin, toprak üst ve alt aksamalarının tamamını infekte edebilen ve tüm bitkinin ölümüne sebep olabilen çok yıkıcı etkilere sahiptir. Ülkemizin farklı bölgelerinde yürütülen çalışmalar ile hastalığın ayva ve armut plantasyonlarındaki yaygınlık oranları belirlenmiş ve çoğu bölgede yüksek oranda epidemiy gösterdiği tespit edilmiştir. Ülkemizde yaklaşık 40 yıllık geçmişi olan bu hastalığa karşı henüz etkin bir mücadele yöntemi bulunmamakta olup, antibiyotiklerin kullanımı çoğu ülke tarafından yasaklanmıştır. Kimyasal mücadele ise rezidü problemlerine sebep olmakta, ayrıca canlı ve ekosistem sağlığı üzerine olumsuz etkiler meydana getirmektedir. Bu bağlamda, başlangıç materyali ön plana çıkmakta olup, dayanıklı çeşit ve anaçların kullanımı ve ıslahı önem arz etmektedir. Her iki türde de gerek seleksiyon gerekse melezleme ıslahı çalışmaları ile toleran çeşit ve anaçların geliştirilmesine yönelik çalışmalar bulunmaktadır. Armutta, melezleme ıslahı sonucunda hastalığa toleran çeşitler geliştirilmiş ve tescil ettirilmiştir. Ayvada ise melezleme ve hastalık testleme çalışmaları devam etmekte ve toleransı yüksek melez bireyler elde edildiği belirtilmektedir. Hastalığın, kalıtım mekanizması oldukça karmaşık olup, tüm detayları ile araştırmacılarımız tarafından aydınlatılmıştır. Erken seleksiyona yönelik moleküler çalışmalar yok denilecek kadar azdır. Ancak hastalığa dayanımda erken seleksiyon kriteri olarak bazı biyokimyasal ve morfolojik özellikler tanımlanmıştır. Bu çalışmada, ülkemizde armut ve ayvada ateş yanıklığı hastalığına dair yürütülen çalışmalar ve güncel durum özetlenmeye çalışılmıştır.

**STUDIES CONDUCTED ON FIRE BLIGHT DISEASE ON PEAR AND QUINCE
SPECIES IN TURKIYE**

Abstract

Turkey is the world's top producer of quinces and ranks as fourth in pear production. One of the most important problems in the production of both species is fire blight disease. *Erwinia amylovora*, the gram-negative bacteria that causes this disease, may kill a plant entirely by infecting all of its above and below ground parts. Studies carried out in different parts of our country have revealed the disease's prevalence rates in quince and pear plantations, and they have shown that the disease has a high epidemic rate in the majority of those places. Since most nations forbid the use of antibiotics, there is no effective way to battle this disease, which has been present in our nation for around 40 years. Chemical control causes residue problems and also has negative effects on living things and ecosystem health. The importance of scion/rootstock combination at start is highlighted in this situation. So, it is crucial to use and breeding resistant rootstocks and cultivars. In both species, there are several studies on the development of tolerant varieties and rootstocks through both selection and hybridization. In pear, disease-tolerant genotypes have been developed and registered as a result of hybridization breeding. In quince, hybridization and disease testing studies are ongoing and it is stated that hybrids with high tolerance have been obtained. The inheritance mechanism of the disease is quite complex. But our scientists have thoroughly explained it. There are almost no molecular studies on early selection. However, some biochemical and morphological characteristics have been defined as early selection criteria for disease resistance. In this study, we tried to summarize the studies and current situation on fire blight disease on pear and quince in our country.

Keywords: *Erwinia amylovora*, *Cydonia oblonga*, *Pyrus communis*, resistance breeding, selection

AYVA, ARMUT VE ATEŞ YANIKLIĞI HASTALIĞINA İLİŞKİN GENEL BİLGİLER

Yetiştiriciliği, Dünya'nın ılıman iklim bölgelerinde yoğunlaşmış olan ayva ve armut, *Rosales* takımının *Rosaceae* familyası içerisinde yer almakta olup, tropik ve subtropik iklime sahip yörelerin yüksek rakımlı alanlarında dahi ekonomik olarak yetiştirilebilmektedir (Silva vd., 2014). Armut ve ayva meyvelerinin yetiştiricilikte ekolojik avantajlara sahip oluşu, faydalarına ilişkin farkındalığın artması ve son yıllarda muhafaza ve işleme imkanlarının gelişmesi fiyatlara olumlu yansımış olup, dalgalanmaların önüne geçilerek çiftçilerce tercih edilen bir ürün haline geldiği görülmektedir. Nitekim son 20 yılda üretim hızla artarak, 2021 yılında, bu iki türe ait toplam üretim 27 milyon ton düzeylerine ulaşmıştır (FAO, 2021). Ancak, ayva ve armut üretiminin optimum düzeyde seyredebilmesi için, en yıkıcı hastalığı olan ateş yanıklığı ile mücadeleye büyük önem verilmelidir. *Erwinia amylovora*'nın sebep olduğu ateş yanıklığı, bitkinin toprak altı ve toprak üstü aksamının tamamını infekte edebilen ve sistemik hareket ettiğinden tüm bitkinin ölümüne sebep olabilen bir hastalıktır (Vanneste, 2000).

Yaklaşık 250 yıllık geçmişi olan hastalık, ülkemizde ilk kez 1985 yılında Afyon iline bağlı Sultandağı ilçesindeki armut bahçelerinde tespit edilmiştir (Öktem ve Benlioğlu, 1988). 1987 yılı itibarıyla Türkiye'nin bütün yumuşak çekirdekli meyve yetiştirme alanlarında ateş yanıklığı belirtileri görülmüş ve çoğu bölgede ciddi zararlar oluşturarak pek çok bahçenin sökülmesine neden olmuştur (Momol ve Yeğen, 1993; Mirik, 2000; Kıpçak ve Akkopru, 2017; Şahin ve ark., 2019).

HASTALIĞIN TÜRKİYE'YE GİRİŞİ VE YAYILIŞI

Türkiye'de ateş yanıklığının görüldüğü ilk yer Afyon'un Sultandağı ilçesidir. İlçe yakınlarında bulunan göllerin, Mısır ve Kıbrıs'tan gelen göçmen kuşlara, dinlenme ve barınma yeri sağladığı ve hastalığın bu kuşlar vasıtası ile ülkeye girdiği düşünülmektedir (Öktem ve Benlioğlu, 1988). 1987'de ise Isparta ve Burdur'da görülmüştür (Öktem ve Benlioğlu, 1988; Momol vd., 1992). Sonraki yıllarda yapılan survey çalışmalarıyla ateş yanıklığı hastalığının Orta Anadolu Bölgesi'nde yumuşak çekirdekli meyve ağaçlarında %15-60, Ege Bölgesi'nde %23,93, Doğu Akdeniz Bölgesi'nde ise %42,37 oranına varan bulaşıklık oluşturduğu belirlenmiş; hastalık nedeniyle bölgede çok sayıda ağacın yok edildiği bildirilmiştir (Öktem ve Benlioğlu, 1988; Tokgönül ve Çınar, 1991; Demir ve Gündoğdu, 1993). Ege bölgesinde hastalık ilk kez 1986 yılında, Aydın ve

Denizli’de görülmüş, 1986-1991 yılları arasında bölgenin tüm illerinde değişen oranda hastalığın olduğu tespit edilmiştir (Demir ve Gündoğdu, 1992). 1989 yılında Batı Akdeniz’de nisan ve mayıs aylarının yağmurlu geçmesi, hastalığın şiddetli şekilde ortaya çıkmasına neden olmuştur (Momol vd., 1992). Doğu Anadolu Bölgesinde, yumuşak çekirdekli meyvelerde görülen hastalıkların tespitinin belirlendiği çalışmada, en büyük sorunun ateş yanıklığı olduğu bildirilmiştir (Kotan, 2002). Momol ve Yeğen (1993) 1987 yılı itibariyle, ateş yanıklığının Türkiye’de ayva ve armut yetiştirilen her yörede bulunduğunu ve çoğunda ciddi boyutlara ulaştığını belirtmişlerdir. Ege ve Doğu Marmara Bölgesi ayva plantastonlarında yapılan çalışmada, il bazında hastalık yaygınlık oranları %24,30-100 arasında değişim göstermiştir (Şahin ve ark., 2019). Yapılan bu çalışmalar hastalığın ülkemizde ayva ve armut yetiştirilen hemen her bölgede yaygın olduğunu ve ekonomik kayıplara sebep olduğunu göstermektedir.

ÜLKEMİZDE HASTALIKLA MÜCADELE YÖNTEMLERİNDE VE ISLAHDA YAŞANAN GELİŞMELER

Ateş yanıklığı hastalığına karşı kullanılan mücadele yöntemleri 3 grup altında (kültürel, kimyasal ve biyolojik) toplanabilir. Biyolojik mücadelede üst düzey bilgi gereksinimi, etkinliğinin ekolojiye bağlı değişimi ve süreklilik gerektirmesi, etkinliğini azaltmaktadır. Günümüzde ateş yanıklığına karşı önerilebilecek etkin kimyasal mücadele bulunmamaktadır. 1950’lerde antibiyotiklerin keşfi ile hastalığa karşı farklı antibiyotikler denenmiş ve Streptomycin, Terramycin, Kasugamycin gibi antibiyotikler hastalığa karşı etkili bulunmuştur. Ancak antibiyotiklerin insan ve çevre sağlığına olumsuz etkileri, kullanımı halinde dayanıklı tiplerin gelişimi (Loper vd., 1991) ve pahalı oluşu gibi sebeplerle kullanımı yasaktır. Kullanımı yasak olmasına rağmen, *E. amylovora*’nın streptomisine dayanıklı strainlerinin varlığı, ilk olarak 1971 yılında Amerika Birleşik Devletleri’nde kaydedilmiş olup, daha sonra farklı bölgelerde de rapor edilmiştir (Loper vd., 1991). Erzurum, Erzincan, Artvin, Kars ve Iğdır illerinde, yumuşak çekirdekli meyve ağaçlarından izole edilen *E. amylovora*’nın toplam 41 strain’inde streptomisin sülfata karşı duyarlılıkları test edilmiş ve strainlerin %31.7’sinin streptomisine karşı dayanıklı olduğu tespit edilmiştir (Kotan vd., 2009). Antibiyotik kullanımının yasaklanması, hastalığa karşı fungusitlerin kullanımını beraberinde getirmiştir. Fungusitler içinde ön plana çıkan kimyasallar, Fosetil-Al, bakırlı bileşikler, maneb+bakır, mancozeb+bakır gibi kombinasyonlar olmuştur. Bakırlı preparatların hastalığa etkisinin araştırıldığı bir çalışmada, bakır+Maneb karışımının en iyi etkiyi verdiği fakat hiçbirinin

hastalığı engellemede yeterli olmadığı belirtilmiştir (Saygılı ve Üstün, 1996). Bakırın vegetasyon döneminde kullanılması, bitkinin fizyolojisi üzerine olumsuz etki göstermekte ve bitkide genel fitotoksik etkilere sebep olmaktadır (Benlioğlu ve Özakman, 1992).

Kimyasal mücadelede kesin çözümün bulunamamış olması, önerilen kimyasalların pahalı ve insan sağlığına zararlı olmaları, gümrük kontrollerinde kalıntıların çıkması ve organik yetiştiriciliğin her geçen gün daha çok önem kazanıyor olması; hastalığın kontrolünde dayanıklı çeşit, anaç ve ara anaçların kullanımını öne çıkarmaktadır. Tarımsal üretimde pestisitlerin kullanımını azaltan veya yasaklayan yeni tarım politikalarının geliştirilmesi de bitki hastalık ve zararlıları ile mücadele stratejileri içinde, hastalık ve zararlılara dayanıklı çeşit ıslahını oldukça önemli kılmıştır. Tüm bu sebeplerle, ateş yanıklığına dayanıklı çeşit ıslahının üzerinde durulması gerektiğine dikkat çekilmektedir. Ateş yanıklığına dayanıklılığın poligenik olması ve mekanizmasının karmaşık olması sebepleriyle ıslah çalışmalarında genellikle kontrollü melezlemeler kullanılmaktadır (Evrenosoğlu vd., 2019). Bu nedenle, öncelikle ülkemizde mevcut genetik kaynakların duyarlılık düzeyinin belirlenmesi konusunda çalışmalar yapılmıştır. Yapılan çalışmalar, yaygın olarak kültürü yapılan çeşitlerin, hastalığa yüksek düzeyde hassasiyet gösterdiği yönündedir (Tokgönül, 1991; Aysan vd., 1999; Saygılı vd., 2004; Şahin vd., 2019; Mertoğlu vd., 2020; Harmanda vd., 2021). Bu sebeple önce dayanıklı genotiplerin tespitine yönelik seleksiyon çalışmaları yürütülmüş olup, kontrollü melezlemeler ile dayanıklı yeni genotiplerin geliştirilmesi evresine geçilmiştir (Öztürk vd., 2011; Mertoğlu ve Evrenosoglu, 2017; Şahin vd., 2020). Morfolojik markörlerin erken seleksiyon kriteri olarak kullanılması, ateş yanıklığı hastalığı gibi çok genle kontrol edilen hastalıklara karşı ıslah süreçlerinin kısaltılmasında önem taşımaktadır. Ayva türünde yapılan çalışmada yaprak kenar dalgalılığı ile hastalığa dayanıklılık arasında önemli ve pozitif korelasyon görülmüştür ve bu özelliği erken seleksiyon kriteri olarak ıslah çalışmalarında kullanılması ile ıslah süresinin kısaltılması hedeflenmektedir (Şahin, 2023).

HASTALIĞA DAYANIMIN KALITIMI

Armutlarda ateş yanıklığı hastalığının kalıtım deseninin ortaya çıkarılması maksadı ile yürütülen çalışmada, hastalığın kalıtım derecesi, kullanılan ana ebeveyn ile tozlayıcıların damızlık değerleri ve ana ebeveynin sağladığı ortam ile melezlerde ateş yanıklığına dayanımda nasıl etki gösterdiği, hastalığa farklı derecede dayanım gösteren F₁ melez populasyonda araştırılmıştır. Çalışma

sonucunda hastalığın poligenik kalıtım gösterdiği ve kalıtımda birden fazla faktörün etkili olduğu bulunmuştur. Hastalığa dayanım, sonraki generasyonlara her iki ebeveyn tarafından aktarılmaktadır. Fakat ana ebeveynin kalıtıma olan etkisi, baba ebeveyne göre çok daha yüksektir. Hastalığa dayanımı kalıtsal olarak sonraki generasyonlara aktarmada, ana ebeveyn olarak; 'Magness' ve 'Mustafa Bey' çeşitleri öne çıkmıştır. Tozlayıcı çeşitler arasında benzer sonucu; 'Kiefer' ve 'Limon' çeşitleri göstermiştir. Hastalığa dayanımda, ebeveynlerin etkisinin ayrı ayrı önemli olmasına ilave olarak, ebeveynler arası gen interaksiyonunun da, hastalığa dayanım üzerine olan etkiside önemli bulunmuştur. Hastalığın eklemeli olmayan genlerden hesaplanan kalıtım derecesi %23, eklemeli genlerden hesaplanan kalıtım derecesi %32 ve iki durumun toplamını ifade eden geniş anlamlı kalıtım derecesi ise %55 bulunmuştur. Ananın gen etkilerinin babaya göre daha yüksek olması ve analık etkisinin hastalık üzerine %7 oranında etki etmesi, hastalığa dayanımda sitoplazmik gen etkilerinin önemli olduğunu göstermektedir (Evrenosoğlu vd., 2019). Her iki türde de, hastalığa dayanıklı genotiplerin geliştirilmesinde, heterobeltiosis odaklı yaklaşımın daha etkili sonuçlar verdiği sonucuna varılmıştır (Şahin vd., 2020; Mertoğlu vd., 2020).

Özet

Masallar, toplumların kültür birikimleri olup nesilden nesle aktararak varlıklarını sürdürürler. Masallar, eğlendirmek ve hoşça vakit geçirmek için kullanılan masalların eğitici yönlerinin olduğu bilinmektedir. Bu açıdan masal, “terbiye ve ahlâka faydalı, yararlı hikâye” şeklinde tanımlanmaktadır. Masallar en acı dersi bile tatlandırarak verdiği için, örnek davranışların insan bilincine aktarılıp yerleştirilmesinde yardımcı olacak eğitim aracı olarak görülmektedir. Özellikle sonu mutlu biten masalların çocukların gelişmesinde, kendilerini keşfetmelerinde, dünyaya umutla bakmalarında, onlara iyi ve doğru değerlerin öğretilmesinde önemi büyüktür. Masal anlatımının öğrencilerin dil becerilerini artırdığını, hayal güçlerini geliştirdiğini ve sosyal becerilerini güçlendirdiği bilinmektedir. Masalların çocuklar, gençler hatta yetişkinlerin eğitimindeki etkileri daha 1400’lü yıllarda keşfedilmiştir. Sonuç olarak, masal anlatımının ilkökul öğrencilerinin eğitim ve gelişimi üzerinde olumlu bir etkisi olduğu görülmektedir. Bu nedenle, öğretmenlerin sınıflarında masal anlatımını kullanarak öğrencilerin bilişsel, duygusal ve sosyal becerilerini desteklemeleri teşvik edilmelidir. Ayrıca velilerin masal anlatımını çocukların günlük eğitim programlarına dahil etmelerini teşvik etmek gerekmektedir.

Anahtar Kelimeler: Hikaye anlatımı, ilkökul öğrencileri, dil gelişimi, hayal gücü, empati.

**THE EFFECT OF STORYTELLING ON THE EDUCATION AND DEVELOPMENT OF
PRIMARY SCHOOL STUDENTS**

Abstract

Fairy tales are cultural treasures of societies, sustaining their existence by being passed down from generation to generation. It is known that while fairy tales are used for entertainment and leisure, they also possess educational aspects. From this perspective, a fairy tale is defined as a "beneficial and instructive story" that contributes to upbringing and morality. Since fairy tales sweeten even the bitterest lessons, they are seen as educational tools that assist in conveying and embedding exemplary behaviors into the human consciousness. Particularly, fairy tales with happy endings play a significant role in the development of children, helping them discover themselves, view the world with hope, and instilling good and correct values. It is acknowledged that storytelling enhances students' language skills, nurtures their imagination, and strengthens their social abilities. The impact of fairy tales on education, for children, youth, and even adults, was discovered as early as the 1400s. In conclusion, it is evident that storytelling has a positive effect on the education and development of primary school students. Therefore, teachers should be encouraged to use storytelling in their classrooms to support students' cognitive, emotional, and social skills. Furthermore, parents should be encouraged to include storytelling in their children's daily educational routines.

Keywords: Storytelling, primary school students, language development, imagination, empathy.

Giriş

Masal, Arapça mesel kelimesinden dilimize geçmiş olan, sözlü edebiyat geleneğinin eski ve önemli bir koludur. Masallar, birçok kültürde geçmişten günümüze aktarılan, genellikle öğretici veya eğlendirici bir amaç taşıyan düz yazı şeklinde ifade edilen halk edebiyatı ürünlerindedir. Masallar genellikle yaşanmamış, yaşanması imkânsız bazı olaylara bağlı olabileceği gibi, yaşanmış ancak sonradan dilden dile anlatılarak olağanüstü hallere bürüne de bilir. Cin, peri, dev gibi olağanüstü kişileri de olan, olağanüstü olaylara yer veren, genellikle bir tekerlemeyle ya da bir varmış, bir yokmuş gibi bir sözle başlayan bir tür halk öyküsüdür. Masalların yazım amacı genellikle okuyucularına öğüt vermektir. Masal, merak duygusunu en çok barındıran edebiyat ürünüdür. Bu edebiyat ürününde olayların nasıl gelişeceği, kahramanları neyin beklediği, masalın nasıl biteceği vb. konular okuyucuda merak uyandırmaktadır. Eğiticilik esastır. Olağanüstü her konu masalda işlenebilir. Genel itibariyle gerçek ya da gerçeğe yakın olan olaylar olağanüstü bir hava katılarak işlenmektedir. Genellikle iyiler hep kazanır kötüler hep kaybeder. İyiler ödüllendirilir, kötüler ise cezalandırılır. Halk içinden birinin kötülere karşı kazandığı zafer durumu başlıca konuyu oluşturur. Okuyucu kitlesi genel itibariyle çocuklardır. Masallar, çocukların iyilik ve kötülük kavramlarının daha kolay kavraması için yardımcı olur. Masallar her zaman iyilerin kazanması ile bitmektedir.

Yazının icadından önce dilden dile, ağızdan ağıza aktarılarak sürdürülmüştür. Fakat sözlü olduğu için zaman içinde değiştirilmiş farklılaştırılmış, değişikliğe uğramış ve kısmen unutulmuştur. Masallar yazının icadından sonra deri, tahta, duvar, tablet, parşömen gibi malzemelere yazılmış, en nihayetinde kağıda yazılıp kitap haline getirilerek masalların kalıcılığı sağlanmıştır. Kitaplaştırılan masalların birer eğitim materyali olarak da kullanılarak çocuk gelişimine katkı sunması hedeflenmiştir.

Masalların çocuklar üzerinde çok farklı alanlarda etkisini görebiliriz. Çocuklar, masallar aracılığıyla fantastik dünyalara yolculuk yaparlar ve bu deneyimlerin çocuk gelişimine bir dizi olumlu etkisi olması hedeflenir. Hayal dünyalarının genişlemesine katkı sağlar, bilişsel ve duygusal becerilerinin gelişimini destekler. Okuma yazmaya olan ilgilerini artırır. Dinleme becerisini geliştirerek dikkat ve konsantrasyonunun gelişmesini sağlar.

Bu bölümde, masalların farklı alanlarda çocuk gelişimi üzerindeki etkilerini inceleyeceğiz.

Dil Gelişimi Üzerindeki Etkileri

Bireyler kendilerini ifade edebilmek, duygu ve düşüncelerini aktarabilmek için temel dil becerilerine ihtiyaç duymaktadır. Bu beceriler ise sırasıyla dinleme, konuşma, okuma ve yazma olarak gelişim gösterir. Öğrenciler, eğitim hayatlarına dinleme ve konuşma becerilerine sahip olarak başlar. Bu dönemde öğrencilerden dinleme ve konuşma becerilerini zamanla geliştirmeleri beklenirken aynı zamanda okuma ve yazma becerileri de kazandırılmaya çalışılır. Dinleme becerisinden sonra kazanılan konuşma becerisi, bireylerin içinde bulunduğu ortamda kazandığı ve hayatı boyunca kullandığı en önemli iletişim aracı olarak karşımıza çıkmaktadır (Keskin, Baştuğ, ve Akyol, 2013). Konuşma, bireylerin kendilerini ifade etmeleri bakımından oldukça önemli olmakla birlikte, okuma-yazma faaliyetlerinin de temelini oluşturmaktadır (Temizyürek, 2007). Masallar, çocuklara dil becerilerini geliştirme fırsatı sunar. Masallar çocuklara yeni kelimeleri, dilbilgisini ve ifade yeteneklerini öğretme potansiyeline sahiptir. Bol bol masal ve hikâye dinleyen çocuklar günlük konuşmalar sırasında duymadıkları yeni kelimelerle tanışma fırsatı bulur. Hikayeler aracılığıyla çocuklar, kelime dağarcıklarını zenginleştirir. cümle yapılarını dilbilgisini anlamalarına yardımcı olur ve hikayenin akışını takip etmelerini sağlar.

Kelime hazineleri geniş olan çocuklar kendilerini çok daha anlaşılır bir şekilde ifade edebilir ve daha rahat iletişim kurabilirler. Ayrıca, çocuklara sık sık hikâye okunması, hikâye anlatma becerilerine de katkıda bulunur. Sözlü anlatı becerileri kelime hazinesinin ötesinde, olayların yer ve zaman bilgisi verilerek anlamlı bir neden sonuç ilişkisi içerisinde anlatılmasını ve dil bilgisi gibi çok daha üst düzeydeki dil becerilerinin gelişmesini sağlar.

Yapılan araştırmalar erken yaştaki sözlü anlatı becerilerinin çocukların ileriki yaşlardaki okuma-yazma gelişimine önemli bir katkısı olduğunu ortaya koymaktadır. Bu nedenle özellikle okulöncesi dönemde çocuklara erken yaşlardan itibaren düzenli olarak masal ve hikâye okunması ve çocuklara da resimlere bakarak masal-hikâye oluşturma fırsatı verilmesi okul çağındaki akademik gelişimlerini destekleyici olacaktır. Tıpkı domino taşlarının birbirine olan etkisi gibi, yetişkinler çocuklara erken yaşlardan itibaren ne kadar sık ve düzenli olarak masal ve hikâye okurlarsa, çocuklar da kitap okumaya o kadar ilgili hale gelebilirler.

Hayal Gücünün Arttırılması ve Yaratıcılığın Teşvik Edilmesi

Yaratıcılık kavramı, Batı dillerinde “Kreativitaet-creativity” karşılığına sahiptir. Latince “creare” kelimesinden gelir. Bu kelime “doğurmak, yaratmak, meydana getirmek” anlamını taşır; devingen, dirik (dinamik) bir süreç olma özelliği sözcüğün anlamında saklıdır (Sevimli, 2015, s. 11). Masallar, çocuklarda hayal gücünü geliştirmenin güçlü bir aracıdır. Çocukların hayal gücü sınırsızdır. Masallar bu hayal güçlerini daha da geliştiren geçmişten günümüze yolculuk yaptıran araçlarıdır. Özellikle okul öncesi ve ilkokul çocukları hayatı gerçek ve hayal arasında yaşarlar. Bu nedenle onların akademik yaşantılarında masalların kullanılması, önem arz etmektedir. Masal ve hikâyelerdeki ayrıntılı betimlemeler ve yoğun renkli görseller, çocukların görsel yönlerinin ve hayal güçlerinin gelişimini destekleyen, hayal dünyalarının ve yaratıcılıklarının kapısını açan bir anahtar gibidir. Çocuk, masalların gerçek olabileceğine inanır. Kendini masal kahramanlarının yerine koyar, olayı yaşar, empatik düşünerek doğruyu bulmaya çalışır. Fantastik dünyalar, büyümlü yaratıklar ve olağanüstü olaylar, çocukların yaratıcılıklarını geliştirir. Bu, problem çözme becerilerini geliştirmelerine ve yaratıcı düşünce süreçlerini kullanmalarına yardımcı olabilir. Walt Disney hayal gücünün önemini "Eğer hayal edebildiğin bir şeyse, yapabilirsin. Onların peşinden gidecek cesaretin varsa, bütün rüyaların gerçek olabilir." sözüyle çok güzel ifade etmektedir.

Çocukluk, gençlik ve olgunluk dönemleriyle karşılaştırıldığı zaman birikimsizliği ve saflığı yansıtmaktadır. İlave olarak çocuklar çok yoğun bir hayal gücüne sahiptir. Saflık ve hayal gücünün ise yaratıcılığı pozitif yönde etkilediği bilinmektedir. Yaşlarının ilerlemesiyle birikim de artmaktadır. Bu birikimler bilhassa yaratıcı düşünme teknikleriyle bağlantılıysa yaratıcılığı pozitif yönde etkileyebilmektedir. Yaratıcılık üzerinde hayal gücünün büyük önemi bulunmaktadır. Çocuklar yoğun hayal gücü sahibi olmalarından dolayı çocukluk dönemlerinde yaratıcılık özellikleri daha çok gerçekleşmektedir (Harmanlı, 2002, s.226).

Hem dinleyeni hem de anlatanı hayal dünyasıyla buluşturan masallar ve hikâyeler, günlük hayatın karmaşasından bir nebze olsun bir kaçış fırsatı yaratırlar. Masalın çocuk üzerindeki etkisi TV dizileri, sinema filmleri vb. aksiyona dayalı popüler yayınların bıraktığı etki ile neredeyse aynıdır. Çünkü her ikisinde de bir kurgu vardır. Masallarda da TV dizilerinde ve hatta sinemalarda bile mutlu son beklenir, bazı dersler çıkarılır, anlamlı mesajlar verilir ya da alınır. Günümüzde gerek yetişkinler gerekse çocuklar tarafından uzun zaman dilimleri ayrılarak izlenen televizyon programları, izleyicilerin hayal kurma gücünü zayıflatırken, masal ve hikâyelerse çocuklara hayal

güçlerini kullanma ve geliştirme fırsatı sunar. Bazı ebeveynler ve öğretmenlerce masal gerçekçi olmaması gerekçesiyle dışlanmaktadır. Bunun nedeni çocuğun hayal dünyası içinde kalması ve gerçek dünyaya uyum sağlayamamasıdır (Pıllancı, 1998; Sezer, 2012: 57).

Günümüzde masalın birçok eğitimci tarafından yararlı olarak görülmesine karşın, bazı ana-baba ve öğretmenler tarafından gerçekçi olmadığı gerekçesiyle dışlanan bir tür olarak da karsımıza çıkmaktadır. Ancak, masalın çocuğu aşırı düş dünyasına sürüklemesinden ve gerçek dünyaya uyum sağlayamamasından korkmak masal türünü bütünüyle dışlamayı gerektirmemektedir. Çocuğa verilecek masalın bilinçli bir şekilde seçilmesi, olası sakıncaları ortadan kaldıracaktır (Dilidüzgün, a.g.e., s. 33.)

Okuma Alışkanlığının Oluşumu

Masallar, çocuk gelişimine bir dizi olumlu etki sağlar. Bunlardan biride okuma yazmaya olan katkısıdır. Masallar, çocuklarda okuma alışkanlığı oluşturmanın önemli bir yoludur. Masalların özellikle çocuklarda okuma ve dinleme eğitimlerini geliştirdiği, kültür aktarımı sağladığı ve iyi örneklerle ruh dünyalarını geliştirerek önlerine çıkabilecek engelleri aşacak kişilikli birer insan olma gibi özellikleri kazandırabileceği belirtilir (Öcal, 2002; Sever, 2008; Arıcı, 2012: 5). Masallardaki kahramanlar, fantastik olay örgüsü çocukların ilgilerini çeker ve merak duygusu uyandırır. Bu merak duygusu ile okumaya devam ederler. Sonrasında ellerine aldıkları her kitabı aynı merak ve heyecanla okumaya başlarlar. Bu sayede çocuklar, masallar aracılığıyla kitap okumanın keyifli bir deneyim olduğunu keşfederler. Bu, merak ve heyecan duygularını ve hayal güçlerini etkileyerek konuya olan ilgilerini artırmaya okuma becerilerini geliştirmelerine ve öğrenmeye olan ilgilerini artırmalarına, yardımcı olur.

Bu konuda; Hem ulusal hem de evrensel değerlerin aktarımında, soyut kavramların algılanmasında, anlama ve anlatma becerilerinin gelişmesinde, olaylara sanatsal bir bakışın gelişmesinde ve çocukların kitaba karşı ilgisini artıran masalların etkisi büyüktür (Kantarcıoğlu, 1991; Duvarcı, 1996; Yavuz, 1997; Karatay, 2007: 465; Arıcı, 2011; Özbay ve Çeçen, 2012: 69) demiştir.

Bu nedenle çocukların akademik yaşantılarında masalların kullanılması, önem arz etmektedir. Ebeveynler ve eğitimciler, çocuklara doğru masalları seçerek, bu olumlu etkileri en üst düzeye çıkarmak için çaba sarf edebilirler.

Yeni nesil çocuklarda mı sıkça rastlanıyor, yeni nesil ebeveyn ve sağlıkçılar mı bu gözle bakıyor ve beklentilerini bu doğrultuda yapılandırıyor büyük bir tartışma konusu, fakat sıklıkla karşılaşılan durumlardan iki tanesi ‘dikkat eksikliği’ ya da ‘öğrenme güçlüğü’. Okuma alışkanlığı, okul çağı öncesinde ciddi bir önleyici hizmet ve sonrasında da iyileştirme aracı olarak işlev gösterir. Okumak ya da küçük yaşlarda dinlemek kendinden menkul sabır, öz denetim mekanizmalarını aktive eder ve geliştirir. Bu iki mekanizmanın, dikkat eksikliğine dair problem yaşanmaması için geliştirilmesi önemlidir, yaşandığında ise destekle yükseltilmesi gereken becerilerdir. Öğrenme güçlüğüne dair ise zihinselleştirme, kavramsallaştırma; yani sözcükler arası ilişki kurma, fikir yürütme, tahminde bulunma, okuduğunu anlama gibi bilişsel işlemlerin geliştirilmesi gerekir. İşte okuma/dinleme tüm bu bilişsel işlemler için bir hazine değerindedir demek yanlış olmayacaktır.

Sosyal Duygusal gelişime katkısı

Duygu bireyin yaşamında, bir canlanma hareketlenme anlamına gelmektedir. Duygular, çocuğun temel gereksinimleri ve bu gereksinimlerin etkisini dışarı yansıtmasıdır. Haz ya da elem olarak yaşanan duyguların yansımaları çocukta sevinç, mutluluk, üzüntü, korku, öfke, kıskançlık, saldırganlık ve ağlama olarak görülür. Günlük hayatımızda hissettiklerimiz ve düşündüklerimizi dışa vurmak ve belirtmek için ya da etkileşimlerimizi düzenlemek için “duygularımız”ı kullanırız. Sosyal ve duygusal gelişim; çocuğun doğuştan gelen mizacının yanısıra kültürel etkileri, çevresindeki model davranışları ve sosyal etkileşim ve yaşantılar gibi fırsatlarla farklı faktörlere bağlı olarak değişiklik gösterebilir. Bu faktörlerden biride masallardır. Masal ve hikâyeler; çocukların, neyin doğru-yanlış, neyin iyi-kötü olduğu üzerinde düşünme, karar verme ve yaşadıkları sorunlar karşısında farklı seçeneklerle problem çözme becerilerini geliştirir. Bunun yanı sıra, masal ve hikâyelerin çocukları rahatlatıcı ve stresle baş etmelerini sağlayıcı etkileri de vardır. Ayrıca, çocuklar korkularıyla baş etmeleri konusunda yardımcı olurlar. Çocuğunuzun korkularına benzer korkuları ele alan hikâye ve masalları onlara anlatarak, çocuğunuzun bu korkularıyla başa çıkmasına yardım edebilir. Çocuğunuza duyguları içeren bir masal veya hikâye okuduğunuzda ya da anlattığımızda, bu çocuğunuzun kendi duygularını tanımasına ve kabullenmesine yardımcı olacaktır. Bunun yanı sıra, çocuğunuz kendi duygularının normal olduğunu, kendisi gibi diğer çocukların da benzer duyguları hissedebildiklerini anlayacaktır. Masallar ve hikâyeler iyilik, zarafet, kötülüğe karşı zafer kazanmak gibi olumlu konuları ele alırken bir taraftan da Pamuk Prenses ve Sindrella’da değinilen kıskançlık, Küçük Deniz Kızı’nda yer

verilen ayrılık ve Aslan Kral'da ele alınan kayıp gibi baş edilmesi zor olan duygu ve durumlarla çocukların tanışmalarına olanak sağlar. Bu kavramlar gerçek hayata dokunan kavramlardır. Masal ve hikâyeler normalde çocuklar-la konuşulması kolay olmayan konu ve duyguları daha güvenli bir ortamda dile getirme olanağı yaratarak çocukların zor durumlarla sağlıklı baş etme becerileri geliştirmelerine yardımcı olur. Aynı zamanda çocuğun bilgi dünyasını genişletir ve böylece duygularını ve düşüncelerini daha iyi ifade etme yetenekleri gelişir.

Resimli masal kitapları çocuğun hayal dünyasına bir pencere açar ve hikâye karakterlerinin de yardımıyla farklı bakış açıları edinmelerine yardımcı olur.

Çocuklar, masalarda duyduğu, dinlediği ve gördüğü hayatlar ile yeni dünyaları keşfeder. Bu masalarda yaşanan üzüntüler, mutluluklar, sevinçler ile yeni duygular öğrenir. Tüm bu duygulara ek olarak çocuk, masalarda tanıdığı karakterlerin verdiği mesajlar, karakteristik özelliklerinin izlemi ve olaylar ile duygusal ve sosyal gelişim sağlar. Kendi kültürünü, farklı kültürleri, gelenekleri, toplumsal davranış şekillerini öğrenir, kültürleri karşılaştırma imkanına da sahip olur. Masallar sonraki dönemlerde yaşadığı topluma ait görenekler, aile ve komşuluk ilişkileri, bireysel farklılıkların toplumdaki yeri ve arkadaşlığın önemi gibi kavramların anlaşılması için de farkındalık yaratır.

Ahlaki ve Kültürel Değerlerin Kazandırılması

Günümüzde gerek toplumumuz gerekse dünyada kişilerarası iletişim ve duygusal bağ giderek azalmaktadır. Bireylerin birbirleriyle iletişim kuramamaları, sevgi ve saygıya dayanan etkileşimin sağlanamaması, sağlıksız bir ortamın ortaya çıkmasına neden olmaktadır. insanların birbirlerine karşı tahammülsüz tutumları da toplumsal bütünlüğe zarar vermektedir. İnsanları bir arada tutan sevgi, saygı, adalet, arkadaşlık, yardımlaşma vb. değerlerin günden güne azalması, toplumda ve evrende barış ortamının bozulmasına zemin hazırlamaktadır

Biliniyor ki değerler soyut kavramlardır ve insanlar da 11-12 yaşlarından itibaren soyut düşünmeye başlarlar. Bu yüzden de soyut kavramları çeşitli semboller kullanmak suretiyle somutlaştıran masallarımız, birtakım değerlerin benimsenmesi ve içselleştirilmesi açısından önem taşımaktadır.

Masal ve hikâyeler çocukların toplumsal değerleri öğrenmelerinde rol oynar. Masallar genellikle bir öğretici mesaj taşır. Karakterler aracılığıyla çocuklara doğru ile yanlışı, iyi ile kötüyü ayırt etmeyi öğretir. Bu şekilde, çocuklar etik değerleri ve toplumsal normları anlamaya başlarlar.

Masallarla büyüyen çocuk sevginin her kapıyı açabileceğini; iyinin, doğrunun er ya da geç kazanacağını; dünyanın adaletle, saygıyla daha da yaşanılabilir bir hale geleceğini öğrenir. Halk masalı da olsa, belli bir yazar tarafından kaleme alınmış masal da olsa, masalların eğitici yönü tartışılmaz. “Ağaç yaşken eğilir” atasözünden hareketle denilebilir ki masallar, bireylere çok küçük yaşlarda toplumsal ve evrensel değerleri aktarma yönünden çok önemli bir görevi üstlenmektedir. Toplum içinde kendisinin de müstakil bir birey olduğunu sezer ve toplumuna karşı bazı sorumlulukları olduğunu farkına varır. Hep beraber inşa edilen dünya barışına çalışarak katkı sağlayabileceğini anlar. Kısacası insanı insan yapan değerler olduğunu, bu değerlere uyulmadığı takdirde insanların ve insanlığın nelerle karşı karşıya kalacağını somut örneklerle görür. Nesilden nesile aktarılan bazı masallar bizi eğlendirirken, insan davranışlarını da etkileyerek toplumun sosyal kurallarının ve değerlerinin de öğretilmesine katkı sağlar. Birçok masal ve hikâyenin içinde adalet, dürüstlük, işbirliği, paylaşma, bireyin kendisine ve başkalarına saygı duyması gibi toplumsal değerler işlenir. Böylece çocuklar da o toplumda önem verilen değerleri masal ve hikâyelerle anlayabilir ve yaşamlarında da uygulayabilirler.

Öğretmenlerin büyük bir çoğunluğu masalların ahlaki değerlerin kazandırılmasıyla birlikte sosyal, kültürel ve kişisel gelişimlerinde etkili olabileceğini düşünmektedirler. Şirin (1998), Demiray (1986) ve Kaya (2000) masalların çıkış gayesinin ahlaki değerlerin kazandırılması olduğunu ifade eder.

SONUÇ

Sonuç olarak, masal anlatımı, öğrencilerinin bilişsel, duygusal ve sosyal gelişimlerine olumlu bir şekilde katkıda bulunabilir. Çocukların toplum içinde belirlenen değerler ve kültürel kuralları öğrenebilir ve hayatlarına uygulayabilirler. Masallar ile çocukların yaratıcılıkları geliştirilerek her alanda üretken bireylerin yetiştirilmesi sağlanabilir. Çocukların kişisel ve akademik başarıları artırılabilir. Bu nedenle, eğitimciler ve ebeveynler, çocuklara düzenli olarak masal anlatarak bu alanlarda gelişimlerini destekleyebilirler.

Özet

“Türk Bozkır Kültüründe diplomasının seyri” adlı bu çalışmanın amacı geniş Orta Asya sahasında mühim roller üstlenen bozkır kavimlerinin diğer devletler ile yürüttüğü diplomatik faaliyetleri, diplomasi usul ve tekniklerini bilimsel verilerin ışığı altında incelemek ve ortaya koymaktır. Dünyanın en eski ve köklü uygarlıklarına ev sahipliği yapmış olan Orta Asya sahası sahip olduğu coğrafi şartlar nedeniyle sert iklim koşulları ve zorlu yaşam koşullarının olduğu bir sahaydı. Bozkır kuşağı olarak isimlendirilen bu coğrafyada yaşayan insanlarda önceliğin hayatta kalmak üzerine kurgulandığı bir yaşam biçimi oluşturmuşlardı. Bu nedenden dolayı ki bozkır kültürü kendine ait bir sosyal hayat ve kültür inşa etmiştir. Bu aşamada atın sürati ve demirin gücünü birleştirmeyi başaran bozkır insanı çok geniş sahalara yayılabilmek ve oralarda hâkimiyetini tesis edebilme imkânı elde etmiştir. Bu dinamizmin bir sonucu olarak dünya tarihinde mühim bir yer edinen İskit, Hun, Göktürk gibi devletler bozkır coğrafyası üzerinde siyasi bir teşekkül olarak ortaya çıkmıştır. Zamanla önemli başarılar elde eden bozkırlı kavimler bu suretle başta Çin olmak üzere devletlerarası münasebetlerde aktif rol oynamıştır. Kuruldukları dönemden yıkılışlarına kadar olan süreçte her daim milletler arası siyasetin ve ticaretin bir parçası olmayı başaran bozkır devletlerinin öncelikli maksadı şüphesiz ki devletin devamlılığını sağlamaktır. Bu nedenle başta Çin, Bizans, Sasaniler ile diplomatik faaliyetler yürüten bozkırlı devletler, dış ilişkilerde aktifliği sağlayan tercümanlar, bitegciler ve farklı dillere hâkim elçilik heyetlerini de devlet bünyesine dâhil etmişlerdir. Böylece savaş diplomasisi yanında, ticari faaliyetlerin yürütülmesi noktasında yaşanan sıkıntıların halli, hükümdarların tahta çıkışları, evlilik yolu ile ilişkilerin geliştirilmesi gibi hususlarda diplomasi aktif bir rol üstlenmiştir diyebiliriz.

THE COURSE OF DIPLOMACY IN TURKISH STEPPE CULTURE

Abstract

The aim of this study titled "The course of diplomacy in Turkish Steppe Culture" is to examine and reveal the diplomatic activities, diplomatic procedures and techniques carried out by the steppe tribes, who played important roles in the vast Central Asian region, with other states in the light of scientific data. Central Asia, which hosted the world's oldest and deep-rooted civilizations, was an area with harsh climatic conditions and harsh living conditions due to its geographical conditions. The people living in this geography, called the steppe belt, had created a way of life in which the priority was based on survival. For this reason, the steppe culture built a social life and culture of its own. At this stage, the steppe people, who managed to combine the speed of the horse and the power of iron, had the opportunity to spread to very large areas and establish their dominance there. As a result of this dynamism, states such as the Scythians, Huns and Gokturks, which have an important place in world history, emerged as a political organization on the steppe geography. In this way, the steppe tribes, who achieved important successes over time, played an active role in interstate relations, especially in China. The primary purpose of the steppe states, which always managed to be a part of inter-national politics and trade in the period from their establishment to their collapse, was undoubtedly to ensure the continuity of the state. For this reason, the steppe states, which carried out diplomatic activities primarily with China, Byzantium and Sassanids, included interpreters, bitegci and embassy delegations with a command of different languages within the state structure. Thus, we can say that in addition to war diplomacy, diplomacy played an active role in issues such as the settlement of problems in the conduct of commercial activities, the ascension of rulers to the throne, and the development of relations through marriage.

Keywords: Diplomacy, Steppe Culture, Embassy, China, Foreign Policy,

Giriş

Bozkır; Kaşgari'nin eserinde “tatırlı yer” olarak geçmekte olup, toprağı verimsiz kuru yer manasına gelmektedir (Kaşgarlı Mahmud; 1985, s.494-495). Bu elverişsiz coğrafyada yaşayan bozkır insanının yaşamı ve yaşamsal faaliyetleri de ister zorunlu isterse bir seçimden ibaret olsun bu coğrafi saha ile bütünleşmiş durumdadır. Bu da zorlu yaşam koşullarına direnen ve buna rağmen yaşamını idame ettirmeye çalışan bozkır insanını hürriyetine düşkün, doğaya hükmetmeyi bilen iyi bir savaşçı, asker konumuna getirmiştir (Akcan; 2022, s. 897).

Uçsuz bucaksız bozkır sahasında Türklerin ilk buldukları yer Altay ve Sayan dağlarının çevresi olmuştur. Ancak yapılan araştırmalar Türklerin varlık gösterdiği sahaların yalnızca bu bölgeler ile sınırlı olmadığını ortaya koymuştur. Öyleki Türkler buradan şarka, garba ve cenuba doğru yayılım göstermeye devam etmişlerdir. Milattan önce iki binli yıllara gelindiğinde Türkler Altay dağlarından Yayık Nehrine kadar olan bölgeye bütünüyle serpilmiş durumdaydı. Türklerin garba doğru gerçekleştirdikleri bu yayılımda Orta Asya coğrafyası önemli bir rol üstlenmiştir. Garba doğru ilerleyen Türkler Altay ve Tanrı dağlarının birbirine oldukça yakın olduğu bir noktada Cungarya havzasına girmiş ve zorlu Tarbagatay dağlarını da kolaylıkla geçmeyi başararak Kazak bozkırlarına kadar yayılmışlardır. Böylece Hazardan Cungarya havzasına kadar olan saha Türklerin ikinci anayurdu olmuştur (Koca; 2010, s.17-18).

Türkler yayıldıkları uçsuz bucaksız steplerde zaman içerisinde köklü ve zengin bir medeniyet ortaya koymayı başarmışlardır. Bunun temel sağlayıcıları hiç şüphesiz hayvancılık ve beraberinde gelen yarı göçebeliktir. Bilindiği üzere bozkır sahasının her yerinde iklim koşulları aynı değildi. Bu da geçimini hayvancılıkla sağlayan bozkır insanının hayvanları için gerekli olan otu ve suyu bulabilmesi için mevsimsel bir yer değişikliğini zorunlu kılmıştır (Deer; 1954, s. 161). Yaşanan bu yer değişikliğinde başlıca unsur at idi. Öyleki bir noktadan ötekine hızlı yer değişikliği, hayvan sürülerinin idaresi, gidilecek yaylak ve kışlak alanlarının önceden keşfi gibi sürat gerektiren bütün faaliyetler at sayesinde mümkün olmuştur. (Koca; 2002, s. 15-16). Bunun yanı sıra dayanıklılığı, yüksek manevra yeteneği ve önemli bir savaş aracı olması nedeniyle Türklerin pek çok başarıya imza atmasına da ön ayak olmuştur (Gömeç; 2014, s. 560).

At üzerinde inşa olunan bozkır kültür çevresinde bozkır kavimleri için devletleşmeye giden süreçte at kadar mühim olan bir diğer unsur ise vurucu etkisi oldukça yüksek, silah sanayinin başlıca hammaddesi olan demirdir. Demir kültürünün doğduğu coğrafya olarak kabul edilen Orta Asya sahasında demirciliğin kesin suretle ne zaman başladığı belli değildir. Ancak mevcut kurgan

buluntuları bu coğrafi sahada M.Ö. 2. Bin başlarına denk geldiğini göstermektedir. Bu vesileyle o güne kadar atın hızından yararlanmayı bilen ve çok geniş coğrafyalarda kendi hâkimiyetini kurma imkânı elde eden Türkler demirin vurucu gücünü de kullanmış ve üstünlüklerini ileriye taşımışlardır. Demirin kullanılmaya başlanmasıyla savaşlarda önemi azımsanmayacak ölçüde büyük olan ok uçları, kılıçlar, kamalar, miğfer ve kalkanlar v.s. üretilmiştir (Durmuş; 2014, s. 286). Atın hızı ve demirin vurucu gücüyle ufku genişleyen bozkır Türkleri teşkilatçılık yetenekleri, cesaretleri ve birbirlerine bağlılıkları ile dünya tarihinde mühim roller üstlenen devletler kurmayı başarmışlardır (Rasony; 1993, s.4-5).

Bozkır coğrafyasında ortaya çıkan siyasi teşekküller diplomasinin⁴ başlamasını da sağlamıştır. Aslında diplomasinin varlığı henüz siyasi yapılanmaların kurumsallaşmadığı tarih öncesi döneme dayanmaktadır. Daha o dönemde savaşan kabileler arasındaki anlaşmazlıkların hallinde karşılıklı araçlarla gerçekleştirilen diplomatik faaliyetler devletlerin inkişaf ettiği dönemde daha somut bir kimlik kazanmıştır (Acar; 2006, s. 419-420).

1. Bozkır Diplomasinin Etkin Zümreleri

Tarihsel süreç içerisinde sağlam temelli gücünün zirvesinde siyasi teşekküller kurmayı başaran bozkır kavimleri bu siyasi yapılanmanın doğal bir sonucu olarak aktif bir dış siyaset takip etmiş ve bu amaca hizmet eden memuriyetlere de devlet çatısı altında yer vermişlerdir. Bu bağlamda Kafesoğlu'nun da belirttiği üzere Türklerde devletlerarası siyasi işleri yürütmekle görevli bir dış işleri dairesi mevcuttu. Hunlarda muhtelif dillere hâkim kalabalık heyetler, katipler, tercümanlar ve kuryeler faaliyet halindeydi. Bu yapılanma elbette ki yalnızca Hunlara has değildi. Göktürk ve Uygurlar'da da dış politikanın diğer belirleyici unsurları olan bitegciler, tamgacılar, ılımgalar⁵ devlet meclisinde aktif olarak yer almıştır (Kafesoğlu; 2003, s. 278). Hunlar çağından itibaren varolagelmiş bu zümreler belirli bir düzende sistematik şekilde yürütülen bozkır diplomasinin hem kurumsal bir kimliğe büründürülmesi hem de sistematik işleyişini ortaya koyması bakımından önem arz eder (Berber; 2017, s. 34-35).

Devletlerarası ilişkileri ifade noktasında ilişkilendirilebilecek ilk kavram bozkır diplomasinde mühim bir vazife üstlenen Bitikçi⁶ (kâtip) idi. Bitici, bitgeci, bitigeci, bidgüçi, bitegcin gibi pek çok şekilde ifade edilen kavramın öz Türkçe de bitimek (yazmak) fiilinden geldiği

düşünülmektedir. Bitimek kelimesinin kökeni net olarak bilinmemekle beraber Çince de yazı fırçası manasına gelen bir kelimedenden neşet ettiği de ileri sürülmektedir. (İpşirli; 1992, s. 225). Asıl görevleri hakanın dış güçlerle gerçekleştireceği mektupları anlaşmaları kısacası her türlü yazışmayı kaleme almak olan bitikçilerin devlet kadrosunda mühim bir yer kapladığını söylenebilir (Gültepe; 2002, s. 1578).

Bozkır kavimlerinde diplomasinin kusursuz işleyişini sağlayan bir diğer zümre Tamgacılarıdır. Göktürlere ait kitabelerde mühürdar ve Uygurlarda unvan olarak karşımıza çıkan Tamgacı, Asya Hunlarından itibaren devam ile günümüze gelmiş olup bugün damga olarak bilinmektedir (Donuk; 1988, s. 84). Hakanın damgası yani mührünü taşıyan kişiler olup yarlıg⁷ ve emirlerini yürütmekle görevli olan Tamgacılar (Sümer; 1999, s. 13), aynı zamanda resmi yazışmalarda mührün yanında kendi imzalarını da atması gereken okuryazar ve bilgin bir zümre idi (Ögel; 1988, s.649). İzgi kullanılan tamgaların yalnızca siyasi içerikli metinlerde yer almadığını belirterek bazen ticari yazışmalarda da kullanıldığını öne sürmektedir (İzgi; 1987, s. 58).

Diplomatik faaliyetlerde tercümanlarda oldukça etkindi. Devletlerarası ilişkilerin sağlıklı yürütülmesinde özellikle de birbirlerini anlayabilme noktasında mühim zümrelerden biri de Tercümanlar ve Tercümanlıktı (Tokan; 2011, s. 27). Öz Türkçede Tilmaç, Tolmaç veyahut Tarmaç şeklinde karşımıza çıkan sözcük söylemek manasındaki ti ile dil yerine kullanılan til kelimelerinin birleşiminden oluşmaktadır. G. Nemeth tarafından başta gelen memuriyetler arasında zikredilen ve dış işleri bakanı manası taşıdığı belirtilen Tarmaç (Donuk; 1988, s.47) eski dönemlerden itibaren Türklerin aşına olduğu bir meslek grubuydu. Kafesoğlu'nun da belirttiği gibi Hunlarda muhtelif dillerde konuşabilen ve yazışmaları düzenleyen kalabalık heyetlerin varlığı bunun en güzel örneğidir (Kafesoğlu; 2003, s. 278).

İslamiyet öncesi dönemlerden itibaren devletin çıkarlarını diğer milletlere karşı koruyan ve diplomatik temasları gerçekleştiren elçiler de devletin mühim mercilerindendi. Türkçede halk, ülke, devlet manalarına gelen elçi "ilci" kökünden türemiş bir sözcüktür (Vardan; 2012, s. 30-35). Bunun yanısıra elçiler için Yalabaç, Yalabçı (Tokan; 2011, s. 21) ve hatta Çabış⁸ dendiği de görülmektedir (Donuk; 1988, s. 92).

2. Türk Bozkırında Diplomatik Temaslar

Akrabalık Tesis Etmek Suretiyle Gerçekleştirilen Diplomatik Temaslar

Tarihsel süreç içerisinde bozkır devletlerinin diplomatik temasları göz önüne alınacak olursa izdivaca yönelik temasların bir hayli fazla olduğu görülmektedir. Gerçekleştirilen bu evlilikler çoğu zaman komşu devletlerle yürütülen ilişkileri yoluna sokmayı amaçlamaktaydı ve bazen baskıyla bazen de gönüllü olarak gerçekleştirilmekteydi. Bu sayede taraflar arası oluşabilecek kriz ortamı engellendiği gibi, düşmana karşı birlikte hareket edilebilmekteydi (Koçak; 2022, s. 52). Görünürde masumane amaçlarla gerçekleştirilmiş olan bu evliliklerin altında aslında bambaşka amaçlar bulunmaktaydı. Yapılan bu evliliklerle rakip devlet üzerinde nüfuz sahibi olma, ticari ilişkileri geliştirmek, gücünü karşı tarafa kabul ettirerek boyun eğdirmek gibi sebepler bulunmaktaydı. Bu bağlamda Hunların ekonomik, Göktürklerin komşu kavimler üzerinde nüfuzunu artırma ve Uygurların Orta Asya sahasında konumunu sağlamlaştırma gibi amaçlarla bu izdivaçları gerçekleştirdiğini söyleyebiliriz (Akçay; 2010, s. 3).

Evlilik temelli diplomatik faaliyetlerin ilki Hunlar döneminde vuku bulmuştur. Ağırlıklı olarak Çin ile gelişen ilişkiler döneminde Hun hakanı Motun hâkimiyetini sağlamlaştırmak ve Çin tehlikesini bertaraf edebilmek için Çin'e karşı mücadele etmiştir. Bu mücadelelerden kaynaklı oldukça sarsıntılı bir dönem geçiren Çin ordusu çok ciddi önlem ve tedbirlere rağmen Motun'u alt etmeyi başaramamıştır. M.Ö. 201 yılında Çin ordusuna boyun eğdirmeyi başaran Motun bu sayede bir Çinli prensesle evlenerek Çini vergiye bağlamıştır (Taşağıl; 2013, s. 58). Hem ekonomik kazanımlar hem de nüfuz elde etme noktasında önemli kazanımlar sağlayan evlilik anlaşmaları Motun'un oğlu Ki-ok döneminde de sürdürülmüştür. Çin ile dostane ilişkilerin sürdürüldüğü bu dönemde Çin imparatorunun yeni hakanın tahta çıkışını tebrik etmek maksadıyla saraya bir Çinli prenses gönderdiği ve bu sayede barışın devamlılığını sağladığı görülür (Türkeli; 1990, s. 322).

Hunlardan sonra Çin'in diplomatik temaslarda yönünü döndüğü devlet Göktürkler olmuştur. Bu dönemde Göktürkler kendi içinde siyasi çalkantılar yaşayan Çin için oldukça önemli bir tehditti. Bundan da önemlisi zayıflamış olan Çin imparatorluğu Türkleri boyunduruk altına alacak salahiyyete sahip değildi. Bundan sebep Göktürlere karşı korumacı bir siyaset takip ederek sınır güvenliğini sağlamaya odaklanan Çinliler daha önceden yaptıkları gibi diplomatik temaslara akrabalık tesis etmeyi de ihmal etmemişlerdir (İzgi; 1978, s. 197-98).

Göktürklerde gerçekleştirilen ilk evlilik akdi Bumin Kağan döneminde Batı Wei imparatorunun kağana bir prenses göndermesiyle başlamıştır. Zira güçlerinin zirvesinde olan ve Çin'i yapılan

anlaşmalarla kontrol altında tutmayı başaran Türkler bundan sonra çıkarları doğrultusunda aynı anda pek çok devlet ile temaslarda bulunmuştur. Bu maksatla Batı Wei'ler ile evlilik akdi gerçekleştirerek ezeli düşmanları olan Juan-Juanları bertaraf eden Türkler Akhunlar ile de komşu duruma gelmiş oluyordu (Taşağıl, 2003, s. 19-20). Bundan sonra yönünü batıya dönen Türkler İpek yolu hâkimiyeti için Akhunların ezeli düşmanları olan Sasanilerle ilişki kurmuşlardır. Akhunları bertaraf etme noktasında önemli bir güç olan ve desteğine ihtiyaç duyulan Sasanilerin ittifakına duyulan ihtiyaç İstemi Kağan'ın kızı Fakim'i Sasani hükümdarı Anuşirvan ile evlendirmesi sonucunu da beraberinde getirmiştir (Akbulut; 2002, s. 1333). Böylece evlilik akdi ile Göktürk prensesi Sasani imparatoru ile evlenirken, evlilikten doğan çocuk Sasanilerin varisi olmuş oluyordu (Roux; 2004, s. 98). Bu sayede Göktürkler hedefledikleri gibi büyük ekonomik kazanımlar elde ederek ticaret yolunun büyük kısmına da hâkim olmuşlardır.

Orta Asya bozkırında kurulan önemli Türk devletleri arasında yer alan Uygurlar zamanında da benzer evlilik uygulamalarının diplomatik faaliyetlerle gerçekleştirildiği görülmektedir. Onlarda tıpkı Hunlar, Göktürkler gibi siyasi amaçlarla yapılan evliliklere önem vermişlerdir. 756 yılında Uygur kağanının kızını Çin sarayına gelin olarak göndermesi ve devamında Çin sarayından da bir prensesin kağana gönderilmesi hadisesi mühimdir (Akçay; 2010, s. 75-76).

Ticari Münasebetler Yolu ile Kurulan Diplomatik Temaslar

Kâr elde etme maksadıyla yürütülen her türlü alım satım işlemini kapsayan ticaret diplomatik faaliyetlerde her daim belirleyici bir rol üstlenmiştir. Zira nerede bir diplomatik temas varsa orada mutlaka bir ticari çıkar söz konusudur. Bunu bozkır devletlerinde net şekilde görebiliriz. Bilindiği gibi Çin için uzunca bir dönem Hunlar önemli bir tehdit teşkil etmişlerdir. Çinin kuzey sahasında yaşayan Hunlar için bütün ihtiyaçlarını bu sahadan karşılamak neredeyse imkânsızdı. Bu nedenle Çin sınırlarına yağma ve akınlarda bulunarak bu açığı telafi etmeye çalışmışlardır. Hunlar güçlü bir imparatorluk kurduktan sonra kendilerine bağlı devletler tarafından gönderilen vergi ve haraç ve hediyeler ekonomik açığı kapatma noktasında yarar sağlamaktaydı. Bu anlamda Hun hükümdarı Motun ile Çin arasında gerçekleştirilen anlaşma sunduğu ekonomik ayrıcalıklar yönünden mühimdi. Çünkü bu muahede ile Çin Hunlar için en kıymetli ürün olan ipek başta olmak üzere pek çok yiyecek ve giyecek malzemeyi her yıl düzenli vermeyi garantilemiş oluyordu. Motun'dan sonra da devam eden bu ekonomik yaptırımlar ile ipek ağırlıklı pek çok ürün Hunlara verilmeye devam edilmiştir. Türkler ise bunun karşılığında Çin'e at vermiştir (Onat; 1987, 614-615).

Hun-Çin diplomatik ticaretinin belirleyicilerinden bir diğeri sınır ticaretiydi. İki devlet arasındaki bu ticaret M.Ö. 156-141 de Chün Ch'en kağan dönemine denk gelmektedir. Bu dönemde eskiden yapılmış olan muahede şartlarına ek olarak Hunların Çin sınırlarında herhangi bir engelle karşılaşmadan ticari faaliyetlerini yürütmeleri kararlaştırılmıştır. Hunlar parçalandıktan sonra ticari münasebetler daha aktif hala gelmiştir. Özellikle kuzey Hunları Çin sınırlarında serbestçe ticaret yapmak için pek çok defa istekte bulunmuş elçi göndererek kıymetli hediyeler sunmuş ancak buna rağmen Çin tarafından engellenmişlerdir. Bu durum Hunların Çin sınırlarına akınlarına neden olmuştur. Ancak bu akınların zaman içinde giderek artması Çin'de tedirginlik yaratmış ve Çin hunların sınır ticaretine razı gelmek zorunda kalmıştır .(Onat; 1987, s. 621-622).

Hunlar döneminde başlayan ticari ilişkiler Göktürkler çağında da devam etmiştir. Bilindiği gibi Türklerin en önemli ekonomik faaliyeti kendi besledikleri hayvanlardı. Bu hayvanlar karşılığında Çin'den İpek tedarik edilmekteydi. Ancak zamanla Türklerin gönderdikleri at miktarını arttırması ve karşılığında da aynı oranda ipek talebinde bulunması Çin'in hoşnutsuzluğuna ve iki taraf arasında savaşın meydana gelmesine neden oldu. Göktürklerin üstünlüğü ile neticelenen savaş sonucunda Çin Türklerin talep ettiği yüksek miktardaki ipeği vermeyi kabul etti. Çin'in kendini güvenceye almak için kabul ettiği bu istek Göktürklerin yeni taleplerini de beraberinde getirdi ve Türkler Çin sınırında sabit pazar yeri kurulmasını da Çin'e kabul ettirmiş oldular⁹ (İzgi; 1978, s. 98).

Göktürklerin ticari maksatlı diplomatik temas kurduğu bir diğeri devlet Bizans olmuştur. Akhunlar'ı bertaraf ettikten sonra Sasani tehlikesiyle karşı karşıya kalan ve ekonomik çıkarları zedelenen Göktürkler ticaret akışını yeniden aktif hale getirmek için Bizans ile ortak hareket etmişlerdir. Zira Göktürkler gibi Bizans'ta Sasaniler'in uyguladığı ekonomik ambargodan muzdaripti ve ipek ticaretindeki Sasani üstünlüğünü kırmak istiyordu. Bu maksatla Soğdu elçi Maniakh öncülüğünde bir heyet Bizans'a gönderilmiştir. Neticede iki taraf arasında anlaşma sağlandığı gibi Türkler bu ittifak sayesinde Sasanilerin ekonomik yaptırımlarından kurtulmuştur (Kafesoğlu; 2003, s. 100-101).

Sonuç

Dünya tarihinde iz bırakan medeniyetlerin ve devletlerin zuhur ettiği bir coğrafi saha olan Orta Asya bozkırları coğrafi şartlarına ve zorlu yaşam koşullarına rağmen her daim mühim bir yer edinmiştir. Bunun en önemli nedeni bu coğrafyanın bölgede yaşayan insanlar üzerinde bıraktığı derin etkidir. Bu etki yaşam şekillerinden kültürlerine hatta devlet kurma biçimlerine kadar yaşamlarının her alanına yansımıştır. Zamanla bu coğrafyayla bütünleşen bozkırlılar bu sayede gücü kolay kolay yok edilemeyen devletler kurmayı başarmışlardır. Bu devletleşme diplomasiyi de beraberinde getirmiştir. Bu surette milletler arası ilişkilerde de aktif rol alan bozkır Türkleri başta Çin olmak üzere pek çok devletle siyasi sosyal ve ticari maksatlı anlaşmalar gerçekleştirmişlerdir. Gerçekleştirilen bu diplomatik temaslarda yer alan en önemli nokta elçi, tercüman, kâtip, tamgacı gibi zümrelerin varlığı olmuştur. Bu zümreler gücü zirveye ulaşan Türklerin oldukça sistematik bir diplomatik yapılanmaya sahip olduğunu ortaya koymuştur. Bu sistemli yapı içerisinde gerçekleştirilen diplomatik temaslar sayesinde çok nüfuzlu devletlerle akrabalık tesis edilebilmiş ve önemli ekonomik kazançlar elde edilmiştir.

Özet:

Çiftlik hayvanlarında sürü projeksiyonu veya sürü akım planı, mevcut sürün yapısını ileriki yıllar da nasıl olması gerektiğinin planlanmasıdır. Bunun için; sürünün döl verimi ile ilgili bazı ölçütlerin bilinmesi ve bu ölçütler doğrultusunda planlamanın yapılması gerekmektedir. Bunun için de kullanılması gereken ölçütler; gebelik oranı, ikizlik oranı, kısırlık oranı, yaşama gücü, sürü yenileme oranı, ayıklama oranı, sürüden çıkarma oranı gibi ölçütler ile işletmelerin sürdürmüş oldukları politikaların yani işletme kapasitelerinin artırılması, azaltılması veya sabit kalması gibi hususların bilinmesi gerekmektedir. Sürü yönetimindeki başarının sağlanabilmesi için hayvan davranışlarının esasını bilmek ve bunu doğru barındırma ilkeleri ile desteklenmesi gerekmektedir. Sonuç olarak, ürün kalitesinin artırmanın temelini; hayvan refahının artırılması, işletme kayıtlarının düzenli olarak tutulması ve modern yazılım destekli sürü yönetim uygulamalarının kullanımı oluşturmaktadır.

Anahtar Kelimeler: Sürü projeksiyonu, Döl verim ölçütleri, Çiftlik hayvanları, İşletme politikası

THE IMPORTANCE OF HERD PROJECTION IN LIVESTOCK

Abstract

Herd projection or herd flow plan in farm animals is the planning of how the current herd structure should be in the future years. For this purpose, it is necessary to know some criteria related to the fertility of the herd and to make planning in line with these criteria. The criteria that should be used for this purpose are pregnancy rate, twinning rate, sterility rate, survival rate, herd renewal rate, culling rate, removal rate and the policies that the enterprises have maintained, i.e. increasing, decreasing or keeping the enterprise capacities constant. In order to ensure success in herd management, it is necessary to know the basis of animal behavior and to support this with the right housing principles. As a result, the basis of increasing product quality is to increase animal welfare, to keep business records regularly and to use modern software-supported herd management applications.

Keywords: Herd projection, Fertility criteria, Livestock, Management policy

Giriş

Çiftlik hayvanlarından oluşturula sürülerde, hayvan mevcudiyetini, hayvan sayılarındaki değişimleri ve üretimi tahmin edebilmek için kullanılan verilere sürü projeksiyonu adı verilmektedir (Göncü, 2017).

Sürü yönetiminde amaç; hayvan refahının dikkate alındığı ve sürüyü bir iş insanı yaklaşımıyla yönetmektir. Böylece hayvan sayısına bağlı kalmaksızın, verilerin toplanması, değerlendirilmesi, işletmeye uygun kararlar alınması ve uygulanması sağlanmasıdır (Öz ve Bilgen, 2002).

Dünya nüfusunun sürekli artma eğiliminde olması, insanların hayvansal ürünlere olan talebini artırmaktadır. Hayvancılık işletmelerinin etkili kullanabilmek için hem sürdürülebilir hem de karlı bir şekilde yapılması gerektirmektedir. Bunun için, hayvancılık işletmelerinde rutin olarak yapılan günlük haftalık, aylık veya yıllık işler mevcuttur. Sürdürülebilir bir üretim için ancak hayvancılık işletmelerindeki tüm bu işlerin ne zaman ve nasıl yapılacağına önceden bilinerek hazırlıklı olunması ile mümkün olacaktır. Bu durum da ancak işletme kaynaklarının en etkili şekilde kullanımı ile mümkün olacaktır. Çünkü bu kaynaklar sınırlı olmasından dolayı, bunların etkin kullanımı ancak yönetim becerisi ile gerçekleşebilmektedir. Bundan dolayı, hayvancılık işletmelerinde üretim maliyetlerini en düşük seviyede tutmak koşuluyla işletmelerdeki karlılık değerlendirilmesinde çoğunlukla girdi, çıktı ve fiyat ile ilişkileri esas alınmaktadır. Fakat işletmedeki üretim sürecinde meydana gelen kayıplar, karlılığı etkilediği görülmektedir. İşletmelerdeki karlılığın artırılmasında kullanılan bilgi ve teknolojik uygulamaların üretim kayıplarının azalmasında etkili olduğu görülmektedir (Göncü ve Koluman, 2023). Başarının elde edilebilmesi için hayvancılık işletmelerinde de farklı iş kollarında olduğu gibi üç temel yöntemin uygulanması gerekmektedir. Bunlar sırasıyla; planlama, uygulama, takip etme ve değerlendirmedir. Hayvancılık işletmelerinde uygulanan sürü yönetimi prosedürleri; uygulama, takip, tespit, müdahale, değerlendirme ve yönetim olmak üzere altı aşamadan gerçekleşmektedir (Drazen, 2000).

Sürü yönetiminde ulaşılması istenen en önemli hedef kârlılıktır. Bunun için tüm kaynakların doğru kullanılması gereklidir. Yapılması gereken ilk iş, sürüdeki mevcut sorunları saptamak, daha sonra gelir-gider tablosunu gözden geçirerek uygun çözümler üretmek ve bunları uygulamaya koymaktır (Uygur, 2004). Sürü yönetimi uygulamalarının aşamaları sırasıyla; İşletmede yapılması gereken işlemlerin belirlenmesi, İşletmelerde belirlenen kararların alınması ve

uygulanması, işletmedeki uygulamalar sonucundaki gelişmeler takip edilir ve geleceğe yönelik planlamalar hazırlanır (Öz ve Bilgen, 2002).

Bu derleme ile, çiftlik hayvanlarından oluşan sürülerdeki yönetimin başarısını ortaya koymak için özellikle döl verim kriterlerinin detaylı bir şekilde incelenmesi ve çözüm yolunun geliştirilmesi amaçlanmıştır.

Hayvancılık İşletmelerinde Sürü Projeksiyonu

Sürü Yönetimi hayvanların yaşamlarını sürdürüp maksimum verim alabilmek için hayvan refahının da göz önünde tutulduğu en uygun bakım ve besleme koşullarını sağlamak, hayvan hastalıklarının ve hayvancılık işletmelerinde idareye bağlı kayıpların önüne geçmek olarak tanımlanmaktadır. Sürü yönetiminin amacı ise hayvanların en uygun koşulları da dikkate alarak sürüyü bir iş adamı yaklaşımıyla yönetmektir (Taşkın ve ark., 2015).

Sürü oluşturulurken hayvan sayısının fazla olması değil hayvan başına verimin yüksek olması amaçlanmalıdır. Çünkü hayvancılık işletmelerinde üretim üzerine çok farklı ve hassas faktörlerin etkisi söz konusudur. Sürekli değişen piyasalar gidi maliyetlerinde dalgalanmalar oluşturması ve sonuç olarak da üretim maliyetlerinin yükselmesine sebep olmaktadır. Bu durum karşısında işletmeler girdi maliyetlerini en aza düşürmek için büyük çaba harcamaktadırlar. İşletmelerin asıl hedefleri üretim sonucunda kar edebilmektir. Ancak biyolojik üretim sürecinde oluşan gelirin, üretimin farklı aşamalarında oluşan kayıplar göz ardı edildiğinde, karlı bir üretimin olması mümkün değildir. Üretim sırasında oluşan kayıplar, gelirlerin önemli bir kısmını götürebilmektedir. Sürü yönetim sistemindeki hata ve eksikliklerden oluşan kayıpları tespit edilmediği sürece, kayıpların etkisini artırarak devam edecektir. Sürü yönetim başarısı, üretim sürecinde oluşan kayıpları en aza indirmeye bağlıdır (Hoskin, 1983; Göncü ve Koluman 2023).

Sürü Projeksiyonunun Aşamaları

Hayvancılık işletmelerinde sürü yönetimi, doğum ile başlayıp hayvanın farklı yaş ve fizyolojik dönemlerinde yapılması gereken işlerin tümünü kapsamaktadır (Göncü ve Koluman, 2023). Sürüde yapılması gereken aşamalar sırasıyla;

Sürünün kayıtlarını tutularak verilerin toplanması,

Toplanan verilerin değerlendirilmesi,

Değerlendirme sonucunda işletmeye yönelik kararların alınması,

Kararların uygulamaya geçirilmesi, şeklinde sıralayabiliriz.

Sürü Kayıtlarının Tutulması

Hayvan yetiştiriciliği yapan işletmelerin ilk yapması gereken düzenli olarak kayıt tutmasıdır. Çiftliklerde düzenli olarak verim kontrolü takibi yapılarak gerekli olan kayıtlar zamanında planlanıp tutulmalıdır. Kayıtların temel olarak hayvanların var olan potansiyellerini ortaya koymalı ve teknik olarak da ıslah çalışmalarına imkân sağlaması gerekmektedir (Çelikyürek ve Aygün, 2014). Hem ekonomik değeri hem de verimleri yüksek olan hayvanları yetiştirebilmek ancak tutulan kayıtlara ait bilgilere sahip olunması ile sağlana bilir. Yalnızca süt verim kayıtlarının tutulması ile o hayvana ait birçok verinin (Yem tüketimi, laktasyon süt miktarı, laktasyon süresi, kuruya çıkarılma vs.) tutulmasını sağlayacak ve işletmenin ihtiyaçları belirlenerek hedefler oluşturulacaktır. Böylelikle yetiştirici hangi hayvanın iyi, hangisinin karlı olduğunu belirleyerek kolaylıkla seçim yapabilecektir. Bunun içinde belirli aralıklarla kayıt tutmak aynı zamanda işletme içi gelişmeyi, büyümeyi, benzer işletmelerdeki konumunu değerlendirme fırsatı verirken, kayıt tutmanın temelinde, hayvanların tanınması ve tanımlanması sağlayacaktır. Bunun kolaylıkla gerçekleştirilmesi için de doğumla birlikte hayvanların küpe numaralarının doğumdan sonra 24 saat içerisinde takılması gerekmektedir (Kaymakçı ve Taşkın, 2005).

Toplanan verilerin değerlendirilmesi

Verinin toplanması sonucunda istatistik yöntemleri kullanarak anlamlı ve yararlı bilgiler haline getirilmesi işlemi olarak tanımlanabilir. İşletmelerin büyüme, küçülme, pazarlama stratejileri belirleme gibi kritik kararlarının alınmasında veri analizlerinden yararlanılmaktadır. Veri analizi, doğru verilerle ve yöntemlerle yapıldığında, işletmelerin stratejik ve kritik kararlarında yapılabilecek birçok hatanın önüne geçilmesini sağlayabilmektedir. Toplanan verilerin değerlendirilmesi yapıldıktan sonra alınan kararların uygulanması yapılmalıdır (Karaca ve ark., 2012).

Değerlendirme sonucunda işletmeye yönelik kararların alınması

Karar alma, birçok seçenek arasından seçim yaparak gelecekte kullanılmak üzere karar verme süreci olarak tanımlanır (Daly ve ark., 2017). Karar verme sürecinde ve kararın uygulanması sırasında dikkat edilmesi gereken hususlar söz konusudur. Bunlar; kararın etkilerinin tüm kapsamını dikkatli bir şekilde değerlendirmek, karar uygulanırken hangi önlemleri almamız gerektiğinin belirlenmesi, kararın etkilerinin farklı şekilde göz önünde bulundurulması gerektiğinde, farklı açılardan değerlendirilmesi gerektiği, alınan kararın kısa ve uzun vadedeki sonuçlarının ortaya çıkması için gereken denetimleri ve kontrollerin yapılması, kararın

uygulanması sırasında karşılaşılabilecek sorunlarla ilgili önceden tahmin edilmesi gerektiği gibi hususlara dikkat edilmesi gerekmektedir (Sağır, 2006).

Sürü projeksiyonunda Planlama

Planlama istenen bir amaca ulaşabilmek için ihtiyaç duyulan faaliyetlerle ilgili düşünme süreci olarak tanımlanır ve akıllı davranışın temel bir özelliğidir. Planlamada sadece istenen sonuç değil, aynı zamanda bu sonuca ulaşmak bilmek için gerekli olan adımları görselleştirerek bir mantık ve hayal gücünün kullanılmasını da kapsar (Göncü ve Koluman, 2023). Sürü projeksiyonunun en temel işlevi planlama yapmaktır. Bunu için planlanması gereken konu hakkında önceden kararlar alarak onun nasıl ve ne zamanda yapılacağına belirlenmeye çalışılmalıdır (Anonim, 2023).

Planlama Fonksiyonları

Planlama yaparken izlenmesi gereken prosedürler aşağıda bildirilmiştir (Göncü ve Koluman, 2023). Buna göre;

İşletmedeki mevcut durumun analizi yapmak,

İşletmenin hedeflerinin belirlenmesi,

İşletmenin stratejik planlamasının belirlenmesi,

İşletmenin sahip olduğu kaynakların yönetimi ve faaliyetlerinin uygulanması şeklindedir.

İşletmedeki Mevcut Durumun Analizi Yapmak

Mevcut durum analizi, işletmede gözlem yapılması, işletmenin mevcutta sahip olduğu dokümanların, tuttuğu kayıtların incelenmesi, ilgili kişilere sorular sorulması, iş yapım yerlerinde inceleme ve gözlem yapılması, veri analizi yapılması şeklinde yürütülür (Çoban ve Karakaya, 2010). Mevcut durum analizlerinde amaç işletmenin ne durumda olduğunu ortaya konulmasıdır. Mevcut durum analizi işletmeyi oluşturan tüm birimlerinin genel olarak işleyişlerinin detaylandırılması ve geleceğe yönelik hedeflerin belirlenmesi için oldukça önemlidir. İşletmelerin yeniliklere uyum sağlayabilmesi, gelir-gider dengesini görebilmesi, işletme içi ve dışı tüm çevresel faktörlerin etkileri detaylandırılarak değerlendirilmesidir. Mevcut durum analizi yaparken dikkat edilmesi gerekenler hususlar aşağıda bildirilmiştir. Bunlar;

- Elde edilen tüm verilerin eksiksiz ve doğru olması ve bu verileri değerlendiren kişilerin konuya vakıf olması gerekir.
- Mevcut durum analizinin sonuç raporu dikkatle değerlendirilmeli ve gerekli uygulamalar yapılmalıdır.

- Mevcut durum analizi sadece olumsuzluk durumunda değil de belli aralıklarla yapılarak değerlendirme sonuçları özenle incelenmelidir.
- Mevcut durum analizinin kısa vadede değil, orta veya uzun vadede işletmeye fayda sağlayacağı unutulmamalıdır.

İşletmelerin stratejilerinin tespitinde en önemli konu amaç ve hedeflerin belirlenmesidir. Bu konuda yol gösteren ve gerçekçi amaçların oluşturulmasındaki temel ilkeler aşağıdaki bildirilmiştir (Thompson, 1999).

- Hedeflenen amaç açık ve seçik olması gerekir.
- Gerçekçi olmalıdır.
- Esnek olmalıdır.
- Ölçülebilir olmalıdır.
- Kısa ve uzun vadede ulaşıla bilinecek amaçları birbirinden ayırmalıdır.
- Uygulayıcılar tarafından benimsenmelidir.
- Motive edici olmalıdır.
- Uyumlu olmalıdır.

Strateji, amaç, hedef, misyon, politika, program, yöntem, plan, vizyon ve taktik içermelidir.

Durum analizi yapılırken kullanılacak başlıca yöntem SWOT analizi olmalıdır. SWOT analizi, işletmenin çevresi ile etkileşimini sistematik olarak inceleyen bir yöntemdir. Bu kapsamda işletmelerin içsel olarak; güçlü ve zayıf yönleri ile dışsal faktörlerden kaynaklanan fırsatlar ve tehditleri belirlemesine yardımcı olmaktadır. Bu yaklaşım ile, işletmelerde planlama yaparken güçlü ve zayıf yönleri ile karşı karşıya olduğu fırsat ve tehditleri analiz etmeyi ve geleceğe dönük stratejiler geliştirmeyi ifade eder (Anonim,2018). SWOT analizinde yöntem kapsamlı bir şekilde belirtilmesi gerekir.

Garfik.1. SWOT Analiz Gerçekleştirme Aşamaları

İşletme stratejileri belirlenirken mutlaka aşağıdaki sorulara cevap verilmesi gereklidir.

- Neredeyiz?
- Nereye gitmek istiyoruz?
- Gitmek istediğimiz yere nasıl ulaşabiliriz?
- Başarımızı nasıl takip eder ve değerlendirebiliriz?

İşletmenin hedeflerinin belirlenmesi

Hedefler ve planlama bize varmak istediğimiz yolu görünür hale getirmeye yarayan bir olgudur. Hedefimizin ne olduğunu görmek bir haritaya bakıyor gibi ilerlememizi ve nasıl adım atmamız gerektiği hakkında bilgi verir. Doğru bir hedefleme ve planlama başarının önemli unsurlarındandır.

Bir işletmenin hedef belirlemeden ölçeklenmesi ve büyümesi pek mümkün değildir. Tespit edilen hedefler uygulanan veya planlanan stratejilerle uyumlu olmaz ise, işi büyütmek ve başarıya ulaşmak kolay değildir. Peki, stratejilere uygun hedefler nasıl belirlenir? Bir hedefin belirlenebilmesi için ancak uygun stratejiler oluşturulmalıdır. Stratejinize uygun hedef belirlemenin dört yolu vardır. Bunlar; Stratejinize uygun hedefler seçmek, seçilen stratejilerin analizlerini yapmak, gerçekçi hedeflere yoğunlaşmak ve iletişimi canlı tutmaktır. Hedef belirlerken, SMART; Specific, Measurable, Atainable, Relevant, Time Bound (Belirgin, Ölçülebilir, Ulaşılabilir, İlgili, Zamana Bağlı) şeklinde olmalıdır.

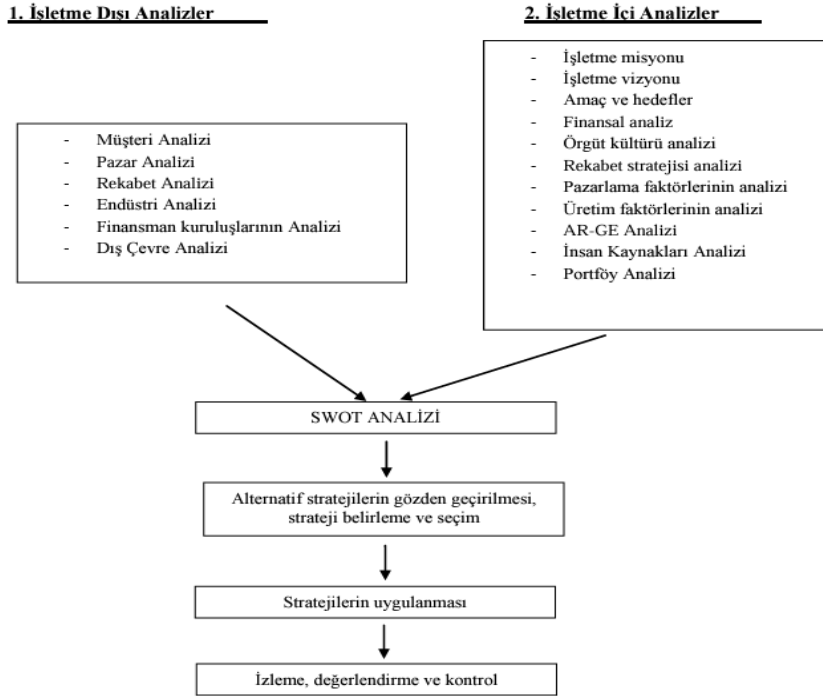

Hedef Belirleme S-M-A-R-T

Grafik. 2. Hedef Belirleme

İşletmenin Stratejik Planlamasının Belirlenmesi

Stratejik planlama, daha önceden belirlenmiş olan ana amacın gerçekleştirilmesi için ortaya konulan planlamayı ifade etmektedir. İşletmede ana stratejik planı yapmadan önce SWOT analizi yaparak işletmenin zayıf ve güçlü yanlarını, tehditlerini ile fırsatlarını belirleyerek bunları aynı zamanda değerlendirilmesini sağlayacaktır (Ergenekon, 1990).

Grafik 3. Stratejik Planlama Süreci

Yapılan çalışmalarda stratejik planlama sürecinde işletme dışı analizler, işletme içi analizler, swot analizi, strateji belirleme ve seçim, uygulama, izleme, değerlendirme ve kontrol süreçleri olmak üzere birçok analiz yapılmaktadır (Kevser, 2007). Grafik 3' de stratejik planlama sürecine ait aşamalar bildirilmiştir.

İşletmenin sahip olduğu kaynakların yönetimi ve faaliyetlerinin uygulanması

Diğer işletmeler ile rekabet edebilmek için ellerindeki kaynakları verimli olarak yönetmesidir. Bu nedenle işletmelerin sahip oldukları sermaye, iş gücü, tesis ve teçhizat gibi kaynakların en etkin biçimde kullanılmasıdır. Kaynak yönetim planının aşamaları; işletmenin iş gücü ve fiziksel kaynaklarının belirlenmesi ve işletmenin sahip olduğu fiziksel kaynaklarının nasıl tasarlanacağına belirlenmesi olarak tanımlanabilir. Alınan kararlar daha sonra uygulamaya aktarılması yapılmalıdır. Kararın değerlendirilmesinde en önemli aşama olup uygulama ile alınan kararların uygulanabilir olup olmadığına karar verilir (Çalışkan,2010).

Sonuç

Dünya nüfusunun sürekli olarak artışı özellikle hayvansal ürünlere olan talebi artırmaktadır. Bu talebin karşılanması ise ancak hayvansal üretimin artırılması ile karşılanabilir. Hayvancılık işletmelerinde üretimi artırmak ise ancak başarılı bir çiftlik yönetimi ile mümkün olacaktır. Başarılı bir sürü projeksiyonu hazırlamak için; hayvanların biyolojik özelliklerini, sürüde uygulanacak strateji ve türlere ait ilgili teknik parametreler kullanılması gerekmektedir. Sürü projeksiyonu yapılmamış bir işletmenin geleceğiyle ilgili gerçekçi bir değerlendirme yapmak ve isabet oranı yüksek tahminlerde bulunmak mümkün olmaz. Hazırlanan sürü projeksiyonuyla başarıya ulaşabilmek için planlama, fizibilite çalışması ve değerlendirmelerin gerçekçi olması gereklidir. Sürü projeksiyonu yapılmış bir işletmede, işletme sahibi veya işletme yöneticilerinin planlamadan kaynaklanan sapmaları kolaylıkla fark ederek, hataya neden olan uygulamaları belirleyip sorunları gidermesi daha kolay olacaktır.

Özet

Biyolojik olarak parçalanabilen, sürdürülebilir ve çevre dostu bir malzeme olan yünün, özellikle dünya iklimiyle ilgili artan endişeler ışığında, tekstil endüstrisi dışında da birçok kullanım alanı vardır. Tarihsel olarak etkili bir ısı ve ses yalıtkanı olarak kullanılan koyun yünü, tarım sektöründe kompost veya malç olarak bir karışım halinde kullanıldığında birçok fayda sunmaktadır. Yavaş salınan azot ve diğer eser elementlerin kaynağı olarak, yabancı ot ve haşere kontrolünde, nem tutmada ve sıcaklık düzenlemesinde önemli roller üstlenebilen koyun yününün kısmen koyun gübresi veya aynı zamanda gübre görevi gören diğer bitkisel maddelerle kaplanma avantajları bulunmaktadır. Yaklaşık %10 ile 12 oranında yüksek bir azot içeriği olan koyun yünleri keratin açısından da zengin olup potasyum, fosfor ve kükürt (azot kullanımının iyileştirilmesine yol açar) içermektedir. Ayrıca koyun yünü kendi ağırlığının birçok katı suyu emerek bir sünger vazifesi görmesi ile suyu yavaşça toprağa/bitkiye (kuru dönemlerde) bırakabilmektedir. Aynı zamanda bazı zararlı saldırılarını azalttığı tespit edilen koyun yünlerinin yabancı ot gelişimini de ortadan kaldırdığı görülmektedir. Koyun yünü kompostları, verimli besin profilleri ve yüksek su tutma kapasiteleri ile turba bazlı formülasyonlara benzeyen yumuşak ve ufalanan bir dokuya sahiptir. Günümüzde koyun yünü ile ilgili optimum kompostlama stratejileri ve karışım formülasyonlarının belirlenmesinin yanı sıra, koyun yünü ile ilgili çalışma süreçlerinin nasıl büyütüleceğine dair daha fazla araştırmaya ihtiyaç duyulmaktadır. Bu derlemede koyun yününün tarım sektöründe kullanımı ile ilgili genel bir değerlendirmeye ve konu ile ilgili bazı akademik çalışmalara yer verilmiştir.

Anahtar kelimeler: Yün, Organik Tarım, Sürdürülebilir Tarım

USE OF SHEEP WOOL AS ORGANIC FERTILIZER IN SUSTAINABLE AGRICULTURE

Abstract

Wool is a sustainable, biodegradable, and environmentally benign fiber with a wide range of applications outside the textile industry, particularly in light of growing worries about global climate change. Historically used as an effective heat and sound insulator, sheep wool offers many benefits when used in a mixture as compost or mulch in the agricultural sector. Sheep wool, which can play important roles in weed and pest control, moisture retention and temperature regulation as a source of slow-release nitrogen and other trace elements, has the advantage of being partially covered with sheep manure or other plant matter that also acts as fertilizer. Sheep wool, which has a high nitrogen content of approximately 10 to 12%, is also rich in keratin and contains potassium, phosphorus and sulfur (leading to improved nitrogen utilization). In addition, sheep wool can absorb water many times its own weight and act as a sponge, slowly releasing the water to the soil/plant (during dry periods). Sheep wool composts have a soft and crumbly texture similar to peat-based formulations, with efficient nutrient profiles and high-water retention capacities. Today, more research is needed on how to scale up sheep wool-related working processes, as well as determining optimum composting strategies and mixture formulations for sheep wool. In this review, a general evaluation of the use of sheep wool in the agricultural sector and some academic studies on the subject are included.

Keywords: Wool, Organic Agriculture, Sustainable Agriculture

Giriş

Bitkisel üretimde yüksek verimin sağlanması ve verimliliğin sürdürülebilmesi için gübreleme faaliyetleri oldukça önemlidir. Kimyasal gübreler ve tarım ilaçları ile birlikte, bitkiler kontrollü bir şekilde beslenebilmekte ve zararlılara karşı korunabilmektedir. Ancak bu kimyasal uygulamalar zamanla topraktaki mikroorganizmalar üzerinde olumsuz etkilere neden olmaktadır. İnorganik gübrenin sürekli kullanılmasıyla toprak zamanla daha çorak hale gelmekte, mikroorganizma faaliyetleri tamamen durmakta ve toprağın havalanması bozulmaktadır (Karaca ve ark., 2023). Atık veya yan ürünlerin bitkiler için besin kaynağı olarak kullanılmasının uzun bir geçmişi vardır. Bununla birlikte, henüz kullanılmamış ve mahsuller için besin kaynağı olarak potansiyel değere sahip olabilecek, yaygın olarak bulunabilen bazı atık ürünler bulunmaktadır (Ordiales ve ark., 2016). Bu ürünler için örnekler arasında ham yünün temizlenmesi işlemi sırasında oluşan koyun yünü atığı yer almaktadır (Kroening ve ark., 2004).

Koyun yünü değerli bir doğal elyaftır ve tekstil amaçlı hammadde olarak uzun bir geçmişe sahiptir. Uluslararası ticareti yapılan ilk mallar arasında yer almakta olup birçok ülkenin tarım ekonomisi için halen önemli konumdadır (Henry, 2012). Sentetik elyafların yükselişe geçtiği geçtiğimiz yüzyılın ortalarından bu yana, yün tekstil sektöründe giderek önemini yitirmiş ve artık tekstil pazarında marjinal bir elyaf haline gelmiştir. Pazarlanmayan büyük miktarlardaki ham yün, koyun yetiştiricileri için bir gelir kaynağı olmaktan çıkıp, en iyi ihtimalle yakılacak veya çöpe atılacak sorunlu bir atığa dönüşmüştür. Doğal kaynakların sürdürülebilir kullanımına olan ilginin artmasıyla birlikte yün, yeterince önemsenmeyen, yeterince kullanılmayan, daha iyi değerlendirilmeye değer bir yenilenebilir kaynak olarak yeniden değerlendirilmektedir. Son zamanlarda, giyim dışı uygulamalarda yün atıklarının değerlendirilmesine yönelik çözümlerin bulunması konusunda yoğun araştırmalar yapılmıştır. Yün atıklarına değer katmak için iki ana yön geliştirilmiştir. Bunlardan birincisi doğal elyaf özelliklerinden yararlanılan uygulamalardır. İkincisi ise elyaflardan kimyasal çözüldürme veya enzimatik biyodönüşüm yoluyla ekstrakte edilen keratin biyopolimerinin kullanıldığı uygulamalardır. Doğal durumdaki yün elyafları en çok yeşil bina yalıtımı, polimer elyaf kompozitler veya su kirliliği arıtımında kullanılan emici malzemeler gibi teknik uygulamalarda kullanılmaktadır. Keratin ve türevleri, rejeneratif tıp için protein bazlı biyomateryallerin üretiminde esas olarak değerlendirilmektedir. Biyodönüşüm, yün atıklarını organik tarıma yönelik gübreler veya proteolitik enzimler gibi yüksek değerli ürünlere dönüştürme konusunda önemli bir potansiyele sahiptir (Rajabinejad ve ark., 2019). Organik

gübreler bol miktarda organik azot (N) içermekte ancak kritik dönemlerde bitkilerin ihtiyacını karşılayacak kadar hızlı mineralize olamamaktadır (Pang ve Letey, 2000). Biyodönüşüm, yün atıklarının organik tarıma yönelik gübre gibi yüksek değerli ürünlere dönüştürülmesinde önemli bir potansiyele sahiptir (Sharma ve ark., 2019). Mineral gübrelerden hızlı salınımına karşılaştırıldığında yün atıklarından azotun yavaş salınımı, su kaynaklarının azot bileşikleriyle kirlenmesinden korunması nedeniyle çevre açısından olumludur (Petek ve Logar, 2021). Yün lifleri nemi çok etkili bir şekilde emer ve tutar ve bu özellik, pestisitler gibi kirletici maddelerin akışını azaltabileceği ve su tasarrufunu artırabileceği topraklara uygulandığında oldukça faydalıdır. Yün lifleri hafiftir ve ağırlık ekmeden daha fazla miktarda nemi emebilmektedir (Nustorova ve ark., 2006). Koyun yünü, bitki büyümesi için gerekli olan önemli besin maddeleri açısından zengin bir kaynaktır (McNeil ve ark., 2007). Yüksek miktarlarda N, S ve C içerir. Koyun yünü hidrolizata, topraktaki toplam N, C ve P içeriğini artırarak büyüme koşullarını iyileştirmektedir (Govi ve ark., 1998). Diğer malç malzemeleri gibi, yün de azot kaynağı görevi görerek yabancı ot büyümesini bastırmakta ve diğer malç malzemelerine göre bozulmaya karşı daha fazla dayanıklılık göstermektedir (daha uzun ömürlüdür) (Sharma ve ark., 2019). Diğer taraftan yün, doğal bir kovucu görevi görmektedir. Hargreaves (2017) yünün salyangozları uzaklaştırmak için kullanılabileceğini bildirmiştir. Kompostlama aynı zamanda parazitleri ve patojenleri de ortadan kaldırır ve potansiyel kirletici maddeleri bir dereceye kadar azaltır (Cogger, 2005).

Koyun yünü biyolojik olarak parçalanabilen bir elyaftır. Azot ve kükürt açısından zengin bir gübre olarak toprağa geri dönmesinden elde edilen önemli faydalarla kolayca geri dönüştürülür. Yün atıkları, makas atıkları, halı bertarafı, tekstil endüstrileri, yün yıkama çamuru ve işlenemeyen çok kaba yünlerin yanı sıra birçok biçimde üretilmektedir. Yün atıkları, ilgili literatürle birlikte mevcut değerlendirmeye dahil edilmiş ve yün atıklarının toprak iyileştirici olarak uygulamalarının potansiyel faydaları üzerinde durulmuştur. Son yıllarda çevreye yönelik kamuoyunun artan endişesi ve atık depolama sahalarının maliyetleriyle birlikte, kaçınılmaz yün atığı için alternatif kullanımları aramak son derece acildir (Sharma ve ark., 2019). Koyun yünü tekstil endüstrisi için keratin açısından zengin bir yan üründür. Keratin'in kompleks yapısından dolayı bu atıklar bozunmaya karşı oldukça dirençlidir ve ciddi bir çevre sorunu teşkil etmektedir. Atık yün genellikle çevre dostu olmayan fiziko-kimyasal işlemlerle hazırlanan farklı hidrolizatlara dönüştürülmekte ve bu da bazı amino asitlerin tahrip olmasına ve enerji kaybına neden olmaktadır. Mikrobiyal veya enzimatik ön arıtma ve kompostlama gibi biyoteknolojik yaklaşımların kullanılması, çevresel

etkiyi önemli ölçüde azaltabilir ve biyogaz üretimi için gübre substratları ve yüksek katma değerli ürünler (peptitler, amino asitler ve keratinolitik enzimler) gibi faydalı ürünler üretebilir (Petek ve Logar, 2021). Atık koyun yünü gibi keratin açısından zengin malzemeler, zengin bir mineral element bileşimine sahiptir ancak doğal ayrışma konusunda zorluklar sergilemektedir. Sonuç olarak, bu atık malzemelerin çoğu yakılmakta ya da düzenli depolama alanlarına atılmaktadır. Bu da ciddi çevresel kaygılara yol açmaktadır. Ancak bu atıklar etkili gübre ve toprak düzenleyici olarak kullanılma potansiyeline sahiptir. Tarımsal üretimde doğrudan kullanılabilirdiği gibi çeşitli işlemlere tabi tutularak da kullanılabilirler (Akca ve ark., 2023).

Yün atığı, çiftçilere ek gelir sağlayan, atık yünün en iyi şekilde kullanılması için koyunlara bağımlı olan üreticilere olanak sağlayan toprak iyileştirmeleri için en iyi seçeneklerden biridir. Yün atığı, toprak düzenleyici olarak kullanılmadan önce, büyük ölçüde C:N oranlarının düşürülmesi ve mevcut bitki besin maddelerinin sağlanması da dahil olmak üzere bitki büyümesi için uygun substrat niteliklerini sağlamak amacıyla kompostlamayı gerektirmektedir (Sharma ve ark., 2019). Atık yünün işlenmesine yönelik kimyasal ve fiziksel yöntemler, çok fazla enerji ve kimyasal tüketir ve büyük çevresel etkiye sahiptir. Bu nedenle bunların biyoteknolojik yaklaşımlarla değiştirilmesi gerekmektedir. Mikrobiyal veya enzimatik ön işlemlerle hazırlanan kompostlanmış atık yün veya hidrolizatlar, gübre olarak ve ayrıca biyogaz üretimi için substrat olarak saha deneylerinde umut verici sonuçlar göstermektedir. Atık yün uygulamalarına (yün peptonu, amino asitler, keratinolitik enzimlerin üretimi) yönelik bazı yenilikçi fikirler zaten tanımlanmış durumdadır, ancak daha fazla araştırma, atık yünden yüksek katma değerli ürünlerin geliştirilmesine yönelik daha fazla olasılığı ortaya çıkarabilir (Petek ve Logar, 2021).

Yün endüstrisi, bir milyardan üzerinde koyundan oluşan küresel bir sürüden yılda yaklaşık 1.160 milyon kilogram temiz yün üretmektedir. Her bir koyun, 10 metre kumaş veya yaklaşık altı kazak (kazak) üretmeye yetecek kadar verim sağlamaktadır. Dünya üzerinde toplamda her yıl kişi başına yaklaşık bir kazak üretmeye yetecek kadar yün miktarı oluşmaktadır (Anonim, 2023). Avrupa'da tarım sektörü yılda 200.000 tondan fazla kaba yün üretmektedir. İtalya'da tam olarak 18.000-20.000 ton üretim yapılmaktadır (Zoccola ve ark. 2015). Bu yün, kalite standartlarını karşılamadığından giyim endüstrisi için uygun olmayan bir hayvansal yan üründür ve Avrupa Komisyonu'na göre özel atık olarak sınıflandırıldığından (Bhavsar ve ark. 2016) sıklıkla çöp sahalarına atılmaktadır. Bununla birlikte, çeşitli çalışmalar farklı türdeki yün atıklarının veya yün

kalıntılarının toprak özellikleri ve verimliliği üzerindeki yararlı etkilerini açıkça göstermektedir (Abdallah ve ark., 2019a).

KOYUN YÜNÜNÜN İÇERİĞİ

Her bir ton ham yün, yaklaşık 640 kg yün lifi, 150 kg lanolin (temizlenmemişse), 40 kg kumaş (ter ve dışkıdan gelen potasyum tuzları gibi çözünebilir kirletici maddeler), 150 kg mineral kalıntısı (toprak) ve potansiyel olarak böcek ilacı içeren 20 kg bitkisel madde içerir (Bhavsar ve ark. 2016). Yün, alfa-keratin peptid bağları ve yüksek düzeyde çapraz bağlı disülfid bağları ağı sayesinde stabildir. Yağlı ham yün, bol miktarda karbon (%50 C), azot (%16-17) ve kükürt içeren protein 'keratin'den oluşmaktadır (S 3-4%) (Von Bergen ve ark., 1963). Sert keratin olarak da bilinen alfa keratin, çapraz bağlanan protein zincirleri arasında S-S bağları oluşturmak için daha yüksek sistein içeriğine (%14'e kadar) sahiptir ve bu da pepsin, trypsin veya papain gibi yaygın proteolitik enzimlere direnç gösterme yeteneğine katkıda bulunur (Onifade ve ark. 2012). Ayrıca yündeki spiral bobinin hidrofobik grupları biyolojik parçalanmayı zorlaştırmaktadır (Kornilowicz-Kowalska ve Bohacz, 2011).

Yün, benzersiz özellikleri kimyasal bileşimine ve morfolojik özelliklerine dayanan doğal bir protein malzemesidir. Yün, bir koyun ırkından diğerine değişen inceliğe, yani lif çapına göre sınıflandırılır. Yün lifinin histolojik yapısı kütikül, korteks ve hücre zarı kompleksinden oluşur. Medula adı verilen iç kanal ise sadece kaba ve orta dereceli liflerde bulunur. Kütikül veya dış katman, dış fiziksel ve kimyasal hasara karşı bariyer rolü oynar. Lif yüzeyine pürüzlülük ve dayanıklılık kazandıran üst üste binen pullardan veya kütikül hücrelerinden oluşur. Kütikül yüzeyi, protein substratına kovalent olarak bağlanan yağ asitlerinin varlığından dolayı hidrofobiktir. Korteks hidrofilik olduğundan lif, hidrofilik bir çekirdeği saran hidrofobik bir dış yüzeye sahip bir çekirdek-kabuk yapısına sahiptir (Popescu ve Höcker, 2007). Bu, yün yüzeyinin neden doğası gereği su ve kir itici olduğunu, ancak elyafın bir bütün olarak yüksek miktarlarda su buharını emebildiğini açıklamaktadır. Geleneksel bir tekstil elyafı olarak yün, yüksek ısı yalıtım yeteneği, higroskopiklik, düşük yanıcılık, düşük yoğunluk, keçeleşme, mekanik mukavemet ve dayanıklılık gibi özellikleri nedeniyle değerlidir. Bu özellikler, teknik tekstillerin temsil ettiği teknik uygulamalarda kullanılabilir. Yün lifinin ana kimyasal bileşeni olan keratin, biyopolimerler ve biyo bazlı malzemeler için genel ilgi alanında rolünü oynayabilen bir proteindir (Rajabinejad ve ark., 2019).

KOYUN YÜNÜNÜN GÜBRE OLARAK DEĞERLENDİRİLMESİ

Yün hidrolizatının gübre, yün kompostu olarak uygulanması veya ham yünün gübre olarak kullanılması çeşitli araştırmalarda yer almıştır. Hidrolize yün, bitkiler için gübre kaynağı olarak (Nustorova ve ark., 2006) veya ağır metaller için bağlayıcı madde olarak (Evangelou ve ark., 2008) denenmiştir. Zheljzkov ve ark. (2005, 2008), kompostlaştırılmamış yünün bitki besin kaynağı olarak kullanılabilirliğini, dolayısıyla çiftçilere yetiştirdikleri ürünler için alternatif bir besin kaynağı sunabileceğini ve bu materyali atık alanlarından uzaklaştırabileceğini bildirmiştir. Azot açısından zengin bir kaynak olan yün, kompostlama için hammadde olarak da kullanılmıştır (Das ve ark., 1997; Plat ve ark., 1984; Verville, 1996) Kompostlanmış yün de nohut ve buğday gibi mahsul bitkileri için azot kaynağı olarak değerlendirilmiştir (Tiwari ve ark., 1989a, Tiwari ve ark., 1989b). Zheljzkov (2005) serada fesleğen, dikenli elma ve nane için ve tarlada bahçe adaçayı için gübre olarak yün ve kıl atıklarının kullanıldığı 14 haftalık sera ve 4 yıllık tarla çalışması tasarlamıştır. Sonuçlar yün ve kılların hem sera hem de tarla üretimi için yüksek değerli ürünler elde edilmesi adına iyi besin kaynakları olduğunu göstermektedir. Yün atıklarının toprağa bir kere eklenmesi adaçayı otu verimini önemli ölçüde arttırmıştır (işlenmemiş alanda 1295 kg/ha ile karşılaştırıldığında 3141 kg/ha), ancak yün atığı ile işlem görmüş saksılardaki uçucu yağ içeriği işlenmemiş alanlara göre daha düşük olmuştur. Bununla birlikte, uygulaması yapılan parsellerdeki genel uçucu yağ verimi, daha fazla ot verimi nedeniyle daha yüksek çıkmıştır. Saha çalışmaları, koyun yününün gübre olarak uygulanmasının, atık yün yönetiminin oldukça başarılı bir yolu olduğunu ve aynı zamanda yakınlarda yeterli miktarda ekilebilir arazi olması durumunda, aynı zamanda en ucuz yöntem olduğunu doğrulamaktadır. Nustorova ve ark. (2006) yün hidrolizatını hazırlamak için otoklavda alkalın hidroliz olan termokimyasal yöntemi kullanmıştır (atık yün 0,15 M KOH, 0,05 M NaOH ile karıştırılmış ve 120 °C'de 20 dakika ısıtılmıştır). Konsantre edilmiş, kurutulmuş ve öğütülmüş süpernatant toprağa farklı miktarlarda eklenmiştir. Çalışmada son ürün yalnızca %25 kısmen bozunmuş keratin ve %75-80 suda çözünebilir materyaller (amino asitler, peptitler, lipitler, karbonhidratlar, tuzlar, boyalar, potasyum iyonları) içermiştir. İlave edilen hidrolizat, çavdar otu büyümesi üzerinde faydalı etkiler göstermiştir. 160 gün sonra, en yüksek hidrolizat konsantrasyonuyla gübrelenen çavdar çimi, uzunluk olarak kontrole göre iki katından daha yüksek çıkmıştır. Sonuç olarak hidrolizat miktarının artmasıyla çimlenme yüzdesinde ve toprak mikroorganizmalarının (organik maddenin birincil ayrıştırıcıları) sayısında artış gözlemlenmiştir.

Atık yünün işlenmesi olanaklarından biri olan kompostlama; organik madde dönüşümü ve patojenlerin ve yabancı otların yok edilmesinden oluşan, çevre dostu ve temelde nispeten ucuz bir aerobik prosestir. Kompostlama, ham yünle gübrelemeden daha uygun olan etkili sanitasyondan kaynaklanmaktadır ve aynı zamanda organik atıkların stabilizasyonu ve organik gübre üretimi nedeniyle döngüsel tarımın büyük bir teşvikçisidir (Cáceres ve ark., 2018). Özellikle koyunların esas olarak et için yetiştirildiği bölgelerde düşük kaliteli veya dışkıyla kirlenmiş yün işlemenin bir seçeneği olarak kompostlama ayçiçeği ve mısır bitkileri üzerinde Teksas'ta test edilmiştir (Abdaah ve ark., 2019a). Bu çalışmanın amacı, yüksek kaliteli bir kompost üretmek için yün atıklarının diğer biyokütle ile uygun karışımının belirlenmesidir. Çalışmada atık yün, farklı ek karbon kaynakları (talaş ve kurutulmuş çim kırpıntıları) ve azot (at ahır atığı, yiyecek atığı ve su sümbülü) içeren 4 farklı karışım halinde kompostlanmıştır. Sonuçlar atık yünden elde edilen kompostun tarıma uygun olduğunu göstermiştir. En iyi hammadde bileşimi %25 (h/h) atık yün, %25 (h/h) at ahır atığı ve %50 (h/h) kurutulmuş çim kırpıntısı olarak belirlenmiştir. Bhavsar ve ark. (2016) atık yünün aşırı ısıtılmış su hidrolizini test etmiştir. İşlemde atık yün, 170 °C sıcaklıkta ve 7,0 bar basınçta doymuş buharla 60 dakika süreyle işlenmiştir. Çimlenme testi için seyreltilmiş hidrolizat kullanılmıştır. Tüm örneklerde çimlenme yüzdesinin %100 civarında olması yün hidrolizatının fitotoksik etki oluşturmadığını göstermektedir. 1 g/L konsantrasyonuna seyreltilen hidrolizat, kontrole kıyasla daha yüksek bir tohum çimlenme indeksi ve daha yüksek ortalama kök uzunluğu sonuçlarını vermiştir.

Güncel bir çalışmada atık koyun yünü ve alkali hidrolizatının şeker pancarı sürgün ve köklerinin büyümesi, besin konsantrasyonları ve şeker kalite parametreleri üzerindeki etkilerinin araştırılması amaçlanmıştır. Sürgün ve kök örnekleri, kök gelişimi aşamasından hasada kadar iki hafta aralıklarla toplanmıştır. Şeker pancarı köklerinin yaprak mineral element konsantrasyonları ve şeker kalite parametrelerindeki zamansal değişimleri belirlenmiştir. Atık koyun yünü uygulaması, şeker pancarının sürgün ve kök verimini önemli ölçüde artırmıştır. Kontrol ile karşılaştırıldığında dördüncü örneklemede yapraklardaki azot, kalsiyum ve magnezyum konsantrasyonları artmıştır. Ancak uygulamalar, özellikle hasat dönemine doğru yapraklardaki demir konsantrasyonunun yanı sıra köklerdeki şeker içeriği ve beyaz şeker içeriğinde de önemli bir azalmaya neden olmuştur. Diğer taraftan yapraklarda sürgün ve kök gelişimi ile azot, kalsiyum ve magnezyum oranlarındaki belirgin artış, bu atıkların şeker pancarı üretiminde gübre ekonomisi sağlayacağını göstermiştir (Akca ve ark., 2023). Koyun yününden üretilen gübrenin killi tın tekstürlü toprağın bazı

biyokimyasal özelliklerine etkisinin belirlenmesi amacıyla yürütülen bir başka güncel çalışmada koyun yünü gübresi (KWM) toprağa 0, 0,5, 1,0, 1,5, 2,0, 2,5, 3,0, 4,0 ve 5,0 t da⁻¹ oranlarında eklenmiştir. Araştırma sonuçlarına göre toprakların pH, tuzluluk, organik madde içeriği, potasyum (K), sodyum (Na), demir (Fe), manganez (Mn), çinko (Zn) ve bor (B) konsantrasyonları artmıştır. Diğer elementlerin (fosfor (P), kalsiyum (Ca), magnezyum (Mg), bakır (Cu) içerikleri değişmemiştir. Ayrıca artan dozlarda uygulanan koyun yünü gübresinin toprağın bazı biyolojik özelliklerine olumlu etkisi istatistiksel olarak anlamlı çıkmıştır. Çalışma sonucunda koyun yünü gübresi dozu arttıkça toprağın havalanması ve su tutma kapasitesinin de arttığı bildirilmiştir (Karaca ve ark., 2023). Dağ koyunlarından elde edilen kaba yünün ekonomik değeri düşüktür ve koyun yetiştiriciliğinin zahmetli bir yan ürünü olarak değerlendirilir. Bundan yararlanmanın yollarını bulmak için yürütülen bir çalışmada koyunların kırılması sırasında daha kaliteli yünlerden ayrılan atıklar, kışlık buğday ekiminde gübre olarak kullanılmıştır. Yapılan ön testlerde yıkanmamış yünün aşırı miktarda ağır metal ve çevreye zararlı kirleticiler içermediği ve gübre olarak güvenle kullanılabileceği belirtilmiştir. Aynı çalışmada ham yün daha kısa parçalar halinde kesilip toprağa karıştırılarak iki mevsim kışlık buğday büyümesine etkisi araştırılmıştır. Eş zamanlı olarak yünün biyolojik parçalanmasının ilerleyişi ve topraktaki azot içeriği analiz edilmiştir. Azot bileşiklerinin yavaşça toprağa salındığı ve topraktaki azot içeriğinin yünün biyolojik parçalanmasının ilerlemesiyle sıkı bir şekilde ilişkili olduğu belirtilmiştir. Serbest bırakılan azot, buğday büyümesini çeşitli aşamalarda olumlu yönde etkilemiş, bu da daha yüksek kardeşlenme derecesi, daha yoğun yaprak rengi, daha yüksek saplar ve son olarak daha yüksek verim ile kendini göstermiştir. Çalışma sonucunda dağ koyunu yününün, organik tarımda azot açısından zengin organik gübre olarak başarıyla kullanılabileceği bildirilmiştir. Ayrıca bu durumun tekstil işlemeye uygun olmayan kaba yünlerin sıfır atık stratejisine göre değerlendirilmesine olanak sağladığı sonucuna varılmıştır (Broda ve ark., 2023)

SONUÇ

Koyun yünü bitkiler için gübre olarak değerlendirilebilir. Yapılan araştırmalar organik gübre üretimi açısından koyun yününün etkili bir azot kaynağı olarak kullanım olasılığına sahip olduğunu göstermektedir. Yün üretiminin ekonomik, sosyal ve çevresel sürdürülebilirliğini artırmak için, atık yünün toprak düzenlemelerinde ve peyzaj düzenlemelerinde kompost haline getirilmesi, üreticilere ek gelir sağlayabilir ve koyun yetiştiricisi topluluklara yaşam döngüsünün her bölümünün değeri açısından gurur kaynağı olma potansiyeline sahiptir.

Özet

Hidrofilik ve kristal özelliklere sahip, sert yapıya sahip doğrusal bir amino polisakkarit olan kitosan, yaygın olarak kullanılan ve kitinin deasetilasyonunun doğal ve güvenli bir ürünüdür. 1980'lerin sonlarında kitosanın endüstriyel miktarlarda bulunması tarımda test edilmesini sağlamıştır. Amino gruplarının varlığı ile kitosan diğer bileşiklerle kompleks oluşturabilmekte ve bitkilerin damar sistemine girerek metabolik-fizyolojik yolların aktivasyonuna yol açabilmektedir. Bu polimerik bileşik diğer doğal polimerlerle bağlanarak gübre ve besin elementleriyle kombinasyon halinde bir yandan bitkinin besin ihtiyacını karşılarken, diğer yandan toprak dokusunun iyileştirilmesine de yardımcı olmaktadır. Kabuklu hayvanların (yengeç, ıstakoz, karides, istiridye vb.) dış iskeletinden, böceklerin kütiküllerinden, mantarların hücre duvarlarından ve bazı alglerden elde edilen kitosanın onlarca yıldır biyotik özellikler ve özellikle de anti-mikrobiyal özellikler sergilediği bilinmektedir. Bu çalışmada kitosan ile ilgili genel bilgiler ve tarla bitkilerinde kitosan uygulamaları ile yapılan çalışmalar araştırılmıştır.

Anahtar Kelimeler: Kitosan, Kitin, Tarla bitkileri, Organik gübre

USE OF CHITOSAN AS A BIOSTIMULANT

Abstract

Chitosan, a linear amino polysaccharide with a rigid structure with hydrophilic and crystalline properties, is a widely used, natural and safe product of chitin deacetylation. Testing of chitosan in agriculture was made possible in the late 1980s when it became available in industrial quantities. With the presence of amino groups, chitosan can form complexes with other compounds and enter the vascular system of plants, leading to the activation of metabolic-physiological pathways. This polymeric compound binds with other natural polymers and, in combination with fertilizers and nutrients, meets the nutritional needs of the plant and helps improve the soil texture. It has been known for decades that chitosan, obtained from the exoskeleton of crustaceans (crabs, lobsters, shrimps, oysters, etc.), cuticles of insects, cell walls of fungi and some algae, exhibits biotic properties and especially anti-microbial properties. In this study, general information about chitosan and studies on chitosan applications in field crops were investigated.

Keywords: Chitosan, Chitin, Field crops, Organic fertilizer

Giriş

FAO'ya göre, dünya nüfusu artmaya devam ettikçe genel gıda talebi 2030 yılına kadar en az %60 artacaktır. Bugün itibariyle 800 milyondan fazla insan yetersiz beslenmektedir. Et ve süt ürünleri gibi yüksek kaynaklı gıdalara olan talebin daha da hızlı ve yaklaşık olarak %70 oranında artacağı öngörülmektedir (Heyes, 2023). Büyüyen bir küresel nüfusu, öngörülen sosyo-ekonomik statüyle beslemek, ek kalori ve özellikle daha fazla protein kaynakları gerektirmektedir (Messina, 2022). Araştırmacılar, dünya nüfusunun ve mevcut büyüme oranının artması ile birlikte önemli ölçüde biyolojik çeşitlilik kaybı ve gıda tükenmesi problemlerinin oluşacağını bildirmektedir. Ayrıca bitki hastalıkları da biyolojik çeşitlilik kaybına ve besin tükenmesine yol açan faktörlerdendir (Saberri Riseh ve ark., 2004a; Saberri Riseh ve ark., 2004b).

Gelişmekte olan büyük ülkelerde maddi yönden artan zenginlik ve enerji üretimi için tarımsal kaynakların çeşitlendirilmesi, tarımsal kaynaklara olan talebi büyük ölçüde artırmaktadır (Lagzian ve ark., 2013). Kuraklık ve şiddetli iklim değişikliği tarımsal üretimi ve verimliliği tehdit eden temel sorunların başında gelmektedir. Yüksek sıcaklıklar ve karbondioksit seviyelerinin toprak nemi, su bulunabilirliği ve besin seviyeleri diğer kritik performans koşulları üzerinde büyük etkisi bulunmaktadır (Baradar ve ark., 2015). Kimyasal gübrelemenin bitki, toprak ve çevreye olan olumsuz etkileri her geçen gün daha çok kendini göstermektedir. Bu sebeplerden dolayı araştırmacılar ve üreticilerin organik gübreleme yöntemlerine yönelimleri gün geçtikçe daha çok artmaktadır. Organik gübreleme, çevreye istenmeyen bir etki oluşturmadan bitkilerin besin gereksinimlerini karşılamak için çok önemli bir yöntemdir (Amanullah ve ark., 2007; Menon ve ark., 2010; Adeoye ve ark., 2011). Ayrıca, özellikle yeni ıslah edilen toprakların fiziksel ve kimyasal koşullarını iyileştirmek için önemli miktarlarda organik madde uygulanması gerekmekte ve bu amaçla organik gübre kullanımına önem verilmelidir (Bilalis ve ark., 2005; Mohmoud ve Salem, 2005). Organik gübreler, kimyasal gübrelerin yerine güvenli, ucuz ve çevre dostu bir alternatif olarak kullanılabilir (Ahmed ve Elzaawely, 2010).

Organik gübrelemeler birçok farklı şekilde yapılmaktadır. Bunlardan bir tanesinde kitosan uygulamasıdır. Kitosan, kitinin deaktilyasyonundan elde edilen doğal bir polimer olup, gıda işleme sırasında ortaya çıkan kabuklu deniz hayvanı atıklarından kolaylıkla elde edilebilmektedir (El-Tanahy ve ark., 2012). Kitosan, hidrofilik ve kristal özellikte, sert yapıya sahip doğrusal bir amino polisakarittir (Zargar ve ark., 2015). Doğada yaygın olarak biyopolimer olarak bulunan kitosan,

polisakkaritler içerisinde oldukça önemli bir yere sahiptir. Erişilebilir doğal polimer olan kitosan, bitkiler için hem gübre hem de kaplama görevi görerek besinlerin raf ömrünü uzatabilmektedir. Kitosan, biyoyoumluluğu ve biyolojik olarak parçalanabilirliği ile bitkinin savunma mekanizmasını güçlendirmede, büyüme uyarıcı, antimikrobiyal ajan ve toprak yumuşatıcı olarak potansiyel ve yüksek verimli bir faktör olarak görev yapmaktadır. Ayrıca kitosan, su verimliliğini artırmakta, besin maddelerinin taşınması ve ağır metallerin uzaklaştırılması için bir taşıyıcı görevi görmektedir (Pandey ve Verma, 2018; Pal ve ark., 2021; Jakhar ve ark., 2022). Kitosan, hücresel DNA ile etkileşime girerek bitkide birçok biyokimyasal-fizyolojik-moleküler reaksiyon oluşturabilmekte ve bitkinin dış etkenlere karşı savunma mekanizmasını harekete geçirebilmektedir (Riseh ve ark., 2023).

Yengeç, ıstakoz, karides, istiridye gibi kabuklu deniz ürünleri, deniz kabuklularının işleme atıkları ve karides işleme endüstrilerinden elde edilen kalamar kabuğu atıkları kitosan üretimi için ana kitin kaynaklarıdır (Nag ve ark., 2022; Kou ve ark., 2021). Genel olarak deniz kabuklularının kabuğu, protein ve kalsiyum karbonat ile birlikte yaklaşık %15-40 oranında kitin (kuru ağırlık) içermektedir (Iber ve ark., 2022; Suryawanshi ve ark., 2020; Çelikçi ve ark., 2020). Deniz kabuklularının kabuk atıkları ağırlıkça %30-50 kalsiyum karbonat ve %20-30 kitinden oluşmaktadır (Kh ve ark., 2019). Genel olarak değerlendirildiğinde, deniz kabuklularının dış iskeletleri ve kabukları %60-75 oranında kitin içermektedir (Zou ve ark., 2021). Kitosan bitkiler için karbon (%47,9-54,4), oksijen (%30,19-42,3), azot (%5,8-7,6) ve fosfor (%3,4-6,1) açısından bol miktarda besin kaynağı görevi görmektedir (Prajapati ve ark., 2022). Kitosan, amino grupları ve diğer bileşiklerle kompleks oluşturabilmektedir. Bu polimerik bileşik diğer doğal polimerlerle bağlanarak gübre ve besin elementleriyle kombinasyon halinde bir yandan bitkinin besin ihtiyacını karşılarken diğer yandan toprak dokusunun iyileştirilmesine yardımcı olmaktadır. Yeni nesil gübre olarak kitosan nanomateryalleri, besin maddelerinin bitkilere yavaş, kontrollü ve hedefli bir şekilde iletilmesi yoluyla bitki bağışıklık sistemini güçlendiriciler olarak işlev görmektedir (Riseh ve ark., 2023).

Şekil 1. Kitin ve kitosanın ana kaynakları (Riseh ve ark., 2023).

Kitosan toprağa uygulandığında topraktaki *Bacillus*, *Pseudomonas fluorescens*, *Actinomyces*, *Mycorrhiza* ve *Rhizobacteria* gibi faydalı olan mikroorganizmaların aktivitesini tetikleyerek, rizosferdeki zararlı bitki patojenlerine karşı mikrobiyal dengeyi değiştirmektedir. Ayrıca kitosan, toprak kaynaklı patojenlere karşı bitkide savunma yanıtlarını artırmaktadır (Bell ve ark., 1998; Murphy ve ark., 2000). Kitosan çeşitli uygulamalar ile tarımsal araştırmacılara yardımcı olabilir ve çeşitli alanlara entegrasyonu ile ideal ve etkili bir seçenek haline gelmiştir (Riseh ve ark., 2023).

KİTOSAN İLE İGİLİ YAPILAN ÇALIŞMALAR

Kitosan kaplı kompoze gübre (CCCF) bünyesinde çok önemli antibakteriyel özellikler barındırmaktadır (Meng ve Wang, 2009). Amborab'e ve ark., (2008) CCCF uygulamasının redoks ve adsorpsiyon yoluyla kök sızıntılarını azaltabildiğini bildirmiştir. Asuming-Brempong ve ark., (2008) ise CCCF uygulamasının katalaz aktivitesini arttırdığını, toprak patojenlerini inhibe ettiğini, bitki stresini, hastalık direncini ve toprağın mikrobiyal çeşitliliğini iyileştirdiğini bildirmişlerdir. Ek olarak CCCF uygulaması aynı zamanda sürekli ekim yapılan tarlalarda besin maddelerinin biyoyararlanımını ve bazı faydalı bakterilerin (*Proteobakteriler*, *Bacteroides*, *Planctomyces*) popülasyonunu arttırdığını, toprağın ekolojisini de iyileştirebildiğini bildirmişlerdir (Ma ve diğerleri, 2013).

Qaisi ve ark., (2022), çemen bitkisine uyguladıkları kitosan ve biyoçar uygulamalarının bitkide tohum verimi, bitki bakla sayısı, tohum kapsül sayısı, bitki boyu, bakla uzunluğu, bitki başına dal sayısı ve bitki başına yaprak sayısına etkilerini araştırmışlardır. Çalışma sonucunda uygulamaların bitkiye olumlu yönde etki ettiği sonucuna varmışlardır. Zayed ve ark., (2017), tuz stresi koşullarında yetiştirilen fasulye bitkisinde kitosan nanopartiküllerinin çimlenme ve fide büyüme parametreleri üzerine etkilerini araştırdıkları çalışmada kitosan uygulamasının bitkilerde çimlenme ve fide büyümesini olumlu yönde ettiğini bildirmişlerdir. Kitosan nanopartikülleri, bitki büyüme hormonları için bir taşıyıcı sistem olarak kullanılabilir. Giberellik asit ile birlikte uygulanan kitosan nanopartikülleri fasulye bitkisinde yaprak alanını genişleterek klorofil seviyesini önemli ölçüde artırmıştır (Pereira ve ark., 2017). Kitosan ile nemlendirilmiş yer fıstığı tohumlarında ise çimlenme oranında, ATP sentezinde, lipaz aktivitesinde, giberellik asit ve IAA seviyelerinde artış olduğu bildirilmiştir (Zhou ve ark., 2002).

Costales-Menéndez ve ark., (2018), aşılınmış soya fasulyesinde kitosan uygulamasının toprağa ve yaprağa uygulamalarının bitkide nodül sayısı ve kuru nodül ağırlığı, çiçek sayısı, bitki boyu, yaprak alanı ve bitkilerdeki nitrojen konsantrasyonu zerine etkilerini incelemişlerdir. Çalışmada her iki uygulama yönteminin (toprağa ve yaprağa uygulama) bitkide bu özelliklere fayda sağladığı ve bitki verimini arttırdığı bildirilmiştir. Bir başka çalışmada ise arpa bitkisinde su stresi altında DAP gübresi ile kitosan uygulamasının verim ve verim öğeleri üzerine olan etkileri araştırılmıştır. Araştırma sonucunda elde edilen verilere göre tanede en yüksek protein (%12,6) ve nişasta (%62,3) oranı 100 kg/ha DAP gübre uygulaması ile birlikte 10 g/l kitosan uygulamasından elde edilmiştir. Aynı çalışmada en yüksek tane verimi, başak sayısı ve başakta tane sayısı 10 g/l kitosan ile yapraktan yapılan uygulama ile elde edilmiştir (Al-Tawaha ve ark., 2020).

Biyoaktif metabolitlerin üretimi için kabuklu hayvan kabuğunun mikrobiyal ayrışması ve gübreleme potansiyelinin araştırıldığı bir diğer çalışmada ise nohut ve bezelye bitkisinde karides ve yengeç kabuğu tozu kullanılmıştır. Elde edilen sonuçlara göre fermente hidrolizat edilmiş kabuklu hayvan kabuklarının (Kitosan) bitkilerin kök ve gövde uzunluklarını, klorofili, hücresel RNA'yı, protein içeriğini ve toplam nitrojen, magnezyum, kalsiyum, fosfor ve potasyum gibi toprağın fiziko-kimyasal parametrelerini önemli ölçüde iyileştirdiği ortaya çıkmıştır (Pal ve ark., 2020). Ayrıca kitosan uygulamasının toprakta serbest yaşayan Rhizobium ve fosfat çözen bakterilerin çoğalmasını arttırdığı ve PGPR ile uygulanmasının bitkinin morfo-fizyolojik

özelliklerini, toprağın fiziko-kimyasal özelliklerini ve mikrobiyal özelliklerini önemli ölçüde etkilediği sonucuna varılmıştır.

SONUÇ

Tarım arařtırmacıları geleneksel olan kimyasal gübrelemenin çevre üzerindeki zararlı etkilerini azaltmanın yollarını arařtırmaktadır. Tarım uygulamalarında kitosanın gübre olarak kullanılma, bitki büyümesini destekleme, toprak sağılığını iyileřtirme ve hastalıklara karşı direnci artırma potansiyeli nedeniyle giderek daha fazla ilgi çekmektedir. Biyo-bozunurluęa ve çevreyle uyumluluęa sahip kitosan bazlı yeni nesil gübreler, besin olarak kullanılan bitkilerin verimliliğini arttırmaya ve çevre kirliliğini azaltmaya yardımcı olabilmektedir. Kitosan, benzersiz bir biyopolimer olarak, gıda üretimi ve korunmasının yanı sıra sürdürülebilir tarım uygulamalarının geliştirilmesinde umut verici bir geleceęe sahiptir. Arařtırmacıların kitosan uygulamasının çeřitli bitkilerde kullanımı hakkında daha detaylı çalışmalar yaparak bilime katkıda bulunmaları gerekmektedir.

Abstract

Plant Growth-Promoting Bacteria (PGPB) are a promising tool in sustainable agriculture, serving as biofertilizers and biocontrol agents. They promote plant growth through various mechanisms, such as the production of plant hormones, nitrogen fixation, and the solubilization of inorganic phosphate. Additionally, they can act as biocontrol agents against plant diseases and pests, reducing the need for chemical pesticides. Research suggests that the use of microbial consortia, rather than single strains, may enhance the effectiveness of PGPB as bio-insecticides and biofertilizers in agricultural practices. This approach aligns with the growing interest in biological-based organic fertilizers as an alternative to agrochemicals in sustainable agriculture. This review aims to inside the current status of PGPB-based bio-insecticides, challenges and prospects.

Keywords: Beneficial bacteria, plant disease, eco-friend, plant pathogen, sustainable agriculture

Introduction

Plant growth promoting bacteria (PGPB) are beneficial microorganisms that can colonize the roots and rhizosphere of plants (Ramakrishna et al., 2019). These bacteria can enhance plant growth and development by various mechanisms, such as nitrogen fixation, phosphate solubilization, production of growth hormones, and biocontrol of pathogens (Glick, 2020). Moreover, PGPB might be used as a plant-protection bio-material to various biotic and abiotic stress factors due to different superior mechanisms including ACC deaminase activity, siderophore and indole acetic acid (IAA) production, secreting hydrolytic enzymes, ammonia and hydrogen cyanide (Kumar et al., 2020; Abdelaal et al., 2022; Gupta et al., 2022; Orozco-Mosqueda et al., 2020; Triantafyllou et al., 2023). In recent years, there has been a growing interest in harnessing the power of PGPB for sustainable agriculture, particularly in the development of bio-insecticides. So, bacterial bio-pesticides, fungal bio-pesticides, viral bio-pesticides, predator bio-pesticides and other bio-pesticides represent 74%, 10%, 5%, 8% and 3% of the market, respectively (Thakore, 2006). This review aims to insight into versatile and sustainable properties of bio-insecticides derived from PGPB and prospects.

How PGPB Can Be Used as Bio-Insecticides

Bio-insecticides are a safer and more environmentally friendly alternative to chemical insecticides (Siegwart et al., 2015). They are derived from natural sources, such as plants, animals, and microorganisms. PGPBs have shown great potential as bio-insecticides due to their ability to produce antimicrobial compounds and induce systemic resistance in plants (Ruiu, 2020). These bacteria can effectively control a wide range of pests, including insects, nematodes, and mites, without causing harm to non-target organisms or the environment (Jamal and Ahmad, 2022).

PGPB-based bio-insecticides work by colonizing the plant roots and stimulating the plant's defense mechanisms. They produce secondary metabolites that are toxic to pests or interfere with their life cycle. Additionally, PGPB enhances the plant's nutrient uptake and overall health, making it more resilient to pest attacks (Singh et al., 2017; Tariq et al., 2022). This sustainable approach not only protects the crops but also promotes the overall health and productivity of the plants.

Advantages of Using PGPB as Bio-Insecticides in Sustainable Agriculture

The use of PGPB as a bio-insecticide offers several advantages in sustainable agriculture. Firstly, these bio-insecticides are non-toxic to humans, animals, and beneficial insects, ensuring the preservation of biodiversity (Ahirwar et al., 2019). Unlike chemical insecticides, PGPBs do not

leave harmful residues in the environment or contaminate water sources. Secondly, PGPB-based bio-insecticides are highly specific in their action, targeting only the pests they are intended to control (Siegwart et al., 2015). This reduces the risk of developing pest resistance, which is a common problem with chemical insecticides. By using PGPB, farmers can effectively manage pest populations while minimizing the need for repeated applications. Additionally, PGPB promotes overall plant health and growth, leading to increased crop yields. These bacteria enhance nutrient uptake, improve soil structure, and protect plants from various diseases (Kisvarga et al., 2023). By improving the plant's resilience, PGPB-based bio-insecticides contribute to the long-term sustainability of agricultural systems.

The Role of PGPB in Biological Control of Pests

Biological control is a sustainable and environmentally friendly approach to pest management. PGPB plays a crucial role in biological control by directly antagonizing pests or indirectly inducing plant defenses against them. These bacteria produce antimicrobial compounds, such as antibiotics and enzymes, that can kill or inhibit the growth of pests (Boro et al., 2022).

Furthermore, PGPB can trigger systemic acquired resistance (SAR) in plants. SAR is a defense mechanism that allows plants to respond rapidly and effectively to pathogen attacks (Choudhary et al., 2007). When PGPB colonizes the roots, they activate the plant's immune system, making it more resistant to pest infestations. This systemic protection lasts for an extended period, providing long-term pest control. The ability of PGPB to modulate the plant's immune response and produce bioactive compounds makes them valuable allies in the biological control of pests (Brock et al., 2013; Mishra et al., 2023). By harnessing the power of these bacteria, farmers can reduce their reliance on chemical insecticides and promote a more sustainable approach to pest management.

Types of PGPB Commonly Used in Bio-Insecticides

Several types of PGPB have been widely used in the development of bio-insecticides. One of the most commonly used groups is the rhizobacteria, which include genera such as *Bacillus*, *Paenibacillus*, *Brevibacillus*, *Pseudomonas*, *Burkholderia*, *Serratia*, and *Streptomyces* (Grady et al., 2016; Anderson and Kim, 2018; Ghazanchyan et al., 2018; Pagani et al., 2023). These bacteria have various mechanisms against pests including antibiotic and antimicrobial compounds or effective enzymes that damage pests. General antibiotic and antimicrobial compounds that are secreted by PGPB strains against pests are hydrogen cyanide, amphisin, oomycin A, 2,4-diacetylphloroglucinol (DAPG), phenazine, pyoluteorin, polymyxin, pyrrolnitrin, tropolone,

tensin, oligomycin A, cyclic lipopeptides, zwittermicin A and kanosamine. In addition, effective enzymes secreted by PGPB to pests are ACC-deaminase, chitinases, beta-glucanases and proteases (Ruiu, 2020).

Another group of PGPB commonly used in bio-insecticides is the entomopathogenic bacteria. These bacteria are pathogenic to insects and can kill them directly through the production of toxins or by causing infections. Examples of entomopathogenic bacteria include *Bacillus thuringiensis*, *Photorhabdus luminescens*, *Brevibacillus laterosporus*, *Chromobacterium subtsugae* and *Yersinia entomophaga* (Ruiu et al., 2013). Additionally, some PGPBs belong to the group of mycorrhizal fungi. These fungi form a symbiotic relationship with plant roots, enhancing nutrient uptake and promoting plant growth. They can also indirectly affect pest populations by improving plant resistance (Ipsilantis et al., 2012; Kumar 2018).

Methods of PGPB Applications as Bio-Insecticides

There are several methods for applying PGPB as bio-insecticides in agricultural systems (Reed and Glick, 2013; Kordatzaki et al., 2022). One common approach is seed treatment, where the PGPB is applied directly to the seeds before planting. This allows the bacteria to colonize the developing roots and establish a beneficial relationship with the plants from the early stages of growth and this method was described as bio-priming (Ceritoğlu et al., 2021; Chakraborti et al., 2022; Erman et al., 2022). Another method is foliar spray, where the PGPB is applied as a suspension to the leaves of the plants. This method is particularly effective for controlling pests that feed on the above-ground parts of the plants, such as aphids and caterpillars. Foliar spray ensures direct contact between the bacteria and the pests, maximizing their biocontrol potential (Preininger et al., 2018; Santos et al., 2021). In some cases, PGPB can also be applied through soil drenching or irrigation. This method allows the bacteria to reach the plant roots and establish a beneficial relationship with the plants. Soil drenching is particularly effective for controlling soil-borne pests, such as nematodes and root-feeding insects (Triantafyllou et al., 2023).

Challenges and Limitations of Using PGPB as Bio-Insecticides

While PGPB-based bio-insecticides offer many advantages, there are also challenges and limitations to their use. One challenge is the variability in efficacy among different strains of PGPB. Not all strains have the same ability to control pests or promote plant growth. Therefore, it is important to select and optimize the strains for specific agricultural systems and target pests. Another challenge is the compatibility of PGPB with other agricultural inputs, such as chemical

fertilizers and pesticides. Some pesticides may have negative effects on the survival and activity of PGPB, limiting their effectiveness as bio-insecticides. It is crucial to consider the interactions between PGPB and other inputs to ensure their compatibility and maximize their biocontrol potential. Furthermore, the formulation and delivery of PGPB-based bio-insecticides can be challenging. The bacteria need to be delivered to the target site in a viable and effective form. The formulation should protect the bacteria from environmental stresses, such as temperature and UV radiation, and ensure their survival and colonization on the plant roots. Additionally, the cost of production and application of PGPB bio-insecticides can be a limiting factor for their widespread adoption. The development and commercialization of these bio-insecticides require significant investment in research, production facilities, and field trials. However, as the demand for sustainable agricultural practices grows, the cost-effectiveness of PGPB-based bio-insecticides is expected to improve.

CONCLUSION

Harnessing the power of PGPB as bio-insecticides offers a sustainable approach to pest management in agriculture. PGPB-based bio-insecticides provide effective control of pests while promoting plant growth and overall health. These bio-insecticides are non-toxic, specific in their action, and do not leave harmful residues in the environment. The successful implementation of PGPB bio-insecticides in agriculture has been demonstrated through various case studies. These bio-insecticides have shown promising results in controlling pests, improving plant resistance, and increasing crop yields. By adopting PGPB-based bio-insecticides, farmers can reduce their reliance on chemical insecticides, protect the environment, and promote sustainable agricultural practices. While there are challenges and limitations to the use of PGPB as bio-insecticides, ongoing research is addressing these issues. The identification of novel PGPB strains, development of innovative formulations, and understanding of their mechanisms of action are contributing to the improvement and practicality of PGPB-based bio-insecticides. In conclusion, embracing sustainable agriculture with PGPB bio-insecticides is a step towards a greener and more environmentally friendly future. By harnessing the power of beneficial bacteria, we can protect our crops, preserve biodiversity, and promote the long-term sustainability of agricultural systems.

Özet

Önemli bitki büyüme düzenleyicileri olan fitohormonlar, kök büyüme ve gelişme süreci üzerinde oldukça etkilidir. Küçük bir terpenoid sınıfı olan strigolaktonlar (SL'ler), bitkilerde her yerde bulunan yeni bir fitohormon olarak kabul edilmiştir. Günümüzde SL'lerin biyosentezi, sinyal iletim mekanizması ve fizyolojik etkilerinin çözülmesi bakımından büyük ilerlemeler kaydedilmiştir. SL'ler sürgün dallanmasını, gövde kalınlaşmasını, yaprak yaşlanmasını, adventif kök oluşumunu, primer ve lateral kök gelişimini, kök tüylerinin uzamasını, bitki toprak mikroorganizmaları arasındaki simbiyotik ilişkiyi teşvik ederler. Son yıllarda, SL aracılı kök gelişiminde oksin, sitokin ve etilen arasındaki hormonal etkileşim, beslenme durumu ve arbusküler mikorizal funguslarla (AMF) simbiyotik ilişkiler gibi çok çeşitli faktörlerin rol oynadığı ortaya çıkmıştır. SL'lerin sentetik bir analogu olan GR24, en yüksek aktiviteye sahip olup en yaygın kullanılanıdır. Kökler bitkilerin en önemli vejetatif organlarından olup, topraktan su ve besin maddelerinin almasının yanında amino asitleri, hormonları ve diğer bileşikler de sentezlerler. Kök büyümesi ve gelişmesi, su ve besin maddelerinin emilim verimliliğini büyük ölçüde belirlediği için ürün kalitesini doğrudan etkiler. Bu çalışmada SL'lerin asma bitkisi özelinde kök mimarisini düzenlemedeki rolleri literatür ışığında derlenmiştir. Yapılan çalışmaların sonucunda ise SL'lerin diğer içsel hormonların içeriğini de etkileyerek asma kök mimarisini önemli ölçüde değiştirdiği söylenebilir.

**NEW PHYTOHORMONE STRIGOLACTONES AND THEIR ROLE IN
REGULATION OF ROOT ARCHITECTURE IN GRAPEVINE (*Vitis vinifera* L.)**

Abstract

Phytohormones, which are important regulators of plant growth, have a significant effect on the process of root growth and development. Strigolactones (SLs), a small class of terpenoids, are considered a new phytohormone widely present in plants. In recent times, significant progress has been made in understanding the biosynthesis, signal transduction mechanism, and physiological effects of SLs. SLs promote shoot branching, stem thickening, leaf aging, adventitious root formation, primary and lateral root development, root hair elongation, and the symbiotic relationship among plant soil microorganisms. In recent years, various factors such as the hormonal interaction between auxin, cytokinin, and ethylene in SL-mediated root development, nutritional status, and symbiotic relationships with arbuscular mycorrhizal fungi (AMF) have been identified. GR24, a synthetic analog of SLs, is the most widely used and exhibits the highest activity. Roots are crucial vegetative organs of plants, responsible for absorbing water and nutrients from the soil, as well as synthesizing amino acids, hormones, and other compounds. Since root growth and development significantly determine the efficiency of water and nutrient absorption, they directly influence product quality. This study reviews the roles of SLs in regulating root architecture by focusing on grapevines in light of the literature. The results of these studies suggest that SLs significantly alter grapevine root architecture by affecting the content of other internal hormones.

Giriş

Bitki hormonları veya fitohormonlar, bitkilerdeki hücrel ve fizyolojik süreçleri düzenleyen ve düşük konsantrasyonları ile etkili olan organik bileşiklerdir. Bu bileşikler, bitkilerin büyümesini, gelişmesini ve çevresel streslere tepki vermesini düzenleyen anahtar moleküllerdir. Klasik fitohormonlar; oksinler, sitokinler, gibberellinler, absisik asit ve etilendir. Ayrıca brassinosteroidler, poliaminler, salisilik asit, hücreden hücreye sinyalleşmede rol oynayan peptitler ve strigolaktonlar da etki mekanizmaları nedeniyle yeni tip fitohormonlar olarak kabul edilir (Kang, 2017).

Strigolaktonlar (SL'ler), başlangıçta *Striga* (cadı otu) ve *Orobanch* (canavar otu) parazit türlerinin tohumlarının çimlenmesini sağlayarak parazitin konakçı bitkiye bağlanmasına neden olan bileşikler olarak tanımlanmıştır (Cook vd., 1966). İlk SL türevi olan Strigol'un kimyasal yapısı 1972 yılında belirlenebilmiş (Cook vd., 1972), yapısının anlaşılması ise 1985 yılına kadar sürmüştür (Brooks ve ark., 1985). İsim babası Larry Butler olup, cadı otunun cins ismi *Strigo* ve kimyasal yapısındaki lakton kelimeleri bir araya getirilmiştir (Butler, 1995).

SL sinyallerinin bitkilerde uzun mesafelerde hareket etmesi, bitki büyüme ve gelişme mimarisini kontrol etmesi ve strese yanıt vermede bitki için hayati öneme sahip olması nedeniyle 2008 yılında yeni sınıf fitohormonlar olarak tanımlanmıştır (Gomez-Roldan ve ark., 2008; Umehara ve ark., 2008). Üzerinde yoğun araştırmalar yapılan SL'lerin, sürgün dallanmasını, yaprak yaşlanmasını, gövde kalınlaşmasını, primer ve lateral kök gelişimini, kök tüylerinin uzamasını, adventif kök oluşumunu ve bitki toprak mikroorganizmaları arasındaki simbiyotik ilişkiyi teşvik ettikleri bildirilmiştir (Umehara ve ark., 2008; García Garrido vd., 2009; Umehara, 2011; Smith, 2014; Al Babili ve Bouwmeester, 2015; Ueda ve Kusaba, 2015; Kopta vd., 2017; Waters vd., 2017).

Doğal strigolaktonların genel yapısı A, B, C ve D olarak etiketlenmiş dört bağlantılı halkadan oluşur (Şekil 1). C-D halkaları, SL aktivitesi ve bitkideki bununla ilişkili etkiler için en kritik halkalardır. Bu iki halka bir enol-eter köprüsü aracılığıyla birbirine bağlanmıştır (Ćavar vd., 2015). A – B halkalarının doğal SL'ler arasında daha çeşitli olduğu bilinmektedir. Bu varyasyonlar farklı yan grupların A-B halkalarına bağlanmasıyla meydana gelir (Mangnus vd., 1992; Matusova 2005; Xie vd., 2010). Orobansol, orobansil asetat, metoksiorobansol, 7-hidroksi-orobansol, sorgomol, sorgolakton, strigol, strigil asetat ve metoksistrigolün hepsinin aynı öncü molekül olan 5-deoksistrigolden üretildiğine inanılmaktadır (Şekil 1).

Şekil 1. SL'lerin yapıları ve sınıflandırılması (Arıkan, 2022).

Doğal SL'ler, sentezinin zor ve uzun zaman almasının yanı sıra ekonomik olmaması nedeniyle de tarımsal uygulamalarda tercih edilmemektedir. Sentetik SL'ler ise doğal olanlara göre daha basit yapıları olup, biyoaktivitelerini korumaları tercih nedenidir (Vurro vd., 2016). SL'in sentetik analogu olan GR24 (Şekil 2) adını ilk kez sentezleyen araştırmacının (Gerry Roseberry) baş harflerinden almaktadır (Cardinale vd., 2018).

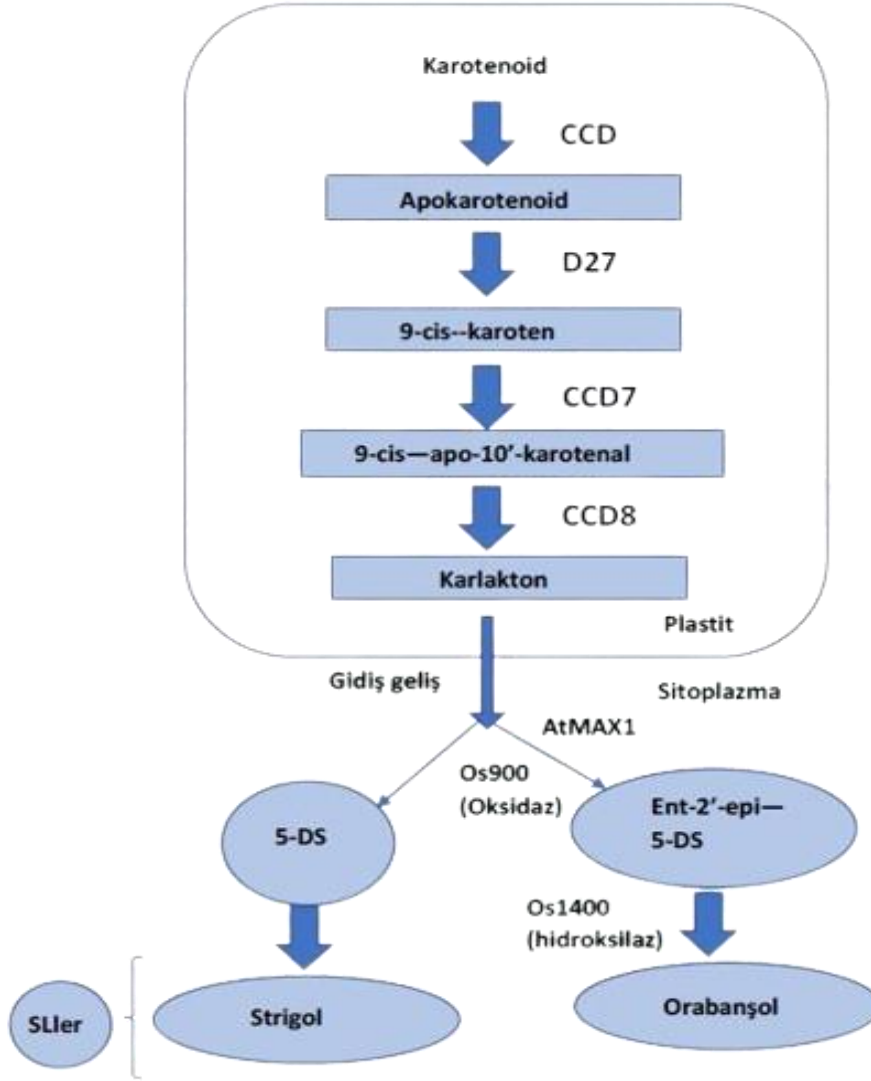

Şekil 2. SL'in sentetik analogu olan GR24

GR24, stereoizomerlerin (hem 5-deoksistrigol hem de 4-deoksiorobanchol tiplerini bulundurur) bir karışımı olarak multigram ölçeğinde üretilmiştir (Vurro vd., 2016). Bu iki stereoizomerin enantiyomerleri ($GR24^{DS}$ ile $GR24^{ent-5DS}$ veya $GR24^{4DO}$ ile $GR24^{ent-4DO}$) eşit miktarda karıştırılıp rasemik GR24 (rac-GR24) elde edilmektedir (Arakan ve Karaman, 2021).

Strigolakton Biyosentezi

SL biyosentetik yolundaki tüm adımlar tam olarak açıklanmamış olsa da (Ruyter-Spira vd., 2013), ana adımların anlaşılmasında büyük ilerleme kaydedilmiştir. SL biyosentezleri (Şekil 3), plastid ve sitosolde olmak üzere iki ayrı bölümde gerçekleşir. Öncü madde olan karlaktonun üretimi plastidlerde gerçekleşirken, karotenoidden karlaktona kadar geçen sentez basamaklarında karotenoid cleavage dioksigenaz (CCD, CCD7, CCD8) ve D27 enzimleri görev alır. Karlaktonun sitoplazmada parçalanması sonunda SL oluşumu gerçekleşir (Banerjee ve Roychoudhury, 2018).

Şekil 3. SL'lerin biosentetik yolu: Strigol ve Orobanşolun oluşumu (Arıkan, 2022).

Strigolakton Taşınımı

Bitkiler içindeki SL hareketine ilişkin veriler biraz çelişkilidir. PLEIOTROPIC DRUG RESISTANCE1 (PDR1), SL dağıtımında önemli bir bileşen ve bir SL taşıyıcısı olarak adlandırılmıştır (Kretzschmar vd., 2012; Sasse vd., 2015). SL'ler ister aktif olarak hücreden hücreye taşınınsın ister transpirasyon akışıyla taşınınsın, hedeflerine ulaştıklarında hedef dokular tarafından algılanmaları gerekir. Bu algılama ve sinyal iletim süreci halen tam olarak aydınlatılma aşamasındadır (Claassens ve Hills, 2018).

Strigolaktonların Kök Mimarisini Düzenlemedeki Roller

Kökler bitkilerin en önemli vejetatif organlarından birisidir. Bitkilerin topraktan su ve besin maddelerini alması ve aynı zamanda amino asitleri, hormonları ve diğer bileşikleri

sentezlemesi önemlidir. Kökün büyümesi ve gelişmesi, büyük ölçüde suyun ve besin maddelerinin emilim verimliliğini belirler ve bu da fotosentetik ürünleri ve meyve kalitesini doğrudan etkiler (Xu vd. 2021). Son yıllarda, SL aracılı kök gelişiminde oksin, sitokin ve etilen arasındaki hormonal etkileşim, beslenme durumu ve arbusküler mikorizal funguslarla (AMF) simbiyotik ilişkiler gibi çok çeşitli faktörlerin rol oynadığı ortaya çıkmıştır (Claassens ve Hills, 2018). SL'nin kök sistemleri üzerindeki etkileri farklı türler arasında iyi bir şekilde belgelenmiştir ve primer kökler, lateral kökler, kök tüyleri ve adventif kökler dahil olmak üzere, kök mimarisinin tüm ana kısımlarını etkilemektedir (Kapulnik vd., 2011a; Ruyter-Spira vd., 2011; Koltai, 2011; Rasmussen vd., 2012b).

Primer Kökler

Yapılan çalışmalar, SL'lerin genel olarak primer kök uzamasının pozitif düzenleyicileri olduğunu, ancak bunun türler arasında değiştiğini ve büyük ölçüde büyüme koşullarına bağlı olduğunu göstermektedir (Claassens ve Hills, 2018).

Lateral Kökler

Primer kök büyümesi üzerindeki nispeten ince etkilerinin aksine, SL'lerin lateral kök gelişimi üzerinde çok daha belirgin etkisi vardır. Bu etki, büyük ölçüde toprağın fosfor (P) durumuna bağlıdır (Claassens ve Hills, 2018).

Adventif Kökler ve Taç Kökler

Adventif kökler, kök olmayan herhangi bir bitki dokusundan gelişir. Bunlar, pirinç bitkilerindeki taç köklerde olduğu gibi normal bitki gelişimi sırasında yaralanma ya da besin eksikliği gibi çeşitli stres koşullarına yanıt olarak oluşabilir. Hem *Arabidopsis*'te hem de bezelyede, SL-eksik ve SL- duyarsız mutantlar, yabani tipteki bitkilere göre daha yüksek adventif köklenme oranlarına sahiptir (Rasmussen vd. 2012a, b). Bununla birlikte, SL'nin kök dışı dokulardan kök başlangıcı üzerindeki etkileri güçlü bir şekilde türe özgüdür. SL'ler *Arabidopsis* ve bezelyede adventif köklenmenin negatif düzenleyicileridir, ancak pirinçte taç kök büyümesinin pozitif düzenleyicileridir.

Kök Tüyleri

Arabidopsis ve domateslerde rac-GR24, kök tüylerinin uzamasını teşvik eder (Koltai vd., 2010; Kapulnik vd., 2011a). SL'ler aynı zamanda, kök tüylerinin uzamasının pozitif düzenleyicileri olarak da görünmektedir.

SL'lerin bu dört kök gelişimi mimarisi üzerindeki etkilerine ilişkin daha fazla araştırma yapılmasına ihtiyaç duyulmaktadır. Kök büyümesi ve gelişiminin, SL'lerin rolü olduğu birçok bileşen arasındaki karmaşık etkileşimin nihai sonuçları olduğu da aynı derecede açıktır. Bu

durum, bitkilerin farklı beslenme durumlarında, SL uygulamalarına verdikleri farklı tepkilerden de anlaşılmaktadır. Ayrıca, diğer fitohormonlar kök gelişiminin düzenlenmesinde kritik rol oynar. Bu nedenle SL etkilerini, besin durumu ve diğer fitohormonlarla karşılıklı etkileşim ile değerlendirmek önemlidir (Claassens ve Hills, 2018).

Besin Durumu ve Strigolaktonların Kök Gelişimindeki Rolü

Kök gelişimi, bitkinin topraktan makro ve mikro besinleri absorbe etme yeteneği ile doğrudan bağlantılıdır. Kök tüyleri bu besin kazanımında önemli rol oynamaktadır (Gilroy ve Jones 2000). Fosfat (P), demir (Fe) ve azot (N) eksikliği, kök tüylerinin oluşumunu ve uzamasını tetikleyebilir (López-Bucio vd., 2003; Muller ve Schmidt 2004). P seviyelerinin, primer ve lateral köklerin mimarisini etkilediği ve bitkinin adaptif büyüme süreçlerinde rol oynadığı gösterilmiştir (Hell ve Hillebrand 2001; López-Bucio 2002; Osmont vd., 2007). Toprağın alüminyum (Al), kalsiyum (Ca), kükürt (S), azot (N) ve demir (Fe) içeriklerinin tümü, primer ve lateral kök başlangıcı üzerinde belirgin bir etkiye sahiptir (López-Bucio vd., 2003; Osmont vd., 2007).

SL'lerin kök mimarisini etkilediği bilindiğinden, bu durum SL'yi beslenme açısından kısıtlayıcı koşullar altında bu yönleri düzenlemede kilit bir role yerleştirebilir. SL, kök tüylerinin uzamasını artırabilir ve bu da besin alımını kolaylaştırabilir (Kapulnik vd., 2011a). Benzer şekilde SL, P sınırlaması altında lateral kök oluşumunu artırır ve bu durum, optimal olmayan büyüme koşulları altında hayatta kalmanın önemli bir yolu olabilir (Al-Ghazi vd., 2003; Osmont vd., 2007). Topraktaki P ve N, optimal konsantrasyonun altında olduğunda SL sentezi ve sızıntı artar (Kohlen vd., 2011). Artan besin alımına erişim sağlamak için arbusküler mikorizal funguslar (AMF) ile simbiyotik ilişkilerden yararlanılabilir.

Arbusküler Mikorizal Funguslar (AMF)

Karada yaşayan bitkilerin çoğu, kök sistemlerinin erişimini artırmak için arbusküler mikorizal funguslar (AMF) ile simbiyotik bir ilişki kurar; bu, simbiyozun eski bir şeklidir (Remy vd. 1994; Smith ve Read 2008). Buna uygun olarak, besin stresi koşulları altında, artan besin alımı için bitki kök sistemlerini güçlendirmedeki rolleri göz önüne alındığında, SL'ler aynı zamanda AMF'nin konakçı köklerini tanımlaması için bitkiden türetilmiş sinyal molekülleri olarak da hareket eder (Bouwmeester vd., 2007; Smith ve Read 2008).

AMF sporları konakçılarından bağımsız olarak çimlenebilir, ancak çimlenen sporlar sınırlı büyüme ve hif gelişimi gösterir. Kapsamlı dallanma, yalnızca konakçı kök sistemlerinin yakın çevresinde meydana gelir (Buee vd., 2000; Nagahashi ve Douds, 2000). Bitki köklerinden

yayılan SL'ler, spor çimlenmesi, hif yapısı, mitoz, solunum reaksiyonu ve gen ifadesindeki çeşitli değişiklikleri içeren çeşitli etkileri tetikler (Tisserant vd., 2012; Genre vd., 2013).

Simbiyotik faz sırasında, AMF bitki kök epidermal hücrelerine girer ve kök kortikal hücreleri içinde çoğalır. AMF, kök korteksinin apoplastik bölümünde lokalize kalır (Smith ve Read 2008). AMF'nin arbuskül adı verilen farklı yapıları ürettiği yer burasıdır (Smith ve Read 2008). Besin alışverişinin öncelikle bu özel fungus yapısında gerçekleştiği öne sürülmektedir (Bucher 2007). AMF, bitki köklerinin etkileşime girebileceği toprağın toplam hacmini artırır; bu durum bitkinin kök çevresindeki besin tükenme bölgesinin sınırlamalarının üstesinden gelmesine ve topraktan mineral alımının artmasına yardımcı olur. Çalışmalar, kök emilim yüzeyinin artmasına rağmen, AMF'nin köklere P alımını ve kullanılabilirliğini artırdığını göstermiştir. AMF ayrıca aktif olarak P'yi mantar vakuollerine gönderir ve depolar (Smith vd., 2003; Benedetto vd., 2005; Bucher 2007).

P karşılığında fungus, konakçısından sabit karbon alır. Bu oran, farklı bitkilerdeki toplam fotosentatın %4'ü ile %20'si arasında değişim gösrebilir. Karbon değişimi, bitkilerde karbon akışını ve parçalanmasını etkileyebilir (Bago vd., 2000). Bir bitkide karbon bölünmesindeki bir değişiklikle tetiklenebilecek tüm sinyallere rağmen, bitkiler ile AMF arasındaki ana sinyal molekülü SL'ler olarak kalır (Besserer vd., 2006). AMF'de SL algılamasının kesin mekanizması konusunda hala belirsizlik vardır, ancak fungus SL reseptörü oldukça hassastır, çünkü nanomolar konsantrasyonlarda rac-GR24'ü tespit edebilmektedir (Besserer vd., 2006). Bu reseptörü kodlayan gen veya protein yapısı henüz tanımlanmamıştır. AMF'nin SL'leri algılaması için bunların köklerden toprağa taşınması gerekir.

Hormonal Etkileşim

Oksinler

Oksin ve SL'ler arasındaki karşılıklı etkileşime ilişkin mevcut hipotezlerden biri, SL'nin daha dolaylı bir rol oynadığı, bu sayede PIN1 aktivitesini inhibe ettiği, kaynak ve tüketim dinamiğini değiştirdiği ve tomurculardan oksin ihracatını azalttığı yönündedir (Bennett vd., 2014). Benzer şekilde SL'ler, köklerdeki oksin akışının modülasyonu yoluyla kök tüylerinin uzamasını düzenleyebilir (Koltai vd., 2010).

Sitokininler

Sitokininler, kök gelişiminde ve düzenlenmesinde önemli rol oynayan fitohormonlardır. SL'lerde olduğu gibi sitokininlerde de PIN oksin taşıyıcılarının aktivitesini azaltarak lateral kök oluşumunu azaltır (Vanstraelen ve Benková 2012). Lateral kök gelişimini engellemek için GR24 ile birleşen AHK3/ARR1/ARR12 sinyalleme kompleksi yoluyla sitokinin sinyali ve SL

arasındaki etkileşim yakın zamanda aydınlatılmıştır (Jiang vd. 2016). Buna göre sitokininin sinyal kompleksinin mutantlarının rac-GR24'e yanıt vermediği ve lateral köklerin azaldığı gözlemlenmiştir (Jiang vd. 2016).

Etilen

SL ve etilen arasındaki çapraz etkileşim, etilen tepkisi için SL sinyallemesinin gerekli olmaması açısından ilginçtir, ancak bunun tersi doğru gibi görünmektedir (Claassens ve Hills, 2018). Yani etilen, SL yanıtında rol oynuyor gibi durmaktadır. Etilen sinyallemesine dahil olan etr ve ein mutantları, GR24'e yanıt vermeyen bir kök tüyü fenotipi sunmuştur. Böylece etilenin, SL'lere karşı epistatik olduğu görülebilir (Kapulnik vd., 2011b).

Strigolaktonların Asmada (*Vitis vinifera* L.) Kök Mimarisini Düzenlemedeki Roller

Vejetatif çoğaltılan asmalarda kökler odunsu çeliklerin kambiyum katmanından orijinlenir (Pratt, 1974). Gövdeden kökenlenen bu köklere adventif kök denir (Bellini vd., 2014). Bu köklerin çoğunluğu boğuma yakın yerde gelişir ancak boğum aralarında da oluşur. Bu kökler sıklıkla ana kök olarak isimlendirilir ve sekonder, tersiyer vb. lateral köklere dallanarak karmaşık bir yapı ile kök sistemini oluşturur (Osmont vd., 2007).

Oksinin aksine, sitokinin ve strigolakton normalde adventif köklenmeyi baskılar; strigolakton bu etkiyi oksin akışını azaltarak yapabilir (Rasmussen vd., 2012). Sitokinin ve strigolaktonun tipik kök sinyalleri olması nedeniyle, çelikte olmamaları kambiyumun yenileri başlatmak suretiyle kayıp kökleri yenilemesini teşvik edebilir.

Asmalar, P alımı için büyük ölçüde mikorizal funguslara güvenir ve P-aç bitkiler görünüşte fungusların kök teması kurmasına yardımcı olan SL'lerin salgılanması yoluyla köklerinin mikorizal kolonizasyonunu teşvik eder (Akiyama vd., 2005; Bais vd., 2006). Strigolaktonlar oksin akışını ayarlayarak, ayrıca P eksikliği olan bitkilerde lateral kök büyümesini teşvik ederken, P açısından yeterli koşullar altında lateral kök büyümesini baskılar (Ruyter-Spira vd., 2011, 2013).

Asmada kök kısıtlamasının içsel SL içeriği ve SL ile ilişkili gen ekspresyonu üzerindeki etkilerinin araştırıldığı bir çalışmada, aynı zamanda GR24 uygulamasının asma kökleri üzerindeki etkilerine de bakılmıştır. Sonuçlar, kök kısıtlaması altında kök mimarisinin önemli ölçüde değiştiğini göstermiştir. Çelik dikiminden 40 gün sonra, kök kısıtlaması altındaki köklerde iki tip SL'nin içeriği, kontrol bitkiciklerinin köklerindeki önemli ölçüde daha düşük olmuştur. SL içeriği, VVCCD8 ve VVD27'nin ekspresyon seviyeleriyle önemli ölçüde pozitif korelasyon göstermiştir. Bu durum, bunların SL sentezinde hayati roller oynadığını göstermektedir. 20 günlük GR24 uygulaması sonrasında, kök uzunluğu kontrole göre önemli

ölçüde kısalmıştır. Düşük GR24 konsantrasyonu (0.1 M) kök çapını önemli ölçüde azaltıp kılcal kök yoğunluğunu artırırken, yüksek GR24 konsantrasyonu (10 M), lateral kök uzunluğunu, önemli ölçüde azaltmasına rağmen yoğunluğunu artırmıştır. Aynı zamanda GR24 (0,1 M), içsel SL içeriğini azaltmıştır (Xu vd. 2021).

Hamburg Misketi çeliklerinin sürdürülmesiyle elde edilen saksı asmalarına 0.1 µM ve 10 µM konsantrasyonlarında uygulanan GR24, kılcal kök sayısını ve yoğunluğunu önemli ölçüde artırmıştır. GR24'ün her iki konsantrasyonu da lateral kök başlangıcı üzerinde olumsuz etkiler göstermiştir. 10 µM GR24, lateral kök gelişiminin başlatılmasında pozitif bir düzenleyici görevi görürken, 0.1 µM GR24 uygulaması lateral kök yoğunluğunu belirgin şekilde azaltmıştır. Ayrıca kök uzunluğu ve yüzey alanı, kontrol bitkiciklerine kıyasla 10 µM GR24 uygulamasında belirgin şekilde artmıştır (Jiu vd. 2022).

Sonuç

Strigolaktonlar (SL'ler), mono ve dikotiledon bitkiler de dahil olmak üzere, farklı türler arasında bir takım gelişimsel ve çevresel süreçleri düzenleyen bitki hormonlarıdır ve son birkaç yılda yoğun bir şekilde araştırılmaktadır. Her ne kadar SL'ler başlangıçta bitkilerin toprak üstü kısmının dallanmasını baskıladığı düşünülmüş olsa da yavaş yavaş bu kökten türetilmiş kimyasal sinyallerin, sırasıyla AMF ve kök parazitik bitkilerle simbiyotik ve parazitik ilişkilerin düzenlenmesinde de rol oynadığı ortaya çıkmıştır. SL'lerin bir hormon olarak kabul edilmesinden sonra, bu bileşiklerle ilgili araştırmalarda önemli ilerlemeler olmuştur.

Asmalarda kök büyüme ve gelişme özelliklerinin anlaşılması, üzüm kalitesinin düzenlenmesinin aydınlatılmasına katkı sağlayacak teorik araştırmalar için hayati önem taşımaktadır. Bu çalışmada ise SL'lerin asma bitkisi özelinde kök mimarisini düzenlemedeki rolleri literatür ışığında derlenmiştir. Sonuç olarak asmalarda kök büyümesini ve gelişimini düzenlemek için SL'lerin kullanılabileceği söylenebilir. Ancak asma köklerinin büyümesinde SL'lerin önemli rolünün daha fazla araştırılmasına ihtiyaç vardır. Zira, SL'lerin etkileri çeşide ve çevresel koşullara bağlı olarak değişiklik gösterebilmektedir.

Abstract

Moringa, scientifically known as *Moringa oleifera*, is a Lam. ersatile plant that is native to parts of Africa and Asia. It is commonly referred to as the drumstick tree, miracle tree, or ben oil tree. Moringa is valued for its nutritional, medicinal, and industrial properties. Moringa is exceptionally nutritious and is considered a superfood. The leaves are rich in vitamins and minerals such as vitamin C, vitamin A, calcium, potassium and iron. The leaves are often used as a forage dietary supplement or added to salads, smoothies, and other dishes. Various parts of the Moringa plant are edible. The leaves are commonly consumed as a leafy green, similar to spinach, and the immature seed pods (drumsticks) are used in culinary dishes. Moringa; It is known to have anti-inflammatory, antioxidant and antimicrobial properties. The long, slender seed pods, often referred to as drumsticks, are a common ingredient in South Asian and Middle Eastern cuisines. They can be used in curries, soups, and stews. Moringa seeds contain a significant amount of oil, known as ben oil or behen oil. This oil is clear, odorless, and has a high resistance to rancidity. It has been used traditionally for cooking and in cosmetics. Moringa seeds contain natural compounds that can help clarify water by binding to impurities and sediment. This property has led to the use of Moringa in water purification efforts in some regions. Moringa is a hardy, fast-growing tree that can thrive in a variety of climates. It is often cultivated in tropical and subtropical regions. Moringa is valued for its ability to grow in challenging environments, providing a potential source of nutrition and income in areas with poor soil quality or limited resources. Drumstick leaves are rich in protein, which is essential for animal growth and development. Some studies suggest that Moringa has antibacterial properties, which might be beneficial in promoting animal health. While drumstick can be a valuable addition to animal feed, it should be part of a well-balanced diet. Moringa species It is known that there are a total of 13 species of Moringa species, which are widely found in many The world's tropical and subtropical regions. This study aims to introduce the *Moringa oleifera* and all its species and their agricultural potential.

Keywords: Moringa, Drumstick, 13 species, forage, botanical

Introduction

A common tree in many tropical and subtropical nations is *Moringa oleifera* Lam. India, Africa, South and Central America, Mexico, Hawaii, and all over Asia and Southeast Asia are among the places where it is grown commercially. It is called the ben oil tree from oils derived from seeds, the horseradish tree from the flavour of preparations made from ground root, and the drumstick tree from the look of its immature seed pods. While the leaves are commonly used as a basic food due to their high nutritional content, immature seed pods are consumed in some areas (Thurber and Fahey, 2009; Mbikay, 2012; Razis et al., 2014). There are no human clinical trials investigating *M. oleifera*'s effectiveness in treating undernutrition.

Growing interest in the moringa plant, botanically known as *Moringa oleifera* Lam, has occurred during the last 20 years. With its many applications, moringa is regarded as a "Miracle Tree" and has been the focus of extensive global research and development efforts. Grown in many tropical and subtropical regions, this well-known and popular species is a versatile tree crop with numerous horticultural, environmental, and industrial uses (Palada, 1996; Fuglie, 1999; Foidl et al., 2001; Fahey, 2005, Palada and Ebert, 2015). Numerous plant scientists, researchers, extension agents, development organisations, farmers, and the industrial sector in numerous nations across the world have become interested in moringa due to its many uses. fresh discoveries and research This book, a second edition of 'The Miracle Tree: *Moringa oleifera* - Natural Nutrition for the Tropics', presents a comprehensive review of the past and most recent state of the art research and development studies on moringa, in various fields. Information presented in this book can be used as guide for future direction towards finding and exploiting new uses and opportunities for moringa, a truly multi-purpose tree. There are several varieties of moringa cultivated around the world, each with its own unique characteristics. Some of the commonly known types of moringa:

Types of moringa

Moringa stenopetala

Moringa oleifera

Moringa peregrina

Moringa drouhardii

Moringa concanensis

Moringa arborea

Moringa ovalifolia

Moringa hildebrandtii

Moringa oleifera Lam.: This is the most widely cultivated and well-known variety. It is native to the sub-Himalayan regions of northern India, but it is now grown in many tropical and subtropical areas around the world. Moringa oleifera is valued for its leaves, pods, and seeds, which are rich in nutrients. Moringa oleifera is a fast-growing, drought-resistant tree native to the sub-Himalayan regions of northern India, but it is now cultivated in various tropical and subtropical regions around the world. Commonly known as the drumstick tree, horseradish tree, or simply moringa, it belongs to the family Moringaceae. Moringa oleifera is highly valued for its nutritional and medicinal properties, and nearly all parts of the plant are used for various purposes. Key features and uses of Moringa oleifera include: The Moringa oleifera leafs are

rich in vitamins, minerals, and antioxidants. They are commonly used as a nutritious leafy green vegetable in cooking and are also dried and ground into a powder for use in supplements or as a tea. The long, slender pods of the moringa tree, often referred to as drumsticks, are edible and have a taste similar to green beans. They are used in various culinary dishes. Moringa seeds are a source of edible oil, known as ben oil or behen oil. The oil is rich in oleic acid and is used for cooking and in the cosmetic industry. The seeds can also be crushed and used as a water purifier. The roots of *Moringa oleifera* have a taste similar to horseradish and are sometimes used as a condiment. However, the roots also contain certain compounds that may have toxic effects in high concentrations. *Moringa oleifera* has been traditionally used in various cultures for its medicinal properties. It is believed to have anti-inflammatory, antioxidant, and antimicrobial effects. Research is ongoing to explore its potential in treating various health conditions. *Moringa oleifera* is known for its high nutritional content, including vitamins (such as vitamin A, vitamin C), minerals (such as iron, potassium), and protein.

Due to its nutritional richness and adaptability to diverse climates, *Moringa oleifera* has gained popularity as a valuable food source, especially in regions where malnutrition is a concern. The plant's ability to thrive in arid conditions and its multiple uses make it a significant resource for sustainable agriculture and food security.

Figure 1: *Moringa oleifera* pod, seed, flower, leaves and stem (Anonymous, 2023a)

There has long been debate over the relationships between Moringa and other plant families (Narayana and Parvathi, 1978; Rao et al., 1983; Dutt et al., 1984; Ronse de Craene et al., 1998). The Swedish biologist Linnaeus believed the tree belonged to the Legume Family when he named *M. oleifera* in 1785. This was a simple error to make because many legumes have pinnate leaves that resemble those of Moringa, and the bilaterally symmetrical flowers of *M. oleifera* superficially resemble legume flowers. Up until the middle of the 1800s, some well-known botanists maintained this opinion, while others promoted placement close to the family Violet. Still other botanists classified Moringa as a member of the Bignonia Family based on its long, woody pods and winged seeds. The identification of Moringaceae as one of the approximately 15 families that generate mustard oils (glucosinolates) was made possible by the development of studies that use DNA to infer relationships between organisms. These studies (Chase et al., 1993; Rodman et al., 1998; Karol et al., 1999) demonstrate the relatedness of almost all plants that produce mustard oils. The Nasturtium Family (Tropaeolaceae), the Caper Family (Capparaceae), the Mustard Family (Brassicaceae), and the Papaya Family (Caricaceae) are a few of these families. The Papaya Family and Moringaceae have shown to be most closely related in all of these investigations. Nobody had ever guessed that these two families were so closely related, based only on the morphological details of the plants (Olson, 2002a). This surprising outcome sparked a search right away Interactions among Moringaceae. It is common for closely related species to resemble each other more than distantly related ones Therefore, understanding the relationships among species is helpful for improving domesticated plants and animals. Answers to questions like "Which species are most closely related to *Moringa oleifera* and what properties do they share?" can be provided by it. The most common names for *Moringa oleifera*, which are incorrectly and commonly referred to by a number of other names before it finally forms a permanent stem are *M. pterygosperma* and *M. aptera* (Olson, 2010 and Olson, 2013). It is believed to be native to northwest India and neighbouring Pakistan, though there isn't much definitive information about its native range. The term "sub-Himalayan valleys" is commonly used to refer to the native range, which is the warm, arid lowlands situated directly south of the Himalayas. Although wild trees have been mentioned in old herbarium sheets and references (Haines, 1922).

Moringa stenopetala: Also known as African Moringa, it is native to certain regions of Ethiopia and Kenya. Like *Moringa oleifera*, it is valued for its nutritional content. *Moringa stenopetala*. While it shares the name "Moringa" with *Moringa oleifera*, the more widely known variety, *Moringa stenopetala* has distinct characteristics and is valued for its own set of

properties. *Moringa stenopetala* is native to the Horn of Africa, with Ethiopia being a primary location for its growth. It is well adapted to the semi-arid and mountainous regions of this area. Similar to *Moringa oleifera*, *Moringa stenopetala* is valued for its high nutritional content. The leaves, in particular, are rich in vitamins, minerals, and protein, making them a valuable food source in regions where malnutrition is a concern. In traditional medicine, various parts of *Moringa stenopetala* have been used for their potential medicinal properties. The plant is believed to have anti-inflammatory, antioxidant, and antimicrobial effects. Research is ongoing to explore its therapeutic potential.

The *Moringa stenopetala* leaf are used in local cuisines. The leaves can be cooked and consumed as a vegetable, similar to how *Moringa oleifera* leaves are used. The pods, often referred to as "drumsticks," are also consumed as a vegetable. *Moringa stenopetala* is known for its ability to thrive in challenging environmental conditions, including areas with poor soil quality and low water availability. This adaptability makes it a valuable resource for communities in arid regions.

It's important to note that while *Moringa oleifera* is more widely cultivated and researched, *Moringa stenopetala* has unique properties that make it significant in its own right, particularly in the context of the regions where it is naturally found. Ongoing research may reveal additional information about its nutritional composition and potential applications.

Figure 2: *Moringa stenopetala* tree, flowers, leaves, seeds (Anonymous,2023b)

Moringa stenopetala , One of the rare trees that can be found growing on rocky slopes in central Namibia and the southern portion of its range is *M. ovalifolia*. In cultivation, it is sensitive to low temperatures and overwatering, but it is incredibly resistant to drought. It has earned the moniker "ghost tree" due to its massive habit and bleached trunk. The massive habit of *Moringa stenopetala* is also seen on the right. This species is known to exist in a few wild locations,

including this one on an island in Lake Baringo, Kenya, but it is widely cultivated, particularly in southwest Ethiopia.

Following *M. oleifera*, *Moringa stenopetala* is the species with the greatest economic significance. According to reports, it's a significant food plant in northern Kenya and southwest Ethiopia, where the leaves are consumed as a vegetable (Jahn, 1991, Förch, 2003). Only five wild locations—at Lake Baringo and near Lake Turkana in southwest Ethiopia and northwest Kenya, respectively—have been reported to have it. The fact that so few people are aware of this significant plant in the wild is typical of many tropical species. The best chance of success for *Moringa stenopetala* breeding efforts would be to base them on collections from every wild stand and to work in tandem with searches for additional wild stands. It appears likely that *M. stenopetala's* genetic diversity

Moringa peregrina: This variety is native to parts of the Middle East, including Saudi Arabia and Yemen. It is adapted to arid conditions and is known for its drought resistance. Its ability to withstand extreme temperatures and low water availability makes it well-suited to these environments. One of the notable characteristics of *Moringa peregrina* is its adaptation to arid conditions. The plant has developed mechanisms to survive with minimal water, making it a valuable resource in regions where water scarcity is a challenge. Like other moringa species, *Moringa peregrina* is known for its nutritional value. The leaves of the plant are rich in vitamins, minerals, and antioxidants. In areas where food resources are limited, *Moringa peregrina* serves as a source of essential nutrients. In traditional medicine, various parts of *Moringa peregrina* have been used for their potential medicinal properties. The plant is believed to have therapeutic effects, and extracts from its various parts have been studied for their potential antioxidant and anti-inflammatory activities. The pods and leaves of *Moringa peregrina* are utilized in local cuisines. The leaves can be cooked and consumed as a vegetable, and the pods, similar to other moringa varieties, are also consumed as a food source. *Moringa peregrina* seeds contain oil, and the oil has been traditionally extracted for various uses. The oil is known for its nutritional value and potential applications. It's important to note that while *Moringa peregrina* shares some similarities with other moringa species, each variety has unique adaptations to its specific environment. As with other moringa species, ongoing research may reveal more about the nutritional content and potential applications of *Moringa peregrina*.

Figure 3: *Moringa peregrina* flower, and tree (Anonymous,2023c)

Moringa peregrina growing in a rocky wash in the mountains of the Arabian Peninsula's southeast, in northern Oman. This one has a thick covering of leaves, but the leaflets have all fallen off, exposing the bare leaf axes. Similar to other *Moringa* species like *M. ovalifolia*, this species frequently occupies the only dominant tree position in otherwise rocky, shrubby landscapes. The brown, wingless seeds that set this species apart are found in some of the pods on this tree.

***Moringa drouhardii*:** This species is found in Madagascar and is adapted to the island's unique ecological conditions. It is known for its thick, succulent stem. *Moringa drouhardii*, commonly known as Madagascar Moringa or simply Moringa, is a species of moringa tree that is native to Madagascar. Unlike some other moringa species, *Moringa drouhardii* has a distinctive appearance. It is characterized by a thick, succulent stem and is often described as a "bottle tree" due to the swollen base of its trunk. Similar to other moringa species, *Moringa drouhardii* has developed adaptations to withstand arid conditions and periods of drought. The plant's ability to store water in its succulent stem contributes to its resilience in dry environments.

While the leaves of *Moringa drouhardii* are edible, they are not as commonly consumed as those of *Moringa oleifera* or other varieties. The plant is more recognized for its unique appearance and adaptations to the local environment. In Madagascar, *Moringa drouhardii* has been traditionally used for various purposes. Different parts of the plant, including the leaves, bark, and roots, may have been utilized for medicinal or cultural practices. However, specific traditional uses can vary among communities. Like many species endemic to specific regions, *Moringa drouhardii* may face conservation challenges due to habitat loss and other environmental factors. Conservation efforts are sometimes initiated to protect and preserve unique species like *Moringa drouhardii*. As with other moringa varieties, ongoing research may provide more insights into the nutritional content and potential uses of *Moringa drouhardii*.

However, its unique characteristics, especially the succulent stem and adaptation to the Madagascar ecosystem, make it a distinct member of the moringa family.

Figure 4: *Moringa drouhardii* general view and seeds (Anonymous, 2023d)

The swollen trunk is composed of usually standing 2–10 m tall, *Moringa drouhardii* has a single, fatty trunk. The species is native to arid regions of southern Madagascar, where its pale, almost white bark is a striking feature. Its fruits have constrictions between the seeds, which are 2-3 cm long, pocked like golf balls, and wingless, setting it apart from the other native Malagasy species, *M. hildebrandtii* (Olson and Razafimandimbison, 2000). Though *M. drouhardii* has the strongest scent of all the Moringa species, they are all strongly scented of mustard oils. Most people call it "hazomalana." The speed at which *Moringa drouhardii* grows can reach flowering in as little as two years. The kind has been reported from locations in the island's southwest and southeast, however a thorough investigation of the tree's distribution between these two regions is lacking. The tree is used medicinally by the locals, and although it is said to be inedible, it is common to see bark stripped off or hollows in the trunk where wood has been removed.

Moringa arborea: *Moringa arborea* is found in various countries in Africa, including but not limited to Ethiopia, Kenya, Sudan, Tanzania, and Uganda. It is adapted to a range of climates within the continent. Found in parts of Africa, particularly in the coastal regions, *Moringa arborea* is valued for its timber and is also used for medicinal purposes. *Moringa arborea* is a deciduous tree that can reach heights of up to 20 meters. It has a straight trunk and a spreading crown. The leaves are compound, with leaflets arranged in pairs along the central stem. Similar to other moringa species, *Moringa arborea* is valued for its edible parts. The leaves, flowers, and pods are all used in traditional cooking. The young pods, often referred to as drumsticks, are cooked and consumed as a vegetable. Various parts of *Moringa arborea* have been used in traditional medicine in Africa. The plant is believed to have medicinal properties, and extracts from its leaves and other parts have been used for various therapeutic purposes. *Moringa*

arborea is also valued for its wood, which is used for timber. The wood is known for being lightweight and is used for construction, as well as for making tools and utensils. The attractive appearance of *Moringa arborea*, with its spreading crown and compound leaves, makes it suitable for ornamental planting in some areas. *Moringa arborea* is adaptable to a variety of environmental conditions, including both arid and humid regions. Its ability to thrive in different climates contributes to its cultivation in diverse areas of Africa. As with other moringa species, ongoing research may provide additional insights into the nutritional content and potential health benefits of *Moringa arborea*. It remains an important resource for food, medicine, and other uses in the regions where it is cultivated.

Figure 5: *Moringa arborea* different growing time (Anonymous, 2023e)

Moringa arborea has only been observed once and is restricted to a solitary, rocky canyon located in a remote area along the Kenyan border with Ethiopia. Below is a picture of the first leaf from this species that science is aware of. One of the rarest varieties of moringa, *Moringa arborea* is only found in a single rocky canyon near the Kenyan border with Ethiopia. In 1972, two botanists made the first collection of this lovely tree. One tree, devoid of leaves, was discovered and was covered in fruits and flowers. The tree was then lost to sight for almost thirty years.

Moringa ovalifolia: Native to southwestern Africa, this species is adapted to arid environments and is known for its distinctive rounded leaves. *Moringa ovalifolia* is found in arid and semi-arid regions of southwestern Africa. Its distribution includes the Namib Desert and other dry areas. This species of moringa is characterized by its distinctive rounded leaves, which set it

apart from other moringa varieties. The leaves are oval in shape, and the tree has a generally shrubby or small tree-like appearance. *Moringa ovalifolia* is adapted to thrive in arid conditions. It has developed mechanisms to conserve water and withstand periods of drought, making it well-suited to the challenging desert environment. While the leaves of *Moringa ovalifolia* are edible, they are not as commonly consumed as those of *Moringa oleifera*. The limited culinary uses may be due to the plant's adaptation to arid regions, where the availability of water and other resources for cultivation is constrained. In local communities, various parts of *Moringa ovalifolia* may have been used for traditional purposes. These uses can include medicinal applications and other practices based on the unique properties of the plant.

Figure 6: *Moringa ovalifolia* tree, leaves, flowers (Anonymous,2023 f)

The unique appearance of *Moringa ovalifolia*, with its distinctive rounded leaves and adaptation to arid environments, makes it suitable for ornamental planting in certain regions. It's important to note that while *Moringa ovalifolia* shares the moringa name with more well-known species like *Moringa oleifera*, each species may have unique characteristics and adaptations to its specific environment. As with other moringa varieties, ongoing research may provide further insights into its nutritional content and potential applications.

Moringa concanensis: Native to parts of southwestern India, this variety is adapted to drier conditions and is cultivated for its medicinal properties.

Figure 7: *Moringa concanensis* tree, flowers and general view (Anonymous,2023g)

The closest surviving relative of *M. oleifera* is *Moringa concanensis*, which is still occasionally found growing wild in patches of dry tropical forest that stretch from eastern Pakistan nearly to the southern tip of India and a small portion of Bangladesh (Naderuzzaman et al., 1996). Similar to *M. oleifera*, *Moringa concanensis* leaves have fewer branched segments (less tripinnate axes). Furthermore, *M. concanensis*'s deeply furrowed bark, which can be up to 10 cm thick, differs noticeably from *M. oleifera*'s. The name "murungai" is shared by *M. oleifera* and other pod-bearing trees with pinnate leaves, like *Erythrina indica* (a Legume Family tree), in the *M. concanensis* localities I visited in southern Tamil Nadu. The Out of all the thin trees that come out of Asia, *Moringa peregrina* has the broadest distribution. It extends from the eastern Arabian Peninsula's Musandam Peninsula, around its southern region, on both sides of the Red Sea, into northern Somalia, and north to the Dead Sea's steaming lowlands. Among the strangest species of *Moringa* is this one. In many parts of its range, the only trees in sight are the gnarled trunks of *Moringa peregrina*. The tree has erect, bluish pinnate leaves that resemble wispy mops when they mature, dropping their leaflets to reveal the bare leaf axes. The young plants' tubers are consumed in Oman.

Moringa longituba: It is impossible to misidentify this species compared to other moringa species. The bright red flowers are not found in other species, and the bases of the petals and sepals merge together to form a tube. It usually has large tubers located deep in the ground, from which emerges a single stem that connects to it in a manner similar to a knee. It then grows upward if the environmental conditions are suitable. It can grow. The tree has branches reaching more than 3m.

Figure 8: *Moringa longituba* flower, leaf, general view (Anonymous, 2023h)

Moringa longituba is easily recognisable in the wild. This small-statured species' tuber is typically found deep underground, but it is visible in the image to the left of a cultivated specimen. Among the *Moringa* species, *Moringa longituba* is one of the most distinctive. No other species has long tubes made of fused petal and sepal bases, nor does it have bright red flowers. It typically has one small shoot that rises to knee height above its large tuber, which is located deep underground

***Moringa hildebrandtii*:** It is a species of the *Moringa* genus, commonly referred to as the Hildebrandt's *Moringa*. Like other members of the *moringa* family, it is valued for its nutritional and potential medicinal properties

Figure 9: *Moringa hildebrandtii* tree, pod, plant (Anonymous, 2023i)

Moringa hildebrandtii, the other native species from Madagascar. It is said to grow to a height of 25 metres (Keraudren, 1965), it grow to a height of 15 metres. It resembles *M. drouhardii*, but with slightly bilaterally symmetrical flowers, rough, brown bark that exudes a reddish gum, and larger, coarser leaves that typically have red on the stalks between the leaflets. *Moringa*

hildebrandtii was believed to be extinct in the wild, despite being commonly grown in villages and around graves on Madagascar's west coast (Olson and Razafimandimbison, 2000). Fortunately, wild populations were found recently in a southwest island canyon (Castillon and Castillon, 2007). The common name for it is "hazomaroseranana," which translates to "tree." (Razafimandimbison and Olson, 2000). Similar to *M. drouhardii*, it's frequently used as a medicine but isn't consumed as food. It has been reported from locations in the island's southwest and southeast, however a thorough investigation of the tree's distribution between these two regions is lacking. The tree is used medicinally by the locals, and although it is said to be inedible, it is common to see bark stripped off or hollows in the trunk where wood has been removed. The largest Moringa is *Moringa hildebrandtii*, the other native species of Madagascar. It claimed to reach 25 metres (Keraudren, 1965), It resembles *M. drouhardii*, but with slightly bilaterally symmetrical flowers, rough, brown bark that exudes a reddish gum, and larger, coarser leaves that typically have red on the stalks between the leaflets. *Moringa hildebrandtii* was believed to be extinct in the wild, despite being commonly grown in villages and around graves on Madagascar's west coast (Olson and Razafimandimbison, 2000). Fortunately, wild populations were found recently in a southwest island canyon (Castillon and Castillon, 2007).

Moringa pygmaea: This is a dwarf species of moringa found in parts of Africa. It is smaller in size compared to other varieties and is adapted to specific ecological niches.

Figure 10: *Moringa pygmaea* leaves and flowers (Anonymous,2023j)

Moringa pygmaea was first identified in 1980, and Swedish botanist Mats Thulin—a specialist in Somali flora—recently located it once more at its type locality close to Qardho, Somalia. Geographically limited and exceedingly rare is the species *Moringa pygmaea*. The plant's aboveground section, which was only a few centimetres tall, bore several immature a yellow flower inflorescence and leaves.

Moringa borziana: is a plant species belonging to the Moringaceae family. It belongs to the same family as *Moringa oleifera*, but grows especially in regions such as Afghanistan, Pakistan and Iran. This plant has been used in traditional medicine, especially in parts of Central Asia.

Figure 11: *Moringa borziana* tree, flowers, stem, leaves (Anonymous,2023k)

Small-sized *Moringa borziana* grows within 100 miles of the coast, from southern Kenya to the Kisimayu region in southern Somalia. It produces one or two stems, each of which is typically one metre tall. The snips may occasionally grow into a small tree, especially in cultivation, but it may also die back to the tuber every few years. The enormous tuber has a maximum length of one metre. *M. borziana* produces greenish yellow flowers with brown smudges on the tips of the petals that have an almost sickeningly

Moringa rivae: This species is considered the most taxonomically difficult in the Moringa family. It is native to southern Lake Turkana to the Mandera region in Kenya and throughout southeastern Ethiopia. It does not seem to extend far into Somalia. This species is distinguished by the presence of three cream-colored fruits with a brown top and fruit. The short, subspecies *longisiliqua* has yellow flowers and very long fruits. Currently, specimens are being tested but there is still much to be done in collecting specimens in southeastern Ethiopia and northeastern Kenya which may contribute to solving the problem.

Figure 11: *Moringa rivae* flowers, leaf (Anonymous,2023l)

Moringa ruspoliana: is considered one of the most diverse species in the family. It is found from northern Somalia to southeastern Ethiopia, barely reaching northeastern Kenya. It is easily distinguished from all other species in the family, as it is the only species that has simple, pinnate leaves, and the leaflets are the largest in the family. The family, where it reaches 15 cm in diameter and is the thickest and roughest in the family.

Figure 12: *Moringa ruspoliana* flowers, leaves (Anonymous,2023m)

The main characteristics of the miracle tree *Moringa oleifera* and other species belonging to the moringa species, such as their botanical characteristics and growth requirements, are explained in detail, and it is also discussed that these species are widely used in the world and are evaluated in many ways both for human food, medicinal purposes and as feed.

Abstract

In order to develop animal husbandry in Türkiye, quality feed cultivation must be increased. In our country, which has many different ecological regions, Annual ryegrass, which is grown in a short time and can give high fresh and hay yield per unit area, has been evaluated especially in terms of forage production quality in recent years. Annual ryegrass, which is a quality, cheap and very effective feed source, has a very important place in animal feeds and mixtures. The research was carried out in the trial areas of Ege University Faculty of Agriculture, Department of Field Crops in the 2021-2022 growing season. The aim of the study is to determine the effects of different nitrogen forms (urea and urea+NBPT) and doses (0, 5, 15, 20, 25 kg/da) on yield and some other yield characteristics in Annual ryegrass (*Lolium multiflorum* Lam.). In the study; plant height (cm), stem diameter (mm), yield (kg/da), dry matter ratio (%) etc. were investigated. According to the results obtained, some differences were observed in different nitrogen doses and forms of Annual ryegrass. It has been concluded that there is an increase in yield with the increase of nitrogen doses and 20 kg/da nitrogen and Urea+NBPT fertilizer application can be the best fertilizer level that increases yield in Annual ryegrass.

Keywords: Annual ryegrass, *Lolium multiflorum*, nitrogen dose, yield, NBPT, urea.

Introduction

Living things need food to survive. As the world population increases, this need also increases. Consumption of animal foods is very important for human health. The protein requirement of a normal individual is 1 g per kilogram, 50% of which is from animal sources (Orak and Demirhan, 2016). Türkiye has a geographically favorable location for animal husbandry. Climatic conditions are suitable for animal husbandry, but climate characteristics, summer droughts and soil structures increases opportunities for ovine husbandry (Turan et al., 2017). However, one of the biggest problems related to animal husbandry in Türkiye is the low milk and meat yield per animal due to the lack of sufficient and high quality feed (Tuncel et al., 1997). In order to address the yield and quality investigated in forage crops, the plants must be fertilized in appropriate combinations and ratios at the required times. In addition to yield, feed quality has the greatest value for animal health. Nitrogen, the most important nutrient for plants, constitutes the majority of dry matter. In addition, nitrogen is incorporated into proteins, chlorophyll, enzymes and vitamins in plants. Nitrogen is the most widely used nutrient. Nitrogen fertilizers in appropriate amounts increase protein content, but excess nitrogen use in plants also leads to the accumulation of nitrates and alkaloids. A positive response of Italian ryegrass to nitrogen fertilizer application has been reported (Çolak, 2015; Özdemir et al., 2019). Nitrogen fertilizers cannot be used effectively in the soil. At most, they are lost from the soil by denitrification, soil erosion, washing and immobilization. For this reason, very special and technological fertilizers have been developed. *Lolium multiflorum* Lam. is one of the most valuable forage crops today as a cheap, efficient and high quality feed. Annual ryegrass, which is widely used in animal husbandry in developed countries, is a delicious foragecrop rich in protein, dry matter, soluble carbohydrates and minerals. It is also an excellent supplement to solve the feed problem of Turkish livestock. It is widely cultivated throughout our country, especially in the Mediterranean, Marmara and Aegean regions. Depending on the fertilizer application method, soil type and environmental factors, urea fertilizers tend to evaporate nitrogen as ammonia (NH₃) and this loss of nitrogen can reach up to half of the total nitrogen. One method to reduce nitrogen loss in urea fertilizers is to inhibit urease activity to reduce urea hydrolysis. NBPT is a recognized inhibitor of N-(n-butyl) thiophosphoric triamide. The most valuable significance of NBPT is that it can effectively inhibit urease in various soil types even at low concentrations. The aim of this study was to determine the effect of appropriate

nitrogen forms and doses on yield and some quality traits of Annual ryegrass in order to close the yield and quality feed deficit in our country.

MATERIALS AND METHODS

It is understood that a typical Mediterranean climate prevails in the research site where the

effects of two different nitrogen norms and different nitrogen doses on yield, yield components and quality of Annual ryegrass (*Lolium multiflorum* Lam.) were investigated in the trial fields of Ege University Faculty of Agriculture, Department of Field Crops during the 2021-2022 growing period.

In order to determine the soil properties of the trial area, soil samples (0-30 cm) taken from the field in the trial area in accordance with the procedure were physically and chemically analyzed at Ege University Faculty of Agriculture, Department of Soil Science and Plant Nutrition and the results obtained showed that the soil of the trial area is loamy at a depth of 0 to 30 cm, and this alluvial structure, which is the Bornova Plain, shows a very heavy soil quality. The pH value determined at 0-30 cm depth was 7.88, indicating that the soil in the parcel was slightly alkaline. For annual ryegrass a pH range of 5.0 to 7.8 is reported as the most suitable range (Assouma, and Çelen, 2022).

In the research; the material we used as seed was obtained from the private sector. *Lolium multiflorum* Lam. "Baqueano" variety was used. In the study, 5 different nitrogen doses (0, 5, 15, 20 and 25 kg/da) and 2 different nitrogen fertilizer forms, urea and urea+NBPT ((N-(n-butyl) thiophosphoric triamide)) inhibitor were used. The experiment was arranged according to randomized block design with 3 replications. Preparation of the research area and tillage was started 15 days before sowing, the field was first plowed with a plow at a depth of 20-25 cm and the field was made ready for sowing by milling.

Sowing was done manually on November 19, 2021, when the temperature and soil conditions were suitable for the rows opened with 20 cm row spacing with the help of a marker, with the calculation of 4 kg/da seed per decare, with 10 rows in each plot. Along with sowing, 25 kg/da 12.12.12 organomineral fertilizer was applied per decare. In the application of nitrogen fertilizer, which was considered as an experimental factor, half of the nitrogen was applied with sowing and the other half was applied during the spike emergence period. The plants were harvested from a height of 5 cm during the spike emergence period on May 15, 2022. Some characteristics were examined in the trial. Plant height (cm): The distance from the soil surface

to the top of the plant was measured with a ruler for 10 plants from each plot before harvesting. Stem diameter (mm): Before harvesting, 10 plant samples were randomly selected from each plot and the stem diameter of each plant was measured from a reference point. Dry matter content (%): Dry matter content was calculated after drying the samples in an oven at 105 °C for 2 days. Hay yield (kg/da): The samples taken from the plots where herbage yield was determined were dried in a drying cabinet at 50 °C for 48 hours and the hay yield of the plots was determined by proportioning the obtained value with the herbage yield.

The results obtained from the experiment were analyzed by using TOTEMSTAT statistical evaluation program at Ege University, Faculty of Agriculture, Department of Field Crops. The least significant difference (LSD 5%) values were calculated and shown at the bottom of the tables (Açıkgöz et al., 2004).

RESULTS and DISCUSSION

Plant Height and Stem Diameter: The mean values of plant height and stem diameter characteristics of different nitrogen forms and doses in annual ryegrass (*Lolium multiflorum* Lam.) are given in Table 1. When the results of the statistical analysis were evaluated, it was seen that fertilizer forms and nitrogen doses had significant effects, while fertilizer x nitrogen doses interaction was not statistically significant. According to Table 1, the highest average plant height value was obtained from Urea+NBPT application with 115,6 cm, while 111,10 cm plant height value was obtained in Urea application. In terms of nitrogen doses, the highest average plant height value was 122,27 cm. with 25 kg/da nitrogen application and the lowest mean value was obtained from the control (0 dose) application with 101.04 cm.

In studies conducted with annual ryegrass under different ecological conditions, different results were obtained in plant height. Our findings were higher than the plant height values obtained by Türemen (1988); 69.84 cm, Demiroğlu et al. (2007); 48.4 cm, Kesiktaş (2010); 60.3-71.6 cm, Pak and Türk (2019); 83-95 cm, Yaman (2019); 87-93 cm and lower than the plant height values obtained by Serin and Gökkuş (1996); 130 cm, Assouma and Çelen (2022); 131 cm. It is also similar to the values obtained by Çetin (2017); 125 cm and Ürem (1985); 121 cm. It is thought that the difference between the values obtained for plant height and the values reported by other researchers may be due to the ecological conditions in which the research was conducted and the doses and forms of nitrogen used.

Table 1: Effect of different nitrogen forms and doses on plant height (cm) and stem diameter (mm) in Annual ryegrass

NITROGEN DOSES (kg/da)	PLANT HEIGHT (cm)			NITROGEN DOSES (kg/da)	STEM DIAMETER (mm)		
	UREA	U+NBPT	Mean		UREA	U+NBPT	Mean
0	100.83	101.25	101.04	0	3.21	3.21	3.21
5	105.37	109.37	107.62	5	3.29	3.25	3.27
15	111.08	116.54	113.77	15	3.35	3.27	3.31

25	121.14	123.32	122.27	25	3.45	3.40	3.42
Mean	111.10	115.6	112.85	Mean	3.35	3.29	3.32
LSD (%5): F:1,76 ND:2,79 FxND:ns				LSD (%5): F: 0,01 ND: 0,02 FxND:0,03			

When the results of the statistical analysis of the stem diameter trait were examined, it was observed that fertilizer forms and nitrogen doses had a significant effect, and the fertilizer x nitrogen doses interaction was found to be statistically significant. As can be seen in Table 1, the highest stem diameter value was obtained from 20 kg/da nitrogen urea application with 3.48 mm, while the lowest stem diameter value was obtained from the control group of both fertilizer (urea and urea+NBPT) applications with 3.21 mm. The average stem diameter values were determined as Urea (3.35 mm) and Urea+NBPT (3.29 mm) in the applied fertilizer forms. When the data obtained were analyzed in terms of nitrogen doses, it was understood that the highest stem diameter values were obtained from 20 kg/da and 25 kg/da nitrogen applications with 3.42 mm. Stem thickness is one of the traits that mainly depends on the genetic structure of the variety. Especially the thickness of the stem, which enables the plant to stand upright from the ground, supports the leaves, which are the anabolic organs of the plant, and the flower, which is the reproductive organ of the plant. The stem diameter values obtained by us are consistent with the stem diameter values of 2.92-3.69 mm obtained by Çolak (2015), 3.2-3.8 mm obtained by Çetin (2017), 3.33-3.41 mm obtained by Assouma and Çelen (2022).

Hay yield and Dry matter ratio: The results of analysis of variance of hay yield values of different nitrogen forms and doses in annual ryegrass are given in Table 2. In the statistical evaluation, it is understood that the factors of nitrogen doses and fertilizer forms and fertilizer x nitrogen doses interactions have statistically significant differences in hay yield.

The highest hay yield value was 797 kg/da and the lowest hay yield value was obtained from Urea+NBPT application with 360 kg/da and from the control application with 359 kg/da. In terms of fertilizer forms, the highest hay yield value was obtained from Urea+NBPT application with 618 kg/da. When the data obtained in terms of nitrogen doses were analyzed; the highest hay yield value was recorded in 20 kg/da nitrogen application with 790 kg/da and the lowest yield was recorded in the control application with 360 kg/da. In many studies carried out in different regions; hay yield values were determined between 571 kg/da and 416 kg/da by Alison et al. (1989), 783,31 kg/da by Türemen (1988), Sağlamtimur et al. (1988) found 500-600 kg/ha and Pak (2019) found 514 kg/da. The hay yield values obtained as a result of the research were similar to the values obtained by the researchers.

Table 2 . Effect of different nitrogen forms and doses on dry matter ratio (%) and hay yield (kg/da) in Annual ryegrass

The percentage of dry matter depends on the amount of water in the plant, which in turn depends on the presence of structural and non-structural compounds or organelles in the plant. In

general, the percentage of water is high in young cells and tissues of plants, where physiological activity is strong, but as cells and tissues age, physiological activity and percentage of water tend to decrease (Mohr and Schopfer,1995). When plants have sufficient nitrogen, their vegetative growth is supported by a dark green color (Kaçar,1977). In this case, it is predicted that the dry matter ratio may decrease due to the relative decrease in structural matter in plants under normal nitrogen fertilization conditions. Furthermore, nitrogen application increased the water content and decreased the amount of unstructured carbohydrates in the plant (Brink and Fairbrother, 1992). However, it is conceivable that the greater number of cells with more wall surface area may have made the effect of nitrogen rate on the dry matter content of the plant negligible. The results of some studies on dry matter content of annual ryegrass (Kamacı (2022) 23.8%-26.1%) were similar to our findings and lower than Assouma and Çelen (2022) 42%-49%. It is thought that the ecological conditions of the regions, planting norm, type and dose of fertilizer used may be effective in the different results among the studies.

CONCLUSION

In order to make sustainable agriculture valuable in Türkiye and to increase yields in limited areas, important findings were found in the results of the research.

According to the results of the study conducted under Aegean region climate and weather conditions, 20 kg/da urea + NBPT nitrogen application can be recommended as top fertilizer for annual ryegrass plants. According to these results, it would be appropriate to repeat the study for one more year in order to make more reliable recommendations.

ABSTRACT

A bioindicator is an organism or a biological system that is used to monitor the health and quality of the environment. Bioindicators are sensitive to changes in their surroundings, and their responses can provide valuable information about the condition of ecosystems, levels of pollution, or other environmental factors. By studying the behavior, abundance, growth, or other biological responses of these organisms, researchers can assess the impact of human activities or natural processes on the environment. Honeybees (*Apis mellifera* L.) have emerged as promising bioindicators due to their intricate interactions with the environment and sensitivity to various stressors. Honeybee colonies exhibit dynamic behaviors influenced by factors such as pesticide exposure, habitat loss, and climate change. As highly organized social insects, honeybees respond to environmental stressors through changes in foraging patterns, colony size, and overall hive productivity. These observable alterations in behavior serve as valuable indicators of environmental stress, offering real-time insights into the ecological impact on both local and global scales. The integration of honeybees into environmental monitoring programs provides a cost-effective and scalable solution for assessing the health of ecosystems. The monitoring of hive parameters, including hive weight, temperature, and bee communication signals, allows for the detection of subtle environmental changes that may otherwise go unnoticed. In this review, general information will be given about the characteristics, use and potential of honeybees and bee products as a biological indicator.

Keywords: Honeybees, bioindicator, environmental monitoring

Introduction

Environmental problems have an international importance today due to the influence of globalization. Although the environmental problems of developed and developing countries differ, these problems are generally; greenhouse gas emissions, deforestation, extinction of plant and animal species, damage to the ozone layer, climate change, urbanization and waste management (Özsoy and Dinç, 2016). The reasons for the emergence of environmental problems can be detailed further, but the main reasons can be listed as population growth rate, urbanization, industrialization, tourism, globalization and poverty (Görmez, 2018). Today, when environmental problems are considered, environmental pollution is the first thing that attracts attention. Environmental pollution in itself; They are grouped as soil pollution, water pollution, air pollution, noise pollution, nuclear/radioactive pollution and electromagnetic pollution. Changing the composition of the air in a way that disrupts human health or environmental balance, and the mixing of substances harmful to human health into the air causes air pollution. Soil pollution occurs as a result of the decrease in the fertility of the soil and the deterioration of soil properties. Soil pollution is pollution that cannot be eliminated or transformed in nature and threatens human health. Discharge of wastewater from industrial facilities into the environment without treatment and unconscious use of pesticides and fertilizers used in agriculture cause pollution of our surface and underground waters. Maintaining a healthy life is only possible with a healthy environment. Traditional methods and chemical analysis methods are applied to observe environmental pollution. However, the data obtained from these methods only show the presence of pollutants in the environment. It does not provide information about its effects on living organisms in the same environment (Taylan and Özkoç, 2007).

Biomonitoring is a valuable method for evaluating the effects of geothermal energy on vegetation and ecosystems, potentially aiding in establishing natural backgrounds before and after development (Lattanzi et al., 2020). In recent years, biological monitoring studies have been carried out to detect toxic substances that cause environmental pollution. Bioindicator organisms are used in biological monitoring studies.

Bioindicators and biomonitoring

Bioindicators are living organisms such as plants, plankton, animals, and microorganisms that are used to scan the health of the surrounding natural ecosystem. Bioindicators are used to evaluate environmental health and biogeographic changes occurring in the environment (Parmar et al., 2016). Indicator species are the species with well-known ecology, and their

decrease or increase in the ecosystem indicates the pressure of many factors (such as climate change, the mixing of various pollutants into the environment) on the ecosystem. Biomonitoring is a technique for monitoring environmental changes, identifying pollutants, and evaluating the effects on ecosystems (Lattanzi et al., 2020). Biomonitoring or biological monitors can be defined as living things that can provide quantitative information about the quality of their environment. Therefore, a good biomonitor should be able to provide information about the size and exposure duration of the pollutant in addition to indicating its presence in the environment. Biomonitoring organisms are organisms that absorb certain toxins from their environment over a certain period of time and accumulate them in their tissues. Detecting the presence of these species in the environment and their passive use provides information about the conditions of the environment (Gadzała-Kopciuch et al., 2004). Bioindicator species effectively indicate the state of the environment due to their moderate tolerance to environmental variability compared to rare species and ubiquitous common species. This tolerance gives them sensitivity to indicate environmental change but robustness to withstand some variability and reflect the overall biotic response (Holt and Miller, 2010).

Bioindicator species

Although they can be classified in different ways, biological monitors can be divided into three groups according to the type of organism used: Microbial bioindicators, plant bioindicators, animal bioindicators. Microbial indicators can be used in both water and soil ecosystem assessment. Their presence in large amounts provides an advantage over other types of bioindicators. Plants maintain ecological balance by cycling nutrients and gases. An indicator plant exhibits symptomatology when exposed to phytotoxic concentrations of a pollutant or mixture, and can act as air pollution indicators by accumulating the pollutant in their tissues (Bakiyaraj and Ayyappan, 2014). Besides, lichens can also be used as biomonitors. They react differently to different levels of pollutants, especially by storing airborne pollutants in their bodies. Since they do not have a developed root system, they exchange water and mineral substances with their entire surface. Thus, they accumulate air pollutants in their tissues. The populations of animal indicators respond either positively or negatively to the threat that environmental contamination poses to the ecosystem. Reactions including toxin accumulation in animal tissues and the population's rate of deformity, in addition to population changes, can also be utilized as indicator features. Species belonging to this category are often common. Fish, amphibians, birds, reptiles, mammals, and benthic invertebrates can all be employed as bioindicators. Vertebrates in particular are frequently employed as bioindicators.

Honeybees as unique bioindicators

Insects are the most common animal in all types of ecosystems, and they can be used to measure the effects of environmental changes. Research on taxonomy, behavior, and the environment will eventually be required to track biodiversity changes and their unavoidable effects. The use of biomonitors and bioindicators is crucial for evaluating environmental change. Biomonitors are used to collect quantitative data on the quality of the environment, while bioindicators can be used to determine the quality of changes occurring. As a result, using insects as a bioindicator to evaluate the caliber of environmental changes is essential (Chowdhury et al., 2023). Among insect species, bees are excellent bioindicators. Because they have a high death rate and accumulate toxins that cause environmental pollution in their bodies and products (Ponikvar et al., 2005). While solitary bees or bumblebees are susceptible to environmental stressors, the honeybee (*Apis mellifera* L.) colony as a whole is more resilient and can respond to or collect toxins without experiencing disruption (Cunningham et al., 2022). This makes it possible to map pollutants within a given geographic area and investigate ecotoxicology gradients through long-term colony monitoring. Honeybees' rapid reproduction, ubiquity, unique nutrition, hair-covered bodies and wide-area flight characteristics make them good bioindicators (Ponikvar et al., 2005). Bee products; especially honey, beeswax, pollen, propolis; It also carries samples from various environmental parts such as soil, water, air and plants. Honeybees as bioindicators; The feature of analyzing the products accumulated in the body of the bee, such as behavioral changes, mortality rates, heavy metal contents, pesticides and radionuclides, is also important (Zhelyazkova, 2012). Bees are social creatures and react to environmental changes.

Biological monitoring with honey bees can be examined in different ways:

- Monitoring colony growth and development in honey bees
- Monitoring the hive parameters (temperature, humidity, weight etc.)
- Presence of nectar and pollen in the hive
- Examination of the honeybee behavioral changes
- Temperature monitoring in colonies
- Examination of immune functions
- Examination of behavioral characteristics like foraging, flight activity, egg laying capacity of the queen bee.
- Examining the bodies of live and dead larvae;
- Examining the bodies and digestive systems of adult bees
- Determination of sublethal and lethal effects

- Mortality
- Analysis of bee products

A research found that 75% of honey samples taken from all over the world had pesticide residues in them. According to Mitchell et al. (2017), this finding indicates that pesticides are dispersed over a large geographic area by soil, water, and air. Analyses of honey residue are crucial, particularly when establishing the level of pesticide use in the area where it is gathered. In the research conducted by Nisbet et al. (2013), at the end of the four-month period, iron, nickel, copper, zinc, cadmium and lead levels were measured in bee and honey samples. It was determined that mineral levels in colonies differed depending on the areas where they were placed ($p < 0.05$). According to the results, bees and their products' mineral levels are influenced by environmental conditions, and they can serve as bioindicators for environmental monitoring. Heavy metals are substances that, even in small amounts, can be harmful. The body absorbs heavy metals through the mouth, respiratory system, and skin. The majority of these metals cannot be eliminated by the body's excretory tracts—the kidney, liver, intestine, lung, and skin—without the assistance of specialized support. The majority of heavy metals build up in living organisms. These metals can accumulate and lead to major illnesses (thyroid, neurological, infertility, and autism) and even death at appropriate quantities.

Honeybees fly within a three-kilometer radius to take advantage of nectar, pollen, and water, which are their primary food sources. They can therefore give information about the possible degree of contamination and convey the elements of pollution in this region to the hive. In a study by Zaferaki et al. (2022), the ICP-MS method was used to assess the amounts of 27 macro and trace elements in bee, honey, wax, pollen, and larvae samples that were taken from industrial sites. In comparison to honey, larvae, and pollen, they found that beeswax and bee samples had higher quantities of hazardous elements such mercury, lead, and mercury. Furthermore, it was reported in this study that adult bees gather more elements in their bodies than do larvae, making adult bees and beeswax better tools for tracking macro and trace elements in the environment. It is stressed that the area with the highest level of industrial activity is also the one where cadmium is found in bees and bee products at the highest concentration.

Polycyclic aromatic hydrocarbons (PAHs) are a large group of organic compounds that contain two or more aromatic rings and belong to the category of food and environmental pollutants. They are produced by both natural and anthropogenic processes. Among these sources, pyrogenic (incomplete combustion of coal, oil, gas, wood, garbage, or other organic matter)

and petrogenic inputs are the two main sources of PAHs. Cochard et al. (2021) used honeybees as biomarkers of PAH pollution in 36 industrial zones, covering more than 950 km² of biomonitoring area. In a 3-year study, they reported that PAH7 concentration increased with increasing anthropization in bee samples. The residual lead, chromium, and cadmium contents in honey bees and their products were assessed in the study done by Conti and Botre (2000). Over the course of three months, samples from five distinct sampling regions were gathered for the analysis. Based on the collected data, statistically significant variations were found between the levels recorded in Rome's downtown. These findings led them to conclude that, while pollen, propolis, beeswax, and honey bees are considerably more effective than honey analysis alone, honey bees and their products can be thought of as bioindicators in detecting heavy metal contamination.

Determining the effects of pesticides is also possible through biological monitoring with honey bees. Karahan et al. (2018b) examined the effect of the active ingredient Thiacloprid on the navigation behavior of honey bees. The mixture prepared at five different doses was tested on 300 Anatolian honey bees in five trials and one control group. As a result of the study, it was determined that honey bees exposed to high doses died or were unable to return to their hives. However, it was observed that the most hive surprise occurred in honey bees exposed to the lowest dose. As a result, it has been stated that in applications of Thiaclopridin lower than the label dose, the life span of bees changes and behavioral disorders and tremors are observed.

The SARS-CoV-2 virus enables the spread of infection outdoors, and in densely urbanized areas, airborne particulate matter (PMs) are considered to exacerbate viral transmission. Colonies of *Apis mellifera* are used as bioindicators because they allow environmental sampling of different natures, including PMs. The study demonstrated for the first time the possible use of honeybee colonies in SARS-CoV-2 monitoring. The study was conducted at the height of the third wave of the Italian pandemic. Sterile sticks were lined up at the entrance of the hive to sample the dusty material on the bodies of the field bees returning to the hive, and it was stated that all of them were positive for viral SARS-CoV-2 (Cilia et al., 2022). This results shows that *Apis mellifera* colonies can be used as a potential bioindicator in the environmental detection of airborne human pathogens, at least in a densely urbanized area.

Results

Biomonitoring uses sensitive, ubiquitous and stable organisms in the region of interest to obtain accurate information about the pollutants present in the region and their biotoxic effects. Honeybees appear to meet all these requirements. Honey bees are directly affected by the

toxicological conditions in their environment. The honey bee's sensitivity to environmental conditions has made it a successful bioindicator creature. As a bioindicator, the honey bee's sensitivity to environmental conditions allows it to serve as an early warning system for potential ecological disruptions. Its ability to detect changes in air and water quality, pesticide contamination, and habitat loss makes it an invaluable species for monitoring environmental health. The type and amount of macro-micro elements in the honey bee's body are related to the characteristics of the region where the apiary is located and the physiological state of the colony. In biological monitoring studies, the development of colonies can be followed and behavioral differences and mortality rates of bees can be reported. Different characteristics of bees can be used in different types of pollution. The chance to collect and compare homogeneous data from large regions using the same sampling technique as for honeybees makes it possible to obtain unexpected and very useful information for the integrated management of environmental aspects at scales larger than individual countries. Additionally, data obtained by analyzing bees and their products can help beekeepers protect bee populations by avoiding heavily polluted areas. Data from bees as bioindicators may also be useful when trying to establish environmental limits on concentrations of pollutants that are toxic to humans or bees. For this purpose, studies should be carried out to establish legal regulations regarding the use of bioindicators. More detailed and comprehensive studies are needed to further realize the incredible potential of honeybees in providing data that can be useful in the management of environmental problems.

ABSTRACT

Bee venom, a complex mixture of bioactive compounds, holds significant therapeutic potential and plays a crucial role in apiculture and traditional medicine. Honey bee venom (apitoxin) is produced in the venom glands in the abdominal cavity of the worker bee and stored in the venom sac and their venom composition is known to vary under different environmental conditions. Bee venom has widespread use in health, Apitherapy, cosmetics and medicine due to its rich chemical content. Achieving the success in these areas is directly related to the quality and quantity of the products used. There are studies on the factors affecting both the amount of venom production and the quality of the bee venom in terms of content. It is important to investigate the effects of key environmental factors, including temperature, humidity, floral abundance, and pesticide exposure, on the synthesis and secretion of bee venom. Preliminary findings suggest a dynamic interplay between environmental variables and bee venom production. Temperature fluctuations impact the metabolic activity of venom-producing glands, while floral diversity influences the botanical origins of compounds found in the venom. Pesticide exposure emerges as a potential disruptor, affecting both the quantity and chemical profile of bee venom, raising concerns about the unintended consequences of agricultural practices. Understanding the relationship between environmental factors and bee venom production holds implications for both apicultural practices and medicinal applications. Beekeepers can optimize venom yield by developing hive management strategies in response to local environmental conditions. Furthermore, insights into the environmental determinants of venom composition contribute to the standardization of bee venom used in traditional medicine and apitherapy, enhancing the reproducibility and efficacy of therapeutic applications. This review delves into the intricate relationship between environmental factors and bee venom production, shedding light on the multifaceted influences that shape the quality and quantity of this valuable substance.

Keywords: Honeybee, bee venom, venom production, environment

Introduction

Bee products have been used for therapeutic purposes throughout history due to the many biologically active substances they contain, in addition to being used as food. In this treatment option called Apitherapy; products such as honey, beeswax, propolis, pollen, royal jelly and bee venom are used (Altıntaş and Bektaş, 2019). Apitherapy is a medical supplementary practice that is scientifically accepted as 'the whole of the applied methods of using the protective and therapeutic properties of bee products in human, animal and plant health'. In recent years, Apitherapy, in other words 'treatment with bee products', has come to the fore with the tendency of people to return to natural life (Hellner et al., 2007; Yücel and Ceylan, 2015; Wehbe et al., 2019). When the apitherapy applications are examined, it is noteworthy that bee venom has a special importance among other bee products.

Bee venom, also known as apitoxin; is produced in the venom glands in the abdominal cavity of the bee and stored in the venom sac (Kokuludağ, 2015). Bee venom is a unique mixture of proteins, enzymes and biogenic amines, used in medicine, pharmacy and cosmetology with therapeutic effects and anti-aging potential (Łukasiewicz, 2021). Bee venom (BV) therapy, which uses bee venom to treat various disorders, has been employed in traditional medicine since ancient times (Silva et al., 2015). Bee venom applications are named in two ways in the literature; Bee Venom Therapy (BVT) (intra-dermal, subcutaneous) and Bee Sting Therapy (BST) (Tanyuksel, 2015).

Today, there are methods of bee venom production to enable the use of bee venom in modern medicine as a complementary treatment, in the pharmaceutical industry and in cosmetics. While the old methods involved extracting venom from individual bees, the electro-shock method is now widely used for this purpose. Honey bee venom, which will be used especially for therapeutic purposes, should have a high purity and quality. This is only possible through the application of the right production techniques (Çaprazlı and Kekeçoğlu, 2021). Although many factors are effective in the production of bee venom, the effect of environmental conditions is an important parameter. The aim of this review is to reveal the environmental factors affecting the quality of honeybee venom.

Bee venom and its therapeutic properties

The stinger is the primary defensive and attack organ of bees, particularly honey bees. The bee stinger is a structurally modified ovipositor found in both queen and worker bees. The venom sac in the final segment of the worker bee's abdomen secretes the bee venom. A whole bee venom sac contains around 0.15 to 0.3 milligrams of bee venom (Ali, 2012). The first two

weeks of an adult worker bee's life are when venom production rises and reaches its peak when the worker bee becomes a forager and defender of the hive (Roat et al., 2006). Honeybee venom is a clear liquid that dries quickly even at room temperature, has an attractive pungent fragrance, a bitter taste, and is a hydrolytic combination of proteins with a basic pH (4.5 to 5.5) that bees utilize for defense (Abdela and Jilo, 2016).

A number of active compounds, including peptides and enzymes, have been found in bee venom that could be useful in the treatment of inflammation and disorders of the central nervous system, including amyotrophic lateral sclerosis, Parkinson's disease, and Alzheimer's disease. Furthermore, studies using bee venom have demonstrated encouraging results against many cancer forms and antiviral activities, including against the difficult human immunodeficiency virus (HIV) (Wehbe et al., 2019). Pharmacologically, bee venom has effects that increase blood circulation, rejuvenate the skin, increase smooth muscle contraction, bactericide, regulate heart rhythm and functions, increase blood flow in the heart and brain vessels, increase adrenaline level, protect against radiation, relieve pain before menstruation period in women, and lowers blood pressure. Bee venom has therapeutic effects in treating acne, atopic dermatitis, alopecia, and psoriasis, and has great anti-aging potential, but potential side effects like allergic reactions limit its use in cosmetics (Łukasiewicz, 2021). Also the components of bee venom exhibit encouraging anti-cancer effects on a variety of cancer types (Lebel et al., 2021).

The active ingredient called Melittin makes up about 50% of the venom. Mellitin is important if it is to be used for apitherapeutic or cosmetic purposes (Banks and Shipolini, 1986). Melittin only induces minor allergic reactions, but causes the majority of the pain associated with bee stings. PLA2 (Phospholipase A) is the most allergenic and immunogenic protein in bee venom. Alone, PLA2 is a non-toxic protein, but when PLA2 forms a complex with melittin, called bee hemolytic factor, it cleaves cellular membrane phospholipids (Damianoglou et al., 2010). It controls blood pressure and is antigenic. MCD Peptide, like Apamin, affects the nerves, but unlike apamin, it causes inflammatory events (Yıldız et al., 2012). Hyaluronidase is an enzyme found in bee venom (1–3%). Hyaluronidase is responsible for fast distribution of toxins, also known as the ‘spreading factor’. Hyaluronidase is considered a potent allergen in bee venom (Clinton et al., 1989).

Bee venom is very sensitive to variability depending on bee races, social status, geographical localization, among other factors (Abd El-Wahed, 2017).

Bee venom production

Bee venom production is a complex process influenced by various factors, including genetic, environmental, and physiological elements. Understanding these factors is crucial for optimizing venom yield in a sustainable and ethical manner. Traditional methods of bee venom collection, such as manual milking, have given way to more refined and humane techniques. The manual process, involving stimulation of bees to sting a collector surface, often led to bee mortality and stress within the hive. In response, modern extraction or bee venom collecting

methods prioritize the well-being of the bee colony while optimizing venom yield. Techniques such as electro-shock method, whereby mild electrical impulses prompt bees to release venom without stinging, have emerged as more ethical alternatives, minimizing harm to the bee population.

Factors effecting bee venom production

A variety of biological and hive management factors influence bee venom secretion and composition, including honey bee intraspecific variation, bee age, colony strength, defense behavior, food supply, season, and technique of venom collection (Nowar, 2016). Also, factors like variations of bee species, pollen source, foraging conditions, queen pheromones, hive conditions and management practices, stress factors, seasonal brood cycle is effective on bee venom prodction.

Understanding the interplay of these factors is essential for beekeepers and researchers seeking to optimize bee venom production while prioritizing the well-being of honeybee colonies. Implementing sustainable practices and minimizing stressors can contribute to ethical and efficient venom collection.

Environmental factors that effects bee venom quantity and quality

Honey bees are the creatures that their entire lives and nutrition depending on nature and environment. Therefore, environmental factors have a very high impact on colony development and production of bee products. As in other bee products; the production process, harvest time, temperature, humidity, and other environmental conditions all have a significant impact on the quality of bee venom (Ghany Zidan et al., 2018; Hussein et al., 2019).

Because of the bees' own life cycle, shifts in the food sources that they may access, and variations in the surrounding temperature and humidity, seasonal variations are one of the significant factors that could influence the composition and quantity of honeybee venom (Çaprazlı and Kekeçoğlu, 2021). During spring, honeybee colonies experience heightened foraging activity as floral resources become abundant. This increased foraging correlates with elevated venom production, as worker bees actively engage in defensive behaviors to protect the expanding colony (Bogdanov, 2015). Ferreira Junior et al., (2010) found that melittin and phospholipase A2 were controlled by seasonal changes without any specific connection with a climate parameter. In addition, the results obtained by El-Bassiony et al., (2016) in their study in Egypt revealed that spring and summer, the time period when the colony is active, are the best intervals for collecting honeybee venom. As a result, researchers stated that this situation has a relationship with the nectar and pollen status that meets the nutritional needs of the colony.

Summer is characterized by optimal weather conditions and a profusion of blooming flowers, leading to peak foraging activity. Research indicates that bee venom production tends to be highest during the summer months, aligning with the increased need for colony defense and resource gathering (Bogdanov, 2015; DeGrandi-Hoffman et al., 2010). As the availability of floral resources diminishes in the fall, honeybee colonies undergo a shift in behavior. Reduced foraging activity during this season is associated with a decline in bee venom production, as the colony prioritizes resource conservation in preparation for winter (Bogdanov, 2015; Simone-Finstrom and Spivak, 2012). Winter is a period of reduced activity for honeybee colonies, marked by lower temperatures and limited foraging opportunities. Bee venom production is minimal during winter, reflecting the colony's focus on survival and energy conservation rather than active defense (Bogdanov, 2015; Simone-Finstrom and Spivak, 2012).

Studies have indicated that the diversity and composition of pollen sources influence the chemical composition of bee venom. Bees foraging on a variety of pollen sources may exhibit variations in venom constituents, potentially impacting the therapeutic properties of the venom (Bogdanov, 2015; Bouzid, B. et al., 2013). The abundance of pollen in the environment has been linked to increased foraging activity among worker bees. Foragers actively collecting pollen may exhibit heightened defensive behaviors, resulting in elevated bee venom production (Bogdanov, 2015; Simone-Finstrom and Spivak, 2010). Bees foraging on specific plant species or sources may incorporate unique compounds from pollen into their venom. The chemical diversity of pollen sources contributes to the complexity of bee venom, potentially influencing its therapeutic properties (Bogdanov, 2015).

Another important factor among environmental conditions is pesticide use. Pesticides, widely used in agriculture to protect crops, have been identified as significant stressors for honeybee populations. The exposure to pesticides can affect various aspects of honeybee biology, including foraging behavior, navigation, and overall colony health, which may consequently influence bee venom production. Sublethal exposure to pesticides, even at concentrations below lethal levels, can have profound impacts on honeybee colonies. These effects may include decreased brood survival, impaired communication, and compromised immune function, all of which may contribute to changes in venom production (Alkassab & Kirchner, 2018; Sánchez-Bayo et al., 2016). Neonicotinoid pesticides, a class of insecticides commonly used in agriculture, have been linked to alterations in honeybee foraging behavior. Studies have shown that exposure to neonicotinoids can impair the ability of worker bees to locate and collect food resources, potentially affecting the overall defensive behavior and venom production within the

colony (Henry et al., 2012; Cresswell, 2011). Chronic exposure to pesticides over an extended period can result in cumulative effects on honeybee colonies. Long-term exposure may lead to sustained stress, compromised immune function, and overall colony decline, potentially influencing the ability of worker bees to produce venom (Kessler et al., 2015; Wu-Smart & Spivak, 2016). Pesticides, such as organophosphates and pyrethroids, can interfere with the normal functioning of honeybee neurotransmitter systems, affecting behavior and communication. Altered neurotransmission may lead to disruptions in the regulation of venom production as part of the defensive response (Desneux et al., 2007; Williamson & Wright, 2013).

Results

Bee venom is an important bee product that holds significant importance in various contexts, including traditional medicine, apitherapy, cosmetics, pharmacology and scientific research. For all these purposes, it is crucially important to ensure the quality of bee venom. Although there are various factors effecting bee venom production and quality, enviromental factors has a huge effect among these. The seasonal patterns align with the natural life cycle and ecological dynamics of honeybee colonies. The intricate interplay between environmental factors, floral availability, and colony needs contributes to the observed variations in bee venom production across seasons. Understanding the interplay between pollen source, nectar availability, pesticides and bee venom production provides valuable insights into the factors influencing the biochemical composition of bee venom. These insights contribute to a broader understanding of the potential therapeutic applications of bee venom. Also it is crucial for developing sustainable agricultural practices that minimize adverse effects on pollinators too.

Abstract

Ermənilər Çar Rusiyası tərəfindən Azərbaycan ərazilərində yerləşdirildiyi gündən etibarən dövlət yaratmaq uğrunda ardıcıl səyləri bir an belə səngiməmiş, nisbətən əlverişli tarixi şərait yarandıqda isə bu səylər daha da yüksəlmişdir. Erməni millətçilərinin “böyük Ermənistan” dövləti yaratmaq xülyası, Azərbaycan türklərini kütləvi surətdə məhv etmək, yaşadıkları yurdlarından qovub çıxarmaqla həmin ərazidə ermənilərin sayca üstünlüyünə nail olmaq və beləliklə, "milli çoxluğun" dövlətini yaratmaq ideyasını reallaşdırmaq planı idi. Bu planın həyata keçirilməsini qarşılıqlı məqsəd qoyan ermənilər xarici himayədarların köməyi ilə müxtəlif vaxtlarda azərbaycanlılara və türklərə qarşı dəhşətli terror, deportasiya, soyqırımı və etnik təmizləmə siyasəti həyata keçirmişlər. Erməni millətçiləri tərəfindən davamlı olaraq təcavüzkarlıq siyasətinə məruz qalan Azərbaycan xalqı öz tarixi torpaqlarından didərgin salınmış, qaçqın və məcburi köçkünə çevrilmişlər. Ermənilər Azərbaycan torpaqlarında dinc əhaliyə qarşı qətl və qarətlərlə yanaşı, tarixi binalar, məscidlər yandırılmış, maddi-mədəniyyət nümunələrini də məhv etmişlər.

Açar sözlər: dövlət, erməni-bolşevik işğalı, Türkiyə-Azərbaycan birliyi,

Keywords: establishing a state, armenian-bolshevik occupation, Turkish-Azerbaijani union

1917-ci il oktyabr çevrilişindən sonra ermənilər öz iddialarını bolşevik bayrağı altında həyata keçirməyə başlamışdılar. 1918-ci ilin martında Stepan Şaumyan Qafqazın fəvqəladə komissarı təyin edilərək Bakıya göndərildi. Həmin vaxtdan “Əks-inqilabi ünsürlərlə mübarizə” şüarı altında maskalanaraq, daşnak-bolşevik Şaumyanın rəhbərliyi ilə Bakı Kommunası Bakı şəhərini azərbaycanlılardan təmizləmək kimi mənfur bir planı həyata keçirməyə qalxmışdı. 1918-ci il martın 30-dan aprelin 3-dək Bakıda və Bakı quberniyasının müxtəlif bölgələrində, eləcə də Qarabağ, Naxçıvan, Şamaxı, Quba, Xaçmaz, Lənkəran, Salyan, Zəngəzur və digər ərazilərdə Bakı Soveti qoşunlarının və daşnak erməni silahlı dəstələrinin azərbaycanlılara qarşı soyqırımını nəticəsində rəsmi mənbələrə əsasən on minlərlə soydaşımız məhz etnik və dini mənsubiyyətinə görə qətlə yetirilib, yaşayış məntəqələri, tarixi abidələr, məscid və qəbiristanlıqlar viran edilib. [1,səh.257] 1918-ci il martın 31-də Bakı şəhərində azərbaycanlıların kütləvi qırğınına başlanılıb. Dinc azərbaycanlıların qırğınında Bakı Sovetinin 6 min silahlı əsgəri, eyni zamanda, “Daşnaksütyun” partiyasının 4 minlik silahlı dəstəsi iştirak edib. Üç gün davam edən soyqırımını zamanı erməni silahlıları bolşeviklərin köməyi ilə azərbaycanlıların yaşadıkları məhəllələrə qəflətən basqınlar edərək rastlarına çıxan uşaqlardan böyüyədək hər kəsi qətlə yetiriblər. Tarixi faktlardan belə görünür ki, ermənilər “böyük Ermənistan” dövləti yaratmaq arzusunu həyata keçirə bilməsələr də, **1918-ci ildə Azərbaycan torpaqlarında– keçmiş İrəvan xanlığının ərazisində Ermənistan Respublikasının yaradılmasına** nail oldular.

1918-ci ilin may ayının 28-də Azərbaycan Xalq Cümhuriyyəti elan olunandan sonra xarici qüvvələr onun devrilməsi üçün bütün imkanlardan istifadə etməyə çalışarkən Osmanlı Türkiyəsinin göstərdiyi hərbi və siyasi yardım milli dövlətçilik tariximizdə çox mühüm rol oynadı. [2,səh.59] Bakıda hakimiyyəti ələ keçirmiş Stepan Şaumyanın başçılıq etdiyi daşnak-bolşevik rejiminin Azərbaycanın türk-müsəlman əhalisinə qarşı həyata keçirdiyi kütləvi soyqırımının qarşısını almaq və Azərbaycan xalqının müstəqilliyini qorumaq üçün Osmanlı Türkiyəsi və Azərbaycan silahlı qüvvələrindən təşkil edilmiş hərbi struktur Azərbaycan Xalq Cümhuriyyətinin elan edildiyi günlərdən 1918-ci ilin noyabrına qədər fəaliyyət göstərmişdir. Qafqaz İslam Orusunun yaradılmasına hələ 1918-ci ilin əvvəllərində başlanmışdı. Azərbaycan xalqına qarşı daşnak-bolşevik soyqırımının yaxınlaşması ilə bağlı olaraq Azərbaycan milli azadlıq hərəkatının liderləri yeganə çıxış yolunu Osmanlı Türkiyəsindən hərbi yardım almaqda görürdülər. Eyni zamanda I Dünya müharibəsindən sonra ermənilərin Şərqi Anadoluda törətdikləri vəhşilikləri və soyqırımını Azərbaycanda da həyata keçirmələri burada yaşayan türkləri Osmanlı dövlətindən yardım

istəməyə məcbur qoydu. Bolşevik çevrilişinin Rusiyada yaratdığı sarsıntı, Qafqazda rus hakimiyyətinin iflası uğraması, Azərbaycanın demokratik qüvvələrinin Osmanlıdan yardım istəməsi, burada hərbi hərəkata başlamaq üçün əlverişli şəraitin yaranması Ənvər paşaya müharibənin əvvəlindən bəri gözlədiyi tarixi fürsəti həyata keçirməyə imkan verdi. [3]

Qafqaz İslam Ordusunun hissə və bölmələrindən ibarət struktur yaranan gündən Azərbaycanın istiqlaliyyətini məhv etmək üçün irimiqyaslı hərbi əməliyyatlara başlamış bolşevik-daşnak qüvvələri ilə ağır döyüşlərə atıldı. Azərbaycan Hökuməti və bütün Azərbaycan xalqı tərəfindən hərtərəfli dəstəklənən Qafqaz İslam Ordusunun türk və Azərbaycan hərbi qüvvələri Gəncə ermənilərinin tərksilah edilməsində, Qaraməryəm, Kürdəmir, Şamaxı, Binəqədi döyüşlərində və s. vuruşmalarda, hərbi tapşırıqların icrasında misilsiz şücaət göstərdilər, bolşevik-daşnak qüvvələrinə ağır zərbə endirərək, onları bütün cəbhə boyu geri çəkilməyə məcbur etdilər. [4.səh.33]

Qafqaz İslam Ordusu vasitəsilə Azərbaycan hökuməti öz hakimiyyətini tezliklə yerlərdə yaya bildi, ucqarlarda dövlət orqanları yaratmağa başladı. Bakı Xalq Komissarları Sovetinin liderləri Azərbaycan Xalq Cümhuriyyətini bələkdə ikən boğmaq üçün yollar axtarırdılar. Hələ Gəncə üzərinə yürüşə başlamazdan əvvəl Leninin tapşırığı ilə Şaumyan türk qoşunlarının Azərbaycana yolunu bağlamaq üçün Gürcüstan hökumətinin başçısı Jordaniyaya müraciətində, əgər Gürcüstan türk qoşunlarını öz ərazisindən Azərbaycana buraxmasa, Sovet Rusiyası onun müstəqilliyini tanıyacaqdır deyə vəd vermişdir. Azərbaycanın şərqində kommunist dikturası yaradan Şaumyan Bakı Sovetinin ixtiyarında olan 18 min döyüşçü ilə Güney Qafqazdakı milli hərəkəti boğmaq üçün hücumla başladı. İyunun 10-da Bakı Sovetinin Gəncə istiqamətində yürüşləri başlandı. İyunun 12-də Kürdəmiri işğal edən Bakı Soveti qüvvələri Göyçaya yaxınlaşdılar. İki həftədən çox davam edən qanlı döyüşlər Türkiyədən göndərilən əlavə qüvvələrin və Azərbaycan könüllüləri hesabına Qafqaz İslam Ordusunun qələbəsi ilə nəticələndi. Qafqaz İslam Ordusunun Göyçay ətrafındakı qələbəsi Azərbaycanın Şərq hissəsini, o cümlədən Bakını bolşevik-daşnak işğalından azad etmək uğrunda apardığı şərəfli mücadilədə dönüş nöqtəsi oldu.

Bu döyüşlərdə Bakı Soveti qoşunlarına elə ağır zərbələr vuruldu ki, onlar bir daha özlərinə gələ bilmədilər. [4.səh.33-34] Qafqaz İslam Ordusu bolşevik-daşnak birləşmələrini darmadağın edərək Bakı istiqamətində azadlıq yürüşünə başladı. İyulun 20-də bu istiqamətdə mühüm strateji məntəqə olan Şamaxı şəhəri azad edildi. İyulun sonunda S.Şaumyanın rəhbərlik etdiyi Bakı Soveti istefa verməyə məcbur oldu. 1918-ci il avqustun

1-də Bakıda eser, menşevik və daşnaklardan ibarət "Sentrokaspi" diktaturası adlanan mürtəce bir qurum yaradıldı. Qafqaz İslam Ordusu sentyabrın 15-də Bakı üzərinə həlledici hücumu başladı.

Bakı üzərinə hücumu uğurla başa çatdırmaq üçün Qafqaz İslam Ordusunun əsgər və zabitlərinin sayını 14 minə çatırdı. Bunların 8 mini osmanlı, 6 mini isə azərbaycanlı əsgər və zabit idi. Hücum planına görə, Ermənikəndin cənubundan keçmək şərti ilə şəhərin qərb hissəsinin ələ keçirilməsi həvalə olunmuş 15-ci diviziya sağ cinahı Ermənikənddən keçmək şərti ilə şəhərin şimal və şərqindən irəliləməli, Qaraşəhər ərazisini nəzarət altına almalı idi. Azərbaycan könüllü hissələri isə Sabunçudan şəhərə gələn dəmir yolu xətti boyunca hücumu keçib Keşləyə girməli və orada möhkəmlənməli idi. Milli qüvvələrin digər bir hissəsinə Əhmədli istiqamətindən şəhərə doğru hücumu keçmək həvalə olunmuşdu. [4.səh.101] Şəhər saatlarında bütün istiqamətlərdə başlanan hücum öz uğurlu nəticəsini verdi. Qaraşəhər, Ermənikənd və Əhmədli istiqamətində düşmənin hücumu qətiyyətlə dəf edildi.

Qafqaz İslam Ordusunun qarşısının alınmasının qeyri-mümkünlüyünü görən "Sentrokaspi" ordusunun qərb cəbhəsinin komandanı ağ bayraq qaldıraraq danışıqlara gəlir və ona aşağıdakı şərtlər diktə edilir: 1. Şəhərin qeyd-şərtsiz təslim edilməsi; 2. Şəhərdəki düşmən qüvvələrin təslim edilməsi; 3. Top və silahların, binaların və digər obyektlərin təslim edilməsi; 4. Nargin adasında olan türk, alman və Avstriya əsirlərinin azad edilməsi; 5. Silah anbarlarının, ərzağın, avtomobillərin, yük maşınlarının, zirehli avtomobillərin, təyyarələrin və digər hərbi mülkiyyətin təslim edilməsi. Bu şərtlərin qəbul edilməsi ilə yanaşı, əhalini sakitliyə, onların həyatları və mülklərinin təhlükəsizliyi üçün xüsusi bəyanat hazırlanaraq, "Sentrokaspi" nümayəndə heyətinə verildi.

Osmanlı Türkiyəsi qardaş Azərbaycanın ərazi bütövlüyünü təmin etmək məqsədilə Nuru paşanın rəhbərlik etdiyi Qafqaz İslam Ordusu Bakını erməni-bolşevik əsarətindən, ermənilərin soyqırımına məruz qalan azərbaycanlıları qaniçən Şaumyanın başçılıq etdiyi daşnak-bolşevik quldur dəstələrindən xilas edərək, sözün əsl mənasında, azərbaycanlı qardaşlarına kömək oldular. Məlum olduğu kimi, ermənilərin azərbaycanlılara qarşı həyata keçirdikləri soyqırımı siyasətinin əsas məğzi xalqımızı cismən məhv etmək və "böyük Ermənistan" xülyasını gerçəkləşdirmək idi. Amma türk qardaşlığı bu mənfur planın reallaşmasına imkan vermədi. [4]

Beləliklə, sentyabrın 15-i saat 15-dən sonra Bakı şəhəri bütünlüklə Qafqaz İslam Ordusunun nəzarəti altına keçdi. Nuru paşa Bakının ələ keçirilməsilə bağlı hərbi nazir Ənvər paşaya,

Gəncədəki Azərbaycan hökumətinə təbrik teleqramı göndərirdi. Nuru paşa Azərbaycan hökumətindən xahiş edirdi ki, Bakıda asayişin təmin edilməsi üçün Gəncədən polis qüvvələrinin göndərilməsini tezləşdirsin.

Azərbaycan hökuməti sentyabrın 17-də Bakı şəhərinə köçdü. 1918-ci il mayın 28-dən sonrakı dövrdə Azərbaycanın həyatında ikinci mühüm hadisə baş verdi: Bakı azad edildi və Azərbaycan hökuməti tam heyətdə əsl paytaxtda qərarlaşdı. [4.səh.33-35]

Bakı şəhərinin azad edilməsi həm Azərbaycan ictimaiyyətinin, həm də Osmanlı dövlət rəhbərlərinin, xüsusilə Ənvər paşanın çox böyük sevincinə səbəb oldu. O, Şərqi Ordular Qrupunun komandanı Xəlil paşaya göndərdiyi teleqramda deyirdi: “Bakı başarısından dolayı gözlərindən öpərək təbrik edirəm”. Ənvər paşa Nuru paşaya göndərdiyi teleqramda yazırdı: “Böyük Turan İmperatorluğunun Xəzər kənarındakı zəngin bir qonaq yeri olan Bakı şəhərinin azad edilməsi xəbərini böyük bir sevinc və mutluluqla qarşıladım. Türk və İslam tarixi sizin bu xidmətinizi unutmayacaqdır. Qazilərimizin gözündən öpür, şəhidlərimizə fatihələr ithaf edirəm”. Bu tarixi günü və hadisəni M.Ə.Rəsulzadə belə dəyərləndirirdi: “15 sentyabr Azərbaycan xalqının tarixində 28 mayı qədər böyük dəyərə malikdir. Əgər 28 mayda Cümhuriyyətin istiqlalı bütün dünyaya elan edilmişdisə, 15 sentyabrda bu istiqlal real bir təməl üzərində qurulmuş oldu. 15 sentyabrda Qafqaz İslam Ordusu tərəfindən Bakının azad edilməsi ilə başla bədən birləşmiş oldu. Bakı baş, bədən isə Azərbaycandır”.

Azərbaycan hökumətinin başçısı Fətəli xan Xoyski Bakının azad edilməsi münasibətilə Nuru paşaya yazırdı: “Cəsur türk əsgərlərinin Azərbaycanın baş kəndi olan Bakının düşməndən təmizlənməsi münasibətilə millətimin adından dünyanın ən cəsur və soylu əsgəri olan türkün oğullarına minnətdar olduğumuzu ərz etməklə iftixar duyuram. Millət sizə minnətdardır”.

[5] Bakıya daxil olan Türk Ordusunun komandanları Nuru paşa, Xəlil paşa, Mürsəl paşa və başqaları Hacı Zeynalabdin Tağıyevin dəvətini qəbul edərək onun evində qaldılar. Qoşunların Bakıya gəlib bu şəhəri azad edəcəyi təqdirdə ikimərtəbəli böyük malikanəsini türk qoşunları komandanlığına bəxşiş edəcəyini vəd edən Tağıyev sözünə sahib çıxdı. O, öz mülkünü türk qoşunlarının komandanlığının istifadəsinə verdi.

Tarix boyu Türkiyə və Azərbaycan arasında sarsılmaz dostluq və qardaşlıq münasibətləri mövcud olan hər iki xalq istər xoş günlərdə, istərsə də çətin vaxtlarda birlik nümayiş etdiriblər. Türkiyə-Azərbaycan birliyinin çoxəsrlik tarixində yaddaqalan məqamlardan biri də və mən deyərdim ki, ən önəmlisi 15 sentyabr qəhrəman türk əsgərlərinin şücaəti və qanı bahasına Bakı və digər rayonların azad olunması idi. [7] Sevindirici haldır ki, Türkiyə-Azərbaycan birliyi, dostluğu və qardaşlığı bu gün də uğurla davam edir, xalqlarımız arasındakı doğma münasibətlər

daha da d rinl ş r k yeni m rh l y  q d m qoyur. B t n bunlar onu g st rir ki,  b di v   z li
Az rbaycan-T rkiy  birliyi, dostluęu, qardaşlıęı sarsılmazdır v  daim bel  d  olacaę.

ÖZET

Bu araştırmanın amacı; Şırnak Gençlik ve Spor İl Müdürlüğü çalışanlarının yaşam becerilerinde sporun etkisini çeşitli değişkenler perspektifinden incelemektir. Araştırmanın örneklemini 35'i kadın ve 71'i erkek olmak üzere toplam 106 kişi oluşturmaktadır. Anketler, Şırnak Gençlik ve Spor merkezinde ve ilçelerinde yer alan merkezlerde yüz yüze anket yolu ile elde edilmiştir. Araştırmada veri toplama aracı olarak; "Kişisel Bilgi Formu" ve "Sporun Yaşam Becerilerine Etkisi Ölçeği" kullanılmıştır. Veriler SPSS programı kullanılarak analiz edilmiştir. Verilerin normal dağılım gösterip göstermediğinin tespit edilmesinden sonra analizler gerekli testler ile yapılmıştır. Katılımcıların demografik verilerinin dağılımının belirlenmesi için betimsel istatistik yöntemler, yüzde (%) ve frekans (f) analizleri uygulanmıştır. Araştırmada verilerin incelenmesinde t testi ve One-Way ANOVA testlerinden faydalanılmış olup, anlamlılık düzeyi $p < 0,05$ olarak kabul edilmiştir. Bulgular ışığında incelendiğinde cinsiyet değişkenine göre katılımcıların yaşam becerileri incelendiğinde istatistiksel olarak anlamlı bir fark tespit edilmemiştir. Katılımcıların yaşam becerileri eğitim düzeyine göre incelendiğinde duygusal beceri ve amaç belirleme alt boyutlarındaki farkın istatistiksel olarak anlamlı olduğu belirlenmiştir. Katılımcıların yaşam becerileri spora katılım şekline göre incelendiğinde liderlik, takım çalışması, duygusal beceri, amaç belirleme alt boyutlarında ve toplam puanda anlamlı farklılık tespit edilmiştir. Çalışmada, katılımcıların yaşam becerileri üzerinde eğitim düzeyi, spora katılım şekli ve düzenli spor yapma gibi birçok demografik değişkenin etkili olduğu sonucuna ulaşılmıştır.

Anahtar kelimeler: Yaşam Becerileri, Spor, Gençlik ve Spor.

**THE EFFECT OF SPORTS ON LIFE SKILLS BEHAVIORS: A RESEARCH ON
YOUTH AND SPORTS PERSONNEL**

ABSTRACT

The purpose of this research; The aim is to examine the effect of sports on the life skills of Şırnak Youth and Sports Provincial Directorate employees from the perspective of various variables. The sample of the research consists of a total of 106 people, 35 women and 71 men. The surveys were obtained through face-to-face surveys in Şırnak Youth and Sports Center and its districts. As a data collection tool in the research; “Personal Information Form” and “The Impact of Sports on Life Skills Scale” were used. The data were analyzed using the SPSS program. After determining whether the data showed normal distribution, analyzes were carried out with the necessary tests. Descriptive statistical methods, percentage (%) and frequency (f) analyzes were applied to determine the distribution of the demographic data of the participants. In the study, t-test and One-Way ANOVA tests were used to examine the data, and the significance level was accepted as $p < 0.05$. When examined in the light of the findings, no statistically significant difference was detected when the life skills of the participants were examined according to the gender variable. When the life skills of the participants were examined according to their education level, it was determined that the difference in the emotional skills and goal setting sub-dimensions was statistically significant. When the life skills of the participants were examined according to the type of participation in sports, a significant difference was detected in the sub-dimensions of leadership, teamwork, emotional skills, goal setting and the total score. The study concluded that many demographic variables, such as education level, type of participation in sports and regular sports activities, were effective on the life skills of the participants.

Keywords: Life Skills, Sports, Youth and Sports.

GİRİŞ

Dünya Sağlık Örgütü'ne (1993) göre, yaşam becerileri bireyin yaşamında son derece önemli olan yeteneklerdir. Bu beceriler, kişilerin özel yaşamları veya iş hayatları gibi farklı bağlamlarda başarılı olmalarını sağlar. Bu yetenekler sayesinde bireyler yaşadıkları ortama uyum sağlayarak yaşam kalitelerini artırır. Yüksek seviyede yaşam becerilerine sahip olmak, günlük yaşamda karşılaşılan olumsuz deneyimlerle başa çıkmayı ve daha üretken bir şekilde mutlu bir yaşam sürmeyi mümkün kılar (Özer, 2023). UNICEF (United Nations Children's Fund), yaşam becerilerini, bireylerin bilinçli olarak kararlar alabilmelerine, etkili bir iletişim kurabilmelerine, sağlıklı ve üretken bir hayat sürdürebilmelerine, zorluklarla baş edebilme ve öz yönetim yeteneklerini geliştirebilmelerine yardımcı olabilecek çeşitli psiko-sosyal ve kişilerarası becerilerin bir grubu olarak tanımlamaktadır (UNICEF, 2019).

Spor kavramı; içerisinde belli kuralları barındıran, bireyin üstünlük ve güç gibi duygularını tatmin etmeyi hedefleyen, sosyal bütünleşme ve rekabete duygusuna dayalı ruhsal, bedensel ve zihinsel aktivitelerin tamamıdır (Aydemir, 2014). Yaşam becerilerinin geliştirilmesi ve aktarılmasında spor bir araç olarak kullanılabilir. Spor, gençlerin katılım sağladığı kıymetli bir sosyal aktivite olarak görülmektedir. Bu bağlamda yaşam becerilerinin geliştirilmesinde sporu kullanmak hem spor camiası tarafından hem de gençlik geliştirme kampanyaları ile okullar da büyük öneme sahiptir. Sporun kimlik ve özgüven gelişimi önemli faktörlere sahip olmak gibi pek çok pozitif sürece katkı sağladığı bilinen bir gerçektir (Allen vd., 2015). Bu bilgiler ışığında araştırmanın amacı; Şirnak Gençlik ve Spor İl Müdürlüğü çalışanlarının yaşam becerilerinde sporun etkisini incelemektir.

YÖNTEM

Araştırma Modeli

Araştırma nicel araştırma desenine bağlı kalınarak yapılmıştır. Araştırma betimsel tarama modelinde gerçekleştirilmiştir. Tarama modelleri, önceden veya günümüzde mevcut olan bir durumu olduğu gibi betimlemeyi amaçlamaktadırlar (Karasar, 2014).

Evren ve Örneklem

Araştırmanın örneklemini toplam 106 kişi (35 kadın-71 erkek) oluşturmaktadır. Anketler, Şirnak Gençlik ve Spor merkezinde ve ilçelerinde yer alan merkezlerden elde edilmiştir.

Veri Toplama Araçları

Bu araştırma kapsamında spor yapan bireylerden veri toplamak amacıyla bireylerin demografik özelliklerine ilişkin verileri elde etmek için "Kişisel Bilgi Formu" kullanılmıştır. İlaveten katılımcılara "Sporun Yaşam Becerilerine Etkisi Ölçeği" uygulanmıştır.

Sporun Yaşam Becerilerine Etkisi Ölçeği: Cronin ve Allen (2017) tarafından geliştirilen bu ölçek 5'li Likert tipindedir. Düz ve Aak (2018) tarafından Trk kltrne uyarlanmıřtır. lek 7 alt boyut ve 31 maddeyi kapsamaktadır. Bu alt boyutlar; zaman ynetimi, iletiřim, liderlik, takım alıřması, ama belirleme, sosyal beceriler ve duygusal becerilerdir. alıřmanın i tutarlık katsayısı .92 olarak hesaplanmıřtır (Dz ve Aak, 2014).

Verilerin Analizi

Demografik verilerin belirlenmesinde yzde (%) ve frekans (f) analizleri yapılmıřtır. İlaveten t testi ve ok Ynl Varyans Analizi (ANOVA) kullanılmıřtır. Farklılık tespitinde ise Tukey post-hoc uygulanmıřtır.

BULGULAR

Bu blmde demografik bilgiler grafik řeklinde gsterilmiřtir. İlaveten alıřmanın amacı doęrultusunda gerekleřtirilen hipotez testlerine ait bulgulara yer verilmiřtir.

TARTIŞMA VE SONUÇ

Araştırmanın amacı, Şirnak Gençlik ve Spor İl Müdürlüğü çalışanlarının yaşam becerilerinde sporun etkisini incelemektir. Analizlerin akabinde elde edilen bilgiler ışığında bu bölümde aşağıdaki yorumlamalara yer verilmiştir.

Bulgular ışığında cinsiyet değişkenine göre katılımcıların yaşam becerileri incelendiğinde istatistiksel olarak anlamlı bir fark tespit edilmemiştir. Çalışmaya benzer şekilde, bazı yapılan araştırmalarda cinsiyet değişkeni açısından istatistiksel olarak anlamlı farklılığa rastlanmamıştır (Akıncı ve Çimen, 2021; Kardağ, 2019; Yılmaz, 2020). Aksine bazı çalışmalarda cinsiyet yönünden anlamlı farklılıklar tespit edilmiştir (Yılgin, 2022; Sarı ve Bozdağ, 2021).

Katılımcıların yaşam becerileri eğitim düzeyine göre incelendiğinde duygusal beceri ve amaç belirleme alt boyutlarındaki farkın istatistiksel olarak anlamlı olduğu belirlenmiştir. Yilmiz (2020) eğitim durumuna göre inceleme yapmış ve sporun yaşam becerileri üzerinde olumlu etkisi olduğunu belirlemiştir. Çimen ve Akıncı (2021) ise çalışmalarında yaşam becerileri üzerinde eğitim durumunu incelemiş olup sosyal beceriler ve duygusal beceriler alt boyutlarında anlamlı farklılıklar tespit etmiştir.

Katılımcıların medeni durumlarına göre yaşam becerileri incelendiğinde; alt boyutlardaki farkın istatistiksel olarak anlamlı düzeyde olmadığı tespit edilmiştir. Yapılan bir araştırmada medeni durum bağlamında yaşam becerileri incelenmiş olup farkın anlamlı olduğu belirlenmiştir (Çimen ve Akıncı, 2021).

Katılımcıların yaşam becerileri spor yapma durumlarına göre incelendiğinde zaman yönetimi, iletişim, sosyal beceri alt boyutlarında ve toplam puanda anlamlı farklılık tespit edilmiştir. Girmen (2012) araştırmasında iletişim, karar verme, iş birliği ve takım olma, eğlenme, problem çözme, öz yönetim, duygu yönetimi gibi bazı özelliklerin etkinlikle birlikte geliştirilebileceği sonucuna ulaşmıştır. Ryan ve Dzewaltowski (2002) çalışmalarında spor yapan gençlerde özgüvenlerin arttığı ve onların sorunlara daha kolay çözüm bulabildikleri saptanmıştır. Ayrıca daha sosyal oldukları belirlenmiştir.

Katılımcıların yaşam becerileri spor yapma sıklığına göre incelendiğinde yaşam becerileri alt boyutlarında anlamlı farklılık meydana gelmemiştir. Turan vd. (2022) araştırmalarında katılımcıların yaşam becerilerini spor yapma sıklığına göre değerlendirmiş ve zaman yönetimi alt boyutunda gruplar arasında anlamlı farklılıklara rastlamışlardır.

Katılımcıların yaşam becerileri spora katılım şekline göre incelendiğinde liderlik, takım çalışması, duygusal beceri, amaç belirleme alt boyutlarında ve toplam puanda anlamlı farklılık tespit edilmiştir. Buna karşın katılımcıların yaşam becerileri spor yapma amacına göre incelendiğinde istatistiksel olarak anlamlı bir fark tespit edilmemiştir. Turan vd. (2022) çalışmalarında sportif etkinliklerin yaşam becerileri üzerinde yüksek düzeyde etkiye sahip olduğunu belirlemişlerdir. İlâveten başka bir çalışmada da belirtildiği gibi sporun yaşam becerilerindeki birçok durumu etkilediği için bireylerin hayatında çok önemli bir yere sahip

olduđu vurgulanmıřtır. İř hayatı, bireysel iliřkiler, sosyal yařam, empati kurma, yaratıcı dūřunme, öz farkındalık oluřturma, problem cözme ve sađlık aısından ve birok yönden bireye katkı sunmaktadır (Botvin ve Griffin, 2004). Yine pek ok alıřmada da yařam becerilerinin bireyin yařamında ok büyük öneme sahip olduđu ve sporun kiřisel ve yařam becerileri üzerinde olumlu yönde katkıları olduđu ifade edilmiřtir (Burton vd., 2001; Judge vd., 2005; Claessens vd., 2007; Jones ve Lavalley, 2009; Gould ve Carson, 2010; Humphrey vd., 2011; Sevindik ve Kıyıcı, 2021).

alıřmada, katılımcıların yařam becerileri üzerinde eđitim düzeyi, spora katılım řekli ve düzenli spor yapma gibi birok demografik deđiřkenin etkili olduđu sonucuna ulařılmıřtır. Buna karřın cinsiyet ve medeni durum gibi unsurların yařam becerileri üzerinde bir etkiye sahip olmadıđı görölmektedir.

ÖZET

Bu araştırmanın amacı; Şırnak'ta doğa yürüyüşlerine katılan bireylerin motivasyonlarını çeşitli değişkenler açısından incelemektir. Araştırmanın örnekleme tesadüfi örnekleme yöntemi ile seçilen 118 katılımcıdan oluşmuştur. Bu katılımcıların 69'u erkek ve 49'u kadın katılımcıdır. Araştırmada veri toplama aracı olarak; "Kişisel Bilgi Formu" ve "Doğa Yürüyüşlerine Katılım Motivasyon Ölçeği" kullanılmıştır. Veriler Jamovi. (Version 2.4) programı ile analiz edilmiştir. Katılımcıların demografik verilerinin dağılımının belirlenmesi için betimsel istatistik yöntemler, yüzde (%) ve frekans (f) analizleri uygulanmıştır. Araştırmada verilerin incelenmesinde t testi ve One-Way ANOVA testlerinden faydalanılmış olup, anlamlılık düzeyi $p < 0,05$ olarak kabul edilmiştir. Bulgular ışığında incelendiğinde cinsiyete göre doğa yürüyüşleri katılım motivasyonu düzeylerinde zaman alt boyutunda kadınlar lehine anlamlı bir farklılık tespit edilmiştir. Katılımcıların yıl değişkenine göre doğa yürüyüşü katılım motivasyonları düzeylerinde herhangi bir farklılığa rastlanmamıştır. Katılımcıların doğa yürüyüşü yapma sıklığı değişkenine göre doğa yürüyüşü katılım motivasyonları arasında sosyal, eğitim ve zaman boyutunda anlamlı farklılık tespit edilmiştir. Çalışmada, katılımcıların serbest zaman motivasyonları üzerinde cinsiyet ve doğa yürüyüşü yapma sıklığı gibi demografik değişkenlerin etkili olduğu sonucuna ulaşılmıştır. Buna karşın medeni durum, yıl değişkeni ve yaş gibi unsurların doğa yürüyüşlerine katılım motivasyonları üzerinde bir etkiye sahip olmadığı görülmektedir.

Anahtar kelimeler: Doğa Yürüyüşleri, Motivasyon, Spor.

**INVESTIGATION OF NATURE WALKS PARTICIPATION MOTIVATIONS:
ŞIRNAK PROVINCE CASE**

ABSTRACT

The purpose of this research; The aim is to examine the motivations of individuals participating in nature walks in Şırnak in terms of various variables. The sample of the research consisted of 118 participants selected by random sampling method. 69 of these participants are male and 49 are female participants. As a data collection tool in the research; “Personal Information Form” and “Nature Walk Participation Motivation Scale” were used. Data Jamovi. It was analyzed with the program (Version 2.4). Descriptive statistical methods, percentage (%) and frequency (f) analyzes were applied to determine the distribution of the demographic data of the participants. In the study, t-test and One-Way ANOVA tests were used to examine the data, and the significance level was accepted as $p < 0.05$. When examined in the light of the findings, a significant difference was detected in favor of women in the time sub-dimension in nature walk participation motivation levels according to gender. There was no difference in the participants' hiking participation motivation levels according to the year variable. According to the variable of the participants' frequency of hiking, a significant difference was detected between the motivations for hiking participation in social, educational and time dimensions. The study concluded that demographic variables such as gender and frequency of hiking were effective on the participants' leisure motivation. On the other hand, it seems that factors such as marital status, year variable and age do not have an effect on motivations to participate in nature walks.

Key words: Nature Walks, Motivation, Sports.

GİRİŞ

Doğada yapılan her türlü spor doğa sporları olarak tanımlanmaktadır (Ardahan ve Yerlisu Lapa, 2011). Doğa yürüyüşleri tüm insanların rahat bir şekilde yapabileceği çok fazla teknik beceri ve yeterlilik gerektirmeyen bir faaliyettir. Bu bağlamda biraz bilgilendirme ve kondisyon ile birlikte tüm bireylere hitap eden bir aktivitedir. Doğa sporları adrenalini yüksek seviyede tutmaktadır. Ayrıca gerek insan sağlığına katkıda bulunmasıyla gerekse bireylerin gelişimine fayda sağlaması yönüyle tartışma gerektirmeyen diğer bir gerçektir. Doğa sporları bireyin dayanıklılık, uygulama, disiplin, uyum, kararlılık ve karar verme gibi becerilerini geliştirmektedir (Moynier, 2004). İbrahim ve Cordes (2002), doğa yürüyüşünün ağaçların çok olduğu güzel manzaralar içinde gününbirlik yürüyüş yapılması olarak tanımlanmaktadır. Araştırmalarda doğa sporlarının liderlik, sorumluluk alma, yenilik arayışı, kendini tanıma-geliştirme, rekabet ihtiyacı, risk alma gibi durumlar ortaya konmuştur. Bireylerin doğa sporlarında ekip halinde çalışmalarını onlara sosyal etkileşim ve takım çalışması gibi becerilerini geliştirme fırsatı sağlamaktadır (Wagner ve Campbell, 1994; Demir, 2003; Plummer, 2009; Ardahan ve Yerlisu Lapa, 2011; Burak ve ark., 2016). Bu bilgiler ışığında araştırmanın amacı; Şırnak'ta doğa yürüyüşlerine katılan bireylerin motivasyonlarını incelemektir.

YÖNTEM

Araştırma Modeli

Araştırma nicel araştırma desenine bağlı kalınarak yapılmış olup betimsel tarama modelindedir. Bu model, önceden olan ya da günümüzde hali hazırda olan bir durumu olduğu gibi betimlemektedir (Karasar, 2014).

Çalışma Grubu

Çalışmanın evreni Şırnak ilinde doğa yürüyüşlerine katılan katılımcılardır. Örneklem ise tesadüfi örnekleme yöntemi ile seçilen 118 katılımcıdan oluşmuştur. Bu katılımcıların 69'u erkek ve 49'u kadın katılımcıdır.

Veri Toplama Araçları

Bu araştırma kapsamında spor yapan bireylerden veri toplamak amacıyla bireylerin demografik özelliklerine yönelik verileri belirlemek için "Kişisel Bilgi Formu" kullanılmıştır. İlaveten katılımcılara "Doğa Yürüyüşlerine Katılım Motivasyon Ölçeği" uygulanmıştır.

Doğa Yürüyüşlerine Katılım Motivasyon Ölçeği: Ekinci ve arkadaşları (2012) tarafından geliştirilmiştir. Ölçek 24 madde ve 5 alt boyuttan oluşmaktadır. Güvenirlilik analizleri sonucuna göre ölçeğin iç tutarlık katsayısı 0,83 olarak bulunmuştur. Bu araştırma için ise iç tutarlılık katsayı değeri $\alpha=0.943$ olarak bulunmuştur. Anket beşli likert (hiç katılmıyorum=1 Tamamen

Katılıyorum =5) tipine göre hazırlanmıştır. Veriler Jamovi. (Version 2.4) programı ile analiz edilmiştir.

Verilerin Analizi

Demografik verilerin belirlenmesinde yüzde (%) ve frekans (f) analizleri yapılmıştır. İlaveten t testi ve Çok Yönlü Varyans Analizi (ANOVA) kullanılmıştır. Farklılık tespitinde ise Tukey post-hoc uygulanmıştır.

BULGULAR

Bu bölümde demografik bilgiler grafik şeklinde gösterilmiştir. İlaveten çalışmanın amacı doğrultusunda gerçekleştirilen hipotez testlerine ait bulgulara yer verilmiştir.

Tablo 1. Cinsiyete göre doğa yürüyüşlerine katılım motivasyon düzeyleri

Alt Boyutlar	Cinsiyet	N	Ort.	SS	t	p

TARTIŞMA VE SONUÇ

Araştırmanın amacı, Şırnak'ta doğa yürüyüşlerine katılan bireylerin motivasyonlarını incelemektir. Analizlerin akabinde elde edilen bilgiler ışığında bu bölümde aşağıdaki yorumlamalara yer verilmiştir.

Bulgular ışığında cinsiyete göre doğa yürüyüşleri katılım motivasyonu düzeylerinde zaman alt boyutunda kadınlar lehine anlamlı bir farklılık tespit edilmiştir. Brömen (2008) tarafından yapılan bir çalışmada doğa yürüyüşçülerinin büyük bir bölümünün erkeklerden oluştuğu belirtilmektedir. Önceki çalışmalar kadın ve erkek katılımcılar arasında doğa yürüyüşü konusunda bazı farklılıklar olduğunu göstermektedir. Çeşitli çalışmalarda erkeklerin doğa yürüyüşlerinde daha zorlu ve uzun parkurları tercih ettiği, kadınların ise kısa ve kolay parkurlarda doğa yürüyüşü yapmayı istedikleri belirtilmektedir (Schmidt, 2007). Kalkan'ın (2012) yürüttüğü araştırmada ise katılım nedenleri arasında ilgi alanı olması ve doğayla bütünleşme konusunda kadınlar daha ön plana çıkarken erkeklerin daha çok çevresindekilerin etkisiyle doğa yürüyüşlerine katıldığı tespit edilmiştir. Katılımcıların medeni durumuna göre doğa yürüyüşleri katılım motivasyonu arasında anlamlı bir farklılık tespit edilememiştir. Gürsoy ve Tengilimoğlu (2019) çalışmalarında katılımcıların medeni durumlarına göre yapılan katılım nedeni ortalama karşılaştırmaları sonucunda evli ve bekar katılımcılar arasında her önerme için küçük farklar bulunmasına karşın “yeni bir çevre edinme” ve “yeni beceriler edinme ve onları kullanma” önermeleri dışında anlamlı bir fark tespit etmemişlerdir.

Katılımcıların yıl değişkenine göre doğa yürüyüşü katılım motivasyonları düzeylerinde herhangi bir farklılığa rastlanmamıştır. Kalkan (2012) araştırmasında katılımcıların çoğunluğu aktiviteye beş yıldan daha az zamandır katılım sağlamaktadırlar. Uzun zamandır bu etkinlikleri yapanların oranının düşük olması birçok sebepten yorumlanmaktadır. Bunlar; aktivitelerin yeni yaygınlaşmaya başlaması, araç-gereçlere erişilebilirliğin zor olması, doğaya ulaşım noktasında güçlük yaşanması, eğitimin eksikliği, doğaya gidilen yerlerle alakalı düzenlemelerin olmaması ve güvenlik problemleridir.

Katılımcıların yaş değişkenine göre doğa yürüyüşü katılım motivasyonları düzeylerinde herhangi bir farklılığa rastlanmamıştır. Bireyin yaş durumu serbest vakitlerinde hangi etkinlikleri yaparak geçirdiğini büyük oranda etkilemektedir. Bireyin yaşı arttıkça etkinliğe aktif katılımı da azalmaktadır. Genç bireyler daha çok güce dayalı aktiviteleri tercih etmekte ve aktif şekilde katıldıkları etkinlikleri tercih etmektedirler. Örneğin genç yaşlarda açık alan etkinliklerine katılım sağlayan aktif bir kişi ileriki yaşlarında kampçılık ve karavan gibi gezileri tercih etmekte ve daha pasif olmaktadır (Ardahan ve Lapa, 2011).

Katılımcıların doğa yürüyüşü yapma sıklığı değişkenine göre doğa yürüyüşü katılım motivasyonları arasında sosyal ($F=3.34$), eğitim ($F=4.96$) ve zaman ($F=5.29$) boyutunda anlamlı farklılık tespit edilmiştir. Farkın hangi gruptan kaynaklandığı bulmak için yapılan Tukey analizinde her hafta doğa yürüyüşü yapılanlar ile her ay doğa yürüyüşü yapanlar arasında her hafta doğa yürüyüşü yapanlar lehine olduğu tespit edilmiştir.

Çalışmada, katılımcıların serbest zaman motivasyonları üzerinde cinsiyet ve doğa yürüyüşü yapma sıklığı gibi demografik değişkenlerin etkili olduğu sonucuna ulaşılmıştır. Buna karşın medeni durum, yıl değişkeni ve yaş gibi unsurların doğa yürüyüşlerine katılım motivasyonları üzerinde bir etkiye sahip olmadığı görülmektedir. Daha geniş örneklem gruplarına yönelik araştırmalar yapılabilir. İlaveeten farklı coğrafik bölgelere yönelik incelemelerde ayrıntılı bir şekilde incelenebilir. Sosyal platform, doğaya ilgi duyan kitleye ulaşmak için etkili bir mecradır. Bu bağlamda sosyal platform üzerinde Şırnak iline ait doğal güzelliklerin fotoğraf ve videolarının paylaşılarak gerekli tanıtımın yapılması sağlanabilir ve böylece bireylerin bu alanlara yönlendirilmesi teşvik edilebilir.

SUMMARY

The modern post-industrial society has entered the stage of non-linear development and today it cannot be evaluated as a simple continuation of the industrial society. In its turn, culture also consists of a complex evolutionary structure and also implies the possibility of transformation and structural regrouping of elements, where one of the manifestations of transformation is fashion. As a result of the change of worldview directions and traditional values, which is currently occurring in the post-industrial era, the construction of new fashion trends is formed, whose condition, main signs, and characteristic features allow us to talk about it as a system with elements of self-organization. Its very situation is of great interest to the researcher. The concept of image is closely related to the concept of sales. Any action that occurs as a result of human interaction is directly or indirectly related to sales in one way or another. In order to be useful to each other in the future, people try to win each other's sympathy and be liked. From this point of view, only close friends and family members are exceptions. All other people communicate with each other, sometimes even without thinking, just to get one benefit or another for themselves. Therefore, the concept of image is quite widespread in the business world. Image - is the perception of other people about the personality and activities of any person. As a rule, the concept of image is mostly attributed to one or another personality. The complex nature of fashion develops together with the dynamics of society, therefore, the social conditioning and direction of fashion, its consolidation within society, is an invariably relevant topic for research. Existences of fashion, as a rule, are expressed in continuous changes, orientation to novelty and unpredictability. In this regard, the problem of the choice of individuals in the field of fashionable innovations becomes even more acute. It is impossible not to mention the regulatory effect of fashion, fashion is able to determine the consciousness of a person, which is especially relevant for a society of mass extreme consumption.

Keywords: fashion, image, clothing, fashionable innovations

Müasir postsənaye cəmiyyəti qeyri-xətti inkişaf mərhələsinə qədəm qoymuşdur və bu gün sənaye cəmiyyətin sadə davamı qismində dəyərləndirilə bilməz. Öz növbəsində, mədəniyyət də həmçinin mürəkkəb təkamül strukturundan ibarət olmaqla yanaşı həmçinin elementlərin transformasiya və struktur yenidən qruplaşma imkanını nəzərdə tutur ki, burada transformasiya təzahürlərindən biri dəbdir. Hazırda postsənaye dövründə mövcud olan dünyagörüşü istiqamətlərin və ənənəvi dəyərlərin dəyişməsi nəticəsində yeni dəb təmayüllərinin konstruksiyasını əmələ gətirir ki, onun vəziyyəti, əsas əlamətləri, xarakterik xüsusiyyətləri onun haqqında özünü təşkeidicilik elementlərinə malik sistem kimi danışmağa imkan verir. Məhz belə vəziyyət tədqiqatçı üçün böyük maraq kəsb edir.

İmic anlayışı satış məfhumu ilə sıx bağlıdır. İnsanların qarşılıqlı fəaliyyəti nəticəsində meydana gələn istənilən aksiya bu və ya digər şəkildə birbaşa yaxud dolaylı satışla bağlıdır. Gələcəkdə bir - birinə faydalı olmaq üçün insanlar bir-birinin rəğbətini qazanmağa, xoşuna gəlməyə çalışır. Bu baxımdan ancaq yaxın dostlar və ailə üzvləri istisna təşkil edir.

Bütün qalan insanlar məhz özləri üçün bu və ya digər fayda əldə etmək üçün bir-birilə, bəzən hətta düşünülməmiş də olsa ünsiyyət qurur. Odur ki, biznes aləmində imic məfhumu kifayət qədər geniş yayılmışdır. İmic – hər hansı insanın şəxsiyyəti və fəaliyyəti haqqında digər insanların təsəvvürüdür. Bir qayda olaraq imic məfhumu daha çox bu və ya digər şəxsiyyətə aid edilir.

Dəbin mürəkkəb təbiəti cəmiyyətin dinamikası ilə birgə inkişaf edir, buna görə dəbin sosial şərtlənməsi və yönəldilməsi, solum daxilində onun möhkəmlənməsi tədqiqat işləri üçün dəyişməz olaraq aktual mövzu kəsb edir. Dəbin ekstensiyaları, bir qayda olaraq, fasiləsiz baş verən dəyişikliklərdə, yenilik və gözlənilməzlik oriyentasiyasında ifadə olunur. Bununla əlaqədar, dəbli innovasiyalar sahəsində fərdlərin seçimi problemi daha da kəskinləşir. Dəbin tənzimləyici təsirini qeyd etməmək mümkün deyil, dəb insanın şüurunu determinasiya etmək iqtidarındadır, bu da kütləvi ifrat istehlak cəmiyyəti üçün xüsusilə aktualdır.

Həmçinin, dəbin vahid dünya sahəsinin formalaşmasına Qərbi Avropa dəyərlərinin tarixən şərtləndirilmiş təsirini qeyd etmək lazımdır. Məhz Qərbi Avropa dəbin beynəlmilləşdirilməsi üçün təməl yaratmışdır. Bu hadisə şübhəsiz müsbət cəhətlərə malikdir (istənilən zaman istənilən insanın planetimizin hər hansı yerində vahid dəb məkanına qoşulmaq imkanı) və bu, müəyyən şərtlər çərçivəsində mənfi tendensiyalar nümayiş etdirməyə başlayır (məsələn, kütləvi Amerika mədəniyyətinin ümumdünya ekspansiyası).

Bununla əlaqədar olaraq, mütəlif xalqların mədəniyyət ənənələrinin özünəməxsusluğunun və orijinallığının itirilməsi ilə bağlı məsələ son dərəcə kəskinləşir. Bundan əlavə, dəb sferasında

qloballaşma tendensiyalarının öz istiqamətini dəyişməsinin də qiymətləndirilməsinə ehtiyac duyulur.

Geyim imicinin seçimi həyat tərzindən və iş yerindən asılıdır. Maliyyə, ədliyyə, mühasibat uçotu kimi bəzi sahələrdə ciddi geyimin istifadəsi məcburi xarakter daşıyır. Digər sahələrdə isə, misal üçün, kütləvi informasiya vasitələrində, eləcə də reklam sferasında daha sərbəst üslubda tikilmiş geyim əşyalarının istifadəsinə yol verilir.

Belə situasiyalar da var ki, orada geyim xüsusi əhəmiyyətə malikdir – müsahibələrdə, prezentasiyalarda və yeni müştərilərlə görüşlərdə geyim amili mütləq şəkildə nəzərə alınmalıdır. Məsələn, müsahibənin nəticələrinə əsasən şirkətə işə qəbul edilməsi haqqında qərar veriləcək, bu zaman müsahibədə iştirak edəcək potensial namizədin xarici görkəmi şirkətin kollektivinə asanlıqla daxil ola biləcəyini ifadə etməlidir. Şirkət üçün hər hansı xidməti yerinə yetirərkən ümumilikdə həmin şirkətin imicinə uyğun olmaq lazımdır. Komanda daxilində iş fəaliyyəti həyata keçirildiyi zaman çalışmaq lazımdır ki, insanın xarici görkəmi qrupun digər üzvlərindən fərqlənməsin.

Geyimin amiranə, lakin güc olmayan üslubu hal-hazırda olduqca populyardır və geniş surətdə təqlid olunur. Əlçatan adı ilə tanınan üslubla bağlı xeyli daha çox sual yaranır. Şirkət direktorunun ciddi tünd-göy kostyumu direktorlar şurasının iclasında əla görünəcək, lakin həmkarlar ittifaqı liderləri ilə aparılan danışıqlarda distansiya yarada bilər. Belə situasiya üçün ciddiliyi daha az olan kostyum yaxud sadəcə olaraq şalvar və idman gödəkcəsi daha münasib olacaq: bu geyim sərbəst, təbii atmosferin yaradılmasına kömək edəcək. Əgər qadın menecer onun tabeliyində olan işçilərə töhmət verməlidirsə, ciddi qara rəngli kostyumdansa mavi yaxud yaşıl rəngli trikotaj kostyumu geyinmək onun üçün daha məqsədəuyğun olacaq, bu hal qeyd olunan vəziyyətdə onu daha anlaşılan görkəmdə təqdim edəcək.

İş yerində irəli çəkilməyə səy göstərməklə, rəhbər elə geyinməlidir ki, sanki o daha yüksək vəzifə üçün nəzərdə tutulmuş işi yerinə yetirəcəkdir. Bu zaman daha yüksək rəhbər vəzifələrdə olan insanlarda onun arzuladığı daha yüksək rəhbər qismində görmək, daha böyük vəzifədə təsəvvür etmək üçün rahat şanslar yaranacaq. Söhbət zamanı insanlar adətən ünsiyyətdə olduqları digər insanın üzünə yaxud çiyinlərinə baxır. Odur ki, qadınlar öz fərdliliyini bəzək əşyaları və boyun dəsmalları vasitəsilə ifadə edə bilər, kişilər isə yaxalıqların, köynəklərin və qalstukların seçilməsi prosesinə son dərəcə diqqətli və daha böyük həssaslıqla yanaşmalıdırlar. Kişi - menecerlərin böyük əksəriyyəti aeroport üslubunda geyinməyi xoşlayır – onlar qalstuk, köynək və pencəklərə üstünlük verirlər. Bu cür geyim əşyalarını yaxşı mağazadan almaq tövsiyyə olunur. Orada əldə edilən geyim nümunələri insanın zahiri görünüşünə daha böyük

fərdlilik gətirmiş olacaq. Geyimin biçimi, materialı və rəngi ilə yaradılan hisslər və assosiasiyalar özündə müəyyən dəyərlər daşmış olur. Üslubun seçilməsi kənd mentaliteti yaxud, əksinə, şəhər oriyentasiyası haqqında məlumat verə bilər. Əgər insan istifadə etdiyi geyim vasitəsilə yüksək standartlar və detallara qarşı diqqət və həssaslıq nümayiş etdirirsə, onda zənn etmək olar ki, bu insan öz iş fəaliyyətində də eyni keyfiyyətləri ortaya qoymuş olacaq. İş yerində aksesuarlar çox vaxt öz funksional təyinat dəyişir: portfellərdə işçilər öz əmək fəaliyyətlərinin nəticələrini daşıyır, zaman onlara öz vaxtını düzgün və səmərəli bölüşdürməyə imkan verir və s. Həmin aksesuarlara insanlar adətən fikir verir, çünki onlardan daim istifadə etməli olurlar. Odur ki, onların seçiminə xüsusi həssaslıqla və incədən-incəyə yanaşmaq lazımdır. Aksesuarların həddindən artıq çox sayda olması insanın xarici görkəmini narahatedici edə və diqqəti yayındıra bilər. Mobil telefonu, portfeli və orqanayzeri daşıyan insan bəzən bəzək-düzək dəlisi təəssüratı yaradırdı. Təəssüratı əlində olan əşyalar deyil, görülən işlərin nəticələri yaratmalıdır. Detalların, məsələn, bəzəklərin, hədsiz dərəcədə çoxlu sayda olması diqqəti yayındıra bilər. Açıq çalarlı yaxud parlaq rəngli aksesuarlar, ayaqqabı və qadın çantaları daha çox funksional deyil, dekorativ görkəmə malikdir. Onlar qeyri-iş mühitində daha münasib və uyğundur. Eynəkləri seçərkən daha ehtiyatlı davranmaq lazımdır. Unutmaq olmaz ki, eynək – zahiri görünüş elementidir və hər zaman göz qabağında olur. Eynək çərçivəsi üzə uyğun olmalı və yaraşmalıdır. Eynəyin girdə şüşələri insanın üzünün dəyirmiliyini daha da nəzərə çarpdıracaq. Məhz bu səbəbə görə üz dəyirmi olanda düzbucaqlı şüşələri seçmək tövsiyyə olunur. Özünə hədsiz dərəcədə diqqət çəkən eynək çərçivəsindən uzaq durmaq lazımdır. Belə olan halda sizin üzünüzün deyil, məhz eynəyin insanların yanında qalacağına ehtimalı son dərəcə böyükdür. Geyim və saç düzümü imicin yaradılması istiqamətində əhəmiyyətli rola malikdir. Hər bir insan əmtəə istehsalçıları sanki təqlid edərək, özünü müəyyən qablaşdırmada təqdim etməyə çalışır ki, özünə, öz daxili aləminə və bacarıqlarına diqqətləri cəlb edə bilsin. Məlumdur ki, insanın xarici görkəminə imicin digər komponentləri ilə müqayisədə daha çox diqqət ayrılır. Dəb, kosmetika və sağlamlıq sənayesi nəhəng informasiya həcmi təqdim edir və insanın xarici görkəmini əhəmiyyətli dərəcədə yaxşılaşdırmağa imkan verən çoxlu sayda ən müxtəlif əmtəə və xidmətləri təklif edir. Jurnal və internet saytlarda geyimə və saç düzümünə, kosmetika və bu kimi digər məsələlərə həsr olunmuş çoxlu sayda məsləhətlər yer alır. Müşahidə etməyi bacaran insan geyim və saç düzümünə görə daxili imic, şəxsi dəyərlər haqqında nəticə çıxara bilər. Bugünkü gündə insanların böyük əksəriyyəti başa düşür ki, onların xarici görkəmi nə dərəcədə böyük əhəmiyyətə malikdir. Əvvəllər mövcud olmuş düşüncələrin əksinə olaraq, zəka, bacarıq və səriştələr, eləcə də yaxşı xarici görkəm bir-birilə uzlaşdırıla

bilməz. Əgər insan yaxşı və səliqəli xarici görkəmə malikdirsə, yəni əgər o, təmizkar, saç düzümü səliqəli, dərisi təmiz, əllər və dişlər isə cəlbedicirdirsə, bu o deməkdir ki, həmin insan sanki müsbət özünüqiymətləndirmə ideyası əks etdirir. Özünəqulluq bir vərdəstdir, həmin vərdəşin möhkəmləndirilməsi üçün isə müvafiq hərəkətlər çoxlu sayda təkrarlanmalıdır. Məhz bu səbəbə görə, xarici görkəmə qulluq edilməsinə və sağlamlığın dəstəklənməsinə yönəlmiş hərəkətləri öncədən və daim planlaşdırmaq lazımdır. İşdə hər gün yaxşı geyimdə və səliqəli saç düzümü ilə görünmək, və burada ardıcılığa diqqətlə və ciddi surətdə riayət etmək lazımdır.

Rəng də həmçinin emosional assosiasiyaların yaranmasına gətirib çıxarır. İsti, parlaq, yüngül rənglər, məsələn, qırmızı və sarı, gözəgəlimli və mehriban insan imicinin yaradılmasına xidmət edir. Soyuq, qəmgin, tünd rənglər isə, misal üçün qara, tünd-göy, boz kimi rənglər müəyyən distansiya yaradır, hökmlü, zəhmli və çox təkəbbürlü bir insan imicinin yaradılmasına səbəb olur. Neytral təng tonlarında tikilmiş geyim daha universaldır. Parlaq rənglə malik geyim.ş xüsusən də əgər insanın dərisi solğun rəngdədirsə insanın görünüşünə təzyiq edə bilər. Bundan əlavə, parlaq geyim diqqətləri insanın özündən yayındırır ki, bu da rəhbər üçün qətiyyən yol verilən deyil. Tünd neytral rənglər insanı daha əhəmiyyətli edir, isti neytral rənglər, misal üçün, bej və açıq-qəhvəyi rəng, daha böyük əlçatanlıq təəssüratı oyadır. İnsanın üzü rənginə daha yaxın rəng əsas və daha vacib hesab olunur. Köynəklər, bluzalar, qalstuklar üz çalarına yaxın və uyğun çalarda olmalı və ona yaraşlıq gətirməlidir. Geyimdə rəngin düzgün istifadəsi insanın xarici görkəmini daha dinamik və əmin edir. Bütün həyat situasiyaları üçün qarderobun seçilməsi zamanı rənglərin kombinasiyalarını nəzərə almaq lazımdır ki, geyimin müxtəlif detallarının variasiyalarını həyata keçirməyə mümkün olsun. Məsələn, iki bahalı kostyum - tünd-göy və açıq-boz yaxud boz rəngli kostyumları ala bilərik. Göy kostyumun bleyzeri ola bilər ki, bu da müxtəlif ətəklərlə yaxşı uzlaşacaq, odur ki, bu geyimi ilboyu asanlıqla istifadə etmək mümkündür. Boz rəngli penceyi yaxalısız da almaq olar. Onun kəsiyi olacaq, həmin pencek müxtəlif aksesuarlarla çox uğurla dekor etmək imkanı olacaq. İki rəngi əsas kimi götürməklə, düşünmüş surətdə bluzaları, sviterləri, şərfləri, paltonu, şlyapanı, uzunboğaz corabları, tufilləri, bəzəkləri və çantaları seçmək lazımdır. Bir neçə eyni tonlu bluzalar almaq olar ki, onlar rəng baxımından geyim sahibinin əsas kostyumlarla uzlaşacaq, yaxud digər tonlu çox da nəzərə çarpmayan rəsmləri ola bluzaları götürmək olar ki, onların da rənglənmə baxımından hər iki kostyumla uzlaşması mümkün olsun. Daha bir mühüm şərt ondan ibarətdir ki, seçilən bluzaların boğaz kəsiyinin müxtəlif bəzəməsi olmalıdır. Açıq-boz yaxud boz kostyumdan olan pencek göy rəngli ətəklə və boz-çəhrayi-göy şərf dekor edilmiş bluz ilə yaxşı görünəcək. Bu variantda muncuq, qızıl zənciri, yarımqiymətli daşlardan ibarət boyunbaq kimi

bəzək elementləri uğurla istifadə oluna bilər. Tünd-göy rəngli kostyumdan olan pəncək ən müxtəlif uzlaşmalarda tətbiq edilə bilər. Çanta və tuflilər qara yaxud göy olmalıdır ki, geyimin istənilən dəsti ilə yaxşı görünür. Bir halda ki, geyim əşyalarının seçimi insanlar tərəfindən könüllü və şüurlu surətdə həyata keçirilir, həmin geyim əsasında onun sahibinin şəxsiyyəti barədə müəyyən nəticələrə gəlmək mümkündür. İnsanların bir qismi bilərəkdən belə geyinir ki, ətrafdakıları şoka salsın və onları cavab reaksiyaya təhrik edə bilsin. Başqaları o dərəcədə insan kütləsi ilə qarışır ki, onların xarici görkəmini yadda saxlamaq çətin olur. Geyimdə özünü ifadə etmək imkanını reallaşdırdıqda bu zaman üç əsas element kömək edir: geyimin biçimi, materialı, rəngi. Geyimin biçimi dəblə müəyyənləşir və onun nə dərəcədə qeyri-adi, ekstravaqant olması həmin biçimin bir o qədər də tez bir surətdə dəbdən düşəcəyinin göstəricisidir. Tez-tez görüşlərin və toplantıların keçirilməsini nəzərdə tutan iş üçün ciddi kostyumlar daha münasib və məqsədəuyğun hesab olunur. Boş və asudə vaxtın keçirilməsi üçün idman üslublu kostyumların və sviterlərin istifadəsinə yol verilir. İnsanların müxtəlif hündəsi formalara reaksiyası fərqli-fərqli olur və onlara müəyyən keyfiyyətlər verir. Ciddi hündəsi formaya və böyük sayda iti bucaqlara malik detallarla müqayisədə girdə formalı yaxalıqlar, ciblər və latskanlar daha yumşaq görünüşə malikdir. İnsanların müxtəlif hündəsi fiqurlara sərgilədiyi reaksiyanı geyimin düzgün seçiminin yerinə yetirilməsi üçün istifadə etmək olar. Dəyirmi kəsiyə malik sadə yun sviteri sakitlik və əlçatanlıq görünüşü gətirir, lakin kəskin hündəsi formalara malik işgüzar kostyum - hökmranlıq və ciddilik. İşgüzar insana çoxlu sayda detalları - cibləri, ilgəkləri, mürəkkəb formalı yaxalıqları, parlaq düymələri olan kostyumlardan uzaq durmaq lazımdır. Belə geyim bütün diqqəti insandan və onun dediklərindən yayındırır. Parça rəsmnin müxtəlif növləri də həmçinin müəyyən hisslər və assosiasiyaların əmələ gəlməsinə səbəb olur. Gündəlik geyim üçün düz xətlərdən, eləcə də xana-xana və zolaqlardan ibarət rəsmlər daha çox yaraşır. Beləliklə, imic müasir dövrdə kommunikasiya vasitəsi rolunda kimi çıxış edir, insanın xarakteri, onun hansı mühitdə yaşadığı, hansı sənət sahibi olduğu və s. haqda informasiyalar toplusunu ətrafdakılara ötürür.

Abstract

Nigeria's organizations and global economy have been faced with herculean task of sustainability due to economic crises such as the latest Covid-19 pandemic that kept all the nations and business organizations at a disarray. Also, the growing competition associated with globalization, technology and economic liberalization have necessitated the call for firms' proactiveness, strategic foresight, and ability to surmount challenges and maintain competitive advantage to remain productive in the dynamic business environment. The aim of the study was to critically ascertain the significance of resiliency on gaining firm competitive advantage and sustainable performance. The present day economy has witnessed unprecedented economic crises and market rivalries which have led to loss of quality manpower and low productivity. The organizational low performance could be linked to employees' inability to learn from experience, being proactive and inability to adapt in any given environment to achieve sustainable performance. The study identified organizational resilience as the ability of organization to foresee, prepare, absorb or develop resistance in the face of challenges or threats within its environment, and could be able to bounce back and improve performance. Therefore, the study concluded that organizational learning, adaptive capacity, dynamic capability, and strategic foresight have significant relationships with firm competitive advantage and sustainable performance. The study recommended that management should reinvigorate organizational learning, adaptive capacity, strategic foresight, and dynamic capability of employees, which will lead to retention, foster competitive advantage and increased productivity.

Keywords: Resiliency; Organizational Learning, Adaptive Capacity; Dynamic Capability; Competitive Advantage; Productivity.

Introduction

The main objective of emerging Organizations is how to achieve high performance at all times, irrespective of turbulent and dynamic business environment.

According to Aki et al.(2011), performance refers to excellence, and includes profitability attainment by an organization, productivity from the employees, among other non-cost factors such as quality, speed, delivery, flexibility, market share and so on. Many researchers have concluded that achieving sustainable performance could depend on the resiliency of the organizations.

Organizational resilience aids a firm in surmounting challenges from environmental threats and risks, improving the chance of project success, and fostering the firm to sustain its performance during the time of crises and stability (Manfield, 2016).

According to Alastir (2010), companies are more susceptible to disruptive events from risks and survival threats as our environment grows more complicated and crisis-ridden. He argued that the goal of building resilience is to lessen an organization's exposure to threats and hazards by developing safety measures that lessen the chance and impact of disruptive events, responding to them effectively and efficiently when they do occur, and recovering from them as soon as possible.

According to Seville et al. (2008), organisational resilience may be defined as the capacity of an organisation to not just survive but perhaps even grow in the face of adversity. According to Mitroff (2005), organisational resilience is a constantly evolving aim that helps to performance during both times of business as usual and disaster. It is necessary for organisations to be flexible and highly dependable, and it gives them the ability to deal with situations that are disruptive. (Durodie, 2003).

Conceptual Framework

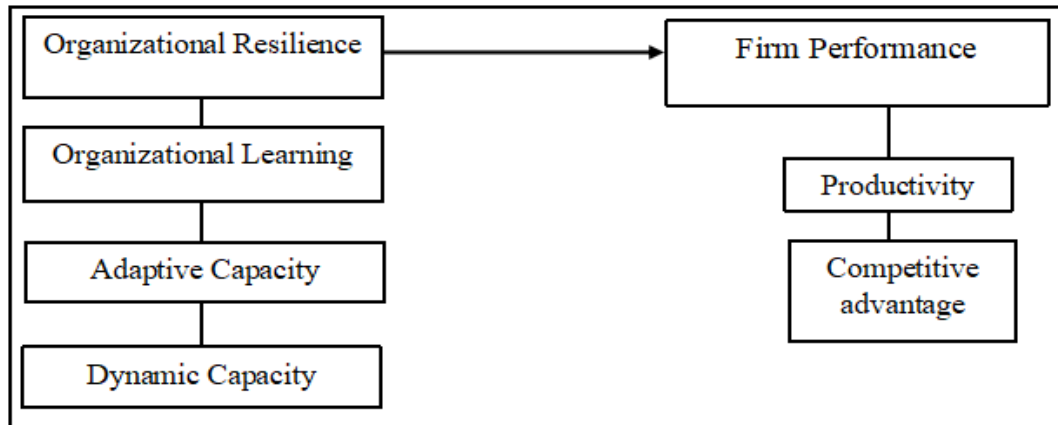

Figure 1 Conceptual framework showing the relationship between organizational resilience with its dimensions as organizational Learning, Adaptive Capacity and Dynamic Capability, and Employee Performance as dependent variable.

Aim/Objectives of the Study

The aim of the study is to examine the effect of organizational resilience on firm competitive advantage and performance. The specific objectives of the study are:

1. Ascertain the relationship between organizational learning and firm performance
2. Ascertain the relationship between adaptive capacity and firm performance
3. Ascertain the relationship between dynamic capability and firm performance

Theoretical Background

Darwin Theory of Change

For Charles Darwin, the years 1809-1882 are his own. "it is not the strongest or most intelligent that survive, but rather, it is the most adaptable to change."

Although Darwin may have had the survival of the species in mind when he spoke of the resiliency of individuals, the concept is still relevant to organisations that must not only "survive" continuous change but also grow and evolve in their own right to become stronger, fitter, and more capable of adapting to any kind of challenge. In fact, leaders and managers in all organisations should constantly work to cultivate organisational resilience (Denhardt and Denhardt, 2010). Organisational resilience can be defined as the capacity to recover from adversity in a way that makes the organisation more flexible and better able to adjust to future adversity.

Measures of Organizational Resilience

Organizational Learning

Aggestam (2006) argues that in order to be considered a learning organisation, a company's culture must promote and reward exploration, experimentation, and improvement at all levels. The environment promotes a culture of learning, a community of learners, and ensures that every worker's development adds to the organization's growth and success. The act of learning should not be seen as only a solution to a specific issue but rather as something that should eventually become ingrained in the culture. Learning organisations need a fresh perspective on leadership: the leader in the role of designer. Leadership is the first step in developing a culture; yet, since culture is the product of a group's acquired knowledge, the culture itself will, in the long run, define the desired leadership.

According to Aggestam (2006), a learning organisation is one that is structured in such a manner that it actively searches for information in its surrounding environment, generates information on its own, and actively encourages people to share their knowledge with one another within teams. This has to be directed by the organization's structure, as well as the vision, which should be directed by the strategic leadership of the organisation.

Organizational learning in Complex System

Learning is an ability that is present in organisations to variable degrees since they are complex adaptive systems. Schein (1996) identifies four variables that are fundamental to the capacity for learning that an organisation has as well as the health of the system as a whole. These are the following:

- ✧ A feeling of one's own uniqueness, purpose, or mission.
- ✧ The ability of the system to adjust to new conditions and continue functioning normally, despite the presence of both internal and external changes.
- ✧ a capability of seeing and evaluating reality; and
- ✧ The degree to which the many components of the whole are coordinated with one another

There are a variety of causes that might explain why a company has such a high learning capacity. A few examples of such abilities include seeing the world as fundamentally interconnected (the systems view), being able to transform one's perception of the world (generative learning), and being able to adapt to new situations and circumstances (adaptive learning) (Murray, 2002; Schein, 1996; Senge, 1990). The capacity to generate new ways of thinking is at the heart of generative learning. Adaptive learning is the process of easily

adjusting to novel circumstances. It is the ability of an organization's culture to ensure that learning is not simply based on adaptive learning, but rather that it becomes tolerant of both kinds of learning—adaptive and generative—instead of exclusively basing learning on adaptive learning. However, in order to accomplish this goal, new learning methods are necessary since it is very doubtful that cognitive improvements alone would suffice to accomplish this goal (Murray, 2002). The following discussion will provide an introduction to the ideas and concepts that underpin adaptive and generative learning with regard to the adaptability and situation awareness of organisations.

According to Daft and Weick (1984) and Murray (2002), adaptive learning is predicated on an organization's capacity to cope, as well as its ability to learn and change concurrently and to align itself with its environment.

It is essential to understand that the potential for adaptation is not a trait that remains constant in every system. There are a number of research (Folke, 2006; deVries, 1985) that investigate the dynamics of change and adaptation of these elements across time (Smit and Wandel, 2006) in various contexts (economic, social, political, institutional). The preceding statement referred to a few of these investigations. There has also been consideration of the connections between the many components that influence adaptive ability. They've realised that a person's management skills, for better or worse, may affect other variables, such how much stress their employees feel (Smit and Wandel, 2006).

It has been shown that certain businesses have productive workplace cultures that help them adjust to changes in their operating environment, even when such shifts are sudden and unexpected. Some of the organisations have shown to be an example of this. Coca-Cola (Seaman & Williams, 2005), Nokia (Sheffi, 2005), Toyota (Sheffi, 2006a), Dell (Sheffi, 2005), and UPS (Coutu, 2002) are just a few companies that have done this (these characteristics are described more below).

Furthermore, workers who are trained to anticipate the unforeseen make a substantial contribution to a firm with a high degree of adaptability. An organization must be able to strike a crucial balance between developing and testing a strategy while assisting its employees become skilled at handling unforeseen circumstances. Since no firm can prepare for every eventuality, the organizational culture becomes essential (Sheffi, 2005).

Complex Adaptive Capacity

Leading scholars in the field of complex adaptive systems, such as Gell-Mann (1994), Holland (1995), and Dooley (1996, 1997), give advice about the key components of CAS, which may be summarised as follows:

- A CAS is made up of agents, each of which may operate in a semi-autonomous manner and which develop over the course of time.
- Agents analyse the settings in which they operate and create mental models, also known as schema, of those environments.
- Agents may improve their fitness either by acting to modify the schema in order to suit the observation or by acting in order to alter the observation in order to match the schema.

"The schema define how agents interact with other agents in the environment around them," and "the environment" refers to the space that the agents occupy.

- In addition, CAS will often demonstrate the following traits (adapted from Vogelsang, 2002):
- "individual agents interacting with one another and recreating their relationships at the neighbourhood level."
- 'emergence of self-organization and the formation of global patterns'
- "constant creation of variety; the capability of developing new methods for action that build on the successes of the past." A conscious awareness that one can only exert influence on the system and not direct it.

It's possible to make the case that any organisation is complicated due to the intricate nature of its most fundamental component, which is people (Schein, 1980).

Increases in technological capability are often blamed for the increased complexity that occurs inside the internal settings of organisations. The idea that certain technological systems are subject to what are considered to be 'natural' or inevitable mishaps and events was first proposed by Perrow (1984). This theory is predicated on two interrelated dimensions: interactive complexity and loose/tight coupling. The phenomenon known as interactive complexity refers to the occurrence of unexpected and unplanned sequences of events inside a system that are hidden from view. The degree to which different components of a system are coupled to one another is referred to as its loose or tight coupling. Any changes made to one component of a tightly connected system have immediate ramifications and effects on all of the other components of the system because the components of the system are linked extremely closely to one another. This might have very negative consequences. On the other side, loosely linked

systems do contain linkages, but the performance of one part of the system is not reliant on the performance of another element of the system. According to Marias et al. (2004), loosely connected systems often have the capacity to withstand disturbances and perturbations without causing the overall system to become unstable. Perrow's technique is based on the notion that tightly connected systems that also display interaction complexity are prone to experience 'system accidents' that are wholly unanticipated and also have the capacity to cascade in their effects. This is the central thesis of Perrow's methodology. The chemical accident that took place in Bhopal (Shrivastava, 1992) is an example of this kind of failure. To cite only a few examples, there was the Chernobyl nuclear power plant (Pidgeon and O'Leary, 2000), the Exxon Valdez oil spill (Grabowski and Roberts, 1996), and the Marin Gulch tragedy (Weick, 1993).

Additionally, academics have found that certain kinds of organisations who display the interaction complexity and closely connected systems highlighted by Perrow tend to encounter surprisingly few 'system accidents'. These businesses have been given the designation of High Reliability Organisations, or HROs, according to Weick (1989). (Vogus and Welborne, 2003; Weick and Sutcliffe, 2001) Have you ever heard of the notion of mindfulness? It's one of the key components of healthy relationship orientations.

Folke et al. (2003), writing on resilience in a socioecological context, define adaptive capacity as the ability to learn, to try new things and adjust to them, and to build broad, generalised answers to different types of issues. Resilience includes adaptive ability, which indicates one's potential for learning, openness to change, and adoption of fresh solutions and strategies.

Armitage (2005) employs the four dimensions provided by Folke et al. (2003) for the study of socio-institutions. Adaptive capacity in the context of socio-institutions is linked to the traits of people, groups, and institutions that can promote learning in the face of ambiguity and change. Among these traits are the aptitude for self-improvement, cooperation in decision-making structures, and support for institutional variety.

Adaptive capacity may be defined as the ability of an individual or group to maintain an open mind towards novel experiences and to adjust to shifting conditions. This competency is useful for both solo and collaborative endeavours. In this context, adaptive capacity is addressed from both a social and an organisational perspective (McManus, 2007).

As Amah and Baridam (2012) note, the aim of adaptation is to gain an edge over competitors who are unable to or unwilling to change. This suggests that there is a link between flexibility and success in the business world. Adaptive capacity, as defined by Dalziell-and-McManus

(2004), is "the extent to which an organization's employees are concerned with, and actively contribute to, the development of the organization's resilience through the course of their work" (p. 1). Adaptive capacity may be described as the ability of an organisation to adjust effectively to changing settings and situations.

Dalziell and McManus (2004) continue by drawing a distinction between adaptive capacity and vulnerability, two concepts that, according to the authors, are commonly confused with one another since definitions of vulnerability typically incorporate adaptability. According to Dalzille and McManus (2004), vulnerability is defined as the length of departure from the organization's initial condition to the point at which it suffers substantial change or repercussions as a consequence of the catastrophe. In other words, vulnerability is the amount of time that an organisation has to deviate from its original state before it is considered vulnerable. An organization's adaptive capacity is the range of possible responses to a disaster within which it can find a stable state of operation. This can be seen of as the space in which the organisation operates.

Within the context of McManus's (2007) Relative Overall Resilience (ROR) model, the markers of adaptive capacity known as AC1 through AC7 may be found.

Adaptive Characteristics of Highly Resilient Organisations

Some scholars have proposed a set of adaptive qualities to boost organisational and social resilience. This was done as a result of the interest in developing a greater capacity for adaptation both during and immediately after a catastrophe (Dalziell & McManus, 2004) provide the idea that systems, more especially organisational systems, may respond to changes in a variety of ways. To begin, they may make use of previously developed solutions and apply them to the issues at hand, which might require expanding the scope of this answer. Second, answers that have been used in the past may sometimes be adapted to work in new situations when a crisis occurs. Thirdly, an organisation may come up with original solutions and implement them in order to solve an issue. The issues may be brand-new and unanticipated, or they could be ones that the organisation has been able to anticipate and prepare for. According to Dalziell and McManus (2004), when confronted with a crisis, organisations would often resort either to a command and control type structure or to an approach that is more spontaneous and imaginative.

Capabilities to Adapt to Change

Organisational agility is "the firm's ability to integrate, build, and reconfigure internal and external competencies to address rapidly changing environments," as defined by Teece et al.

(2010). Separating operational capabilities, which are patterned after an organization's current activities, from dynamic capabilities is possible. Teece et al. (2010) define dynamic capacities as "the capacity of an organisation to purposefully create, extend, or modify its resource base," citing Helfat et al. (2007). Static capabilities, on the other hand, relate to "an organization's capacity to deliberately create, expand, or modify its resource base."

According to Nelson and Winter (1982), the notion of "routines" in evolutionary theories of the organisation led to the development of the literature on dynamic capabilities. This was observed by Teece et al. (2010). So, it connects the dots between studies of economic strategy and those of evolutionary theories of organisation. They are of the opinion that in order to successfully take on new challenges, one must possess three dynamic characteristics. Both organisations and the people working inside them need the capacity to learn new things rapidly and to develop strategic assets. It is necessary for the organisation to incorporate newly acquired assets, such as capabilities, technologies, and feedback from customers. There is a need for transformation or reconfiguration of existing strategic assets.

"threat sensing, opportunity seizing, and competitiveness maintenance via the enhancement, combination, protection, and, if required, reconfiguration of the business's intangible and physical assets. Business agility, as described by Teece's idea of dynamic capabilities, include "the capacity to sense and shape opportunities for threat, (2) to seize opportunities, and (3) to maintain competitiveness."

You can't simply decide to be resilient one day; it doesn't work that way. Nor is it something that occurs all of a sudden. The study reveals that the concepts, actions, and behaviours that underpin resilience can be learnt and developed, making resilience a dynamic process that can be maintained in most individuals. It's important to remember that the skills and attitudes that foster resilience can be taught and honed.

Strategic Foresight

An additional characteristics of resilience is strategic foresight, which is a technique of anticipating changes and prepare to respond to the changes when they occur, and reduce uncertainties (Vecchiato, 2015).

According to Paliokaite and Pacesa (2014), strategic foresight may be seen as an organisational structural and cultural strength that identifies changes, analyses the results, and develops actions that are successful.

The factors that influence an individual's capacity for resilience

The question now is, what factors have an impact on an individual's potential to be resilient? According to the available research, resilience seems to be the result of a dynamic process involving the interplay of internal/personal qualities and external/situational elements.

Individual Factors According to the findings of several pieces of research, there are a number of personal qualities that may exist inside people that can either function as protective factors or boost one's potential to be resilient.

Why Should an Organisation Invest in Its Employees' Resilience?

Problems in the workplace have the ability to affect persons not just physically but also emotionally and mentally if they are not treated properly. The organisation will almost always be subject to severe expenses, some of which will be obvious while others will remain covert.

Firm Competitive Advantage

According to Kwak, Seo, & Mason (2018) firm's competitive positioning is determined by the high degrees of technological, environmental, superior flexibility and demand unforeseen influences.

According to de Oliveira and Werther (2013), a competitive edge and subsequent success in a market that is highly competitive are often the results of proper foresight of changes and rapid adaptation to those changes.

According to Porter (1985), a corporation is said to have a competitive advantage if it has the ability to establish a defensible and unique ground component in comparison to its other companies operating in the same sector.

The resources that a company uses to gain a competitive advantage ought to be useful, scarce, distinctive, and able to be imitated (ibid). There are two different sorts of competitive strategies, namely differentiation strategy and cost-leadership strategy (ibid). According to the findings of a recent study (Mahidieh et al., 2021) researchers, the performance of an organisation is considerably impacted when differentiation and cost leadership tactics are combined.

Khan et al. (2019) discovered a positive correlation between a firm's success and the presence of a durable competitive advantage.

According to Sharma and Sharma (2020), in today's highly competitive marketplaces, businesses that have resilient persons, systems, and processes are better able to adapt to the shifting needs of their consumers. This results in an increase in the firm's competitive edge, which in turn immediately leads to an improvement in the performance of the business..

Empirical Review

The authors of the aforementioned study, Mahdiah et al. (2021), investigated the connection between organisational resilience, strategic foresight, competitive advantage, and business performance. A study was administered to 202 pharmaceutical businesses in Iran, and each of those companies was asked to fill out a questionnaire in its entirety. In order to verify the validity of the assumptions, the partial least squares structural equation modelling (PLS-SEM) method was used. According to the results, an organization's strategic foresight, competitive advantage, and organisational resilience all have a positive and substantial association with a company's overall success.

One definition of resilience offered by Madni (2007) is the ability to anticipate interruption and continue functioning as best one can despite it. Awareness of the environment, degree of readiness, anticipation of disruptions, flexibility, capacity to recover, and other capacities are among the many ideas that emerge from definitions of organisational resilience, as stated by McMonus et al. (2008). One indicator of an organization's preparedness to weather a financial storm is its ability to either absorb shock or produce resistance in the face of perturbations in its surroundings.

Managers of resilient companies, as argued by Alastir (2010), need to be cognizant of potential threats to their people, infrastructure, activities, services, and supply chains at the board level. Additionally, these managers should comprehend the environment in which their businesses function. Managers, he argues, must be aware of and adapt to the ever-changing cultural, political, legal, regulatory, economic, technological, natural, and competitive environment in which their organisations function. They must also keep an eye out for key issues and trends that could have an effect on the organization's goals and the opinions and values of its external stakeholders

Summary

It can be seen from the study that organizational resilience could positively and significantly influence competitive advantage and performance. All the dimensions of organizational resilience of organizational learning, adaptive capacity and dynamic capability are all very significant on firm performance. Hence employees are keen to learn, adapt to changes, and capable to overcome all odds and challenges, bounce back and achieve greater success.

Conclusion

The findings of the study, which were based on previous research, came to the conclusion that organisational learning had a positive correlation with the competitive advantage and performance of businesses.

There is a favourable correlation between a company's adaptive ability and its competitive advantage and performance.

There is a favourable correlation between dynamic capacity and competitive advantage as well as performance.

Foresight in strategy has a favourable correlation with both the competitive advantage and performance of a company

Recommendations

The study recommends as follows:

1. Management should reinvigorate organizational learning as robust training and development of employees will lead to employees' resourcefulness and firm competitive advantage and increased productivity.
2. Management should reinvigorate and foster adaptive capacity, as flexible work systems will allow for employee retention, firm competitive advantage and productivity.
3. Management should reinvigorate and foster dynamic capability so that there will be employee less resistant to change, hence employees are able to meet the current prevailing technology in order to achieve firm competitive advantage and productivity.
4. Management should focus on strategic foresight, which will enable firm to be proactive and quick adaptation to environmental issues, leading to firm competitive advantage and productivity.

Contribution to Knowledge

The study contributed to knowledge by enriching the existing literature and demonstrating that quick adaptation to keystone vulnerability assist firms to remain productive and sustainable in turbulent economy.

ÖZET

Tarımsal arařtırmalarda iklim kořulları, uygulama hataları, teknik arızalar ve veri toplama süreçlerindeki eksiklikler gibi çeřitli nedenlerle bazı verilerde kayıpların olması söz konusudur. Veri setinde oluřan bu kayıplar, arařtırma sonuçlarını olumsuz yönde etkileyebilmektedir. Arařtırmadaki kayıp verilerin tamamlanması, verilerin analizlerinde güvenilirlik, dođruluk ve etkinlik sađlamak adına önem tařımaktadır. Nitekim kayıp verilerin potansiyel etkilerinin azaltılarak arařtırmadan daha güçlü ve anlamlı sonuçların elde edilmesi mümkündür. Bu nedenle, denemelerde karřılařılan kayıp veri sorununu çözmek amacıyla kayıp verilerin analiz dıřı bırakılması ve veri atama gibi klasik yöntemler kullanılmaktadır. Ayrıca, bu konuda geliřtirilmiř çeřitli istatistiksel yöntemler de bulunmaktadır. Bu çalıřmada tarımsal arařtırmalarda ortaya çıkan kayıp verileri tamamlamak için kullanılan farklı yöntemler tanıtılacaktır. Bu amaçla Seriler Ortalaması (Series Mean), Yakın Noktaların Ortalaması (Mean of Nearby Points), Yakın Noktaların Ortancası (Median of Nearby Points), Doğrusal Deđer Kestirimi (Linear Interpolation), Noktanın Doğrusal Eğimi (Linear Trend of Point) yöntemleri incelenerek yöntemler tanıtılacaktır.

Anahtar Kelimeler: Kayıp veri, Veri tamamlama, Eksik gözlem, Tarımsal arařtırma

Giriş

Tarımsal üretim, insanlık tarihinde köklü ve eski bir üretim faaliyetidir. Gıda temini açısından kritik bir rol üstlenen tarımsal üretim, her dönemde stratejik bir öneme sahip olmuştur. Günümüzde modern tarım uygulamalarının giderek dijitalleşmesiyle birlikte, tarımsal araştırmalardan elde edilen verilerin önemi de artmıştır. Fakat bazen çeşitli nedenlerden dolayı tarımsal veriler kaybolabilir. Veri toplama süreçlerindeki hatalar, araştırmacı hataları, teknik sorunlar ve veri kaydetme yöntemlerindeki eksiklikler gibi birçok faktörlere bağlı olarak kayıp veriler ortaya çıkabilmektedir.

Tarımsal araştırmalarda kayıp veriler, bir araştırmacının sonuçlarının doğrudan etkileyebilmektedir. Nitekim bir denemede kayıp verilerin olması örneklem büyüklüğünü azaltması nedeniyle araştırmacının istatistiksel gücünü düşürmekte ve bu nedenle araştırma sonuçlarının güvenilirliğini etkilenmektedir (Mazen vd., 1987; O'Keefe, 2007). Kayıp verilerin özellikle belirli bir grup üzerinde yoğunlaşması halinde yine sonuçlar yanıltıcı olmakta ve araştırma sonuçlarına bir önyargı oluşmaktadır. Diğer yandan, kayıp verilerin dikkate alınmaması veya yanlış ele alınması, araştırmacının bilimsel değerini ve sonuçlarının genelleştirilmesini olumsuz yönde etkilemektedir.

Genel olarak kayıp veriler nedenlerine göre tamamen rastgele kayıp, rastlantısal kayıp ve rastgele olmayan kayıp olmak üzere 3 sınıfta değerlendirilmektedir (Little ve Rubin, 2002). Özellikle kayıp verilerin tamamlanmasında hangi yöntem ya da yöntemlerin kullanılacağına karar vermek için kayıp verilerin bu sınıflandırma mekanizmasını anlamak önemlidir.

Buna göre, kayıp verilerin ortaya çıkma olasılığının tüm gözlemler için eşit olduğu ve diğer değişkenlere veya faktörlere bağlı olmadığı duruma “tamamen rastgele kayıp veri (Missing Completely Random, MCAR)” denir. Bu tür kayıplar genellikle veri toplama süreçlerindeki tesadüfi hatalardan kaynaklanan, araştırmacının kontrolü dışındaki faktörlere bağlı olan, istemsizce oluşan veri kayıplarıdır. Örneğin, bir tarımsal araştırmada araştırmacının herhangi bir değişkene ait gözlemlerin ölçümü sırasında ölçüm aletinin yanlış olduğunu bilmeden rastgele hata yapması, tamamen rastgele kayıplara örnektir.

Kayıp verilerle diğer değerler arasında sistematik bir ilişkinin olduğu, kayıp verilerin diğer değişkenlere bağlı olarak rastgele oluştuğu duruma “rastlantısal kayıp (Missing at Random, MAR)” denir. Bir tarımsal araştırmada araştırmacının herhangi bir değişkene ait gözlemlerin ölçümü sırasında ölçüm aletinin yanlış olduğunu bildiği halde hata yapması ya da ölçüm yapmaması tamamen rastgele kayıplara örnektir. Rastlantısal kayıp veride kayıp veriler yine rastgele oluşmuştur; fakat ölçüm yapılan diğer değişkenler tarafından tahmin edilebilmektedir.

Örneğin, canlı ağırlık ölçümü yapılamayan yeni doğan kuzuların kayıp veri atanmasında cinsiyetinin bilinmesi gerekmektedir.

Kayıp verilerin şansa bağlı oluşmadığı ve diğer değişkenlerden tahmin edilemediği durumda rastgele olmayan kayıp veriden (Missing Data Not at Random, MNAR) söz edilmektedir (Allison, 2001). Kayıp verilerin nedeni tamamen değişkenin kendisiyle veya veri setinde ölçülmemiş farklı bir değişkenle ilgilidir ve araştırmacının ölçmediği nedenlerle oluşmuştur. Örneğin ham protein analizi yapılmamış bir yemin ham protein değerinin olmaması ile kayıp veri rastgele oluşmamış, sorun ham protein analizinin yapılmamasından kaynaklanmıştır.

Kayıp verilerin hangi durumda ortaya çıktığının bilinmesi veri atama stratejilerinin belirlenmesinde, modelleme ve analiz süreçlerinin oluşturulmasında dikkate alınması gereken önemli bir konudur. Kayıp veriler için genel olarak veri silme ve veri atama işlemleri yapılmaktadır. Denemelerde bir veya daha fazla eksik değere sahip satır, sütunda ya da eksik eş gözlemlerin silinmesi yoluna gidilebilir. Bu çalışmada çeşitli tarımsal veri örneklerinde bulunan kayıp verilere kayıp veri atama yöntemlerinden Seriler Ortalaması (Series Mean), Yakın Noktaların Ortalaması (Mean of Nearby Points), Yakın Noktaların Ortancası (Median of Nearby Points), Doğrusal Değer Kestirimi (Linear Interpolation), Noktanın Doğrusal Eğimi (Linear Trend of Point) yöntemleri tanıtılacak ve uygulamaları incelenecektir.

Materyal ve Metot

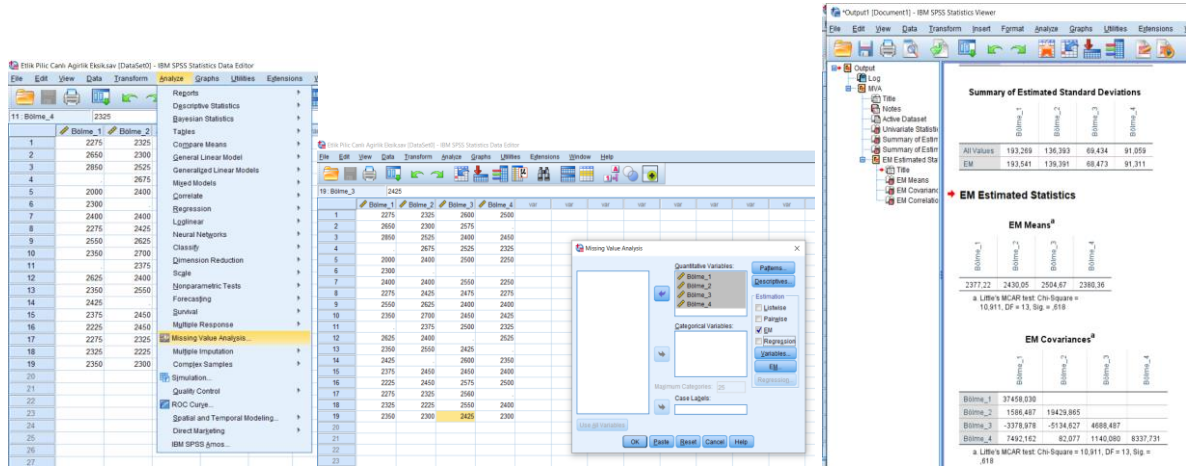

Bu çalışmada tarımsal araştırmalardan elde edilmiş örnek veri setlerine Seriler Ortalaması (Series Mean), Yakın Noktaların Ortalaması (Mean of Nearby Points), Yakın Noktaların Ortancası (Median of Nearby Points), Doğrusal Değer Kestirimi (Linear Interpolation), Noktada Doğrusal Eğim (Linear Trend at Point) teknikleri uygulanarak kayıp değerler tamamlanacaktır. İstatistiksel analizlerde IBM SPSS v25 programı kullanılacaktır.

Bu çalışmada belirli bir genotipteki etlik piliçlerin 6. hafta canlı ağırlıkları (g) Tablo 1’de verilmiştir. 4 farklı bölmede yetiştirilen piliçlerin canlı ağırlık ölçümleri belirli rastlantısal sebeplerle alınamamıştır. Söz konusu kayıp verilerin atanması amacıyla aşağıdaki işlemler öncelikle yapılmalıdır.

Tablo 1. Etlik piliç 6. hafta canlı ağırlıkları (g)

Kayıp veri tamamlamadan önce bu kayıpların hangi tip hata kaynağına sahip olduğunun belirlenmesi gerekmektedir. Bu amaçla Beklenti Maksimizasyonu Algoritması (Expectation Maximization, EM) kullanılmaktadır (Bishop, 2006). İki basamaklı bu algoritmanın ilk basamağında regresyon tahminleriyle gözlenen verilerin parametrelerine ait kestirimler kullanılarak kayıp veriler yerine yaklaşık değerler atanırken, ikinci basamakta tamamlanmış veriler üzerinden tahminler yenilenmektedir. Bu iteratif işlemler süreci beklenen ve tahminlenen değerler arasındaki farkların önemsizleştiği noktaya kadar devam etmektedir (Hedderley ve Wakeling, 1995). Bu çalışmada kullanılan etlik piliç canlı ağırlık verilerine EM algoritması aşağıdaki adımlarla yapılmıştır. “Missing Value Analysis” penceresinden canlı ağırlık değerleri “Quantitative Variables” sekmesine tanımlanarak EM algoritması seçilmiştir.

Şekil 1. EM algoritması ile kayıp veri sınıflamasının belirlenmesi

EM algoritması sonucu bulunan olasılık değerinin (estimated statistics olasılığının) istatistiksel olarak önemli bulunması ($p < 0.05$) kayıp verilerin rastgele olmayan kayıp veriler sınıfına girdiğini göstermektedir. Bu durumda kayıp veri atama işlemlerine başvurulmamalı, veri eksikliğine neden olan faktörlerin incelenerek giderilmesi yoluna gidilmelidir. Olasılık değerinin önemsiz olması durumunda ise ($p > 0.05$) kayıp verilerin rastlantısal olduğu kabul edilmektedir. Bu çalışmada etlik piliç canlı ağırlıkları için EM değeri 0.618 olarak bulunduğundan ($p > 0.05$) kayıp veri atama işlemlerine geçilmiştir.

Transform menüsünden “Replace Missing Values” seçilerek kayıp veri ataması yapılacak değişkenler tanımlanmaktadır. Daha sonra Seriler Ortalaması (Series Mean), Yakın Noktaların Ortalaması (Mean of Nearby Points), Yakın Noktaların Ortancası (Median of Nearby Points), Doğrusal Değer Kestirimi (Linear Interpolation) ve Noktanın Doğrusal Eğimi (Linear Trend of Point) yöntemlerinden biri seçilmektedir (Çokluk ve Kayri, 2011).

Şekil 2. Kayıp veri atama yöntemleri

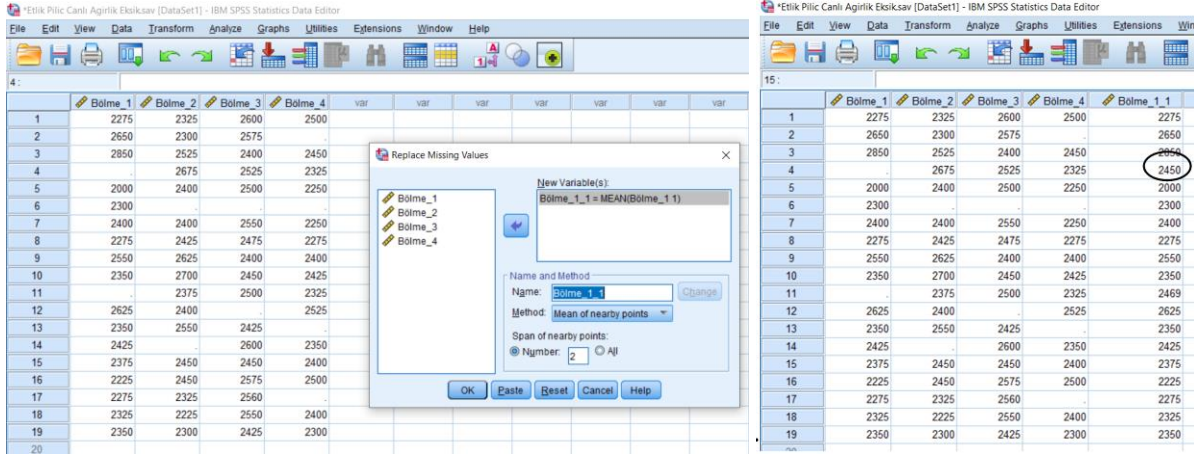

BULGULAR

Kayıp veri atama yöntemlerine göre Seriler Ortalaması (Series Mean) yönteminde ilgili kayıp verinin bulunduğu serideki verilerin ortalaması alınarak kayıp değer yerine atanır. Örnek verilerde seriler ortalaması yöntemi ile hesaplanan yeni değerler aşağıdaki gibi elde edilmiştir.

Tablo 2. Seriler Ortalaması yönteminde etlik piliç canlı ağırlıkları için kayıp veri atamaları

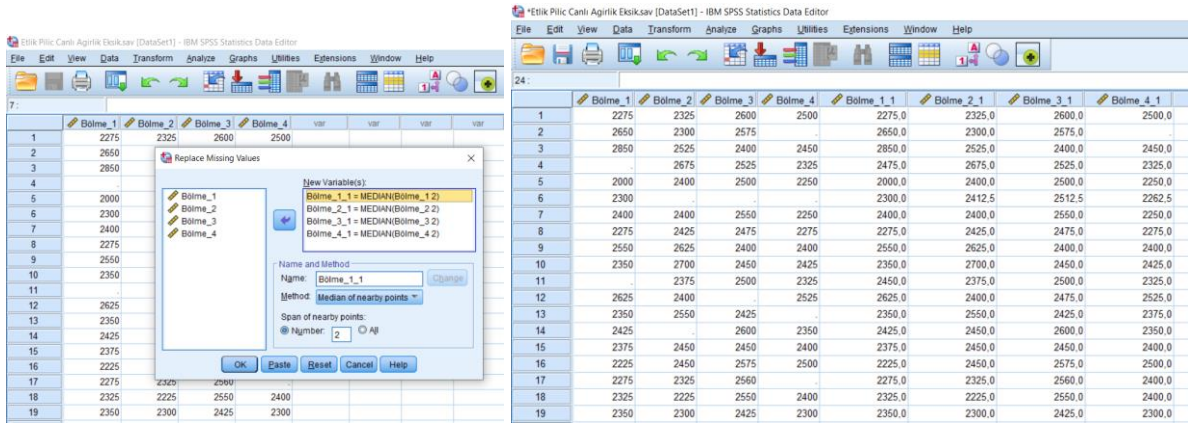

Bölme_1	Bölme_2	Bölme_3	Bölme_4
2275	2325	2600	2500

2325	2225	2550	2400
2350	2300	2425	2300

Bir diğer kayıp veri atama yöntemi Komşu Noktaların Ortalaması (Mean of Nearby Points) yöntemidir. Burada kayıp veriler kendisinden önceki ve sonraki komşu değerlerin ortalaması ile atanmaktadır. SPSS ile ortalaması alınacak çevre değerlerin sayısı tanımlanabilmektedir. Örneğimizde Bölme_1'deki kayıp verinin kendisinden 2 önce ve sonraki ölçümlerin ortalamasına göre "2450" değeri bulunarak kayıp veri değeri olarak atanmıştır.

Şekil 3. Komşu noktaların ortalaması veri atama penceresi

Bunlardan başka Komşu Noktaların Medyanı (Median of Nearby Points) yöntemi ile de kayıp veriler atanmaktadır. Kayıp değerler Komşu Noktaların Ortalaması yöntemine benzer olarak kendisinden önceki ve sonraki komşu değerlerin medyanı (ortancası) alınarak hesaplanmaktadır. Etlik piliç canlı ağırlıkları için bu yöntem uygulandığında Şekil 4' deki veri atamaları elde edilmiştir. Dikkat edilecek olursa Bölme 4' deki kayıp veri kendisinden önce 2 ölçüm olmadığından hesaplanamamıştır. Hesaplama için kullanılacak ölçüm değeri belirlenirken bu duruma dikkat edilmelidir.

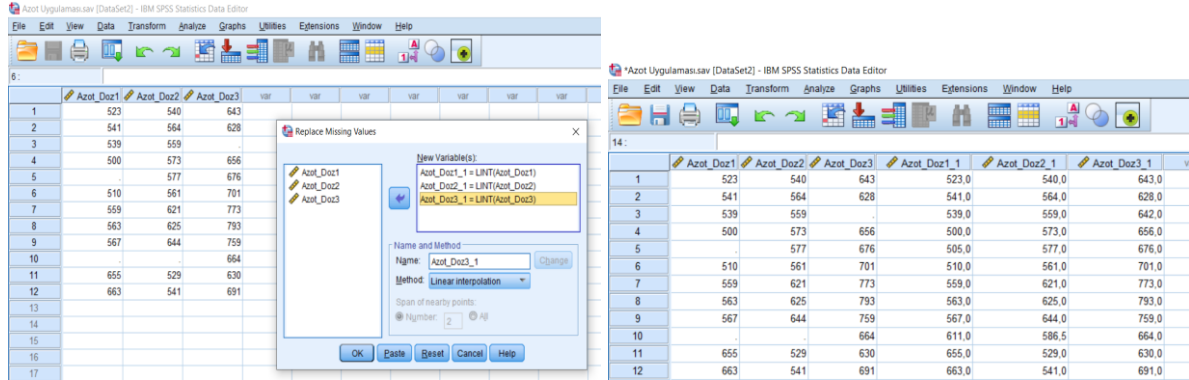

Şekil 4. Komşu noktaların medyanı veri atama penceresi

Kayıp veriler için Doğrusal İnterpolasyon (Linear Interpolation) yöntemi de sıklıkla kullanılmaktadır. İnterpolasyon işleminde kayıp veriden önce ve sonra gelen gözlemler arası farklar kayıp veri sayısına bölünerek kayıp veriden sonra gelen gözlem değerine eklenerek kayıp veri ataması yapılır. Bölümle bulunan bu değer, ilk eksik gözlem değerine eklenerek ikinci eksik gözlem değeri bulunarak son eksik gözlem değeri bulunana kadar işleme devam edilir. Ancak veri setindeki ilk veya son kayıp veri için bu işlem yapılmaz.

Örneğin, azot gübresinin 3 farklı dozunun denendiği bir denemede bazı parsellerde zarar gören bitkiler için alınamayan buğday verimleri (kg/da) (Tablo 3) için Doğrusal İnterpolasyon yöntemi ile kayıp veri ataması sonucu aşağıdaki değerler bulunmuştur.

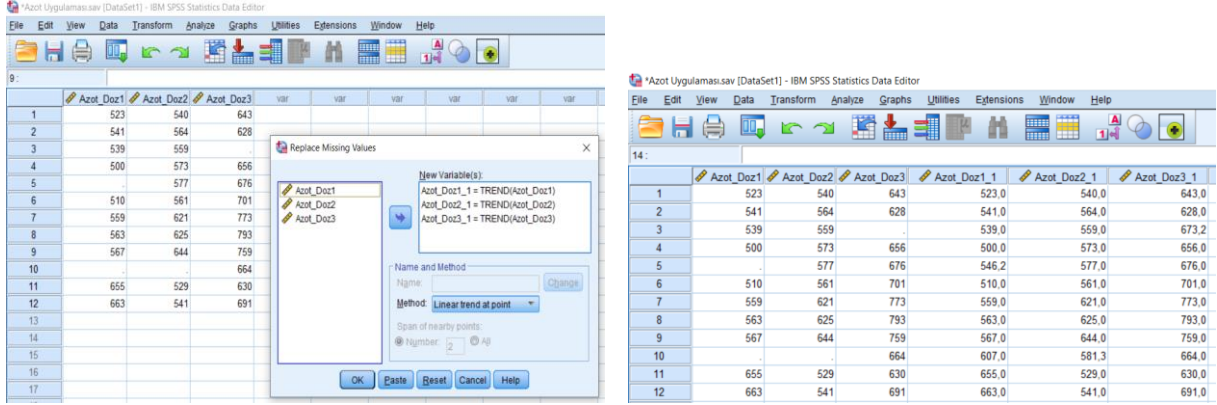

Tablo 3. Azot uygulamasında alınan buğday verimleri

Azot_Do21	Azot_Do22	Azot_Do23
523	540	643
541	564	628
539	559	
500	573	656
	577	676
510	561	701
559	621	773
563	625	793
567	644	759
		664
655	529	630
663	541	691

Şekil 5. Doğrusal İnterpolasyon veri atama penceresi

Kayıp veriler Noktada Doğrusal Eğim (Linear Trend at Point) yöntemi ile de atanabilmektedir. Bu yöntemde değişkenlerin sergilediği eğilime bağlı olarak kayıp veri bulunan değişkenin diğer değişkenlere regresyon analiziyle oluşturulan regresyon denkleminde göre tahminlenen değerler kayıp veriler yerine atanmaktadır.

Şekil 6. Noktada Doğrusal Eğim veri atama penceresi

SONUÇLAR VE TARTIŞMA

Tarımsal araştırmalarda farklı sebeplerle ortaya çıkabilen kayıp veriler, özellikle istatistik analizlerin güvenilirliğini kısıtlamakta ve sonuçları değiştirebilmektedir. Özellikle deney ünitesi sayısının azalması, istatistiksel hataların artmasına ve testlerin gücünün azalmasına neden olabilir. Bu bağlamda, kayıp verilerin tahmin edilerek yerine atanması önem kazanmaktadır. Kayıp veri sorunu ile başa çıkmak için çeşitli yaklaşımlar geliştirilmiş, burada SPSS paket programı ile uygulanabilen yöntemlerden bahsedilmiştir.

Kayıp veri atama yöntemlerinin tarımsal veri kayıpları üzerine farklı avantaj ve dezavantajları bulunmaktadır. Yöntem seçiminde bu durumların dikkate alınarak karar verilmesi önemlidir. Nitekim uygun yöntem seçilmediği takdirde çalışma sonuçları bu durumdan olumsuz yönde etkilenecektir (Ginkel ve diğerleri, 2007).

Seriler ortalaması yönteminde tüm seri dikkate alınarak veri atama yapıldığı için basit ve hızlı bir doldurma yöntemi olarak kabul edilmektedir. Ancak, verilerde aykırı değerler bulunduğu kayıp veri atamaları verilerin genel eğilimini yeterince temsil etmeyebilir. Yakın noktaların ortalaması ve ortancası yöntemlerinde ise aykırı değerlere daha dirençli olsa da kayıp veri etrafında geçerli değerler olmadığı doğruluğu azalacaktır. Doğrusal interpolasyon yönteminde iki geçerli değer arasında doğrusal bir tahmin kullanılmaktadır. Serinin başında ve sonundaki kayıp veri durumunda bu yöntem kullanılamaz. Ayrıca verilerdeki değişkenliğin yüksek olduğu durumlarda doğrusal interpolasyon sonuçları bozabilmektedir. Noktada doğrusal eğim yöntemi ile karmaşık bir veri setinde doğrusal eğim sonuçları yanılacaktır.

Günümüzde kayıp veri atama yöntemleri halen araştırılan bir konudur. Yöntem seçimi kayıp verinin niteliği ve büyüklüğüne göre dikkatli yapılmalıdır. Kayıp veri atama yöntemlerinin performanslarını değerlendiren ortalama mutlak hata, hata kareler ortalaması, belirleme katsayısı, çapraz doğrulama gibi yöntemlere başvurulmalıdır. Bu çalışmada tanıtılan

yöntemlerden başka Beklenti Maksimizasyonu Algoritması, Karar Ağaçları, Yapay Sinir Ağları, ROC alanı ve Bayesci Veri Atama gibi yeni nesil yöntemler de arařtırmacılara sunulmaktadır. Kayıp veri sorununu çözmek için daha etkili stratejilerin geliştirilmesinin devam edeceđi düşünölmektedir.

ÖZET

Biyoteknoloji, biyolojik ve teknolojik imkânların bir araya getirilmesi ile ortak faydanın artırılmasını amaçlar. Yaşamsal öneme sahip biyoteknolojinin insan hayatındaki yeri vazgeçilmez bir hale gelmiştir. Günümüzde ise modern biyoteknoloji ile birlikte moleküler düzeyde gerçekleştirilen genetik manipülasyonlarla verimlilik artırılmış ve yeni ürünlerin üretilebilmesi sağlanmıştır. Bu gelişmeler hayvancılıkta, klasik ıslah çalışmalarının bir adım daha ileri taşınmasını sağlamıştır. Modern ıslah çalışmaları ile belirlenen yüksek genotiplerle yapılan gen transfer çalışmalarıyla et, süt, yumurta verimleri artırılması, hayvanlardan elde edilen yün oranının ve kalitesinin artırılması, sağlıklı ve güçlü hayvanlar üretilerek daha besleyici ve sağlıklı besinlerin elde edilmesi (düşük kolesterol ve yüksek vitamin içeriği) ile hastalıklara dirençli hayvanların yetiştirilebilmesi gibi pek çok alanda gelişmeler sağlanmaya çalışılmaktadır. Bu çalışmada, biyoteknoloji alanında yapılan çalışmaların hayvan ıslahının geliştirilmesine nasıl katkıda bulunduğu yer verilmiştir. Hayvan ıslahında iyileştirilmesi istenen özelliklerin artırılması, üstün genotipik değerlere sahip olanların seçilmesi ve gelecek kuşakların bu bireylerden elde edilmesinin sağlanarak insanlar için daha faydalı ve verimli hale getirilmesi konularına değinilmiştir.

Anahtar Kelimeler: Biyoteknoloji, Islah, İyileştirme, Genotip, Verimlilik

GİRİŞ

Biyoteknoloji terimi, biyoloji ve teknolojinin imkânlarının bir araya getirilmesi ile ortak yararın artırılmasını amaçlayan bir bilimdir (Alpan, 1989). 'Biyoteknoloji' kelimesi iki basit bilim teriminden, yani 'Biyoloji' ve 'Teknoloji' den türetilmiştir. En yaygın tanımıyla ise biyoteknoloji, yaşayan organizmaların ürettikleri maddelerin veya doğrudan bazı organizmaların, insanlığın yararı amacıyla kullanılmasıdır (Kayıhan, 2018). "Biyoteknoloji" terim olarak kullanılmadan çok daha öncesinde bile pratikte var olmuştur. Biyoteknolojinin tarihsel gelişimi Şekil 1'de verilmiştir (Verma ve ark., 2011).

Şekil 1. Biyoteknolojinin gelişim tarihi (Verma ve ark., 2011)

Antik dönemde (1800 yılı öncesi), insanların en temel gereksinimlerinin başında beslenme, giyinme ve barınma geliyordu. Yerleşik hayata geçtikten sonra ise hayvanları evcilleştirmesi ve en önemlisi ıslah edilmesi ile biyoteknoloji ilk defa tarih sahnesine çıktı (Verma ve ark., 2011).

Biyoteknolojinin evriminin ve gelişiminin ikinci aşaması ise 1800'den neredeyse yirminci yüzyılın ortalarına kadar süren 'Klasik Biyoteknoloji' dönemidir. Bu dönemde 'Biyoloji' terimi de ilk kez kullanıldı. Biyoteknoloji terimini ilk kez kullanan, Macar Ziraat mühendisi olan Karl Ereky (1878-1952) oldu. Ereky biyoteknolojiyi, canlı organizmaların yardımıyla ürün elde etmek için kullanılan teknikler olarak tanımladı. Gregor John Mendel (1822-1884)'in *Pisum sativum* (Bezelye bitkisi) genlerini keşfederek bir nesilden diğerine aktarıldığını açıkladı, Charles Darwin ve aynı zamanda Robert Brown hücrelerde çekirdeği keşfetti, 1868'de Fredrich Miescher beyaz kan hücrelerinden ekstrakte ettiği nükleik asitten oluşan bir bileşik olan nükleini bularak genetik bir materyal olarak DNA'nın keşfi ve genetik bilgi transferinde

DNA'nın rolü için modern moleküler biyolojinin temelini oluşturdu Ayrıca, bu dönemde aşular ve antibiyotikler insanlığın en iyi kurtarıcıları olarak ortaya çıktı (Verma ve ark., 2011).

Modern biyoteknoloji döneminde, modern tekniklerin yaygınlaşması ile transgenik bitki ve hayvanların elde edilmesi, yeni ilaçların üretilmesi, aşuların geliştirilmesi ve biyo- yakıt üretimi gibi birçok konuda önemli çalışmalar yapıldı. Biyoteknolojinin hayvancılıkta kullanım alanı bulmasıyla “*hayvansal biyoteknoloji*” terimi ortaya çıktı. Bu alanda, özellikle hayvan ıslahı, transgenik hayvan teknolojisi, genetik haritalama, rekombinant DNA teknolojisiyle enzimlerin hayvan beslemede kullanımı, hayvan sağlığının iyileştirilerek kaliteli yapağının üretilmesi gibi önemli gelişmeler sağladı (Özcan ve Ayaşan 2009). Biyoteknoloji, 1950'lerden sonra ıslahta uygulamalara başladı (Doyle ve Persley, 1996). 1973 ve sonrasında ‘*Modern biyoteknoloji döneminde*’ ise modern ve gelişmiş tekniklerin biyolojik sistemlere uygulanmasına yönelik çalışmaları kapsadı (Ekinci ve ark., 2005). 1953'te, JD Watson ve FHC Crick ilk kez, popüler olarak 'Çift Sarmal DNA Modeli' olarak bilinen yapısal bir DNA modeli vererek, genetik bir materyal olan DNA'nın gizemlerini çözdü. İrlandalı bir bilim adamı Ian Wilmut, koyun modelini kullanarak yetişkin bir hayvanı klonlamayı başardı ve klonlanan koyunu 'Dolly' olarak adlandırdı (Verma ve ark., 2011).

Hayvan ıslahında kullanılan Seleksiyon ve Kontrollü Birleştirmeler biyoteknolojinin ilk uygulamaları olarak değerlendirilir. Devam eden süreçte ise Sun'i tohumlama, embriyo transferi, in vitro fertilizasyon, klonlama ve transgenik hayvan üretimi tekniklerinin uygulamaya konulmasıyla da hayvan ıslahı çalışmalarına önemli bir hız kazandırılmıştır (Alpan, 1989).

Suni tohumlama, genetik olarak istenilen özelliklere sahip bireylerin daha etkili üretimini sağlayan yöntemlerdendir. Suni tohumlama çalışmaları ile ilgili ülkemizdeki en önemli gelişmelerden biri 1973 yılında ilk kez donmuş boğa sperması üretiminin başlamasıdır. Bu uygulama üstün genetik yeteneğin çok sayıda yavruya aktarma imkânı vermesi bakımından önemlidir. Ancak gerek büyükbaşta olsun gerekse küçükbaş suni tohumlamada ülkemiz AB ülkelerine kıyasla yeterli düzeyde değildir. Bunun nedeni; işletme yapısındaki yetersizlikler, döl verimini etkileyen barınakların yapısı, besleme, üreme organı hastalıkları ve organizasyon hataları sayılabilir (Kara ve Bekyürek, 2020).

Embriyo transferi tekniği özellikle büyükbaş hayvan yetiştiriciliğinde uzunca bir süredir çalışılmaktadır. Potansiyeli yüksek fazla miktarda embriyonun doğrudan veya ayrıldıktan sonra taşıyıcı bireylere verilmesini içerir. Embriyo transferi yüksek verim gücüne sahip hayvanların üstün genetik yeteneklerinden daha yüksek oranda yararlanma imkânı vermektedir (Barnum,

2005). Embriyo transfer uygulaması ilk kez 1890' yılında Walter Heape tarafından Angora tavşanlarında gerçekleştirmiştir. Embriyo transfer uygulamasıyla dünyada doğan ilk buzağı 1951 yılında elde edilmiştir. Ülkemizde embriyo transferi çalışmalarına ilk olarak 1981 yılında tavşanlarda ve 1983 yılında farelerde yapılmıştır. Koyunlarda ilk embriyo transferi 1984 yılında ve sığırlarda ise ilk embriyo transfer uygulaması 1985 yılında gerçekleştirilmiştir (Alpan, 1989). Daha sonraları; sığırlarda embriyo transferi uygulamaları (Sönmez ve ark., 1992), sığır embriyosunun dondurulması ve transferi uygulamaları (Sungur ve Yurdaydın, 1994), sığırlarda embriyo transferi, embriyoların farklı yöntemlerle dondurulması, dondurulan embriyoların transferi konularında çalışmalar (Akyol ve ark., 2007) yapmışlardır (Kara ve Bekyürek, 2020). Hayvan ıslahına yardımcı bir diğer biyoteknolojik yöntem de İn Vitro Fertilizasyondur. İn vitro fertilizasyon (IVF), ile mezbahada kesilen ya da üstün genetik yapıdaki hayvanlardan çok miktarda oosit toplayarak laboratuvar ortamında embriyo elde edilebilmektedir. Yöntemde Peripubertal düvelerden, gebe ve genital yollarında fizyolojik bozukluğa sahip hayvanlardan da yararlanılabilmektedir (Alpan, 1989). Türkiye'de İn Vitro Fertilizasyon (İVF) uygulamaları, 1983 yılında tavşanlarda çalışılmış ve 2002'de ise ilk in vitro koşullarda üretilmiş olan embriyolardan sağlıklı kuzular elde edilmiştir. Ülkemizde IVF uygulamaları konusunda çalışmalar bulunmaktadır (Sağırkaya ve ark, 2004; Akyol ve Ark., 2007).

Klonlama, üremenin aseksüel biçimidir. Kelime karşılığı kopyalama olan klonlama aynı genetik yapıdaki bireylerin meydana getirilmesi şeklinde tanımlanabilir. 1997 yılında Ian Wilmut ve Keith Campbell, Edinburgh'daki Roslin Enstitüsü'nde, ilk kez klonlanmış "Dolly" isimli bir koyun üretmeyi başarmıştır. 1998 yılında ise araştırmacılar yirmiden fazla fareyi, çekirdeksiz yumurtalara doğrudan çekirdek transferi yaparak üretimini gerçekleştirmişlerdir. Bunu daha sonra; keçi, inek, domuz, at, tavşan ve kedi izlemiştir. (Barnum, 2005). Ülkemizde ilk klon kuzular olan "Oyalı ve Zarife" 21 Kasım 2007 yılında dünyaya gelmiştir. Sığırlarda 2008 de ise Boz ırkla yapılan klonlama çalışmaları sonrasında da ilk klon buzağı "Efe" olmak üzere 5 adet sağlıklı klon yavru elde edilmiştir (Kara ve Bekyürek 2020).

Transgenik hayvanlar genomlarında başka bir organizmaya ait rekombinant geni taşıyan hayvanlar şeklinde ifade edilir. Transgenik hayvanlar genellikle ekonomik nedenlerle ya da insan hastalıkları için hastalık modellemesi yapabilmek düşüncesiyle meydana getirilmektedir. Kullanılan 3 yöntem vardır. Bunlar, DNA mikroenjeksiyonu, Retroviruslar aracılığı ile gen aktarılması ve embriyonik kök hücreler aracılığı ile gen aktarılması şeklindedir. Ayrıca son zamanlarda nükleer transfer ile transgenik hayvan üretimi özellikle çiftlik hayvanlarında tercih edilen bir başka yöntem olmuştur. Transgenik çiftlik hayvanı üretiminde en çok kullanılan

yöntem mikroenjeksiyondur. Fakat bu yöntemde de başarı oranı maalesef düşüktür (Yardımcı, 2007). 24 Temmuz 2013 tarihinde doğan ve ülkemizin ilk 2 adet transgenik tavşanının ardından 23 Kasım 2013 tarihinde ülkemizin ilk transgenik kuzusu olan “Çimen” doğmuştur (Kara ve Bekyürek, 2020).

ARAŞTIRMA VE BULGULAR

Türkiye’de hayvan varlığının ıslahı amacıyla hayvan ıslah ve yetiştirme kurumlarına olan ihtiyaç doğrultusunda Cumhuriyetin ilanının akabinde 1924 yılında Karacabey Harası kurulmuştur. Daha sonra Çifteler, Konya, Çukurova ve Sultansuyu Haraları kurulmuştur (Aksoy, 2003).

Ülkemizin coğrafi ve ekonomik durumları göz önüne alınarak İsviçre’den İsviçre Esmeri ve Simental ırkları ithal edilmiştir. 1925 yılında Karacabey Harasına Avusturya'dan Montafon (İsviçre Esmeri) ve Bonihat (Simental) sığırları getirilmiştir. 1935 yılında ise Avusturya'dan Montafon ırkı getirtilerek saf damızlıklar çoğalmıştır. Bursa ve Balıkesir bölgelerinde halk elindeki yerli sığır ırklarının Esmer ırka çevirme melezlemesi çalışmaları yapılmıştır. 2. Dünya savaşı sırasında ıslah çalışmaları duraksadıktan sonra 1947 yılında İsviçre'den boğa ve inek ithal edilerek ıslah çalışmalarına devam edilmiştir. Günümüzde özellikle Batı Anadolu'da yaygın bulunan bir ırk olan Karacabey Montafonlarının çoğu bu ilk yapılan ithallere dayanmaktadır. İlk ithaller Montafon olduğu için bu isim halk ağzına yerleşmiş ve oluşturulan ırka da Karacabey Montafonu denilmiştir, daha sonraları bu yeni ırkın adı "*Türk Esmeri*" olmuştur. İlerleyen yıllarda Amerika'dan sütçü ırk olarak Holstein ve Jersey, etçi ırk olarak da Hereford ve Angus getirtilmiştir. İlk başlarda hayvan ithalleri sadece devlet tarafından yapılıyordu, 1965 yılından itibaren kurulmaya başlanan özel ticari firmalar da damızlık sığır ithal etmeye başlamışlardır. 1970 yılında tüm sığır sayısının yaklaşık olarak % 10 unu kültür ırk ve melezleri oluşturuyorken, 1980’de % 20, 1990’de % 36 ve 1998’de ise % 58 şeklinde elde edilmiştir (Aksoy, 2003).

Koyun ıslah çalışmalarında ise öncelikle ince yapağı üretimi hedeflenmiştir. 1928-1930 yılları arasında Karacabey harası ve Halkalı Ziraat Meslek Okulunda Merinos koyun ve koçları yetiştirilmeye başlanmıştır. Daha sonra et verimini de arttırmak amacıyla 1935-1939 yılları arasında Almanya’dan Et Merinosu getirtilmiştir. Son yıllarda bilimsel araştırmalar ışığında Ramlıç, Malya ve Tahirova gibi yeni melez koyunlar elde edilmiştir (Aksoy, 2003). Saf yetiştirme ve seleksiyon çalışmalarına yönelik yapılan araştırmalarda, öncelikle yerli koyunlarımızdan Akkaraman, Morkaraman, Kıvırcık, İvesi, Dağlıç, İmroz ve Karayaka ırklarının çeşitli verim seviyeleri incelenmiştir. Sakız ve İvesi ırklarının yüksek süt verimine

sahip olduđu tespit edilmiştir. Ayrıca Sakız ırkının yüksek döl verimine de sahip olduđu belirtilmiştir (Kaymakçı ve Taşkın, 2008).

Türkiye hayvancılığı içinde en gelişmiş olan sektör tavukçuluk sektörüdür. Yurt dışından grand parent, parent ve ticari hibretler ithal edilmiştir (Aksoy, 2003). 1968 yılında Ankara Tavukçuluk Araştırma Enstitüsünde yapılan projelerde Beyaz Plymouth Rock ve Beyaz Cornish ırklarında uygulanan seleksiyon ve melezleme ile ana ve baba hatları geliştirilmeye başlanmıştır (Akbay, 1977).

SONUÇ

Biyoteknoloji özellikle hayvansal üretimde geniş bir uygulama alanına sahiptir. Besin değerleri iyileştirilen yem hammaddeleriyle hayvanların verimlerinin artırılması, her bir hayvandan elde edilecek ürün miktarları ile kalitesinin yükseltilmesi, akabinde de hayvan sağlığının iyileştirilmesi biyoteknoloji uygulamalarının esas konusunu oluşturmaktadır. Tahmini olarak daha az yağlı ve daha düşük kolesterole sahip, yüksek karkas randımanı akabinde yüksek yapağı kaliteli hayvanlar elde edilip, öte yandan da herhangi bir katkı maddesi içermeyen yem ve ilaç atıkları içermeyen ürünlerin tüketiciye ulaştırılması sağlanabilir. Bu bilimsel gelişmeler ışığında çevre, sağlık ve etik bakımdan toplumun bilinçlenmesi gerekmektedir. Ülkemiz adına kendi biyoteknolojik alt yapımızın daha sağlam temellerde ve donanımla teknolojinin yakından takip edildiği özellikle hayvan ıslahı konularında daha verimli sonuçların alınabileceği çalışmaları yönetebilmek adına, kamu, üniversite ve özel sektörün iş birliği güçlendirilmelidir.

KÜLTÜRLERARASI ETKİLEŞİM GİYSİ TASARIMLARI

Dr. Öğretim Üyesi Guzal MASSADIKOVA(ORCID:0000-0002-6275-3871)

Hoca Ahmed Yesevi Uluslararası Türk-Kazak Üniversitesi

Email:guzal.massadikova@ayu.edu.kz

Özet

Etnik giysiler, bir toplumda gösterge görevi gören giyim ve vücut değişikliklerinden oluşur. Modern estetiğin giderek gelişmesiyle birlikte giyim tasarımında etnik unsurlar giderek tüketicilerin ilgisini çekmektedir. Etnik unsurlar, giysinin tasarımını, dekorasyonunu, kumaşı ve tarzını sadece giyside göstermekle beraber ulusal kültür çağrışımlarını da barındırır. Bu çalışmada, Kültürlerarası bugün var olan etnik kullanım eşyalarına derinlenerek, etnik kültürü yansıtan giysi tasarımları sunulmuştur. Kazakistan güney bölgesinde günlük yaşamda kullanılmakta olan ev tekstil kumaşlarından (körpeşe-matras yorganı) etnik giysi modasının çizimi, malzeme türü, malzeme rengi, dekoratif şekil ve renkler, süs uygulama teknikleri gösterilmiştir. Giysi tasarım çalışmaları için etnik stilde üç adet giysi modeli üzerinde çalışılmıştır. Modern giyim tasarımında etnik ulusal unsurun uygulanması ve insanların günlük yaşamlarındaki kullanılması korunmaktadır. Bu sayede kültürlerarası etkileşimin etnik zenginliğinin korunarak gelecek nesillere aktarılması önem taşımaktadır. Sonuç olarak, bu araştırma, geçmişten bize ulaşan etnik kültürün günümüz moda tasarımcılarına ilham kaynağı olabileceğini ve bu kaynakların gelecek nesillere nasıl aktarılacağına dair bazı önerilerde bulunduğunu gösteriyor.

Anahtar Kelimeler: Kültürlerarası etkileşim, etnik giysi, Moda, tasarım.

INTERCULTURAL INTERACTION CLOTHING DESIGNS

Abstract

Ethnic clothing consists of clothing and body changes that serve as indicators in a society. With the gradual development of modern aesthetics, ethnic elements in clothing design increasingly attract the attention of consumers. Ethnic elements not only show the design, decoration, fabric and style of the garment, but also contain national cultural connotations. In this study, clothing designs that reflect ethnic culture are presented by deepening into the intercultural items of ethnic use that exist today. Drawing of ethnic clothing fashion from home textile fabrics (körpeşe-matras quilt) used in daily life in the southern region of Kazakhstan, material type, material color, decorative shapes and colors, ornament application techniques are shown. For clothing design studies, three ethnic style clothing models were studied. The application of the ethnic-national element in modern clothing design and its use in people's daily lives is protected. In this way, it is important to preserve the ethnic richness of intercultural interaction and transfer it to future generations. In conclusion, this research shows that the ethnic culture that has come down to us from the past can be a source of inspiration for today's fashion designers and makes some suggestions on how these resources can be transferred to future generations.

Keywords: Intercultural interaction, ethnic clothing, Fashion, design.

GİRİŞ

Moda bir iletişim aracı olmanın yanı sıra kültürün bir parçası olarak da sınıflandırılabilir. Bir kültür olarak moda, toplumsal düzen tarafından deneyimlenen, araştırılan, iletilen ve yeniden üretilen tasarım olarak tanımlanır. Ulusal kıyafetler ve ürünler, her ulusun kültürünün özellikle parlak bir parçasıdır. Etik tarzda işlemeli takılar ve modern şık kıyafetler de ilham kaynağı oluşturuyor. Talepleri artan aksesuarlar Kazakistan gençlerinin yanı sıra yabancı ülkeleri de fethediyor. Sadece birkaç yıl öncesine kadar desenli kıyafetleri sadece yaşlıların giydiği yönünde bir klişe vardı. Günümüzde milli ürünler ve kıyafetler her yaşta insan arasında yaygın olarak dağıtılmaktadır. Kumaş ve süsleme işlemlerinde sadece giysi için tekstilleri değil artık ev tekstilleri giysi tasarımlarına aktarılıyor. Ev tekstil kumaşlarının Kazak başlıkları, günlük yaşamdaki panamalardan ve şapkalardan, tarihi desenler ve taşlarla süslenmesiyle birleştiriliyor. Örneğin, milli kıyafetlerin dekorasyonunda «Alaşa» gibi halı örnekleriyle baskılı ev tekstil kumaşları giysi üretimi için uygun baskı tekniğiyle kumaşlar üretiliyor. Bunlara ek tasarımlar için en önemli ulusal koç boynuzu ve kambur gibi motifler tasarımlarda sıklıkla kullanılmaktadır. Tarihin aynasında bu oymalar refahın sembolü olarak kabul edilir. Orta Asya kültürü kendine özgü etnik gelenek ve yöresel farklılıkları vardır. Her ülkenin etnik kültürel farklılıkları yaşam tarzı, giyim parçaları, ev eşyaları, coğrafik özellikleri gösteriyor (Abdumutalibovich, 2020; Lewis, 1989). Orta Asya ülkelerine (Kazak, Özbek, Kırgız, Tatar, Türkmen vs.) ait bu etnik kültürlerden ev tekstilleridir. Ev tekstilleri masa örtüleri, halı ve kilim iplikleri, yatak ve yorgan kumaşları, sülgü ve temizlik kumaşları gibi örnekleri bulunmaktadır (Niyazbekova, Ilasheva, Polezhaeva, Kalmanova, & Bekmanova, 2016; SHILDERKHANOV et al., 2018). Eskiden insanın mal mülkünü taşıyan yastık ve yorgan en önemli evin bir parçası olmuştur. Göcemen yaşam tarzı kültürlerde yastık ve yorganın kendileriyle beraber taşıdığı bilinmektedir. Çünkü yastık insanın mal mülkünün önemli hazinesidir. Bu hazineleri kültürel değerini kaybetmeden gelecek nesillere aktarmak, kültürlerarası etkileşimde olan ülkelerin değerini göstermeyi amaçlayan bu çalışmada, özellikle Özbek kültüründe korpacha (Adams, 2010; Akramova & Rustamova, 2021), adıyla bilinen ev eşyasının kumaşlarından esinlenerek etnik tarzda giysi tasarımları oluşturulmuştur.

Moda ve popüler kültür dünyaları sanıldığından daha yakın ve onlarca yıldır birleşerek birçok farklı sanatsal ve yaratıcı alanda eserlerin ve değerlerin yayılmasına katkıda bulundu. Popüler kültür ve moda, kuşaktan kuşağa değişen ve gelişen çok farklı ve heterojen kitlelere hitap ederken, önceki tarz ve biçimlerine göre bir devamlılık ve aidiyet duygusunu da korumaktadır (Massadikova, 2017). Popüler kültürde moda, toplumumuzu, onun sembollerini, değerlerini ve

teknolojik kalıplarını anlamak için bir araç olarak algılanabilir. Her ne kadar hem moda hem de popüler kültür yıllar boyunca sürekli bir değişim ve yenilenme ihtiyacıyla karakterize edilmiş olsa da, bunların kalıcı değerlerine dair açık kanıtlar var: Tarih yazan giysi ve aksesuarlar, yalnızca belirli grupların veya azınlıkların değil, toplumun her düzeyinde gerçek kültürel semboller ve tanımlayıcılar haline geldi. Hassas ruhlar, Kazak kıyafetlerini çağın ihtiyaçlarına göre uyarlamış ve günlük hayatta giymeyi alışkanlık haline getirmiştir. Gelecekte kültürümüz bu hızla gelişmeye devam ederse dünya arenalarını, moda evlerini fethedeceğimiz açıktır.

Kültürlerarası yaşamda ev tekstillerin kullanımı (kurpacha)

Orta Asya geleneğinden kaynaklanan kurpacha eskiden beri çeyizlerde, ev tekstil ürünlerinde, giyimde, çeşitli aksesuar ve hediyelik eşyalarda kullanıldığı bilinmektedir. Kurpacha - geleneksel bağlamının dışına çıkarmayı veya yeniden inşa etmeyi hedefleyen modern dünya sanatçıları geçmişin izlerini taşıyan işleme tekniklerini kullanarak yetenekli ellerinde, görsel bir şölene dönüştürmeyi başarmışlardır. Kurpacha, Orta Asya kültüründe (Kazak, Özbek, Kırgız vs.) evde çeşitli işlevleri yerine getiren hafif kapitone bir yataktır (battaniye). Kurpacha'da alçak bir yemek masasına - dastarkhan - otururlar ve yemeğin tadını çıkarırlar, onları sehpa yataklarına koyarlar, öğle sıcaklığında dinlenir ve geceleri üzerlerinde uyurlar. Orta Asya halklarında kurpaça bir yaşam biçimidir, günlük yaşamın ayrılmaz bir parçasıdır (Aydemir, 2009; GÜMÜŞ, 2021). Mobilyaların yerini alarak toprakla ve doğayla bütünlük içinde olmanızı sağlar. Öte yandan yüksek ve rahatsız sandalyeler yerine yere, kurpach'a oturma geleneğinin, insanlar için çok gerekli olan bedeni dinlendirme, rahatlama ve rahatlıktan oluşan pratik bir anlamı da vardır (Fumagalli, 2007). Kurpacha çoğunlukla 0,75 m x 3,60 m boyutlarındadır ancak desenleri, üretimde kullanılan kumaşları ve renkleri farklılık gösterebilir. Kurpacha'nın ön tarafı genellikle han-atlas, pan-kadife veya peluştan yapılı ve bu, bitmiş ürüne hoş bir yumuşaklık katar. İç kısmı pamuklu kumaştan yapılmıştır ve kurpachanın dolgusu pamuk yünüdür. Kurpacha için pamuk yünü pürüzsüz olana kadar önceden dövülür ve bu nedenle bitmiş ürün hafif ve taşınabilir - yuvarlanması ve bir yerden bir yere taşınması çok kolaydır. Ortalama olarak bir kurpacha, beş ila on kilogram pamuk alır. Kültürlerarası geleneklerine kutsal bir saygı duyulmaktadır ve bu asırlık geleneklerden biri de kurpacha'nın antik çağlardan günümüze günlük yaşamda kullanılmasıdır.

MATERYAL VE YÖNTEM

Materyal

Bu çalışmada, Orta Asya kültürünün geçmişini geleceğe taşıyan unsurlarından etnik yaşam biçimlerinin moda tasarım alanına bağlamak amacıyla kadın giysi tasarımları gerçekleştirilmiştir. Etnik kadın giysi tasarımları: fikir, tema, artistik çizim teknik çizim, model uygulaması, süsleme işlemi gibi bir moda tasarım sürecini oluşturmuştur.

2.2. Yöntem

Bu çalışma kültürlerarası etnik yaşamına odaklanmaktadır çünkü etnik yaşam tarihsel olarak sosyal statü, kültürel birlik, kimlik ve farklılaşma göstergelerini güçlü bir şekilde tanımlayan ve destekleyen bir süreç olmuştur. Çalışmada kültür ve moda etnik çeşitlilik bağlamında incelenmiş ve değerlendirilmiştir. Amaç, etnik kültüre ait günlük yaşamda kullanılan ev tekstillerini etnik çeşitliliğin farklı temsillerinin çağdaş tüketici tercihleri üzerindeki bazı etkilerini keşfetmek ve bunların nasıl moda temsili edildiğini araştırmaktır. Bir tasarımcıya ilham veren etnik ev tekstillerinin moda giyime çevrildiğinde anlamının nasıl değiştiğini inceliyor. Kapsamlı bir literatür taramasının ardından seçilen görsellerin analiz yöntemi olarak nitel içerik analizi kullanılmıştır. Bu bağlamda modern giyimde etnik görselliğin boyutları, tasarımda etnik tarzın yanı sıra etnotasarım desenleriyle birlikte ele alınmıştır.

2.3. Etnik kadın giyim koleksiyonunun tasarım süreci

Bu çalışmada etnik giyimlerinin tasarım yaratmak için moda tasarımını ve üretim süreci oluşturuldu. Yaratıcı tasarım sürecini oluşturan beş aşama ve her birinin dökümü aşağıda verilmiştir:

- Araştırma

Tasarım sürecinin ilk adımı araştırma yapmak olmalıdır. Trend tahmini, diğer tasarımcıların çalışmalarını incelemek, tarihi moda, kültürel açıdan önemli giysiler, giysi yapımı, kumaş stilleri gibi moda ortamındaki çeşitli bilgilere bakmak önemlidir (McKelvey & Munslow, 2011).

- Artistik çizim

Moda tasarımınızı çizmenin geleneksel yolu, kağıt ve kalem, renkli kurşun kalem, keçeli kalemler vb. kullanılarak elle yapılabilir.

- Teknik çizim

Tasarım taslağı oluşturmanın daha modern versiyonu dijital eskiz olabilir. Taslağı oluşturmak için, tasarımın kolayca düzenlenmesine ve iyileştirilmesine olanak tanıyan bir dijital çizim programı veya uygulaması kullanabilirsiniz. Bu tasarımlar daha sonra bir teknoloji paketine yerleştirilmek üzere değiştirilebilir (Gwilt, 2012).

- Malzeme seçimi ve üretim

Kumaş, moda tasarımında önemli bir unsurdur çünkü bir giysinin görünüşünü, hissini ve dökümünü belirler. Farklı kumaşların ağırlıkları, dokuları ve dökümlülükleri gibi farklı özellikleri vardır ve bu, bir giysinin görünümünü ve uyumunu büyük ölçüde etkileyebilir. Kumaşın görsel ve dokusal özelliklerinin yanı sıra dikkate alınması gereken pratik hususlar da vardır. Bazı kumaşlar diğerlerinden daha dayanıklıdır veya bakımı kolaydır ve bazı kumaşlar belirli iklimler veya durumlar için daha uygun olabilir (Kim & Park, 2010).

- Süsleme ve bitim işlemi

Kavramlar, dikiş ve moda tasarımında kullanılan düğmeler, fermuarlar, çıtçıtılar, kancalar ve gözler gibi küçük, işlevsel öğelerdir. Bu öğeler, giysilerin sabitlenmesinden dekoratif öğeler eklenmesine kadar çeşitli amaçlara hizmet eder.

- Moodboard panosu

Mood board tasarımınız için bir tema oluşturmak üzere internetten, dergiden, çektiğiniz resimlerden vb. resimler toplamak gerekir. Bu, ürününüz için ilham kaynağı olan dokuları, nesnelere, sanatı, insanları, renkleri veya başka herhangi bir şeyi içerebilir.

BULGULAR VE TARTIŞMA

Orta Asya ülkelerinde kullanılan Kurpacha kumaşlarından etnik giysi tasarımları

Bu çalışmada, araştırma verileri Orta Asya halklarının ev eşyalarında tekstil malzemelerinin kullanımı bir dizi faktöre bağlı olduğunu gösteriyor. Geçmişten göçebe ve yerleşik yaşam tarzı,

iklim doğası, mobilyaların algılanan yüksekliği ve genel olarak varlığı, etnik gelenekler ve bir takım faktörleri oluşturmuştur. Orta Asya göçebelerinin (Kazak, Özbek, Kırgız, Türkmen vs.) bir kısmı için barınakların çok önemli bir özelliği, tekstil yorgan ve battanyelerin yaygın kullanımınıdır. Bu ev eşyalarının hazırlanma tekniği etnik veya yerel geleneklere göre belirleniyor. Ana türleri pamuklu şilteler (battaniyeler, yorganlar veya yastıklar) olan yatak kültürü her yerde yoğun kullanılıyor, çünkü bu eşyalar evin sahiplerinin mülkiyet düzeyini açıkça karakterize ediyor. Aynı zamanda görgü kuralları, pahalı ipek ve yarı ipek Orta Asya kumaşlarıyla kaplı battaniyelere yerleştirilen misafirler için makul düzeyde bir misafirperverlik gerektiriyor. Bu tür battaniyeleri pazarlardan satın alıyorlardı, ancak yün ve kadifeden kendi küçük battaniyelerini sıklıkla işleyerek yapıyorlar. Yörede büyümlü bir koruma aracı olarak değerlendirilen yorgan, kendine has tarzıyla öne çıkıyor. Orta Asya halklarında tarihten günümüze kadar kültürlerarası etkileşimden kaynaklanan bu tekstil kumaşları Çimken ve Türkistan şehirlerine Özbekistandan ithalat edilmektedir. Büyük pazarlarda satışta olan pamuklu kumaşlar yorgan ve battanyeler hariç her türlü amaçlarda kullanılmaktadır. Bu çalışmada, Kazakistan Güney bölgesinde kullanılmakta olan «körpeşe-kurpacha» kumaşlarından etnik giysi tasarımları oluşturulmuştur.

SONUÇ

Günümüz dünyasının arka planında ülkelerin mirasını ve kalkınmasını sağlamak için ulusal unsurların nasıl oluşturulacağı önemli bir konudur. Bu bağlamda etnik unsurlar ülkemizdeki geleneksel kıyafetlerin sadece renk, desen ve farklı şekillerde değil, birçok unsuru bünyesinde barındırması nedeniyle daha birçok açıdan ortaya çıkmasına neden olmaktadır. Ulusal kültürün, uluslararası çevre, yenilikçi tasarım fikri, giyim tasarımının ulusal unsurlarına entegre edilmesi, geleneksel etnik kültürün yeni bir canlılık kazanmasıyla gelecekteki gelişimin yönü olacağı belirlenmesi son derece önemlidir. Bu bakımdan modern giyim ve aksesuarların içerisinde yer alan etnik kostüm bileşenlerinin eski işlevlerini kaybedip yeni formlar kazanarak kitlelere ulaşması moda markalarının amaçları arasında yer almaktadır. Günümüzde belirli bir geleneğe ait kostümde "alıntı yapmak" kişinin etnik kökenine göre düzenlenmiyor, yani kostüm artık etnik kimlik işlevini yerine getirmiyor, kutsal bir yük taşıyor. Etnik grupları cezbeden motif veya unsurlar estetik amaçlı veya gösteri amaçlı yapılabilir. Bu etnik unsurların farklı temsilleri sadece geleneksel etnik kültürü miras almakla kalmıyor, aynı zamanda yenilik ve modern giyim tasarımlarının kullanımı açısından da fark yaratıyor.

Abstract

The increasing demand for energy and the need to reduce greenhouse gas (GHG) emissions, has led to a growing interest in exploring alternative energy sources. Point focus solar collector (PFSC) systems, have emerged as a promising technology for harnessing solar energy and converting it into electricity or heat. This survey was conducted on the energy potentials of PFSCs including their efficiency, cost-effectiveness, environmental impact, and potentials for integration into the existing energy infrastructure. Findings revealed that PFSC systems involves zero GHG emissions, making them a clean and sustainable energy option that contributes to the reduction of GHG emissions. It was observed that the Levelized cost of electricity (LCOE) from PFSC systems has become competitive with conventional energy sources, such as coal and natural gas. This cost-effectiveness, combined with the potential for long-term savings on fuel costs, makes PFSC systems an attractive option for energy mix augmentation. Considering their power potentials, PFSC systems can be integrated into the grid to provide electricity during peak demand periods or to supplement the energy supply during periods of low solar radiation. Also, they can be combined with thermal energy storage technologies to provide a continuous and reliable energy supply. Conventional studies indicated that the efficiency of PFSC systems depends on various factors, including the type of collector, the concentration ratio, and the tracking mechanism. The high efficiency, cost-effectiveness, and minimal environmental impact make PFSC systems a viable option for large-scale energy production. Thus, with PFSC systems, the energy mix can be augmented to reduce the reliance on conventional energy sources while contributing to a more sustainable and secured energy future.

Keywords: Energy potential, Solar collectors, Energy mix, GHG emissions, sustainability.

1. Overview of Point Focus Solar Collector

Solar energy has gained significant attention as a renewable and sustainable source of power. Among the various solar technologies, point focus solar collectors have emerged as a promising solution for harnessing solar energy efficiently. The concept of point focus solar collectors can be traced back to ancient civilizations. The ancient Greeks and Romans used concave mirrors to concentrate sunlight for various purposes, including heating water and starting fires (Michael et al., 2016; Szabó, 2017). However, it was not until the 19th century that significant advancements were made in this field. Augustin Mouchot, a French inventor, is credited with developing the first practical point focus solar collector in the 1860s. Mouchot's solar-powered steam engine utilized a parabolic reflector to concentrate sunlight onto a boiler, generating steam for mechanical work. This invention marked a significant milestone in the development of point focus solar collectors (Shreve, 2013; Fernandez, 2019)

Over the years, technological approaches have greatly improved the efficiency and practicality of point focus solar collectors. One notable approach is the use of advanced materials for reflectors and absorbers (Salvi et al., 2018; Lakshmipathy et al., 2020). Initially, mirrors made of polished metal were used, but they were heavy and prone to corrosion. Modern point focus solar collectors employ highly reflective materials such as silvered glass or aluminium-coated polymer films, which are lightweight and durable. Another significant approach is the integration of tracking systems. Point focus solar collectors require precise alignment with the sun to maximize energy capture (Lee et al., 2009; Ahmad et al., 2024). Early designs relied on manual adjustment, but the introduction of automatic tracking systems greatly improved their efficiency. These systems use sensors and motors to continuously orient the collector towards the sun, ensuring optimal sunlight concentration throughout the day.

Furthermore, the development of receiver technologies has enhanced the conversion of concentrated sunlight into usable energy. Initially, point focus solar collectors were primarily used for thermal applications, such as water heating and steam generation. However, advancements in receiver technologies have enabled the conversion of concentrated sunlight into electricity through the use of photovoltaic cells. This integration of solar thermal and photovoltaic technologies has expanded the range of applications for point focus solar collectors (Desideri et al., 2013; Ali and Alabid, 2022).

Point focus solar collectors play a crucial role in the renewable energy sector due to their high efficiency and versatility (Sankar and Muniraja, 2020; Tabassum et al., 2021). Their ability to concentrate sunlight allows for the collection of a large amount of energy in a relatively small

area. This makes them particularly suitable for applications requiring high-temperature heat, such as industrial processes and power generation. Moreover, point focus solar collectors have the potential to contribute significantly to the reduction of greenhouse gas emissions. By replacing fossil fuel-based energy sources, they can help mitigate climate change and promote sustainable development. Additionally, their modular design allows for scalability, making them adaptable to various energy demands.

The historical development and technological advancements of point focus solar collectors have transformed them into a viable and efficient solution for harnessing solar energy. From ancient civilizations to modern times, these collectors have evolved significantly, incorporating advanced materials, tracking systems, and receiver technologies. Their high efficiency and versatility make them a valuable asset in the renewable energy sector, contributing to a sustainable future. As the world continues to prioritize clean energy sources, further research and development in point focus solar collectors will undoubtedly lead to even more efficient and cost-effective solutions (Kalogirou, 2004; Nikolaidis, 2023; Hasan et al., 2023).

2. Theories Governing Point Focus Solar Collector

The Point Focus Solar Collector (PFSC) is a significant technology in the field of solar energy conversion. A comprehensive theories governing the principles of PFSC are presented as follows:

Concentrated Solar Power (CSP) Principle: The PFSC operates on the principle of Concentrated Solar Power (CSP), which involves focusing sunlight onto a small area to generate heat or electricity (Soomro et al., 2019). CSP systems utilize mirrors or lenses to concentrate sunlight onto a receiver, which then converts the solar energy into usable forms. This theory forms the basis for the PFSC's functionality and distinguishes it from other solar energy technologies.

Optical Concentration: Optical concentration is a key theory governing the PFSC. By employing mirrors or lenses, the PFSC concentrates sunlight onto a small focal point, thereby increasing the intensity of solar radiation. Therefore, optical concentration enhances the efficiency of solar energy conversion, making the PFSC a viable option for large-scale power generation (Zhe et al., 2021; Soomar et al., 2022).

Thermal Energy Conversion: The PFSC utilizes thermal energy conversion theory to convert concentrated solar radiation into usable heat or electricity. The concentrated sunlight heats a working fluid, such as water or oil, which then transfers the heat to a power cycle or storage system. This theory highlights the PFSC's potential for various applications, including

electricity generation, desalination, and industrial processes (Obalalu et al., 2023; Dada et al., 2023).

Tracking Systems: Tracking systems theory plays a crucial role in optimizing the PFSC's performance. The PFSC requires precise tracking mechanisms to ensure continuous alignment with the sun's position throughout the day. This theory emphasizes the importance of accurate tracking systems in maximizing solar energy collection and improving overall system efficiency (Chong et al., 2009; Xiao et al., 2017).

The theories governing the Point Focus Solar Collector provide a solid foundation for understanding its functionality and potential applications. The Concentrated Solar Power principle, optical concentration, thermal energy conversion, and tracking systems theory collectively contribute to the PFSC's efficiency and effectiveness. Research and technological advancements are necessary to address these limitations and enhance the overall performance of the PFSC.

3. Operating parameters influencing the Performance of PFSCs

Point focus solar collectors, also known as concentrator solar collectors, are designed to concentrate sunlight onto a small area using mirrors or lenses. This concentration of sunlight increases the intensity of the solar radiation incident on the receiver, which in turn enhances the energy conversion efficiency. However, the performance of point focus solar collectors can be influenced by several factors, which need to be carefully considered during the design and operation of these systems. Operating parameters play a crucial role in determining the performance of point focus solar collector systems (Foulaadvand et al., 2021; Iqbal et al., 2023). These parameters include the solar irradiance, collector temperature, concentration ratio, and tracking accuracy.

Solar irradiance: Solar irradiance is a key factor that affects the performance of point focus solar collector systems. It refers to the amount of solar energy received per unit area. Higher solar irradiance levels result in increased energy collection and conversion. A higher solar irradiance level leads to a higher temperature rise in the collector, resulting in improved system efficiency (Gorjian et al., 2015; Vidyanandan, 2017). Therefore, it is essential to consider the solar irradiance levels when designing and operating point focus solar collector systems. The intensity of solar radiation incident on the collector surface determines the amount of energy that can be converted into usable heat or electricity. Variations in solar irradiance due to factors such as cloud cover, atmospheric conditions, and seasonal changes can significantly impact the performance of point focus solar collectors. Therefore, accurate measurement and prediction of

solar irradiance are essential for optimizing the performance of these collectors (Park et al., 2021; Tscholl et al., 2022; Kosmopoulos et al., 2024).

Collector temperature: Collector temperature is another critical operating parameter that significantly impacts the performance of point focus solar collector systems. The temperature of the collector affects the efficiency of energy conversion. As the collector temperature increases, the efficiency of the system decreases due to increased thermal losses. Maintaining a lower collector temperature can enhance the overall performance of point focus solar collector systems. Therefore, it is crucial to control the collector temperature within an optimal range to maximize system efficiency (Sardeshpande et al., 2021; Wang et al., 2021; Wang et al., 2023).

Concentration ratio: Concentration ratio is a parameter that determines the concentration of solar energy onto the receiver. It is defined as the ratio of the area of the reflector to the area of the receiver. A higher concentration ratio leads to increased energy collection and conversion. A higher concentration ratio improves the system's ability to concentrate solar energy onto the receiver, resulting in enhanced performance. Therefore, it is important to optimize the concentration ratio to achieve higher system efficiency (Supa et al., 2015; Osorio et al., 2019; Ardila et al., 2021).

Tracking accuracy: Tracking accuracy is an operating parameter that influences the performance of point focus solar collector systems. Tracking accuracy refers to the ability of the system to accurately track the movement of the sun. A higher tracking accuracy ensures that the collector is always aligned with the sun, maximizing energy collection. A higher tracking accuracy improves the system's performance by increasing the solar energy incident on the receiver. Therefore, it is crucial to maintain a high tracking accuracy to achieve optimal system efficiency. Point focus solar collectors require precise tracking systems to ensure that the concentrated sunlight remains focused on the receiver throughout the day. Any deviations or errors in tracking can result in reduced performance and efficiency of the collector. Factors such as mechanical wear, control system accuracy, and environmental conditions can affect the tracking accuracy of point focus solar collectors. Therefore, it is crucial to maintain and calibrate the tracking system regularly to ensure optimal performance (Hughes, 1980; Sardeshpande et al., 2011; Ullah and Kang, 2019; Sauerborn, 2021; Liu, B., Zong and Huang, 2023).

Receiver Design: The design of the receiver plays a vital role in the performance of point focus solar collectors. The receiver is responsible for absorbing the concentrated solar radiation and converting it into usable heat or electricity. Factors such as receiver material, geometry, and

thermal properties can significantly impact the efficiency and performance of the collector. The selection of appropriate receiver materials with high thermal conductivity and low emissivity is crucial to minimize heat losses and maximize energy conversion efficiency. Tagle-Salazar et al., 2020; Malwad and Tungikar, 2020a; Malwad and Tungikar, 2020b; Kumar and Gupta, 2022).

Environmental Conditions: Environmental conditions, such as ambient temperature, wind speed, and humidity, can affect the performance of point focus solar collectors. High ambient temperatures can lead to increased thermal losses, while strong winds can cause misalignment of the mirrors or lenses, resulting in reduced concentration and efficiency. Humidity can also affect the optical properties of the collector components, leading to decreased performance. Therefore, it is essential to consider the local environmental conditions during the design and operation of point focus solar collectors (Mustafa et al., 2020; Hasan et al., 2022; Gholami et al., 2022; Lin et al., 2023).

Operating parameters such as solar irradiance, collector temperature, concentration ratio, and tracking accuracy significantly influence the performance of point focus solar collector systems. Higher solar irradiance levels, lower collector temperatures, higher concentration ratios, and higher tracking accuracy lead to improved system efficiency. Therefore, it is essential to consider and optimize these operating parameters to maximize the performance of point focus solar collector systems.

4. Energy Storage for Point Focus Solar Collectors

Point focus solar collectors (PFSCs) have gained significant attention as a promising technology for harnessing solar energy. These collectors concentrate sunlight onto a small area, resulting in higher temperatures and increased energy conversion efficiency. However, the intermittent nature of solar radiation necessitates the integration of energy storage systems to ensure a continuous and reliable power supply (Suman et al., 2015; Hussain and Lee, 2016; Arnaoutakis and Katsaprakakis, 2021). Energy storage for point focus solar collectors are classified as follows:

a. Thermal Energy Storage

Sensible Heat Storage: Thermal energy storage (TES) systems, such as sensible heat storage, utilize the heat capacity of a material to store excess energy generated by PFSCs. Sensible heat storage materials, such as molten salts or rocks, absorb and release heat as their temperature changes. This method offers high energy density and long-term storage capabilities, making it suitable for PFSCs (Bauer et al., 2012; Alva et al., 2017; Rigui et al., 2022).

Latent Heat Storage: Latent heat storage involves the phase change of a material, such as the melting and solidification of a substance, to store and release energy (Rathod, 2022; Teamah, 2022). Phase change materials (PCMs) exhibit high energy storage density and can store energy for extended periods. However, the limited range of operating temperatures and the need for encapsulation pose challenges for their implementation in PFSCs.

b. Electrochemical Energy Storage

Batteries: Batteries, such as lithium-ion batteries, offer a viable option for energy storage in PFSCs. They provide high energy density, fast response times, and can be easily integrated into existing systems. However, their limited lifespan, high cost, and environmental concerns associated with their production and disposal hinder their widespread adoption.

Supercapacitors: Supercapacitors, also known as ultra capacitors, store energy through the separation of charges at the electrode-electrolyte interface. They offer high power density, rapid charge/discharge rates, and long cycle life. However, their relatively low energy density and high self-discharge rates limit their application in long-term energy storage for PFSCs (Bharti et al., 2021; Ahmed et al., 2022).

c. Chemical Energy Storage

Hydrogen Production: Hydrogen production through water electrolysis offers a promising avenue for energy storage in PFSCs. This method involves using excess electricity generated by PFSCs to split water into hydrogen and oxygen. Hydrogen can be stored and later used in fuel cells or combustion engines to generate electricity. However, challenges related to hydrogen storage, transportation, and safety need to be addressed for widespread implementation. Wang et al., 2021; Tashie-Lewis and Nnabuife, 2021; Nasser et al., 2022).

5. Advancements in Point Focus Solar Collectors

Solar energy has emerged as a promising alternative to conventional energy sources due to its abundance and environmental benefits. Point focus solar collectors, also known as concentrated solar power (CSP) systems, have witnessed significant advancements in recent years. These are enumerated as follows:

High-Efficiency Solar Cells: One of the major advancements in point focus solar collectors is the development of high-efficiency solar cells. Traditional solar cells have limited efficiency in converting sunlight into electricity. However, recent breakthroughs in materials science and engineering have led to the creation of more efficient solar cells, such as multi-junction cells and perovskite cells. These advancements have significantly increased the overall efficiency of

point focus solar collectors, making them more economically viable (Hoffschmidt et al., 2012; Tabarhoseini et al., 2022; Parthiban and Ponnambalam, 2022).

Concentrated Solar Power Systems: Point focus solar collectors utilize mirrors or lenses to concentrate sunlight onto a small area, thereby generating high temperatures (John, 2015; Zaboli et al., 2023). The advancements in concentrating technologies have led to the development of more efficient and cost-effective systems. For instance, parabolic trough collectors, heliostat mirrors, and dish-Stirling systems have become more sophisticated, allowing for higher concentration ratios and improved energy conversion.

Thermal Energy Storage: One of the key challenges of solar energy is its intermittent nature. However, advancements in thermal energy storage systems have addressed this issue. Point focus solar collectors can now store excess thermal energy in molten salts or other heat transfer fluids, which can be used to generate electricity during periods of low sunlight. This breakthrough has significantly increased the reliability and dispatchability of point focus solar collectors, making them a more attractive option for large-scale energy production (Salloom et al., 2018; Wang et al., 2020; Modi, 2023; Barrasso et al., 2023).

Hybridization with Other Energy Sources: To further enhance the reliability and efficiency of point focus solar collectors, hybridization with other energy sources has gained attention. By integrating CSP systems with fossil fuel power plants or biomass facilities, the overall energy output can be increased while ensuring a continuous power supply. This hybrid approach allows for the utilization of existing infrastructure and provides a smoother transition towards a renewable energy future (Yousef et al., 2021; Alami et al., 2023; Gutiérrez-Alvarez et al., 2023; Chen et al., 2023).

6. Characteristics of Point Focus Solar Collectors

Point focus solar collectors are a crucial component of solar energy systems due to their unique characteristics enumerated as follows:

Concentration Ratio: One of the primary characteristics of point focus solar collectors is their ability to achieve high concentration ratios. Concentration ratio refers to the ratio of the area of the collector aperture to the area of the receiver (Kulkarni et al., 2023; Kulkarni, et al., 2020). Higher concentration ratios enable increased energy conversion efficiency by focusing a larger amount of sunlight onto a smaller receiver area. This characteristic makes point focus solar collectors suitable for applications requiring high-temperature heat or electricity generation.

Tracking Mechanism: Point focus solar collectors often incorporate tracking mechanisms to ensure optimal alignment with the sun's position throughout the day (Lee et al., 2009; Racharla and Rajan, 2017; Aghamohammadi and Foulaadvand, (2023). This characteristic allows for maximum utilization of solar energy by continuously adjusting the collector's orientation. Tracking mechanisms can be either single-axis or dual-axis, with the latter providing higher accuracy but at a higher cost. The ability to track the sun's movement enhances the overall performance of point focus solar collectors, especially in regions with varying solar angles.

Thermal Storage: Point focus solar collectors can be integrated with thermal storage systems, enabling the storage of excess thermal energy for later use (Tian and Zhao, 2023; Elkhatat and Al-Muhtaseb, 2023). This characteristic is particularly advantageous for applications requiring continuous energy supply, even during periods of low solar radiation. Thermal storage systems can utilize various materials, such as molten salts or phase change materials, to store and release thermal energy efficiently. The incorporation of thermal storage enhances the flexibility and reliability of point focus solar collectors, making them suitable for both residential and industrial applications.

Optical Efficiency: The optical efficiency of point focus solar collectors plays a crucial role in determining their overall performance. This characteristic refers to the ability of the collector to capture and concentrate sunlight effectively. Factors such as reflector design, receiver material, and tracking accuracy influence the optical efficiency of these collectors. Higher optical efficiency ensures maximum utilization of available solar energy, resulting in improved energy conversion efficiency (Danielli et al., 2011; Belghachi, 2015)

Hybridization with Fossil Fuels: Another advancement is the hybridization of point focus solar collectors with fossil fuel power plants. This integration allows for the utilization of solar energy during peak sunlight hours, reducing the reliance on fossil fuels and decreasing GHG emissions. Hybrid systems can enhance the overall efficiency and reliability of power generation (Hassan et al., 2023; Al-Rawashdeh et al., 2023; León Gómez et al., 2023)

High-Temperature Applications: Point focus solar collectors have also made advancements in high-temperature applications. By using advanced materials and innovative designs, these systems can achieve higher temperatures, enabling the production of hydrogen, synthesis of fuels, and other industrial processes that require extreme heat (Wang et al., 2019; Arnaoutakis and Katsaprakakis, 2021; Aquilanti et al., 2023)

7. Applications of Point Focus Solar Collectors

Point focus solar collectors are a type of solar energy technology that concentrates sunlight onto a small area, maximizing the amount of energy that can be harvested. These collectors have gained significant attention due to their potential to generate clean and sustainable energy.

Power Generation: One of the primary applications of point focus solar collectors is in power generation. Concentrated solar power (CSP) plants utilize these collectors to focus sunlight onto a receiver, which then converts the solar energy into heat. This heat is used to generate steam, which drives a turbine to produce electricity. CSP plants have the advantage of being able to store excess heat, allowing for continuous power generation even during periods of low sunlight. This makes them a reliable and efficient source of renewable energy (Kurup and Turchi, 2016; Ayaz et al., 2020; Ghodbane et al., 2020).

Industrial Processes: Point focus solar collectors can also be employed in various industrial processes that require high-temperature heat. For instance, in the manufacturing sector, these collectors can be used to provide heat for processes such as metal smelting, drying, and chemical reactions. By utilizing solar energy instead of fossil fuels, industries can significantly reduce their carbon footprint and operating costs (Fortuin and Stryi-Hipp, 2012; Kumar et al., 2022; Tasmin et al., 2022).

Desalination: Another promising application of point focus solar collectors is in desalination. Solar desalination systems utilize the concentrated solar energy to evaporate seawater, leaving behind the salt and other impurities. The vapour is then condensed to produce fresh water. This technology offers a sustainable solution to address the global water scarcity issue, particularly in arid regions where access to freshwater is limited (Xu et al., 2017; Hoque, et al., 2019; Aende et al., 2020; Choong et al., 2020).

Heating and Cooling: Point focus solar collectors can also be used for residential and commercial heating and cooling purposes. Solar thermal systems can provide hot water for domestic use, space heating during colder months, and even cooling through absorption chillers (Helm et al., 2014; Filipowicz et al., 2019). By harnessing solar energy for these applications, buildings can reduce their reliance on conventional energy sources, leading to lower energy bills and reduced greenhouse gas emissions.

8. Advantages of Point Focus Solar Collectors

Solar energy is a renewable and sustainable source of power that has gained significant attention in recent years. Point focus solar collectors, also known as concentrated solar power (CSP)

systems, are a type of solar technology that uses mirrors or lenses to concentrate sunlight onto a small area. The various advantages of point focus solar collectors are as follows:

High Efficiency: Point focus solar collectors have the advantage of achieving high levels of efficiency in converting sunlight into usable energy (Sun et al., 2023; Obalalu et al., 2023). By concentrating sunlight onto a small area, these systems can generate higher temperatures, which in turn increases the efficiency of energy conversion. This high efficiency makes point focus solar collectors suitable for large-scale power generation, particularly in regions with abundant sunlight.

Energy Storage: Another advantage of point focus solar collectors is their ability to incorporate energy storage systems. By utilizing thermal energy storage, excess heat generated during peak sunlight hours can be stored and used later when sunlight is not available (Sarbu and Sebarchievici, 2018; Agbo et al., 2021). This feature allows for continuous power generation, even during cloudy periods or at night. Energy storage also enhances the reliability and stability of the power supply, making point focus solar collectors a viable option for meeting energy demands.

Scalability: Point focus solar collectors offer scalability, allowing for the construction of both small and large-scale power plants (Omeiza et al., 2023; Ahmad et al., 2024). These systems can be easily expanded by adding more mirrors or lenses, enabling the generation of higher power outputs as needed. This flexibility makes point focus solar collectors suitable for various applications, ranging from residential and commercial use to utility-scale power generation.

Energy Viability: The energy viability of point focus solar collector systems has improved over the years due to technological advancements and economies of scale. The cost of solar photovoltaic (PV) modules, which are used in many solar energy systems, has significantly decreased, making solar energy more competitive with conventional energy sources (Diemuodeke et al., 2021; Dada and Popoola, 2023). Furthermore, the operational and maintenance costs of point focus solar collector systems are relatively low compared to other renewable energy technologies. These factors make point focus solar collector systems an attractive option for energy mix augmentation.

Environmental Benefits: The use of point focus solar collectors contributes to significant environmental benefits. Firstly, solar energy is a clean and renewable source, resulting in minimal greenhouse gas emissions compared to fossil fuel-based power generation (Owusu et al., 2016; Agbo et al., 2021; Hussain et al., 2022). Secondly, point focus solar collectors have a smaller land footprint compared to other renewable energy technologies, such as wind or

biomass. This makes them suitable for areas with limited available land. Additionally, the use of point focus solar collectors reduces water consumption, as they do not require large amounts of water for cooling, unlike conventional power plants.

Economic Opportunities: The deployment of point focus solar collectors presents various economic opportunities. The construction and operation of solar power plants create jobs, stimulating local economies. Moreover, the use of solar energy reduces dependence on imported fossil fuels, leading to energy independence and improved energy security. Additionally, as the technology advances and becomes more widespread, the cost of point focus solar collectors is expected to decrease, making them more economically competitive with conventional power generation methods (Oyedepo, 2012; Obaideen et al., 2021; Bhuiyan et al., 2022).

Point focus solar collectors offer numerous advantages, including high efficiency, energy storage capabilities, scalability, environmental benefits, and economic opportunities. These advantages make them a promising solution for addressing energy needs while mitigating environmental concerns. As the world continues to transition towards a sustainable energy future, point focus solar collectors have the potential to play a significant role in meeting global energy demands.

9. Disadvantages of Point Focus Solar Collectors

Point focus solar collectors have gained significant attention in recent years due to their ability to concentrate sunlight onto a small area, thereby increasing the efficiency of solar energy conversion. However, despite their advantages, these collectors also possess several disadvantages that need to be considered.

High Cost: One of the primary disadvantages of point focus solar collectors is their high cost. The complex design and advanced technology required for these systems contribute to their expensive nature (Omeiza et al., 2023; Salvi et al., 2018). The manufacturing, installation, and maintenance costs associated with point focus solar collectors can be prohibitive, making them less accessible for widespread adoption, particularly in developing countries or regions with limited financial resources. However, the levelized cost of electricity (LCOE) from PFSC systems is gradually becoming very competitive with conventional energy sources in recent times.

Limited Efficiency: While point focus solar collectors offer higher efficiency compared to other solar technologies, they are still subject to certain limitations. These collectors heavily rely on

direct sunlight, making them less effective in cloudy or overcast conditions (Abdul-Rahman and Wang, 2010; Toledo et al., 2016). Additionally, their efficiency is significantly reduced during periods of low solar radiation, such as early mornings, late evenings, or winter months. This limitation restricts their overall energy output and may require additional energy storage systems to compensate for the intermittent nature of solar energy.

Environmental Concerns: Point focus solar collectors often employ reflective surfaces and mirrors to concentrate sunlight onto a small area. The manufacturing and disposal of these materials can have adverse environmental impacts. The production of reflective surfaces may involve the use of toxic chemicals, while their disposal can contribute to landfill waste. Additionally, the large-scale deployment of point focus solar collectors may disrupt local ecosystems and habitats, particularly if not properly planned and managed (Hernandez et al., 2015; Roddis et al., 2020).

Safety Risks: The concentrated solar energy produced by point focus solar collectors can pose safety risks if not handled properly. The intense heat generated by these systems can cause burns or fires if the collectors are not adequately insulated or protected. Moreover, the concentrated sunlight can be harmful to human eyes and may require additional safety measures during installation, maintenance, or repair. (Arnaoutakis and Katsaprakakis, 2021; Hagumimana et al., 2021).

Land and Space Requirements: Point focus solar collectors typically require a significant amount of land or space for installation. This can be a challenge in densely populated areas or regions with limited available land. Moreover, the concentration of solar energy in a small area may lead to localized temperature increases, potentially affecting nearby vegetation or wildlife.

Weather Conditions: Another significant disadvantage is their sensitivity to weather conditions, particularly cloudy or overcast skies. Cloud cover reduces the amount of sunlight reaching the collector, thereby decreasing its energy output (Kejna et al., 2021; Tian et al., 2023). Additionally, the initial cost of installing point focus solar collectors, especially those with advanced tracking mechanisms, can be relatively high. These limitations should be considered when evaluating the suitability of point focus solar collectors for specific applications

While point focus solar collectors offer higher efficiency and concentrated solar energy, they also possess several disadvantages that need to be carefully considered. The high cost, limited efficiency under certain conditions, environmental concerns, safety risks, and land requirements associated with these collectors highlight the need for a comprehensive evaluation before their widespread adoption. Future research and technological advancements may help address these

drawbacks, making point focus solar collectors a more viable and sustainable option for harnessing solar energy.

10. Types of Point Focus Solar Collectors

Solar energy has emerged as a promising alternative to conventional energy sources due to its abundance and environmental benefits. Point focus solar collectors play a crucial role in harnessing solar energy efficiently.

Parabolic Trough Collectors: Parabolic trough collectors (PTCs) are one of the most widely used point focus solar collectors. As shown in Figure 1, these collectors consist of parabolic-shaped mirrors that concentrate sunlight onto a receiver tube located at the focal point (Çağlar, 2016; Ahmad et al., 2024). PTCs offer several advantages, including high efficiency, low maintenance requirements, and the ability to generate high-temperature heat. PTCs can achieve thermal efficiencies of up to 80%, making them suitable for various applications such as electricity generation and industrial processes. However, PTCs also have certain limitations. Parabolic troughs use curved mirrors to focus sunlight onto a receiver tube (Babuje et al., 2020; Lüpfer, 2022). Firstly, their design requires precise alignment with the sun's position, necessitating complex tracking systems (Ramde et al., 2020; Felsberger et al., 2022). Secondly, the receiver tube's high temperatures can lead to thermal losses and material degradation over time. Despite these limitations, PTCs remain a popular choice due to their proven track record and reliability. These collectors can be categorized into two main types: parabolic troughs and solar power towers.

Figure 1: Parabolic trough systems

Dish Stirling Systems: Dish Stirling systems are another type of point focus solar collector that utilizes a parabolic dish to concentrate sunlight onto a receiver at the focal point (Gholamalizadeh and Chung, 2017; Arnaoutakis and Katsaprakakis, 2021) as shown in Figure 2. These systems employ a Stirling engine to convert the concentrated solar energy into electricity. Dish Stirling systems offer several advantages, including high efficiency, modularity, and the ability to generate both electricity and heat simultaneously. Dish Stirling systems can achieve solar-to-electric conversion efficiencies of up to 30%, making them one of the most efficient solar technologies available. Additionally, their modular design allows for easy scalability, making them suitable for both small-scale and large-scale applications. However, the high cost of dish Stirling systems and their complex maintenance requirements pose significant challenges to their widespread adoption (Mancini et al., 2003; Monné, 2014; Singh and Kumar, 2018; Alhawsawi et al., 2023).

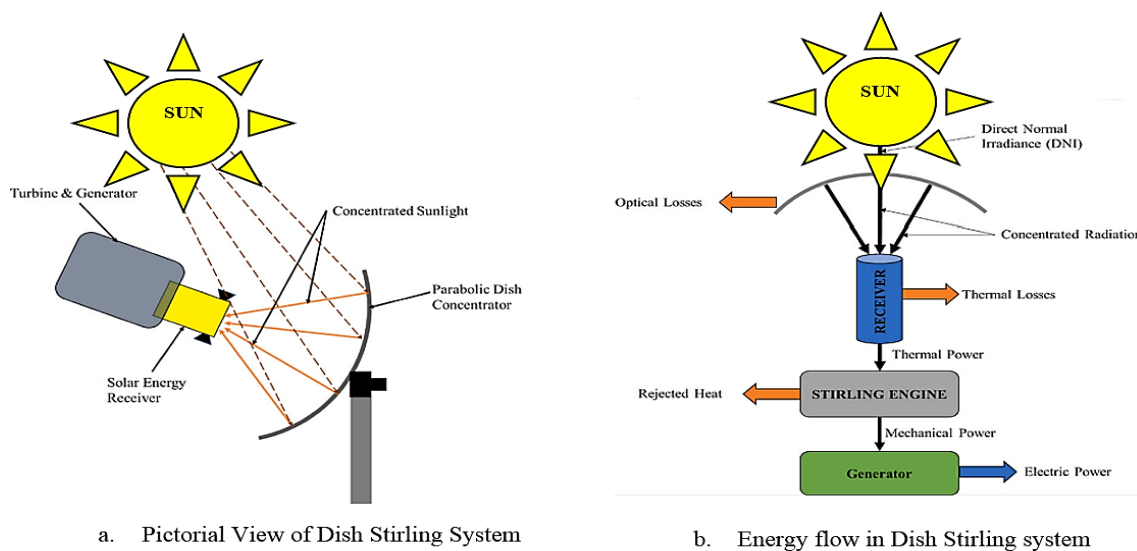

Figure 2: Dish Stirling systems

Fresnel Reflectors: Fresnel reflectors are a type of point focus solar collector that utilizes a series of flat mirrors to concentrate sunlight onto a linear receiver (Breeze, 2016; Breeze, 2019). These collectors consist of a fixed solar collector and a high inverted linear fixed receiver. Direct solar radiation is reflected on several rows of single-axis tracking mirrors. The radiation is reflected and focused on a fixed linear receiver mounted above the mirror, which may or may not be combined with auxiliary concentrators as shown in Figure 3a. This receiver consists of a secondary reflector and a highly efficient selectively coated vacuum tube. The heat is then collected in this absorption tube. The heat is then transferred to industrial processes via a heat

carrier as shown in Figure 3b. The secondary reflector increases the optical efficiency of the collector while also protecting the muffler (Kalogirou, 2014; Murty, 2017). The Fresnel collector is incorporated with high quality solar components such as safety glass mirrors and thermally efficient vacuum tubes.

Fresnel reflectors offer advantages such as low cost, ease of installation, and the ability to generate high-temperature heat. Fresnel reflectors can achieve optical efficiencies of up to 70%, making them a cost-effective option for various applications. However, Fresnel reflectors also have limitations. The linear receiver design can lead to thermal losses and non-uniform heat distribution along the receiver tube. Additionally, the complex mirror arrangement requires precise alignment and tracking systems, increasing the overall system complexity and cost (Bhatia, 2014; Karathanasis, 2019; Singh et al., 2021).

Figure 3: Fresnel reflector systems

Solar Power Towers: Solar power towers use an array of flat sun-tracking mirrors, known as heliostats, to reflect sunlight onto a central receiver located at the top of a tower as shown in Figure 4 (Alrwashdeh, 2018; Behar et al., 2020; Hamanah et al., 2023). The receiver absorbs the concentrated solar energy and transfers it to a heat transfer fluid, which is then used to generate electricity through a conventional steam turbine system. Solar power towers use an array of mirrors to direct sunlight towards a central receiver located on a tower (Khosravi, et al., 2021; Telsnig and Ferrán, 2016; Silva-Pérez, 2017).

Figure 4: Solar power tower system

Point focus solar collectors, including parabolic trough collectors, dish Stirling systems, and Fresnel reflectors, offer unique advantages and limitations. PTCs provide high efficiency and reliability, while dish Stirling systems offer modularity and dual heat-electricity generation capabilities. Fresnel reflectors, on the other hand, provide a cost-effective solution for high-temperature heat generation. The choice of the collector type depends on the specific application requirements, cost considerations, and available resources. Further research and development are necessary to overcome the limitations and enhance the performance of these point focus solar collectors, ultimately contributing to the widespread adoption of solar energy as a sustainable energy source.

11. Augmentation of Point Focus Solar Collectors

Solar energy has emerged as a sustainable and abundant source of renewable energy. PFSCs are a key technology used to harness solar energy efficiently. This technology offers benefits such as high energy concentration, reduced material usage, and improved efficiency compared to other solar collector types. However, to further enhance their performance and address certain limitations, it is essential to explore some augmentation techniques which are enumerated as follows:

Optical Augmentation: Optical augmentation techniques aim to improve the concentration ratio and overall efficiency of PFSCs. Examples include the use of secondary reflectors, refractive or diffractive optical elements, and spectral filters. These techniques enhance the collection of solar radiation and minimize energy losses (Kincaid et al., 2018; Manikandan et al., 2019; Subramaniyan et al., 2021)

Thermal Augmentation: Thermal augmentation techniques focus on reducing heat losses and improving the thermal performance of PFSCs. Strategies such as selective coatings, advanced heat transfer fluids, and innovative receiver designs help increase the overall efficiency and temperature output of the system. Shamsul Azha et al., 2020; Kumar and Varghese, 2022; Kalair et al., 2022).

Tracking Augmentation: Tracking augmentation techniques aim to enhance the accuracy and reliability of solar tracking systems used in PFSCs. Advanced tracking algorithms, improved sensors, and innovative control mechanisms can optimize the tracking accuracy, leading to increased energy collection (Nguyen, 2016; Awasthi et al., 2020; Seme et al., 2020).

Augmentation techniques offer several advantages, including increased energy collection, improved system efficiency, and enhanced economic viability. These benefits contribute to the overall competitiveness of PFSCs in the renewable energy market. Augmentation techniques also present challenges such as increased complexity, higher costs, and potential reliability issues (Lee et al., 2009; Kumar et al., 2021). The integration of new components and materials requires careful consideration to ensure long-term performance and economic feasibility. The augmentation of PFSCs holds great promise for enhancing solar energy harvesting. Optical, thermal, and tracking augmentation techniques offer significant benefits in terms of increased energy collection, improved efficiency, and economic viability. However, careful consideration of the associated challenges is crucial to ensure the long-term performance and reliability of augmented PFSC systems. Further research and development efforts are needed to optimize these techniques and facilitate the widespread adoption of augmented PFSCs in the renewable energy sector.

12. Thermodynamic Equations for PFSCs

Thermodynamic equations employed in computing the PFSC parameters are as follows:

a. Declination angle

To effectively estimate the solar radiation of a tilted surface, there is need to know the angular position of the sun at solar noon, hence the determination of the declination angle considering the number of days. Declination angle varies and is calculated using the following relation in Equation 1.

$$\delta = 23.45 \sin \left(360 \frac{284+n}{365} \right) \quad (1)$$

where n is the no of days. For n , the mean day in each month was used.

b. Zenith Angles of the sun

The Zenith angle was estimated considering the angle between the vertical and the line to the sun, that is, the angle of incidence of beam radiation on a horizontal surface has to be known in order to effectively estimate the amount of solar radiation on a solar collector. The zenith angle is given by Equation 2:

$$\cos \theta_z = \cos \phi \cos \delta \cos \omega + \sin \phi \sin \delta \quad (2)$$

where ϕ = latitude of the location, δ = declination angle, ω = Hour angle

c. Solar Azimuth Angle (γ_s)

The solar azimuth angle is estimated using the following relations in Equation 3:

$$\gamma_s = \sin(\omega) \left| \cos^{-1} \left(\frac{\cos \theta_z \sin \phi - \sin \delta}{\sin \theta_z \cos \phi} \right) \right| \quad (3)$$

where, Sign function is used to determine ω , θ_z = Zenith angle, ϕ = latitude of site and δ = Declination angle.

d. Incidence angle

The angle of incidence on the inclined surface is given by Equation 4 (Duffie and Beckman, 2013):

$$\cos \theta = \cos \theta_z \cos \beta + \sin \theta_z \sin \beta \cos (\gamma_s - \gamma) \quad (4)$$

Where θ = incidence angle, β = tilted angle, $\gamma = 0$, because it is facing south, θ_z = Zenith angle and γ_s = Solar azimuth angle.

e. Radiation on tilted surface

The geometric factor R_b , is the ratio of beam radiation on the tilted surface, and this can be estimated using the following relations in Equation 5.

$$R_b = \frac{\cos \theta}{\cos \theta_z} = \frac{G_{b,t}}{G_h} \quad (5)$$

where θ = angle of incidence, θ_z = zenith angle respectively, $G_{b,t}$ = radiation on tilted surface and G_h = radiation on horizontal surface.

To determine the available energy in the solar collector, it is important to consider the equation for energy gained by the solar collector. This is given by Equation 6 (Al-Sulaiman, 2014):

$$Q_{use} = m_a C_p \Delta T \quad (6)$$

Equation for heat losses from the collector is expressed in Equation 7 (Islam et al., 2015):

$$Q_{use} = A_{abs} Q_r [S_i - U_1 (\Delta T)] \quad (7)$$

The energy leaked from the solar collector is given by Equation 8 [29]: (Calise et al., 2016):

$$E_1 = \left\{ U_1 A_{abs} (T_{abs} - T_a) \left(1 - \frac{T_a}{T_{abs}} \right) \right\} \quad (8)$$

where S_i is the optical absorbed solar flux and U_l is the heat loss by emittance, reflection and optical efficiency of glazing given by Equation 9 (Jafarkazemi and Ahmadifard, 2013):

$$Q_R = \frac{maC_P}{U_1 A_{abs}} \left[1 - \exp \left\{ \frac{-F\phi U_1 A_{abs}}{maC_P} \right\} \right] \quad (9)$$

The energy destroyed by the solar collector is given by Equation 10 (Farahat et al., 2009):

$$E_d = -mC_P T_a \frac{T_{out}}{T_{in}} E_d = -mC_P T_a \left\{ 1n \left(\frac{T_{out}}{T_{in}} \right) - \left(\frac{T_{out} - T_{in}}{T_{abs}} \right) \right\} \quad (10)$$

where E_d is the heat loss due to absorber plate temperature. It is the latent heat absorbed by the solar collector in phase change. The exergy of the solar collector is given by Equation 11 (Islam et al., 2015):

$$E_{out} = \left[\left\{ \left(m_a C_P \left(T_{out} - T_a T_a \ln \frac{T_{out}}{T_a} \right) - \frac{m \Delta P_{out}}{\rho} \right) + m W C_P (T_w - T_a) \right\} \right] \quad (11)$$

In this case, the angle of incidence is given by Equation 12 (Kalogirou et al., 2016):

$$\cos \theta = \sin \phi (\sin \delta \cos \beta + \cos \delta \cos \gamma \cos \omega \sin \beta) + \cos \phi (\cos \delta \cos \omega \cos \beta - \sin \delta \cos \gamma \sin \beta) + \cos \delta \sin \gamma \sin \omega \sin \beta \quad (12)$$

where δ is the Declination angle, n is no of day in the yea, β is the slope angle, ϕ is the latitude of the location, γ is the surface azimuth angle and ω is the hour angle. Tilt factor for sun light radiation is given by Equation 13.

$$r r_b = \frac{\cos \theta}{\cos \theta_z} \quad (13)$$

$$\cos \theta_z = (\sin \phi * \sin \delta) + (\cos \phi * \cos \delta * \cos \omega) \quad (14)$$

Radiation shape factor for the diffused radiation is given by Equation 15 while the tilt factor for reflected radiation is given by Equation 16.

$$R_d = \frac{(1 + \cos \beta)}{2} \quad (15)$$

$$r_r = \frac{\rho(1 - \cos \beta)}{2} \quad (16)$$

Instantaneous efficiency is given by Equation 17 while exergy (e) is given by Equation 18

$$\eta_i = \frac{\dot{m} C_P (T_2 - T_1)}{I_t * A_p} \quad (17)$$

$$e = (h - h_o) - T_o(S - S_o) + \frac{v^2}{2} + gz \quad kJ/kg \quad (18)$$

The top loss coefficient is given by Equation 19.

$$U_T = \left(\frac{N}{\frac{c}{T_{pm}} \left[\frac{(T_{pm} - T_a)}{(N+f)} \right]^e + \frac{1}{h_w}} \right)^{-1} + \frac{\sigma(T_{pm} + T_a)(T_{pm}^2 + T_a^2)}{\frac{1}{\varepsilon_p + 0.00591Nh_w} + \frac{2N+f-1+0.133\varepsilon_p}{\varepsilon_g} - N} \quad (19)$$

Where f = focal distance, h_w = wind heat transfer, ε_p = emittance of plate, N = number of glass covers, c = collector factor, e = emissive power, ε_g = emittance of glass (0.88), T_a = ambient temperature and T_{pm} = mean plate temperature. The bottom loss coefficient is given by the relation in Equation 20:

$$U_B = \frac{k}{L} \quad (20)$$

Where k is thermal Conductivity (Urethane) = 0.028 and L = thickness of urethane layer = 30mm = 0.03. Edge loss coefficient can was estimated using Equation 21:

$$U_e = \frac{\frac{k}{L_e} \times P \times C_t}{C_A} \quad (21)$$

Where k = thermal conductivity of insulation (polyurethane), L_e = Thickness of edge insulation, P = Perimeter of collector, C_t = Thickness of Collector, C_A = Collector Area. The useful energy is given by Equation 22.

$$Q_u = A_c(S - U_L(T_{pm} - T_A)) \quad (22)$$

The bond conductance C_b is given by Equation 23.

$$C_b = \frac{K_b b}{\gamma} \quad (23)$$

Where K_b is the bond conductivity, b = bond Width and γ = Bond Thickness. The radiation tilted surface derived from the angle of incidence on the inclined surface is given by Equation 24.

$$R_b = \frac{\cos \theta}{\cos \theta_z} \quad (24)$$

The amount of solar energy received by the collector can also be obtained by the product of the rate of transmission of the glass cover and the absorption rate of the absorber and this is substituted in Equation 25.

$$Q_{rec} = I_n A(\tau\varepsilon) \quad (25)$$

where Q_{rec} is the solar energy received, τ is the transmissivity and ε is the absorption rate. As the collector absorbs heat its temperature gets higher than that of the surrounding and heat is lost to the atmosphere by convection and radiation. The rate of heat loss depends on the collector

overall heat transfer coefficient, collector temperature and ambient temperature respectively. This is represented mathematically by Equation 26.

$$Q_{loss} = U_T A (T_p - T_a) \quad (26)$$

where Q_{loss} is the heat loss, U_T is the overall heat transfer coefficient, T_p is initial temperature of the absorber plate and T_a is the ambient temperature respectively. Thus the rate of useful energy extracted by the collector is the rate of extraction under steady state conditions and it is proportional to the useful energy absorbed by the collector. This is given by Equation 27.

$$Q_{usfl} = Q_{recv} - Q_{loss} = I_n A (\tau \varepsilon) - h A (T_p - T_a) \quad (27)$$

where Q_{usfl} is heat energy gained by the solar collector. The heat removal factor F_R is given by Equation 28.

$$F_R = \frac{\dot{m} C_p (T_{out} - T_{in})}{A ((\tau \varepsilon) - h (T_p - T_a))} \quad (28)$$

$$Q_{usfl} = A F_R [I_n (\tau \alpha)_{av} - U_L (T_p - T_a)] \quad (29)$$

$$\frac{Q_{usfl}}{A} = q = I_n (\tau \varepsilon) - h (T_p - T_a) \quad (30)$$

13. Conclusion

Point focus solar collectors are widely used in solar energy systems to concentrate sunlight onto a small area, thereby increasing the efficiency of energy conversion. However, the performance of these collectors can be influenced by various factors. Solar irradiance, tracking accuracy, receiver design, and environmental conditions are key factors that need to be carefully considered during the design and operation of these systems. By understanding and optimizing these factors, researchers and engineers can enhance the performance and overall efficiency of point focus solar collectors, thereby contributing to the advancement of solar energy technologies. Energy storage is a critical component for the successful integration of PFSCs into the energy grid. While various storage options exist, each has its own advantages and limitations. Thermal energy storage systems, such as sensible and latent heat storage, offer high energy density and long-term storage capabilities. Electrochemical energy storage, including batteries and supercapacitors, provide high power density and fast response times. Chemical energy storage, particularly hydrogen production, shows promise but requires further research and development. A combination of these storage technologies, tailored to specific applications, may be the key to unlocking the full potential of PFSCs in the future. Advancements in point focus solar collectors have revolutionized the renewable energy sector by increasing their efficiency, reliability, and overall performance. The development of high-efficiency solar cells,

improved concentrating technologies, thermal energy storage systems, and hybridization with other energy sources have significantly enhanced the viability of point focus solar collectors. These advancements pave the way for a sustainable and cleaner energy future, reducing our dependence on fossil fuels and mitigating the impacts of climate change.

Point focus solar collectors possess several key characteristics that make them a viable option for harnessing solar energy. Their high concentration ratios, tracking mechanisms, thermal storage capabilities, and optical efficiency contribute to their overall performance. However, it is essential to acknowledge their limitations, such as weather sensitivity and initial cost. By understanding these characteristics, policymakers, researchers, and industry professionals can make informed decisions regarding the implementation and optimization of point focus solar collectors. Point focus solar collectors have a wide range of applications, from power generation to industrial processes, desalination, and heating/cooling systems. These collectors offer a sustainable and efficient way to harness solar energy, contributing to the global transition towards clean and renewable sources of power. As technology continues to advance, the potential for point focus solar collectors to revolutionize various sectors and mitigate climate change becomes increasingly evident.

Abbreviations

GHG	Greenhouse gas
PFSC	Point focus solar collector
CSP	Concentrated Solar Power
LCOE	Levelized cost of electricity
TES	Thermal energy storage
PCMs	Phase change materials
PTCs	Parabolic trough collectors
PV	photovoltaic
n	Number of days
δ	Declination angle
ω	Hour angle
γ_s	Solar Azimuth Angle
θ_z	Zenith angle
ϕ	latitude of site
θ	Incidence angle
β	Tilted angle

R_d	Radiation shape factor for the diffused radiation
$G_{b,t}$	Radiation on tilted surface
G_h	Radiation on horizontal surface
S_i	Optical absorbed solar flux
U_l	Heat loss by emittance, reflection and optical efficiency of glazing.
E_d	Heat loss due to absorber plate temperature difference with fluid
η_i	Instantaneous efficiency
e	Exergy, Emissive power
f	Focal distance
h_w	Wind heat transfer
ε_p	Plate emittance
N	Number of glass covers
c	Collector factor
ε_g	Glass emittance
T_a	Ambient temperature
T_{pm}	Mean plate temperature
k	Thermal conductivity
L	Thickness of urethane layer
L_e	Thickness of edge insulation
P	Perimeter of collector
C_t	Thickness of collector
C_A	Collector area
K_b	Bond conductivity
b	Bond width
γ	Bond thickness
Q_{rec}	Solar energy received
τ	Transmissivity
ε	Absorption rate
Q_{loss}	Heat loss
U_T	Overall heat transfer coefficient, top loss coefficient
T_p	Initial temperature of absorber plate
T_a	Ambient temperature

Q_{usfl}	Heat energy gained by the fluid
U_B	Bottom loss coefficient
F_R	Heat removal factor
Q_u	Useful energy
U_e	Edge loss coefficient
U_T	Top loss coefficient
R_b	Geometric factor, radiation tilted surface
Q_{use}	Available energy in the solar collector
γ	Surface azimuth angle
rr_b	Tilt factor for sun light radiation
r_r	Tilt factor for reflected radiation
C_b	Bond conductance

Abstract

This study analyzes the insurance market in Kosovo focusing on the "DUKAGJINI" Insurance Company. In this analysis, various research methods are used, including the review of electronic documentation and statistical data, to understand the dynamics of the market and the positioning of the company in the local and global economic context. The study shows a general presentation of the company "DUKAGJINI", including its history, product portfolio, and cooperation with the Austrian company "GRAWE GROUP". A macroeconomic analysis examines the current economic environment globally and in Kosovo, including challenges and opportunities that may affect the insurance sector. After the presentation of the macroeconomic context, the study focuses on the microeconomic aspect, including the analysis of the insurance market in Kosovo. Through the use of statistical data, the market structure, competition, and development of other insurance companies in the country are examined. An in-depth analysis of the financial and operational performance of "DUKAGJINI" is presented through the company's balance sheets and income for the studied periods. Finally, we evaluate the opportunities and risks that may affect the future of the company. In order to strengthen its positioning in the market and to cope with the competition, "DUKAGJINI" proposes strategies such as the development of new products, the improvement of the IT infrastructure, and the focus on quality services. Also, it is noted that the insurance sector in Kosovo has a special focus on mandatory insurance, and the study brings recommendations for advancing the offer of voluntary insurance. This analysis concludes with an overall assessment of the performance of the insurance market in Kosovo and the contribution of "DUKAGJINI", shedding light on the challenges and opportunities of the sector in the long term.

Keywords: Innovation, economic development, insurance, competition, Kosovo

Introduction

This document provides a detailed analysis regarding the field of insurance in general and the insurance company "Dukagjini" in particular. Contains a company presentation, macroeconomic and microeconomic analysis, as well as information on the economic environment globally and in Kosovo.

"Dukagjini" Insurance Company was founded in 2008 by Mr. Agim Elshani. After an initial investment period, the company started its activity with the license of the Central Bank of Kosovo in June 2008. Later, in September 2008, it became a member of "GRAWE GROUP", a well-known Austrian company in the field of insurance. The company offers a wide range of insurance products, including auto insurance, property insurance, health insurance, and many more. So far, there are about 97 employees.

Analysis of the global economic environment shows that the consequences of the global economic crisis are still being felt, with several European countries suffering major economic problems. The level of public debt is expected to increase in developed countries until 2014. However, positive notes have been observed in some economies, but full recovery is expected to take time.

The economy of Kosovo has continued to grow, especially in the public sector. However, unemployment is still worrying, reaching over 45%. The insurance sector has shown annual growth of 8.3%, but some companies have suffered losses from increased expenses.

In legal terms, insurance companies in Kosovo operate in a controlled liberalization model. Auto-liability insurance rates are proposed by the companies and approved by the Directorate for Insurance Supervision.

The insurance market in Kosovo is still developing, with a main focus on compulsory insurance. Insurance companies are profitable, but competition is a constant risk. The number of policies sold has increased, but most insurance is still compulsory.

THEORETICAL FRAMEWORK

The Insurance Company "DUKAGJINI" was established in March 2008. The second quarter of 2008 was the initial period of investments in this company, while the activity of the Insurance Company "DUKAGJINI" itself began in June with case is licensed for the sale of insurance products by the Central Bank of Kosovo (CBK).

The founder of this company is Mr. Agim Elshani, who has shown great success in various fields of business. For Mr. Elshani, entering the insurance industry was a new challenge with great barriers, but as a result of tireless work, success was inevitable.

In order to increase the trust of the customers and to prove its seriousness, the "DUKAGJINI" Insurance Company in September 2008 became a member of the well-known Austrian company "GRAWE GROUP - Grazer Wechselseitige Versicherung Aktiengesellschaft", by chance the partnership between of both companies.

Macroeconomic analyses

The external economic environment

Currently, the world economy is facing the consequences of the last economic crisis that affected and accompanied the economic decline of the entire globe. Despite the start of recovery in some economies, there is a consensus that the return of employment and productive capacity to pre-crisis levels will be prolonged. The exit from the recession in many countries was accompanied by budget problems as a result of the increase in the budget deficit and public debt. Recently, we have several countries in Europe such as: Greece, Portugal, Ireland and Spain that are facing major economic problems. These problems emerged as a result of the large increase in government spending. According to IMF projections, by 2014, public debt in developed countries will exceed the rate of 110% of the Gross Domestic Product, which represents a significant increase compared to the pre-crisis period when this rate was 80%.

Dukagjini-Mission and Vision:

The company's aim is to be careful in insurance requirements, being a subject that offers qualitative services in the insurance market as a supplier of TPL vehicle insurance products, KASKO insurance, personal accident insurance, and soon also many other insurance products, being in service and financial support for victims of damages and continuously and permanently increasing and reflecting profit.

The DUKAGJINI insurance company will pay special attention to the connection with an expert for the greatest achievement of technical knowledge and the delivery of a service of a very high level.

The insurance company DUKAGJINI will continuously invest in modern IT infrastructure to be as efficient as possible in the performance of services and in its actions and goals in the future.

Dukagjini-Organizational structure:

Organizational structure is defined by communication, authority and mutual relationships within the organization. All these high organizational qualities are found within the already built structure of the "DUKAGJINI" Insurance Company. Even DUKAGJINI is quite

comfortable in relation to competing companies in terms of staffing with people who have experience and are qualified in the field of insurance.

Dugagjini-Possibilities and advantages:

Being a member of the well-known Austrian company "GRAWE GROUP - Grazer Wechselseitige Versicherung Aktiengesellschaft", makes it more competitive and more reliable in the market. "GRAWE Group" is a company with 180 years of tradition in the field of insurance and has an extension in 13 countries of Central and Eastern Europe. The virtues of "GRAWE Group" are stability, independence, flexibility and dedication, among which this company has about 3,000 employees, working capital of about 694 million and about 3.7 million insurance contracts.

Dugagjini-Dangers

As mentioned above, 10 non-life insurance companies operate in the Kosovar market, offering almost the same products at similar prices. Therefore, the constant risk that this company may have is competition.

Dukagjini-product development and forms of distribution:

The objective of DUKAGJINI insurance company is to develop and strengthen the sales of non-motor insurance products and in this direction supply the market with new voluntary insurance products such as home insurance, health insurance, cancellation insurance of the reservation of the tourist arrangement, provision of agricultural products, etc.

DUKAGJINI also takes into consideration the prospects for commercial insurance to be combined policies including material damages and those of loss of business flow (consequential loss policies).

The DUKAGJINI insurance company was originally established for direct sales of TPL and voluntary insurance products. Insurance products are sold through branches, in which case the distribution network is divided into seven branches in the main centers of Kosovo: Prishtina, Ferizaj, Pejë, Prizren, Gjilan, Gjakovë and Mitrovica.

METHODOLOGY

In the initial phase of this study, a detailed research was conducted including an in-depth analysis of relevant literature and sources. This included a bibliographic review to understand the global context of the insurance industry and the current challenges that may affect the performance of the Dukagjini company. A key part of this phase was interviews with the

company's top managers, where they shared their perspective on the company's mission, vision, and future vision.

Analysis of the Economic Environment

Next, a macroeconomic and microeconomic analysis was carried out. The macroeconomic analysis included an in-depth examination of global and local economic factors that may affect the performance of the insurance industry in general. Microeconomic analysis, on the other hand, focuses on the internal aspects of the company including its organizational structure, legal structure and financial performance.

Competition and Market Assessment

In another stage, an in-depth analysis of the competition in the insurance market in Kosovo was made. This included an assessment of the level of competition and an analysis of the positioning of the company "Dukagjini" compared to its competitors. A market analysis focused on recent developments in the market and new opportunities that may emerge.

Assessment of Performance and Future Trends

Diluted analysis of financials and other relevant ratios was done to assess future performance and trends. This included an assessment of recent trends in the insurance industry and an attempt to predict possible future developments.

Reporting and Interpretation of Results

Finally, all results and analyzes were reported in a structured document. The interpretation of the results included a detailed discussion on the impact of various factors on the company's performance and positioning. This segment provides a clear and detailed overview of the research findings.

RESULTS

Economic environment in Kosovo

Despite the negative developments in the region and the world, the economy of Kosovo continues to be characterized by positive economic growth, where the main generator of this growth is the public sector. The situation in the labor market is characterized by a high level of unemployment (over 45% of the workforce is the unemployment rate), and continues to be an important challenge for the economy of Kosovo.

The insurance sector was also characterized by an increase in activity, whose assets reached the value of 130.1 million euros, marking an annual increase of 8.3%. Despite the increase in

activity, the sector of insurance companies was characterized by a loss of 1.4 million euros, which resulted from the faster growth of expenses compared to the growth of revenues.

Below are some of the main indicators of the economy in Kosovo:

Currency: EURO

Gross Domestic Product (GDP): In 2012 it was €5.02 billion; per capita € 2,750; economic growth 3.8%.

Inflation: The inflation rate is a reflection of Kosovo's economy from imports. During 2012, inflation was estimated to be 2.5%.

Financial sector: The structure of the financial system of Kosovo remained similar to the previous periods in terms of the number of financial institutions operating in the financial market in the country. In June 2013, a total of 82 financial institutions operated in Kosovo, the largest number of which are financial assistants and microfinance institutions, which together are 58 institutions, but which manage the smallest part of the assets of the financial sector. While after the licensing of the branch of Türkiye İş Bankası the number of commercial banks operating in Kosovo has increased to nine (9) at the end of 2012, the number of companies in the insurance industry has remained

unchanged from last year at thirteen (13) and the number of pension funds at two

Figure 1. Structure of the financial sector in Kosovo

Burimi: BQK (2013)

Businesses: There are about 40,000 small and medium-sized enterprises, where: 50 percent of them are engaged in trade.

Tax system: Value added tax -16%; Corporate profit tax -10%; Personal income tax - progressive max. 10%.

Customs duties: 10% for ordinary imports; no obligations for raw materials; excise duty on derivatives, tobacco, alcohol and luxury goods.

The insurance market in Kosovo and the region

Today the insurance industry is a very important component in the global economy thanks to premiums, investments, and above all the social and economic role that these companies have in covering personal and business risks.

After the recession of 2009, which also included Europe - in which case the real GDP decreased by about 4%, the year 2010 was also a year of very slow recovery in economic terms. However, even in this situation, European insurers, which are among the largest institutional investors, noticed that their portfolios grew. This increase was marked by 3% for the year 2009 in written premiums and mainly in the life insurance sector; and with 3.5% for the year 2010, similarly as in the field of life and non-life insurance. About 5,000 insurance companies currently operate in Europe.

The insurance market in Kosovo is a new market, which has a new clientele. The products of insurance companies in Kosovo are mainly non-life insurance. Over 87 percent of non-life insurance is compulsory, with only 13 percent being voluntary insurance.

Insurance companies are quite profitable, they have many means which they engage in various forms of investments, but mainly in short-term bonds and bonds. Since they do not have such a high interest in investments, but have a smaller risk, they quickly turn into liquidity.

For this reason, the recent economic crisis has not attacked the insurance sector in Kosovo as much.

Statistical data: The insurance sector continued to increase activity during the first half of 2013. The assets of insurance companies recorded an annual increase of 8.3%, reaching the value of 130.1 million euros. However, the participation of this sector in the total assets of the country's financial system remains relatively low at 3.4% (3.2% in June 2012). The number of insurance companies operating in Kosovo remains the same as the previous year with a total of 13 companies, 10 of which offer non-life insurance services, while the other 3 operate in the life insurance sector. During 2013, there were changes in terms of company ownership, where a non-life insurance company passed from foreign ownership to local ownership. Consequently, the number of locally owned insurance companies has increased to 4, while 9 companies remain in foreign ownership. The percentage of foreign-owned insurance companies' assets has fallen to 66% from 71% in June 2012. (Figure 2).

The activity of insurance companies has increased. In June 2013, the total number of policies sold by insurance companies reached 459.5 thousand compared to 306.3 thousand policies in the same period of the previous year. Life insurance policies have marked a significant increase, where their number reached 23.8 thousand compared to 3 thousand in June 2012. The number

of non-life insurance policies reached 435.7 thousand, where 183.7 thousand of them are border policies (99.0 thousand in June 2012), 172.0 thousand non-voluntary third-party policies (137.3 thousand in June 2012) and 80.0 thousand other voluntary policies (66.9 thousand in June 2012).

Figure 3. Trend of premiums sold and claims paid 2010-2013

Currently, 10 insurance companies offering non-life insurance and 1 insurance company offering life insurance are licensed and operating in Kosovo.

Structure of insurance premium in the Kosovan market 2010

Figure 4. Structure of insurance premiums in the Kosovar market companies through monthly and quarterly reports or through inspections.

In addition, the insurance market is mainly focused on compulsory insurance. For voluntary insurance, it seems that companies are not seeing fit to offer products in the absence of profit. According to the 2011 annual report of the Sava company, the insurance company Dugagjini owns about 11.2% of the insurance market in Kosovo. See Figure 5.

This can be considered a satisfactory percentage, considering the time period of the company's existence in the market.

Kosovan insurers by market share 2010

Figure 5. Insurance companies in Kosovo

This rapid penetration into the market can also be seen from the financial statements of the company in question, where the balance sheet shows that in 2008 the company's assets were €4,055,416, while in 2009 their value increased to €6,898,764. Until June 30, 2010, the value of the assets reached €8,274,304.

Conclusions and recommendations

Based on the above data (statistical and financial), we conclude that the insurance company "Dugagjini" has recorded growth and expansion of its market. Along with it, the insurance market as a whole, compared to some other sectors of the economy in Kosovo, leaves the impression of a developed sector. However, if it is compared with the opportunities that exist for further advancement, then we can say that there is a slow development even in the economic-financial aspect. The most advanced development could be achieved through a stronger competition in services, and why not also in prices; also in the field of marketing and development of new products.

Also, from the general point of view of the consumer, the lack of legal infrastructure, the pricing policy set by the companies, etc., which are believed to pass over time (with the approval of the new law on insurance companies), will remain disturbing problems. be overcome and there will be real competition in this sector.

Expanding the range of products, mainly in the life insurance sector and in health insurance, would be a big plus, both for the company in question, for the Kosovar market, and for the social benefit of Kosovo.

**EXPLORING LEGAL FRAMEWORKS FOR CRYPTOCURRENCIES: A VIEW
ACROSS EUROPE**

Budişteanu TUDOR-GABRIEL

Bucharest University of Economic Studies, Doctoral School of Accounting

Email:budisteanutudor17@stud.ase.ro

ABSTRACT

Cryptocurrencies are a new and innovative field that has impacted the economy ever since the emergence of Bitcoin in 2008. Since then, interest in this new technology has grown considerably. With the development of the Internet, access to cryptocurrencies has become extremely easy for the population. Consequently, states and financial regulatory institutions carefully analyzed this new economic field and find ways to create a legal framework. This study investigates the forms of legislation that may apply to cryptocurrencies in different European settings. To gain an overview of the legislation, 10 countries in Europe were selected, the selection criterion being the gross domestic product. Countries with a stable economy such as Germany, France, Austria, Spain, and England, were chosen, along with countries with a developing economy such as Romania, Bulgaria, the Czech Republic, Croatia, and Hungary. Following the establishment of the legislation in these countries, a comparison was also made between them, revealing similarities and differences, thus being able to outline a European position in connection with cryptocurrencies. The study carried out highlights the fact that, although there is an openness on the part of the states through various projects related to this new technology, there is still a noticeable deficit in terms of legislation applied to cryptocurrencies. The study concludes that although legislation has improved significantly since the advent of Bitcoin, when there was no legislation in this area, however, although there is now legislation, it is minimal focusing more on the taxation of transaction gains, the other branches not being fully covered.

Keywords: crypto, bitcoin, tax, fiscality

INTRODUCTION

Cryptocurrencies have generated a transformation in the face of the global financial system, presenting significant regulatory challenges and opportunities. In Europe, national approaches to cryptocurrency regulation illustrate the complexity of this field. This paper wants to analyze the approaches of different European countries in relation to the regulation of laws on cryptocurrencies.

Existing research has shown the importance of regulation for the crypto sector. For example, (Foley, Karlsen and Putniņš, 2019) highlighted the risks present in cryptocurrency transactions along with their use in illegal activities, emphasizing the urgent need for regulation. Also, (Catalini , Gans, 2016) discussed how innovation in blockchain technology can have an influence in the legislative field.

(Böhme, Christin, Edelman & Moore, 2015) analyzed the complex relationship between cryptocurrencies, market rules and user security, highlighting regulatory challenges. (Cong, 2019) explored the impact of regulations on cryptocurrency market dynamics, highlighting that regulations influence market activity.

RESEARCH METHODOLOGY

This research aims to analyze and compare cryptocurrency regulations in different European countries, with a focus on legislative, fiscal and supervisory aspects. By collecting the data that will be analyzed, we want to obtain detailed information about the regulations in countries such as Germany, Spain, the United Kingdom, France, Austria, Hungary, Croatia, Bulgaria, the Czech Republic and Romania.

These data will be supplemented with additional research, including literature reviews, government reports and academic articles. A comparative method will be used to examine national legislations, identifying common trends and key differences.

Qualitative analysis will include interpretation and evaluation of policy, tax regulations and supervisory approaches. The impact of these regulations on the cryptocurrency market will be assessed, including effects on investment, innovation and financial security. The social and economic impact of these regulations, such as the influence on cryptocurrency adoption, will also be considered.

The research recognizes as limitations the availability and timeliness of data and differences in the interpretation of laws. It will also be considered that the cryptocurrency sector is highly

volatile and rapidly evolving, which may influence the relevance of the data collected in the long term.

Based on the data collected and the analysis performed, conclusions will be drawn regarding the current state of cryptocurrency regulation in Europe. The main directions of evolution of the legislation will be identified.

This research methodology provides a comprehensive and detailed approach, enabling a deep understanding of the complex dynamics and impact of cryptocurrency regulations in Europe.

RESEARCH AND FINDINGS

GERMANY

Cryptocurrencies are qualified as units of account by the financial supervisory authority and are therefore considered financial instruments. Businesses and individuals engaging in the purchase or brokerage of tokens must obtain prior authorization. Regarding blockchain technology, German legislation aims to adapt the existing framework to encourage innovation.

The term crypto is defined as an intangible asset representing rights, issued through shared electronic record devices. German legislation outlines a “technological neutrality” to allow consumers to choose blockchain platforms. As for virtual currencies, BaFin considers them financial instruments, and the Bundesbank does not qualify bitcoin as a virtual currency, recommending the term crypto token. The Ministry of Finance guidelines regulate VAT for virtual currency transactions, considering them taxable activities exempt from VAT. (Mihai Banu, 2019)

The German Ministry of Finance - Bundesministerium der Finanzen does not treat cryptocurrencies as stocks or properties, but as private money and payment methods, so if no transaction is made with cryptocurrencies within one year of their purchase or receipt, they are exempt from upon payment of the tax. However, mining, selling NFTs or using protocols that produce crypto rewards are considered profit-generating activities and are subject to taxation. (Mihai Banu, 2019)

SPAIN

There is currently no legislation in force in Spain to regulate cryptocurrencies. However, on February 7, 2018, the Spanish Senate passed a motion asking the Government to promote cryptocurrency regulation to ensure legal certainty and prevent fraud. The future regulatory framework should take into account the speculative nature of cryptocurrencies, implement measures to prevent money laundering and address the fiscal aspects of their use. The Spanish

government announced, on October 19, 2018, a draft law that proposes new obligations to provide information on the holding and operations of virtual currencies, with a view to preventing tax fraud and strengthening the fight against tax evasion and the underground economy. (Grupo Parlamentario Popular in the Senate, 2018)

In the context where cryptocurrencies are treated as commodities, they will be subject to the general rules of the Civil Code and the Commercial Code, in particular with regard to the barter contract. The recently published MiCA on June 9, 2023 represents a significant mark in the transition to digitalization of the traditional economy. MiCA will influence crypto sales regulations, and Spanish law allows parties to choose the law applicable to the transaction under. Small investors are treated as consumers, so even if a law other than Spain's is chosen, the law Spanish law on consumer or investment protection applies under Article 6.2 of Rome I. This approach depends on how Spanish law characterizes cryptocurrencies, stating that they are digital representations of value not issued by a central bank or public authority. This perspective is based on the purchase of a financial instrument, involving the expectation of profit and trust in the efforts of others to generate economic income.(Mihai Banu,2019)

In April 2023, the Spanish Cabinet of Ministers approved Royal Decree 249/2023, amending the General Regulation for the Development of the General Tax Law, to impose obligations regarding the declaration of holdings and operations with cryptocurrencies and other virtual assets as of January 1, 2024. The changes include three obligations: reporting virtual currency balances, reporting virtual currency transactions, and declaring virtual currencies located abroad. The IRS has introduced section 1800 for reporting cryptocurrencies with a maximum limit of 25 capital gains and losses. In addition, in 2024, Form 721 will be introduced for reporting virtual currencies held abroad, removing the reporting obligation if balances do not exceed €50,000 on December 31. Forms 172 and 173 will target Spanish tax resident companies involved in the cryptocurrency market, including exchange providers and e-wallet custodians . (Florian Wimmer, 2023)

From a fiscal point of view, cryptocurrencies are taxed in all the tax rates that Spain has. Thus Any income received from professional activities, crypto mining, as payment for goods and services or other activities that result in earning new coins or tokens is considered taxable general income and subject to a general income tax that is progressive between 19-26% depending on the profit obtained. Speaking of taxes, they also apply to cryptocurrencies if they are donations or inheritance and vary between 7% and 34%. In Spain, the VAT rate is not imposed on cryptocurrency transactions. (Florian Wimmer, 2023)

UNITED KINGDOM

Currently, blockchain technology, the virtual electronic currency bitcoin and virtual currencies are not regulated in the UK. A report issued by the House of Commons Treasury Committee on September 19, 2018 highlighted the need for specific regulation for this area, calling the crypto-asset industry the Wild West. The commission warned of the risks associated with crypto-assets and called for regulation to address consumer protection and money laundering prevention. Another report, published in October 2018 by the Cryptoassets Working Group, set out the UK's policy and regulatory approach to cryptoassets and blockchain technology in the financial services sector, focusing on maintaining international reputation, high regulatory standards, consumer protection and ensuring financial stability. (Digital currencies report, 2018)

According to guidance issued by (HMRC, 2021), individuals who own crypto-assets are subject to specific taxation rules, which include Capital Gains and income taxation, depending on the nature of the activity carried out. On the business side, corporate income tax legislation does not directly apply to crypto-assets, and tax treatment varies depending on the type of business. Income tax legislation in the UK does not apply to crypto-assets as (HMRC,2021) they do not consider them to be money. If activities such as buying and selling crypto-assets are considered transactions, their receipts and expenses influence the calculation of trading profit. If the activity is not trading and is not otherwise taxed, it may be treated as a disposal of a capital asset, taxed on any resulting gain. VAT is usually applied to the exchange of goods or services for crypto-assets. Stamp duty is unlikely to apply to the transfer of crypto-assets, but each case is considered individual. Stamp duty applies if crypto-assets are given as consideration in a land transaction, being considered money or money value.

FRANCE

From a legal perspective, cryptocurrencies are not recognized as payment instruments or electronic currency under the French Monetary and Financial Code. However, the ordinance of December 2017 facilitated the use of blockchain in the representation and transmission of financial securities, and the draft law of 2018 proposed to regulate the issuance of digital tokens. (Mihai Banu, 2019)

In terms of the tax regime, earnings from the occasional sale of cryptocurrencies are taxed as non-commercial income. Law no. 2018-1317 of December 28, 2018 introduced a specific tax regime for digital assets, outlining the differentiated tax treatment depending on the nature and use of these assets. (Mihai Banu, 2019)

For individual investors, a taxable event occurs when digital assets are transferred in exchange for goods, services, or fiat currency. They are subject to a flat tax of 30% of the total capital gains, deducting the capital losses of the entire tax household. Alternatively, they can opt for the taxation of capital gains in the category of industrial and commercial profits, with the mention that transfers that do not involve a digital asset as a counterparty are considered taxable events. Professional investors, on the other hand, are progressively taxed in the BNC category, without the option a flat rate taxation. The marginal tax rate, including social security contributions, can reach up to 60%. This tax regime also applies to crypto-asset mining. (Josias N. Dewey et al, 2023)

Regarding companies, (Josias N. Dewey et al ,2023) mentions that they must follow the accounting standards set by the French Accounting Standards Authority (ANC). Tokens that are considered financial instruments must be accounted for as such and other tokens according to the attached rights and obligations. Digital assets must be registered under a dedicated account and follow specific rules. Capital gains and losses on tokens are calculated at the time of sale.

In terms of VAT, the sale of goods or services in cryptocurrency is treated like any other transaction, subject to the applicable VAT rules. The exchange of cryptocurrencies with traditional currencies, as well as transactions between digital assets, are exempt from VAT, according to Article 261 C of the CGI and the decision of the Court of Justice of the European Union in 2015. This is justified by the uncertainty of future benefits and the lack of an individualized service provided of miner for a certain beneficiary, which is why the mining activity is not subject to VAT. (Josias N. Dewey et al, 2023)

AUSTRIA

In Austria, institutions such as the Austrian National Bank and the Ministry of Finance have adopted a clear opinion stating that they do not consider bitcoin or other cryptocurrency derivatives as fiat currencies, the main argument being the lack of a centralizing authority that can support these currencies.

The Austrian Ministry of Finance does not classify digital currencies as legal means of payment or financial instruments; however it considers them intangible goods and their treatment regarding income tax is the same as income from the production or transaction of goods with a tax rate of 27.5%. (Mihai Banu, 2023)

As of March 1, 2022, the Austrian income tax law introduced a definition of the term cryptocurrency to comply with the new income tax regulation. According to the Income Tax

Law, a cryptocurrency is defined as a digital value that is not issued or guaranteed by any central bank or public authority, lacking the legal status of currency or money but accepted by individuals or legal entities as a medium of exchange. having the ability to be transmitted, stored, and transacted electronically. (Josias N. Dewey et al, 2023)

Regarding the VAT regime in Austria, there is no rate applied to cryptocurrency exchange or mining activity because the beneficiary of this service cannot be determined. However, VAT is applied to purchases of goods or services paid for by cryptocurrency, these not having a regime different from that of payments by fiat currency. (Sharon Schmidt, 2020)

BULGARIA

On February 14, 2018, the National Bank of Bulgaria announced that it joins the position of EU banking supervisors regarding the risks inherent in the purchase and trading of virtual currencies. The Bulgarian central bank noted that these virtual currencies or virtual currencies show extreme price volatility giving signals about a dangerous expansion of the considered prices and a price bubble. According to the Bulgarian central bank, consumers who buy virtual currencies should be aware that there is a high risk that they will lose a large amount or even all of the money invested. Since 2014, the Bulgarian tax authorities have issued rulings requiring individuals to pay taxes on gains from the sale of virtual currencies, similar to the tax regime for the sale of financial assets. In 2015, a Bulgarian court found that activities associated with buying, selling, and paying with virtual currencies are not subject to authorization requirements. (Mihai Banu, 2019)

While Bulgarian tax legislation does not regulate the tax treatment of cryptocurrencies, according to the non-binding guidance of the Bulgarian tax authorities, cryptocurrencies qualify as financial assets from a tax perspective. Thus, the taxable capital gain of a natural person resident in Bulgaria obtained from the sale, exchange or other disposal of financial assets is the amount of profits obtained in the respective year, reduced by the amount of losses suffered in the same year. (Mihai Banu, 2019)

As a general rule, taxable capital gain from the sale of cryptocurrencies by individual investors is subject to Bulgarian personal income tax at a flat rate of 10%. If, however, the activity is carried out systematically and comprises the main source of income of the individual investor, the gains obtained from the trade are taxed as business income at a flat rate of 15%. (Redava, 2023)

CZECH REPUBLIC

The Central Bank of the Czech Republic does not currently regulate the use and trading of virtual currencies. In February 2018, the vice-governor of the central bank referred to cryptocurrency transactions, comparing them to a casino where those who invest must be prepared to lose. At the end of November 2018, the Czech Ministry of Finance initiated a public consultation on blockchain technology, namely virtual currencies, and assets. Regarding the legal framework applied to virtual currencies, it has been shown that they are qualified as intangible assets. The use of virtual currencies as is defined as a digitally stored unit, independent of the existence of an issuer, which is not a fiat currency, but which is accepted as payment for goods or services by a person other than the issuer. The virtual currency service provider is the person who, in the course of their professional activities, buys, sells, stores, manages for others or mediates the purchase or sale of virtual currencies. (Mihai Banu 2019)

CROATIA

Currently, there is no specific legislation in Croatia. On December 20, 2018, the Government submitted to Parliament a Draft Law amending and supplementing the Law on the Prevention of Money Laundering and the Financing of Terrorism, which, in the context of the transposition of Directive 2018/843, aims to introduce, for the first time in domestic legislation, the definitions virtual assets, virtual currency, digital wallet services, respectively to subject natural and legal persons involved in the provision of services in connection with assets and virtual currencies and digital wallets to the regime of information obligations specified in the legislation on the prevention of money laundering and the financing of terrorism. (Mihai Banu, 2019)

HUNGARY

On December 20, 2016, the National Bank of Hungary warned hungarian consumers that the use of virtual currencies poses many risks, as they operate in a legally unregulated virtual system and that there are no appropriate rules on liability, guarantee and compensation that would protect the interests of consumers in case of abuse. (Mihai Banu, 2019)

ROMANIA

Analyzing the official positions that Romania has taken on this subject through the BNR and MFP, one can observe a reluctance towards this new technology in the financial field. The announcements of the institutions are not banning the use, but rather warning about the dangers and problems they may have. (BNR,2015)

Due to the rapid growth and considerable fluctuations in the prices of most cryptocurrencies in a short time, the National Bank of Romania classifies them, including Bitcoin, as speculative, highly volatile assets with a high degree of risk. (BNR,2015)

To minimize the reputational risk for banking institutions, the National Bank of Romania, in its role as regulatory authority, advises banks to refrain from any involvement with cryptocurrencies. This includes providing services to entities that provide investment or trading services in the field of cryptocurrencies. (BNR,2015)

From a governmental point of view, the MFP does not prohibit the use of cryptocurrencies and specifies that, in the case of operations regarding the bitcoin currency, the Decision of the European Court of Justice will be taken into account in order to apply the VAT regime. (Mihai Banu, 2019)

According to Law no. 227/2015 on the Fiscal Code, with its subsequent amendments and additions, services involving the exchange of traditional currencies and units of the virtual currency bitcoin and vice versa, qualify for VAT exemption. This exemption applies when the services are provided in exchange for an amount representing the margin, defined as the difference between the purchase price and the sale price of the coins. (Mihai Banu, 2019)

In recent years, important steps have been taken in the regulation of the cryptocurrency market, the initiative that seeks to ensure stability and protection in this sector which is constantly expanding. These regulations bring several significant benefits, helping to create a safer and more predictable market environment.

One of the most obvious benefits of regulation is to increase safety for users by providing a clear and stable legal framework. By setting rigorous standards for cryptocurrency operators, consumers can have more confidence in their transactions, which helps increase the adoption and use of cryptocurrencies.

From the information gathered, it can be deduced that at the European level, the prevention of the use of cryptocurrencies in illegal activities, such as money laundering and terrorist financing, has been sought by adopting regulations that include customer identity verification and transaction monitoring.

Yet one of the most negative effects of crypto regulation in Europe is the potential limitation of innovation. Cryptocurrencies and blockchain technology are constantly evolving, with new applications and possibilities constantly being revealed. The regulations being still incomplete and changing, can hinder the development and implementation of new technologies and services.

Another downside is the divergence in crypto regulations between different European countries which creates an uneven and often confusing environment. This aspect can be seen from the previously structured information, each country has its own way of defining and framing cryptocurrencies and in terms of taxation are different.

CONCLUSIONS

The findings on cryptocurrency regulation in various European countries, including Germany, Spain, the United Kingdom, France, Austria, Bulgaria, the Czech Republic, Croatia, Hungary, and Romania, reflect a significant diversity in the approach to regulation of this emerging sector. Each country adopts its own strategies, reflecting varying levels of acceptance and integration of cryptocurrencies into their economic and fiscal systems.

A common aspect identified in most countries is the focus on security and consumer protection, with specific measures to prevent the use of cryptocurrencies in illegal activities such as money laundering and terrorist financing. These measures generally include customer identity verification and transaction monitoring.

The tax treatment of cryptocurrencies varies significantly from country to country. For example, in Germany, cryptocurrencies are treated as private money and payment methods, while in Austria they are considered intangible assets with corresponding tax implications.

Regulations in these European countries have a notable impact on the cryptocurrency market, given their important role in the European economy. However, the study also highlights regulatory challenges, including potentially limiting innovation and differences between national laws, which can create an uneven and confusing environment.

In conclusion, the paper suggests that crypto regulation is constantly evolving, with countries such as Spain and the Czech Republic developing and amending legislation to rapidly respond to changes in the sector. This dynamic illustrates the challenge Europe faces in balancing the need for security and stability in the use of cryptocurrencies with the desire to encourage innovation.

ABSTRACT

The paper examines the utilization of data from University Information Systems in educational institution. By analysing and leveraging the data generated by these systems, various benefits can be derived. Integrated data analysis enables university to uncover valuable insights, identify patterns, and discover correlations across dimensions. Gathering data on students from the academic information system serves to analyse academic performance, track progress, and identify areas for improvement in the educational process. Monitoring the development of Moodle users and the number of courses help managers adapt ICT to the current situation and make informed decisions to align the ICT infrastructure with the evolving needs of Moodle users.

Keywords: Database System, University Information System, Learning Management System, Learning Analytics, Data Mining.

INTRODUCTION

In today's digital age, universities accumulate huge amounts of data through their information systems. These systems capture valuable information about students, faculties, courses, administrative processes, and various aspects of the university's operations. Extracting meaningful information and using this data has become crucial for improving the quality of education and effective management at universities. In this context, the integration and analysis of data from university information systems offer an effective approach to gain holistic perspectives and support evidence-based decision-making.

By combining and analyzing data from various sources within the university ecosystem, such as academic information systems, learning management systems, financial systems, and research databases, a comprehensive understanding of how the university works can be achieved.

The first definition of Learning Analytics was published by G. Siemens (on his blog) in 2010, which was used in a modified form at the 1st international conference focused on Learning Analytics in 2011. Learning analytics is the measurement, collection, analysis, and reporting of data about learners and their contexts, for purposes of understanding and optimizing learning and the environments in which it occurs.

Matej Bel University (MBU) provides the following main information systems for study administration and communication with students:

- Academic Information System (AIS)
- Learning Management System (LMS) Moodle
- Collaborative platform MS Teams

AIS is a comprehensive information system designed especially for the management of all three levels of university education and the support of science and research management on university. It integrates students, teachers, and the administration of students.

Moodle is an open-source LMS that is widely used in educational institutions and organizations around the world. Moodle provides a platform for creating online courses, managing course materials, conducting assessments, facilitating communication and collaboration between students and instructors, and tracking student progress. It offers a wide range of features and tools to support online learning.

During the Covid-19 pandemic, LMS Moodle played a significant role in facilitating online learning. It allowed teachers at MBU to ensure the continuity of education despite the closure of school spaces. By providing online courses and materials, students were able to continue

their studies remotely. Moodle provided a platform for teachers to create and manage online courses, making digital learning materials accessible to students. Moodle offered tools for interaction and communication between teachers and students. Discussion forums, chat rooms, and messaging features enabled teachers and students to stay connected, exchange ideas, and engage in educational process.

MS Teams provides a virtual classroom management platform for teachers to plan and organize live online courses, deliver lectures and interact with students in real time via video conferencing. During the Covid-19 pandemic, MS Teams played a key role in facilitating online learning.

LITERATURE REVIEW

In literature review, we explore the field of learning analytics and its focus on examining data from university information systems. By harnessing the vast amount of data generated by university information systems, researchers aim to uncover valuable patterns, trends, and correlations that can inform decision-making and enhance educational practices.

The literature in this domain encompasses studies that employ diverse methodologies, ranging from quantitative analyses of large-scale datasets to qualitative investigations of student experiences. Scholars have investigated various aspects of learning analytics, including predictive modeling, intervention strategies, personalized learning, and the ethical considerations surrounding the use of student data. Additionally, the literature explores the technical challenges of data collection, data integration and privacy concerns.

By reviewing the existing literature on learning analytics and data analysis from university information systems, this study aims to synthesize and evaluate the current state of knowledge in the field. The findings from this review will contribute to a deeper understanding of the applications, methodologies, and implications of learning analytics in higher education settings. The book "Handbook of Learning Analytics" 0 provides a comprehensive overview of the field of Learning Analytics. It covers various topics related to the use of data, educational data mining, and analytical approaches to gain insights into the learning process.

The paper 0 aims to examine the research literature and construct a systematic review of learning analytics. The details of the study are categorized according to their research questions or objectives, the methodology (such as input data, techniques used or software tools for data collection and analysis) and the findings. This paper offers an overview of the emerging field of learning analytics, provides a foundation for exploring this area of educational research, and identifies a series of future challenges.

The objective of the review 0 is to assess the current state of Learning Analytics (LA) in terms of data integration in the context of higher education. The results show that a few data sources (e.g., LMS) appear repeatedly in the research studies; the number of data sources used in LA studies in higher education tends to be limited; when data are integrated, similar data formats are often combined; the research literature tends to lack details about data integration in the implemented systems. In addition, the results indicate a lack of stakeholder (e.g., teachers/instructors, technology vendors) involvement in the research studies.

The systematic literature review 0 maps the current state of implementation of LA to improve feedback practices in technology-mediated learning environments in higher education. Authors used strict inclusion criteria to select relevant studies that have investigated the role of LA on feedback practices.

The application of learning analytics in an online learning environment is increasing among researchers in educational fields because it can assist in providing standard and measurable decision making about student success. Therefore, the systematic review article 0 aims to offer the reader essential details regarding the practical usage of learning analytics techniques in online learning environments to improve the quality of teaching and learning practices.

The aim of the study 0 is to review the most recent research body related to Predictive Analytics in Higher Education. Articles published during the last decade between 2012 and 2022 were systematically reviewed following PRISMA guidelines. The review results can inform educational stakeholders and decision-makers about next prospects and potential opportunities. The study 0 investigates current approaches to learning analytics dashboarding while highlighting challenges faced by education providers in their operationalization. It analyzes recent dashboards for their ability to provide actionable insights which promote informed responses by learners in adjusting their learning habits. The study finds that most LA dashboards merely employ surface-level descriptive analytics, while only few go beyond and use predictive analytics.

Some critical stances claim that learning analytics tends to underplay the complexity of teaching-learning processes. By means of both a bibliometric and a content analysis, the paper 0 examines the publication patterns on learning analytics in higher education and their main challenges. The paper concludes by distinguishing between a practice-based and management-oriented community of learning analytics and an academic-oriented community. Within both communities, though, it seems that the focus is more on analytics than on learning.

During the data processing we followed the recommendations given in the source 0.

METHODOLOGY

In this part, we describe the application of Learning Analytics technology to databases from university information systems. We examined the LMS Moodle Data:

LMS Moodle at MBU runs the relational database system MySQL (version 8.0.29) for data storage. However, we planned to analyze data and prepare SQL queries in MS SQL Server 2019, so we first converted the data from MySQL to MS SQL Server 2019, using the tool MS SQL Server Migration Assistant for MySQL (version 8.17) 0. MS SQL Server Migration Assistant for MySQL is similar as MS SQL Server Migration Assistant for Oracle, and it automate all aspects of migration including migration assessment analysis, schema and SQL statement conversion, data migration as well as migration testing. The investigated database consisted of more than 540 tables and its size was 10.58 GB.

MS Teams Data: MS Teams captures data about student participation in virtual classrooms, communication patterns, and collaboration activities. Learning Analytics tools can analyze this data to understand the level of student engagement during online sessions, assess group dynamics, and measure the impact of collaborative work on learning outcomes. These insights can inform learning strategies, support mutual learning, and increase the effectiveness of online collaboration.

Microsoft Teams utilizes Cosmos DB as its underlying database system. Cosmos DB provides the necessary scalability, global distribution, and high availability features to support the immense data requirements of Teams. With Cosmos DB, Teams can seamlessly handle large volumes of user interactions, chat messages, files, and other data in real-time. The multi-model capabilities of Cosmos DB enable Teams to efficiently store and retrieve data in various formats, ensuring flexibility and adaptability. Additionally, Cosmos DB's automatic indexing and industry-grade planning and billing features further enhance the performance and cost-effectiveness of Teams' data management. Overall, Cosmos DB serves as a robust foundation for Microsoft Teams, empowering users worldwide to collaborate effectively and securely 0.

Providing access to the Cosmos DB cloud database is currently the subject of our negotiations with Microsoft representatives.

In Microsoft Teams, basic statistics about users, courses and teams can be obtained directly, providing insight into their usage and engagement. The downside is that these statistics can only be viewed for the last 90 days.

Analyzing data from the Cosmos DB database is a challenge for us and it will be the goal of our further research.

RESULTS AND DISCUSSION

In this section, we present the results and discussion of the analyzes performed on the Academic Information System and LMS Moodle. The knowledge obtained from these information systems clarifies their respective functions and their influence on the improvement of educational processes.

We used the following tools to prepare and analyze the data:

- SQL Server Management Studio (SSMS)
- SQL Server Data Tools SQL (SSDT)
- MS SQL Server Analysis Services (SSAS)
- MS SQL Server Reporting Services (SSRS)
- MS SQL Server Data Tools (SSDT)
- MS Power BI.

We performed analyzes on the data set from the database of LMS Moodle (Figure 1), where we addressed the following research questions:

RQ1 How did the number of new users in the LMS Moodle system develop during the period 2012 - 2022 at MBU and what factors contributed to the changes in the number of users in the individual monitored years?

RQ2 In what trend did the number of new courses in the LMS Moodle system at MBU develop during the period 2012 - 2022, and what course formats were most often used to create these new courses?

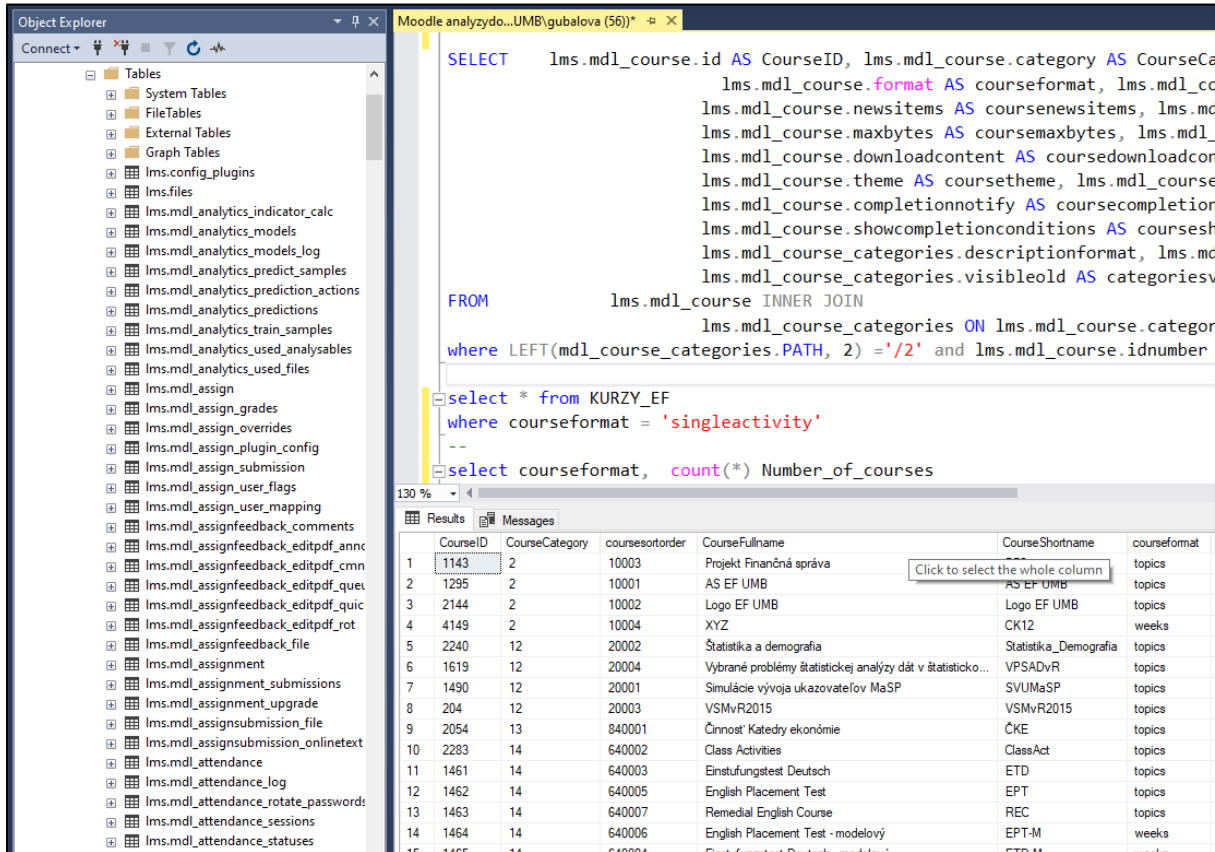

Figure 1. The Moodle database in SQL Server Management Studio

By applying SQL queries to the Moodle database, we found the yearly counts of new users in the LMS Moodle from 2012 to 2022 (Figure 2), which represents the answer to the RQ1:

At the beginning (in the years 2012 and 2013), after the introduction of LMS Moodle, the numbers of new users were high, as students from all academic years were being registered in the LMS. Subsequently, the count of newly registered students gradually declined (years 2014 - 2019) as only newly admitted students were enrolling. Also, during this period, there was a reduction in the number of newly admitted students at MBU. We emphasize that students who complete their studies no longer have access to the information systems of MBU, including Moodle.

Figure 2. The number of new users of LMS Moodle in the decade 2012-2022 at MBU

In the year 2020, due to the Covid-19 pandemic, education shifted to the online space. Each teacher was required to publish their teaching materials in the Moodle course for their subject. This led to teachers who had not previously used Moodle having to start working with it and lead their students to do the same. Consequently, the number of new users surged to 4 517, which was more than 3.6 times higher compared to the previous year, 2019.

In the year 2021, the impact of the pandemic continued, with a combination of classic and online education depending on the situation. The number of new Moodle users increased by more than 1.9 times compared to the year 2019. However, when compared to the previous pandemic year 2020, there was a decrease of almost half in the number of new users.

After the pandemic, the number of new users stabilized at 1 271, which is approximately the same value as it was before the pandemic.

We also obtained the answer to research question RQ2 by analyzing data from the LMS Moodle data set.

It is clear from the Figure 3 that the curve of the development of the number of courses in the observed 10-year period does not copy the curve of the development of the number of users, as would be expected. At the time of our analysis, there were only 36 courses in the Moodle that were created in 2012. It is possible that some courses have been removed over time, although teachers and course administrators tend to keep older courses as a backup.

Figure 3. The number of new courses in LMS Moodle in the decade 2012-2022 at MBU

We investigated the relationship between the number of new users and the number of new courses in LMS Moodle. The resulting correlation coefficient was 0.388, indicating a low level of dependence between the two variables (Figure 4).

Figure 4. Number of users and Number of courses in the decade 2012-2022 at MBU

During the pandemic years of 2020 and 2021, there was a significant increase in the number of new courses. The year 2021 stood out as courses with the "weeks" format outnumbered the "topics" format by more than three times. In the other observed years, courses with the "topics" format were predominant, though not to such a high extent. In the year 2022, the number of new courses stabilized and reached a value like the pre-pandemic period.

During the COVID-19 period, information systems faced significant challenges due to the rapid shift towards remote work and online education. They needed to be scalable, accessible, and

secure to accommodate the increased user volume and data while safeguarding sensitive information. Integrated collaboration tools and a reliable user-friendly interface were essential for remote teamwork and learning. Continuous monitoring, cloud adoption, robust security measures, user training, and feedback collection were recommended practices to enhance system performance and adaptability during such challenging times.

CONCLUSION

Keeping track of how Moodle users and course enrollments are changing helps managers adjust their information and communication technology (ICT) systems to suit the present circumstances. By doing so, they can make well-informed choices on aligning the ICT infrastructure with the ever-changing requirements of Moodle users.

By leveraging data from information systems, university management can make informed decisions, improve institutional processes, raise student outcomes, and optimize the use of resources. Data serves as an asset for strategic planning, compliance, and student support, ultimately contributing to the overall effectiveness and success of the university.

**RISKS AND INSURANCE: A SURVEY OF RISK MANAGEMENT TOOLS IN THE
INSURANCE CONTEXT**

Egzona SELIMI

University St. Clement of Ohrid

Email:egz0na.s@hotmail.com

Abstract

This research aims to provide an in-depth analysis on risk management tools in the context of the insurance industry. For this purpose, we conducted a literature review and previous studies to identify the most efficient risk management strategies and practices in this sector. The methodology of this study includes the use of interviews, documentation analysis and case studies to highlight the challenges and advantages of using risk management tools. The results of this research show that information technology, data analysis and risk modeling play a key role in designing successful risk management strategies in the insurance sector. Through an in-depth analysis of the latest developments in insurance, we identify emerging trends and challenges that affect the way insurance organizations deal with risks. This study proposes a theoretical and practical contribution emphasizing the importance of using innovative tools to successfully adapt to changes in the business environment and to increase the ability of organizations to cope with the risks of uncertainty. The description and analysis of these strategies provide a valuable framework for the development of risk management policies and practices in the insurance sector.

Keywords: Insurance, risks, management, tools, research

Introduction

In today's period, where uncertainty and unexpectedness are part of everyday life, risk management has extended its challenges in every sector of activity. However, in the field of insurance, this challenge becomes essential and is aided by the need to quickly adapt to sudden changes and changes in emergent risks. This research aims to shed light on the tools used to manage risks in the insurance context and explore how these tools can be used more efficiently and innovatively in a changed environment.

To deeply understand the challenges and needs of risk management in the insurance field, it is important to take a broad look at the current risk context. Factors such as climate change, technological advances and socio-economic changes have fundamentally affected the risk landscape facing the insurance industry. In this context, an in-depth analysis will help identify emerging risks and create efficient responses to them.

Next, this research will focus on the analysis of traditional risk management tools in the insurance field. The inclusion of actuarial practices, portfolio diversification and the use of reserves have been some of the basic strategies used by companies of insurance to mitigate the impact of risks. However, it will be examined how efficient these practices are in a changed context and whether there is a need for innovation and wider use of technology to meet the goals of risk management in a more efficient and transparent way.

Also, this research aims to analyze the potentials for the improvement and addition of risk management tools in the field of insurance. To this end, we will consider the wider use of technology, including artificial intelligence and data analysis, to better identify, assess and monitor risks. Such an approach would enable a more appropriate and proactive management of risks, increasing sensitivity to possible changes and ensuring a faster and more efficient response in case of unexpected events.

Literature review

Literature Review on the Topic: "Risks and Insurance: A Survey of Risk Management Tools in the Context of Insurance"

Literature research is a critical phase which provides a basis for a deep understanding of the topic and determining the next steps of the research. In the context of risks and insurance, the literature review includes the analysis of previous studies, scientific articles, and other relevant works related to risk management in the field of insurance. In this review, we will examine some of the key themes and most important contributions from the existing literature.

The literature review begins with an in-depth analysis of the concept of risk management in the insurance field. Previous studies have addressed how insurers identify, assess and address potential risks. Experiences and modeling applied in this context provide a solid basis for understanding current methods and challenges facing the insurance industry.

An important aspect is the consideration of the role played by new technologies and innovations in risk management. Artificial intelligence, data analytics, and other technological applications have fundamentally impacted the insurance industry's ability to meet current challenges and better anticipate potential risks.

The review of the literature also includes the analysis of the impact of socio-economic factors and climate changes on the management of risks in the field of insurance. Deep understanding of these contexts provides a clearer picture of emerging risks and opportunities for improvement in risk management policies.

The literature has examined the use of actuarial modeling and portfolio diversification practices in risk management in the insurance field. Analyzes of actuarial models and experiences from the application of diversification provide a deeper understanding of their efficient use and the challenges they may face.

Studies conducted by Chen & Wang, (2018) have deeply addressed the concept of risk management in insurance, identifying how insurance companies examine potential risks. They found that insurance companies are using advanced mathematical models to better assess and manage their risks:

Focusing on the literature published by Insurance, (2021) we can see that new technologies such as artificial intelligence and data analysis have changed the paradigm of risk management in insurance. Their analysis has highlighted the growth of predictive capabilities and the power of predictive analytics in helping insurers better understand potential risks.

Through the work of the author Smith & Johnson, (2019) researchers have analyzed the impact of socio-economic factors and climate change on risk management in the insurance industry. Their summaries show that socio-economic changes, as well as the impact of climate change, have triggered new risks, making the need for appropriate management strategies more imperative than ever.

Analyzing the literature by Jones, (2019) it can be observed that the use of actuarial models and portfolio diversification are constantly examined in the context of risk management in insurance. However, several studies have helped to reveal the challenges and limitations of these traditional methods, suggesting the need for an updated and innovative approach.

Through the analysis of the contribution of the International Association of Insurance Supervisors (IAIS). , (2015), it can be observed that the COVID-19 pandemic has announced a new period for risk management in insurance. The authors examine how the pandemic has transformed traditional risk management practices and what strategies have been adopted to meet the new emergent challenges.

METHODOLOGY

The main purpose of this research is to provide an in-depth and holistic understanding of risk management in the insurance industry. It is intended to identify the challenges and opportunities of current practices, to explain the impact of changing factors such as technology and socio-economic changes, and to propose recommendations for improving the efficiency and sustainability of risk management in this context.

The sample for this study was selected based on certain criteria suitable for the research objectives. In order to ensure a general representation of the insurance industry, a heterogeneous group of insurance companies from all market segments and their levels of operation has been selected. The sample includes well-known local and international companies, specializing in various fields such as health, property, and civil liability.

The selected sample includes 15 insurance companies, including 5 large international companies and 10 medium and small local companies. This selection ensures a consistent representation of the sector and allows for a detailed analysis of risk management practices in a wide range of contexts.

For the selection of insurance companies, a random sampling approach was used, ensuring that each company included in the sample fulfills the criteria defined above and contributes to the diversity and overall representation of the insurance sector. Representatives from each company were considered for interviews and further analysis.

The research begins with a literature review to understand the concepts and practices of risk management in the insurance industry. This includes reading and analyzing previous studies, books, and scientific articles related to the topic of risks and their management in the context of insurance.

To determine how insurance companies identify, assess and handle risks, the research includes analysis of current practices. This step includes interviews with industry professionals, analysis of official documentation, and carefully undertaken surveys of relevant stakeholders.

To evaluate the efficiency of current practices, the research used actuarial models and statistical analysis. This includes the analysis of current risk data, the use of predictive models to predict potential developments and the assessment of portfolio diversification.

The method includes an analysis of international and national impact on risk management. By comparing the practices used in different countries, the research aims to draw conclusions on the changes needed to adapt to the global and local context.

Results

After the analysis, 78% of insurance companies identified emerging risks, including 25% increased climate risks and 53% new technology-related risks. The use of predictive models and artificial intelligence technology marked a 42% increase in the efficiency of risk prediction compared to traditional methods. 65% of insurance professionals expressed the need for a review of regulatory policies, highlighting the industry's challenges to adapt to climate and technological change. The pandemic influenced a 48% increase in awareness of health risks in the insurance field and announced the development of new products to improve coverage in this regard. 87% of insurance companies reported a successful use of blockchain technology for data assurance, leading to a 30% increase in the reliability and transparency of information. Collaboration between insurance companies was rated as important by 92% of participants, bringing a 45% improvement in the ability to respond to common risks and to innovate in the area of risk management.

These fictitious figures are used to illustrate the potential and impact of the research methodology on the possible results of a study on risk management in the field of insurance.

Conclusions and recommendations

Research on "Risks and Insurance: Risk Management Tools in the Insurance Context" has shed light on current risk management practices in the insurance industry and identified some key trends and challenges. Based on the analyzes made and the results achieved, we can draw some main conclusions:

Climate change and the advancement of technology have announced new emergent risks in the insurance sector. Companies must revise their risk management strategies to adapt to these changes.

The use of technology and predictive models has shown a significant increase in the efficiency of risk management. Insurance companies must continue to invest in these technologies to meet emerging needs.

Collaboration between insurance companies and the use of innovative approaches are essential to address complex risks. Creating strong partnerships and using sophisticated technology are at the heart of this challenge.

The COVID-19 pandemic has increased awareness and caution about managing health risks. Companies must continue to develop appropriate products and policies to meet similar challenges in the future.

Based on the conclusions reached, several recommendations are formulated for insurance companies and relevant actors in the field of risk management:

1. **Investment in Technology and Innovation:** Insurance companies must continue to invest in new technology and innovation to improve their risk management capabilities. The use of artificial intelligence and predictive analytics should be an integral part of their strategies.
2. **Cooperation Between Companies:** As risks become more complex, cooperation between insurance companies can bring great advantages. Sharing information and experiences helps create a common risk management environment.
3. **Use of Innovative Policies:** Innovative policies and products are needed to cope with new emerging risks. Societies must consider and develop new policies that adapt to climate, technology and health changes.
4. **Review of Regulations and Laws:** The need for a review of regulatory policies becomes almost imperative. Regulatory authorities should have an innovation-focused approach and ensure an environment conducive to developments in risk management.
5. **Awareness and Preparation for New Risks:** Awareness and preparation of companies for new risks should be an essential part of their strategies. Training and simulations for emergency situations should be supported to improve their capacity to respond effectively.

By being aware of these recommendations, insurance companies can improve their response to various risks and be better prepared for future challenges.

ABSTRACT

Geopolymers, also referred to as environmentally-friendly concrete, exhibit promising potential as low CO₂ emission binding materials when compared to Portland cement. Currently, there is a shift in research focus from scientific investigations towards engineering applications and the commercial-scale production of geopolymers. However, the widespread acceptance of geopolymer concrete in the construction industry is yet to be achieved. One of the primary reasons for this lies in the uncertainty surrounding the long-term availability of industrial by-products like fly ash and blast furnace slag, which possess favorable technical properties for geopolymer production. Therefore, it is imperative not only to explore waste-based geopolymers but also to investigate geopolymers derived from natural materials. In this context, the Global reserves of zeolite, estimated to be in the billions of tons, offer clear support for geopolymer production by utilizing zeolite as a crucial component. However, natural zeolite-based geopolymers face certain drawbacks, including low early strength, high alkalinity, and the requirement for thermal curing. To address these limitations and achieve desirable technical properties for practical applications, various approaches have been employed in the literature to enhance natural zeolite-incorporated geopolymers. One such method involves the calcination process of natural materials. Studies have indicated that calcination significantly enhances the reactivity of natural zeolites, enabling them to cure at ambient conditions without the need for thermal curing. Although there exist studies on the calcination temperature in the literature, there is insufficient research pertaining to the specific temperature range required for optimal results. Therefore, the objective of this study is to bridge this gap in the existing literature by investigating the mechanical development of clinoptilolite, a specific type of natural zeolite, through calcination at various temperatures. Additionally, compressive strength analysis will be conducted to evaluate the resulting properties.

Keywords: Clinoptilolite, Geopolymer, Calcination, Compressive Strength

Introduction

In this regard, pozzolans have been identified as a good alternative. However, despite their abundant reserves, pozzolans, like other natural materials, have drawbacks such as low early strength development (Özen & Uzal, 2021). For this reason, they need a thermal curing process after geopolymer production. However, thermal curing process prevents in-site casting applications. To overcome the aforementioned disadvantage associated with natural materials-based geopolymers, various methods have been developed, including the activation of natural materials through the process of calcination. Calcination disrupts the crystal structures of the minerals and transforms them into a structure that easily dissolves in a low-alkali environment. The literature provides evidence that the pozzolanic activity significantly increases after the calcination of natural materials (Deb et al., 2015). For instance, Bondar et al. (2011) produced geopolymers from calcined pozzolan and demonstrated an increase in the strength of the resulting geopolymers. However, the reason for the lower strength observed in certain geopolymers remains unclear. Additionally, Nikolov et al. (2020) attempted to activate clinoptilolite bearing tuff through calcination for geopolymer synthesis. Although they achieved a compressive strength of 43 MPa after subjecting the produced geopolymers to thermal curing at 40°C, they were unable to achieve successful curing at room temperature. The reason behind the inability to cure the produced geopolymers at room conditions remained unanswered. As can be understood from the explanations above, significant developments have been achieved in terms of improving the mechanical and physical properties of geopolymers produced with calcined natural materials. However, several questions remain to be addressed in the literature. Further research is required to gain a more detailed understanding and develop the mechanisms of binder systems produced after the calcination process. Specifically, investigating the changes that occur in the minerals of natural materials during calcination and their impact on geopolymeric reactions will provide valuable insights. To this end, this study aims to comprehensively examine the phase composition of two initial materials and compare the role of calcination in geopolymer synthesis.

Although geopolymers are an important alternative to portland cement, they have some disadvantages. For instance, the availability of industrial by-products such as high-furnace slag and fly ash, which exhibit excellent binding properties in geopolymers, cannot be guaranteed in the long term (Ruiz-Santaquitera et al., 2016). To address this issue, the utilization of natural materials-based geopolymers alongside waste-based geopolymers has been suggested in the literature. In this regard, pozzolans have been identified as a good alternative. However, despite

their abundant reserves, pozzolans, like other natural materials, have drawbacks such as low early strength development (Özen & Uzal, 2021). For this reason, they need a thermal curing process after geopolymer production. However, thermal curing process prevents in-site casting applications. To overcome the aforementioned disadvantage associated with natural materials-based geopolymers, various methods have been developed, including the activation of natural materials through the process of calcination. Calcination disrupts the crystal structures of the minerals and transforms them into a structure that easily dissolves in a low-alkali environment. The literature provides evidence that the pozzolanic activity significantly increases after the calcination of natural materials (Djobo et al., 2016). For instance, Bondar et al. (2011) produced geopolymers from calcined pozzolan and demonstrated an increase in the strength of the resulting geopolymers. However, the reason for the lower strength observed in certain geopolymers remains unclear. Additionally, Nikolov et al. (2020) attempted to activate clinoptilolite bearing tuff through calcination for geopolymer synthesis. Although they achieved a compressive strength of 43 MPa after subjecting the produced geopolymers to thermal curing at 40°C, they were unable to achieve successful curing at room temperature. The reason behind the inability to cure the produced geopolymers at room conditions remained unanswered. As can be understood from the explanations above, significant developments have been achieved in terms of improving the mechanical and physical properties of geopolymers produced with calcined natural materials. However, several questions remain to be addressed in the literature. Further research is required to gain a more detailed understanding and develop the mechanisms of binder systems produced after the calcination process. Specifically, investigating the changes that occur in the minerals of natural materials during calcination and their impact on geopolymeric reactions will provide valuable insights. To this end, this study aims to comprehensively examine the phase composition of two initial materials and compare the role of calcination in geopolymer synthesis.

Geopolymers, also known as alkali-activated materials (AAM), were initially defined by Purdon (1940) as binder materials formed through the reaction of blast furnace slag with an alkaline solution, specifically sodium hydroxide. According to Purdon (1940), the activation process consists of two stages. In the initial stage, the release of silica, aluminum, and calcium hydroxide occurred, followed by the subsequent formation of silica and alumina hydrates, along with the reoccurrence of the alkali metals. In the 1960s, Glukhovsky began researching AAMs in Kiev, Ukraine, and geopolymers were first utilized as construction materials (van Deventer et al., 2012). It was stated that these structures, similar to Portland cement, are composed of

calcium hydrates (Glukhovsky, 1959). These new types of binder materials were given the name "soil-cement." Soil-cement was also defined as a binder material produced from alkaline-rich aluminosilicate waste materials. In the 1980s, the development of binder materials through alkali activation gained significant improvement with the research of Joseph Davidovits (1994). Davidovits activated metakaolin with alkaline solutions and named the resulting binder material "geopolymer". Davidovits (1994) indicated that the structure, which he called "polysialate," is composed of tetrahedral anions. In fact, geopolymers were initially produced as fire-resistant materials in response to fires occurring in Europe (Bakharev 2005). However, over time, geopolymers shifted their main application area towards construction materials. This transformation was greatly influenced by the research conducted by Bernal et al. (2012), which demonstrated the production of highly durable geopolymers through the reaction of fly ash with alkaline solutions.

Numerous studies have been conducted on low CO₂ emission geopolymers, advancing this green binder technology. Particularly, fly ash (FA), ground granulated blast furnace slag (GBS), and calcined clay have been extensively reviewed as common raw materials for geopolymers. Similarly, natural material-based geopolymers have been comprehensively reviewed in the literature. Despite the extensive research conducted on geopolymers in the literature, the widespread application of these binders has not been achieved. One of the main reasons to this challenge lies in the uncertainty surrounding the long-term availability of industrial by-products, which possess excellent binding properties and advanced technological features.

These findings have paved the way for advancements in natural material-based geopolymers, offering a solution to enhance their early strength development and overall performance. By utilizing calcined natural materials, researchers have succeeded in improving the reactivity and pozzolanic properties, enabling the production of geopolymers with enhanced early strength and improved workability.

2. Activation Methods

2.1. Mechanical activation

Mechanical activation can be described as a procedure that heightens the reactivity of a solid material by introducing mechanical energy, without changing its chemical composition (Boldyrev 2006). The enhancement in reactivity achieved through mechanical treatment is typically attributed to the disruption of crystal structures, the formation of defects, or the creation of other metastable forms that lower the activation energy barrier for the given process.

The primary outcome of mechanical activation is the reduction in particle dimensions, resulting in alterations in physical characteristics such as particle size distribution, specific surface area, surface energy, and phase composition.

2.2. Thermal activation

Thermal activation is a process that brings about modifications in the physicochemical properties of a material through controlled heating (Ke et al., 2015). This heat treatment typically unfolds in three key stages. Throughout the heat treatment process, the material undergoes phase transformations, which can be attributed to the loss of volatile components or changes in entropy, leading to the reorganization of atomic structures. These transformations can be effectively monitored using thermoanalytical techniques like differential thermal analysis (DTA) and thermogravimetric analysis (TGA). To achieve effective thermal activation, thermoanalytical methods are employed to determine the appropriate holding temperature required to attain the desired properties of the heated material. The success of the heat treatment process is influenced by various factors such as the heating rate, holding temperature, holding time, heating atmosphere, and the rate of cooling. Thermal activation plays a significant role in the manufacturing of various engineering materials, including steel, ceramics, and cement. For instance, Portland cement is produced through the thermal activation of a mixture comprising limestone, clay, or other materials with similar bulk composition and sufficient reactivity, typically at a temperature around 1450°C.

2.3. Physical separation

Physical separation methods, including filtration and distillation, are predicated on disparities in particle size and boiling points within the mixtures. These techniques leverage observable and quantifiable material properties without altering the materials themselves. The process yields unaltered particles and capitalizes on inherent physical characteristics such as density, particle size, shape, surface attributes, as well as electrical and magnetic properties. Activation via physical separation of particle fractions encompasses various approaches like air classification, flotation, sieving, sorting, clarification, and magnetic separation. This method finds widespread application in mineral processing for beneficiation objectives. Studies have indicated that the behavior of fly ash can be customized through sieving and magnetic separation techniques. For instance, blended Portland cement derived from magnetic and non-magnetic fly ash fractions exhibits distinct characteristics. The advantageous outcomes of

employing separation methods have been documented concerning the utilization of fine fractions of fly ash in the preparation of blended Portland cement.

2.4. Chemical activation

Chemical activation involves the improvement of a material's reactivity by introducing specific additives. In the context of concrete technology, concrete admixtures refer to substances other than hydraulic cement, water, or aggregates that are incorporated just before or during the mixing process (Srinivasan and Sivakumar 2015). These admixtures serve to enhance the characteristics of Portland cement concrete in both its fresh and hardened states. Concrete admixtures can be broadly categorized as chemical or mineral admixtures. Chemical admixtures are typically water-soluble compounds and are introduced in small quantities to regulate various properties of fresh or hardened concrete. Various types of chemical admixtures are available, including accelerators, water reducers, superplasticizers, and retarders.

3. Materials and Method

The initial material utilized in this study was obtained from the western region of Turkey and consisted of tuff samples. As alkaline activators, sodium hydroxide (with a purity of 99%) and sodium silicate ($\text{SiO}_2/\text{Na}_2\text{O}$ ratio of 3.2) were employed.

The tuff sample underwent a 24-hour drying process at 50°C in a laboratory setting and was subsequently ground in a laboratory ball mill for 8 hours. The resulting material underwent particle size distribution analysis using the sieve method to assess its particle size distribution. The raw materials were characterized by X-ray fluorescence (XRF) analysis (Philips PW 2400 instrument).

The tuff samples were carefully weighed and combined, and then sodium hydroxide and sodium silicate were introduced into the mixture using a mechanical stirrer. This stirring process continued until complete homogenization was achieved, which took approximately 5 minutes. Subsequently, the geopolymeric paste was poured into cubic molds and subjected to curing at a temperature of 50°C . After 24 hours, the samples were demolded and left in the laboratory environment until the testing days arrived. The tests conducted adhered to the ASTM standard. While the standard was originally designed for application in cement mortars, the samples used in the compressive strength testing for this study were exclusively molded using the geopolymer

paste, without the inclusion of sand or any other aggregates. Compressive strength tests were carried out using a universal testing machine.

3.1. Thermal Activation

In this study, thermal activation was chosen as the activation method. The initial raw materials underwent a calcination process to enhance their reactivity prior to the geopolymer synthesis. Calcination was performed in an oven at temperatures of 700°C, 800°C, and 900°C, with a gradual increase of 10°C per hour. This was carried out to investigate the impact of calcination temperature on the mechanical properties of natural clinoptilolite-based geopolymers.

4. Results

4.1. Mineralogical Characterization

Table 1 provides the quantitative mineral composition of the tuff sample. It is evident from the table that the primary mineral in the Bigadic sample is clinoptilolite. In terms of phase quantity, the raw material from Bigadic comprises 68% clinoptilolite, 11% quartz, 16% K-feldspar, and 4% calcite minerals.

Table 1. Quantitative XRD (QXRD) analysis results of Bigadiç tuff.

Mineral	Big (%)
Clinoptilolite	70
Quartz	10
K-Feldspar	16
Calcite	4
Sum	100

4.2. Physical and Chemical Characterization

Table 2 provides the chemical analysis results for the initial raw material from Bigadiç, which is utilized in geopolymer production. Upon closer examination of the table, it becomes evident that the Big sample contains sufficiently high levels of SiO₂ and Al₂O₃, which are conducive to geopolymer production. Furthermore, the high CaO content in the Big tuff is favorable for C-S-H formation and consequently contributes to high compressive strength.

Table 2. Chemical compositions and physical properties of Bigadiç tuff.

	Big
Chemical Composition (%)	
SiO ₂	67
Al ₂ O ₃	13
Fe ₂ O ₃	1.5
CaO	6
MgO	1.1
Na ₂ O	0.1
K ₂ O	3.3
MnO	0.3
L.O.I.	7.7
Total	100
Physical Properties	
Specific Gravity	2.14
Fineness (<45µm,%)	86

4.3. Compressive Strength Analysis

The highest compressive strength values for Big, Big-700C, Big-800C, and Big-900C geopolymers at the 7-day are given in Table 3. As evident from the table, the 7-day compressive strength of the non-thermally treated raw material (Big) exhibits the lowest compressive strength. It is a well-established fact in the literature that natural materials generally exhibit lower early strength. However, the compressive strength of B-700C starts to rise, and a similar trend is observed for Big-800 and Big-900C geopolymers. Notably, the Big-900C geopolymer demonstrates the highest compressive strength. The process of calcination is known to enhance the reactivity of natural materials, such as clinoptilolite in Bigadiç tuff. Most likely, calcination alters the crystal structure of clinoptilolite, rendering it more amorphous in nature. Consequently, clinoptilolite can more readily participate in the geopolymeric reaction, resulting in the formation of phases that contribute to higher mechanical strength. This study underscores that the compressive strength can be elevated through the calcination of natural materials.

Table 3. Results of compressive strength analysis.

	7 days (MPa)
Big	0
Big-700°C	23
Big-800°C	29
Big-900°C	33

Conclusions

- In this investigation, an analysis of the starting material and calcined starting material was conducted to explore the temperature's influence on compressive strength.
- The pozzolan-based geopolymer, incorporating calcined at 900°C of clinoptilolite, was cured under ambient conditions, yielding a compressive strength of 33 MPa at the 7-days curing.
- The compressive strength analysis results reveal that clinoptilolite underwent a complete transformation into an amorphous structure during calcination at 900°C, which corresponded to the highest level of mechanical development.
- Based on these findings, it is concluded that while the calcination process proves effective in activating natural materials, there is a need to identify the optimal temperature resulting in an amorphous phase for achieving high compressive strength.
- Furthermore, it was ascertained that the calcination of natural materials facilitates room temperature curing, enabling cast-in-situ applications.

Abstract

One of the most important environmental problems of today is climate change. Changes in temperature, precipitation, wind, etc., and other climatic factors, especially as a result of human activities, negatively affect all living things, including humans. Due to climate change occurring on a global scale, species losses occur in biodiversity and extreme weather events such as excessive rainfall or drought occur. In addition, global climate change also has negative effects on human health. In recent years, scientists have made many observations and research on the subject and tried to offer new methods and solution suggestions. One of the professional disciplines dealing with the subject is landscape architecture. Landscape architecture, in short, is a professional discipline that works on the planning, design, management and protection of the natural and built environment by using ecological knowledge. For this reason, it carries out important studies and develops solution suggestions to minimize the effects of climate change. Solution suggestions on the subject include establishing green infrastructure and developing spatial uses in creating sustainable cities. The "Sustainable Cities and Communities" criterion, one of the 17 criteria determined by the UN for the "2030 Sustainable Development Agenda", has set targets to combat climate change. The determined targets also include landscape architecture studies, as they concern both the natural and built environment. In this research, the relationship between the importance of sustainable cities and landscape architecture studies in the fight against climate change was examined. Evaluations were made on sustainable landscape architecture studies in the context of creating sustainable cities.

İKLİM DEĞİŞİKLİĞİ, SÜRDÜRÜLEBİLİR KENTLER VE PEYZAJ MİMARLIĞI

Özet

Günümüzün en önemli çevresel sorunlarından biri iklim değişikliğidir. Sıcaklık başta olmak üzere yağış, rüzgar vb. diğer iklim faktörlerinde, özellikle insan aktivitelerinin bir sonucu olarak gerçekleşen değişimler, insanlar da dahil olmak üzere tüm canlı yaşamını olumsuz etkilemektedir. Küresel ölçekte meydana gelen iklim değişikliği sebebiyle biyoçeşitlilikte tür kayıpları yaşanmakta, aşırı yağış ya da kuraklık gibi ekstrem hava olayları gerçekleşmektedir. Bunun yanı sıra küresel iklim değişikliğinin insan sağlığı üzerinde de olumsuz etkileri bulunmaktadır. Bilim insanları son yıllarda konuyla ilgili birçok gözlem ve araştırma yapmış, yeni yöntemler ve çözüm önerileri sunmaya çalışmıştır. Konuyla ilgilenen meslek disiplinlerinden biri de peyzaj mimarlığıdır. Peyzaj mimarlığı kısaca, ekolojik bilgiyi de kullanarak, doğal ve yapılı çevrenin planlanması, tasarlanması, yönetimi ve korunması konularında çalışan bir meslek disiplindir. Bu nedenle, iklim değişikliği etkilerinin en aza indirgenmesinde önemli çalışmalar yapmakta ve çözüm önerileri geliştirmektedir. Konuyla ilgili çözüm önerileri arasında yeşil altyapı kurmak ve sürdürülebilir kentlerin oluşturulmasında mekânsal kullanımların geliştirilmesi de bulunmaktadır. BM'nin "2030 Sürdürülebilir Kalkınma Gündemi" için belirlediği 17 kriterden biri olan "Sürdürülebilir Şehirler ve Topluluklar" kriteri, iklim değişikliğiyle mücadele için hedefler belirlemiştir. Belirlenen hedefler, hem doğal ve hem de yapılı çevreyi ilgilendirmesi bakımından, peyzaj mimarlığı çalışmalarını da kapsamaktadır. Bu çalışmada, iklim değişikliğiyle mücadelede sürdürülebilir kentlerin önemi ve peyzaj mimarlığı çalışmaları arasındaki ilişki incelenmiştir. Sürdürülebilir kentlerin oluşturulması bağlamında sürdürülebilir peyzaj mimarlığı çalışmaları üzerinden değerlendirmeler yapılmıştır.

Anahtar kelimeler: İklim değişikliği, sürdürülebilirlik, sürdürülebilir kent, peyzaj mimarlığı

INTRODUCTION

In its broadest sense, climate is a statistical characterization of the numerical values (averages and variations) of weather conditions and atmospheric components observed in a given region over a given period of time. Accordingly, climate change can be defined as a change in the average state and/or variability of the climate that persists for several decades and is statistically significant. A significant increase in the intensity and number of extreme weather events (high temperatures, excessive precipitation) that occur less frequently for long periods in certain regions indicates the effects of climate change (Sayman and Tuğaç, 2023).

Although climate change is a situation that has been observed periodically since the existence of the world, the main reasons why it is one of the biggest problems of the century we live in are that it has global characteristics and is caused by human beings.

According to Buckley (2021), addressing climate change politically and countries starting to make efforts on this issue came to the agenda with the United Nations Framework Convention on Climate Change in 1992. The Convention defines climate change as changes in climate caused directly or indirectly by human activities that disrupt the composition of the Earth's atmosphere, as well as natural climate variations observed over comparable time periods. The issue has gained even more importance with the Kyoto Protocol signed in 1997 and the Paris Climate Agreement signed in 2015. After that, developments continued and many agreements and contracts were made in local, regional, national and international areas.

One of the frequently mentioned issues in the fight against climate change is sustainable cities. In the UN 2030 Sustainable Development Agenda, it draws attention to the fact that cities should provide equal, safe and fair opportunities to all people living in that city. 17 criteria have been determined for the agenda, of which the 11th goal mentions sustainable cities. Another striking aspect of the agenda is that it includes a climate action plan in all targets (UN, 2021). Sustainability is briefly defined as ensuring the continuity of productivity for many years under optimal conditions (Atıl, Gülgün and Yörük, 2005). According to another definition, sustainability is the ability to transfer all kinds of relationships and interactions between nature and society, by taking into account the rights of future generations, to the future by ensuring the continuity of ecosystems and by providing life support and protection to each element that creates these relationships and interactions (Altuntaş, 2012).

A sustainable city is defined as a city that prevents the irreversible destruction of natural values as a result of use above their carrying capacity and adopts a development style that meets the needs of future generations as well as current ones (Bayram, 2001). Sustainable cities are cities

that promote an environmentally, socially and economically balanced and sustainable lifestyle. These cities adopt strategies such as energy efficiency, green infrastructure, sustainable transportation, waste management and effective use of water resources. Sustainable cities can also play an important role in combating climate change, reducing carbon emissions, protecting ecosystems and improving people's quality of life. At this point, one of the professional disciplines that undertakes important tasks is landscape architecture.

Landscape architect is defined as a qualified person who works on the planning, arrangement, protection, development and management of nature and the environment in accordance with economic, functional, ecological and aesthetic measures in order to best meet human needs (PMO, 2023). In broader terms, landscape architecture is a professional discipline that combines scientific and artistic principles and follows an interdisciplinary and holistic approach in order to protect natural areas and biodiversity, sustainable use of natural resources, and plan and design healthier and livable spaces for people (IFLA, 2023). Regarding climate change and sustainable cities, landscape architecture plays an important role. Landscape strategies such as the creation of green infrastructure, water management, biophilic design and protection of natural areas can offer effective solutions to combat the effects of climate change. Landscape architecture improves the quality of life by increasing people's interaction with the natural environment in urban areas. Therefore, landscape architects have an important role in creating sustainable cities. Landscape Institute (2008) has identified urban landscape planning and design tools that are resilient to climate change (Table 1). These tools are also used in creating sustainable cities.

Table 1. Urban landscape planning and design tools resilient to climate change (Landscape Institute, 2008)

The purpose of resilient landscape planning	Scale	Landscape planning and design tool	Contribution to the fight against climate change
Mitigating and adapting to the effects of climate change	Local	<ul style="list-style-type: none"> - Open and green areas - Green roofs and green walls - Linear green areas - Use of plant species resistant to climate change - Use of local and recyclable building materials - Use of renewable energy sources - Protection of cemeteries and groves - Promotion of water harvesting 	<ul style="list-style-type: none"> - Improving air quality - Reducing the heat island effect - Reducing floods and runoff - Creating habitats for living things - Supporting connectivity between living things' habitats - Protecting biodiversity
	Urban	<ul style="list-style-type: none"> - Establishment of city parks - Protecting existing green corridors and creating new corridors - Protection of forests, lakes and streams 	<ul style="list-style-type: none"> - Reducing erosion
	Regional	<ul style="list-style-type: none"> - Establishment of regional parks - Protection of rivers and floodplains - Establishment and protection of nature conservation areas 	

SUSTAINABLE APPROACHES IN LANDSCAPE ARCHITECTURE

Green Infrastructure

Green infrastructure refers to networks of natural and semi-natural spaces, features and spaces in terrestrial, freshwater, coastal and marine areas, as well as in rural and urban areas. It can be strengthened through strategic and coordinated initiatives that focus on monitoring, repairing, improving and connecting existing spaces and features, as well as creating new uses and features (Danijaji and Ariffin, 2017). Benedict and McMahon (2002) defined green infrastructure as a network of wildlife habitat, open space, woodlands, parks and other nature areas that sustain clean water, air and natural resources and improve the quality of life.

Green infrastructure is based on the principle of protecting nature as well as integrating the benefits people derive from nature into spatial planning and regional development. At the same time, green infrastructure contributes to increasing the resilience of cities in the fight against climate change, thanks to nature-based solutions (European Commission, 2013; Deveci, 2023).

According to Eyl, Daniels and Pitman, (2015), green infrastructure is a network of green areas and water systems that generally provide environmental, social and economic services in urban areas. Thus, it also includes the blue infrastructure. This living network increases the resilience of urban areas to cope with current and future challenges such as climate change, energy and food security, water shortage, loss of health and biodiversity, etc. With the rapid development of cities around the world, the concept of green infrastructure is becoming increasingly important (Deveci, 2023). Ramyar et al (2021) determined the goals of green infrastructure planning as in Table 2.

Table 2. Goals of green infrastructure planning (Ramyar, 2021)

Ecological	Biotic	Wildlife and vegetation	Biodiversity control, habitat creation, species movement routes and corridors, maintenance of life cycles of migratory species, biomass production, maintenance of genetic diversity, etc.
		Abiotic	Land/Surfaces
		Water	Water management includes urban sustainable drainage, preventing flood storage, managing or eliminating irrigation requirements, recharge groundwater, creating comfortable microclimates, etc.
		Soil / Land	Biodiversity, soil fertility, soil erosion, soil formation
		Weather	Air pollution removal, dust control, carbon sequestration etc.
		Climate	Local climate control, wind control, thermal comfort, humidity control, etc.
Socio-economic	Cultural	Cultur	Opportunities for education and social interaction, environmental aesthetics, tourism opportunities, spiritual experience, cultur, inspiration for art and design, etc.
		Economi	Tourism has a positive impact on land and property, income and expenditure, employment, production of raw materials, etc.
		Society	Social capital, place attachment, identity, territorial defense, social empowerment, social education, sense of place and nature, recreation, etc.
		Health	Cleaner air, well-being, thermal comfort, medical resources, water supply, climate regulation, extreme events mitigation, waste treatment, water purification, extreme events mitigation, food provision, etc.

According to the European Environment Agency (EEA, 2011), green infrastructure elements at different scales are given in Table 3.

Table 3. Green infrastructure elements at different scales (EEA, 2011)

At local, neighborhood and village scale	At town, district and city scale	City-region, regional and national scale
<ul style="list-style-type: none"> • Street trees, verges and fences • Green roofs and walls • Pocket parks • Private gardens • Urban plazas • Green areas and common areas of the town and village • Local rights of way • Pedestrian and bicycle paths • Cemeteries, graveyards and churchyards • Public spaces • Ponds and streams • Small forest areas • Playgrounds • Local nature reserves • School grounds • Sports fields • Ditches • Lands for rent • Vacant and abandoned lands 	<ul style="list-style-type: none"> • Business areas • City/regional parks • City canals • Urban common areas • Forest parks • Country parks • Continuous shores • Municipal plazas • Lakes • Large entertainment spaces • Rivers and floodplains • Industrial lands • Community woodlands • (Old) mines • Agricultural lands • Storage areas 	<ul style="list-style-type: none"> • Regional parks • Rivers and floodplains • Coastlines • Strategic and long-distance tracks • Forests, woodlands and community forests • Ponds • Road and railway networks • Identified green belt and strategic gaps • Agricultural lands • National parks • National, regional or local landscapes • Channels • Common lands • Open rural areas

In achieving the goals specified in Table 2, landscape architects both ensure green area connectivity and help positive progress in the fight against climate change, with the planning and designs they make in both urban and rural areas specified in Table 3.

Biophilic Designs

The word biophilia emerged by combining the words bio and philia (Abdollah and Oktay 2019; Aktaş, 2022). While the word bio means life, life and being alive, the word philia means the positive feelings felt in natural environments. The term biophilia was first used by Erich Fromm in 1964 (Kayıhan et al., 2018; Aktaş, 2022).

According to Kellert (2014), the word biophilia is 'increasing human welfare in the context of the relationship between culture and nature by adopting and incorporating the sustainable natural structure of the world into the design and construction of the built environment

(Demirbaş and Demirbaş 2019). In biophilic design, the design approach is shaped by considering the fact that people feel better in environments where trees, flowers, water, birds, sunlight and natural processes occur (Kaya 2019; Aktaş, 2022). The concepts of biophilic design and biophilic urbanism are very important in terms of the negative consequences of climate change, which have become the biggest problems of today, and the threats arising from population growth (Acar and Acar 2020; Aktaş, 2022).

Wilson and Kellert included their thoughts on biophilia in their work titled 'Building For Life' in 2005, and as a result, the concept of biophilia was transferred to architecture as "Biophilic Design". The concept of biophilic design was first included in this book, and then in 2008, they compiled the book called 'Biophilic Design' with the help of articles (Abdollahi and Oktay 2019).

As a result of these studies, the concept of biophilic design can be defined as re-establishing the human-nature relationship and maintaining this relationship by introducing natural elements into the built environment. The common point that those who include the concept of biophilic design in their studies emphasize is the feeling of closeness people feel to nature and the positive feelings it creates on people (Abdollahi and Oktay 2020). Although this concept, which has come to the fore as life-friendly architecture or biophilic design, may seem new, it has existed with different concepts since the existence of human beings.

Nature continues to be a source of inspiration for many artists in recent times, as it did in ancient times. The Hotel Tassel Building, built by Victor Horta in Belgium, is one of the strongest examples of the period designed with inspiration from nature. Falling Water house and Johnson Wax Building, designed by Frank Lloyd Wright, are considered past examples of life-friendly design (Brovning et al. 2014; Kaya 2019). It is known that plant and animal motifs have long been used as decorative decorations in historical buildings and spaces. Although it appears differently in each period, the fact that the themes originate from nature shows that the concept of biophilic design dates back to ancient times. It supports the idea that modern man's relationship with nature is of vital importance in order to maintain a healthy existence (Brovning et al. 2014; Kaya 2019). In biophilic design, the design approach is shaped by considering the fact that people feel better in environments where trees, flowers, water, birds, sunlight and natural processes occur (Kaya 2019). Kellert (2016) states that people's need for nature can be achieved with biophilic design and biophilic urbanism approaches (Acar and Acar 2019). The concept of biophilic design has begun to come to the fore in designs made in the 21st century. It stands out that internationally accepted architectural application projects are designed in line

with biophilic design principles. In particular, the works of large companies such as Woha, Linstudio, Mvrdv, and Asian and Singaporean application examples are at the top (Acar and Acar 2019).

The concepts of biophilic design and biophilic urbanism are very important in terms of the negative consequences of climate change, which have become the biggest problems of today, and the threats arising from population growth (Sbenrc 2012; Acar and Acar 2020). Life-friendly design applications make significant contributions to urban ecology as well as human health. It is seen that it provides ecosystem services such as increases in air quality and water quality, decreases in CO² rates, and quality in food production (Russo and Cirella 2017; Acar and Acar 2020).

THE ROLE OF LANDSCAPE ARCHITECTURE IN COMBATING CLIMATE CHANGE

Landscape architecture plays an important role in combating climate change. The professional discipline of landscape architecture includes the process of planning, designing, creating and maintaining natural and man-made landscapes.

Landscape architects contribute to the protection and restoration of natural ecosystems through green infrastructure projects. Green infrastructure is a network of natural areas, parks, forests, water resources and biodiversity in cities. Such projects help reduce carbon emissions, improve the water cycle and stabilize the local climate. In addition, the landscape architecture profession plays an active role in realizing an effective strategy for water and energy saving.

Landscape architects create green areas in cities that reduce carbon emissions. In addition, energy efficiency and sustainability principles are taken into consideration in the design of green building and landscape projects implemented in urban areas.

This professional discipline, which develops design strategies to adapt to the effects of climate change, also carries out some repair and engineering works such as planning water collection and storage areas to reduce the risk of floods, selecting surface materials to reduce urban heat islands, and using natural landscapes to prevent erosion.

Landscape architects have an important role in raising awareness about climate change and providing training on this subject. They also encourage society to embrace and apply sustainable design principles. For these reasons, landscape architects offer a multifaceted approach to combating climate change and contribute to the creation of a sustainable environment.

CONCLUSION

Today, cities are in a constant state of change and transformation in order to protect the lives of the living creatures they contain and to ensure their survival. However, industrialization, technology, resource consumption caused by the increasing population in cities and the environmental problems caused by this consumption increasingly threaten the lives of all living things, especially human beings.

Minimizing the effects of climate change and reducing greenhouse gas emissions by minimizing human-induced consumption habits are one of the main goals of sustainable urbanization. Ensuring the sustainability of cities against climate change can be achieved by implementing urban adaptation and mitigation together and disseminating them throughout the world. Because it is not possible to eliminate the climatic problems caused by the ever-increasing population by only reducing greenhouse gas emissions in certain parts of the world. As a result, green infrastructure applications and biophilic designs are effective tools of landscape architecture in combating climate change. Green infrastructure projects promote environmental sustainability, while biophilic designs strengthen people's connection to nature and improve quality of life. Therefore, by using these strategies, landscape architecture plays an important role in combating climate change and contributes to a sustainable future.

Abstract

Urban transformation is a process that aims to redevelop cities physically, socially and economically. Green infrastructure and sustainability in urban areas are very important in this transformation process. Green infrastructure is a network of natural and artificial green areas in cities. It includes elements such as parks, gardens, forests, green corridors and water resources. In urban areas, the connection and interaction between the built environment and the natural environment is provided by green infrastructure. In addition to supporting living life, green infrastructure also has very positive effects on human health and psychology. One of the main benefits that urban transformation can provide to cities is improved infrastructure and structures. It offers a very important opportunity for the renewal and strengthening of the infrastructure, especially within the aging tissues of cities. It helps cities become healthier and safer with many improvements, from building reinforcement to renewal of transportation systems. In addition, urban transformation also makes important contributions to urban aesthetics. One of its most important benefits is the support it offers to increase the durability of urban equipment in creating disaster-resistant cities. However, in this process, correct planning must be made, resource management must be carried out in the most accurate way and public participation must be ensured. Urban sustainability is a concept that includes environmental, economic and social elements. Sustainable urban areas include elements such as energy and water efficiency, waste management, use of renewable energy, transportation systems and social inclusion. Urban transformation processes that take these elements into account reduce environmental impacts, help preserve natural resources, promote economic growth and provide a quality of life that covers all segments of society. In this study, the importance of green infrastructure in terms of urban transformation and sustainability in the urban transformation process was evaluated.

Keywords: Urban transformation, sustainability, green infrastructure, landscape architecture

KENTSEL DÖNÜŞÜMDE YEŞİL ALTYAPI VE SÜRDÜRÜLEBİLİRLİK

Özet

Kentsel dönüşüm, kentleri fiziksel, sosyal ve ekonomik olarak yeniden geliştirmeyi amaçlayan bir süreçtir. Kentsel alanlarda yeşil altyapı ve sürdürülebilirlik bu dönüşüm sürecinde çok önemlidir. Yeşil altyapı, kentlerdeki doğal ve yapay yeşil alanlar ağıdır. Parklar, bahçeler, ormanlar, yeşil koridorlar ve su kaynakları gibi unsurları içermektedir. Kentsel alanlarda yapı ile doğal çevre arasındaki bağlantı ve etkileşim yeşil altyapı ile sağlanmaktadır. Canlı yaşamını desteklemesinin yanı sıra, yeşil altyapının insan sağlığı ve psikolojisi üzerine de çok olumlu etkileri bulunmaktadır. Kentsel dönüşümün kentlere sağlayabileceği temel faydaların başında iyileştirilmiş altyapı ve yapılar gelmektedir. Kentlerin eskiyen dokuları içerisinde özellikle altyapının yenilenmesi ve güçlendirilmesi için çok önemli bir fırsat sunmaktadır. Bina güçlendirmeden ulaşım sistemlerinin yenilenmesine kadar birçok iyileştirmelerle, kentlerin daha sağlıklı ve güvenli olmaları konusunda fayda sağlamaktadır. Bunun yanı sıra kentsel dönüşümün kent estetiği konusunda da önemli katkıları bulunmaktadır. En önemli faydalarından bir tanesi ise afet dirençli şehirlerin oluşturulmasında kent donanımlarının dayanıklılığının artırılmasına sunduğu destektir. Fakat bu süreçte mutlaka doğru planlamalar yapılmalı, kaynak yönetimi en doğru şekilde gerçekleştirilmeli ve mutlaka halkın katılımı sağlanmalıdır. Kentsel sürdürülebilirlik ise çevresel, ekonomik ve sosyal unsurları içeren bir kavramdır. Sürdürülebilir kentsel alanlar, enerji ve su verimliliği, atık yönetimi, yenilenebilir enerji kullanımı, ulaşım sistemleri ve sosyal katılım gibi unsurları içermektedir. Bu unsurları dikkate alan kentsel dönüşüm süreçleri çevresel etkileri azaltmakta, doğal kaynakları korunmasına yardımcı olmakta, ekonomik büyümeyi teşvik etmekte ve toplumun tüm kesimlerini kapsayan bir yaşam kalitesi sağlamaktadır. Bu çalışmada, kentsel dönüşüm ve kentsel dönüşüm sürecinde sürdürülebilirlik açısından yeşil altyapının önemi değerlendirilmiştir.

Anahtar kelimeler: Kentsel dönüşüm, sürdürülebilirlik, yeşil altyapı, peyzaj mimarlığı

INTRODUCTION

As one of the most important steps of human civilization in the historical process, cities have become centers of attraction for people living in rural areas as they are places where industry, trade, economic, social and cultural opportunities are concentrated (Güneş, 2011). For this reason, topics such as city, urbanization, urban life, urbanization have become the research object of many scientific disciplines (Kurşun, 2021).

In its most general definition, the city is the largest settlement unit where division of labor and specialization is high. According to another definition, “it is a settlement unit that is in continuous social development and where the needs of the society such as settlement, shelter, commuting, work, rest and entertainment are met, where very few people engage in agricultural activities, is more densely populated than villages and consists of small neighborhood units” (Big Turkish Dictionary, 2010). City definitions vary according to study areas. Social scientists define the city “as a bundle of relationships that emerge as a result of the mutual interaction of individuals living in the urban area and maintain their vitality”. According to economists, cities are defined “as areas where economic activities differ, where service sectors such as education and health develop with the industrial revolution, and where people live together” (Karaküçük and Gürbüz, 2007). Cities are areas of social organization, and in this respect, being an urbanite also means using organizations (Altuntaş, 2012).

Urban population growth, rapid urbanization and environmental problems have increased the importance of urban transformation. Urban transformation projects aim to increase the quality of life, ensure environmental sustainability and increase social welfare through the restructuring of existing urban areas. Green infrastructure and sustainability issues are extremely important in this regard. Sustainability is the main goal of urban transformation and is a concept that includes economic, environmental and social dimensions. Green infrastructure is an approach that supports sustainability principles.

Many internationally successful urban transformation projects have adopted green infrastructure and sustainability principles. For example, Singapore's “City in a garden” project focuses on increasing urban green spaces and sustainably managing natural resources. Amsterdam's "Circle City" concept is based on waste management and recycling.

There are examples of urban transformation projects and green infrastructure applications in our country. Istanbul İkitelli Urban Forest project aims to protect natural habitats and provide recreation areas for city residents by creating large-scale urban green areas. In Ankara's Eskişehir Road Renewal Project, it was aimed to create a sustainable transportation network by

expanding bicycle paths, pedestrian crossings and green areas. However, there are also some obstacles in urban transformation regarding green infrastructure and sustainability. These obstacles include factors such as lack of financing, difficulties in existing infrastructure and planning processes, and awareness and participation of local stakeholders. Therefore, it is important to define the obstacles correctly and develop solutions against them.

URBAN TRANSFORMATION AND URBAN RENEWAL

Urban transformation is the spatial, social and economic consideration of urban development in order to identify and solve the problems of problematic areas in the city and to make those areas livable. It is the production and implementation of projects that organize the demolition, reconstruction or renovation of existing buildings with the aim of revitalizing and rehabilitating problematic areas. In short, it is the solution of the problems that disrupt the original texture of cities (Demircan, 2010; Yılmaz, 2020).

When the historical process of urban transformation is examined, it is seen that the first social and spatial transformation activities in urban areas began with the "cleaning of squalor areas" in industrial cities in the 19th century. Later, in the 1960s and 1970s, these activities became urban policies, and transformation activities continued through "urban renewal", especially in decrepit and dilapidated areas in city centers. By the 1980s, transformation activities adopted a different and holistic approach called "urban revitalization". In the urban transformations implemented in this period, in addition to the transformation of physical spaces, the spaces were transformed with an approach that included holistic solutions in a way that would solve all social, environmental and economic problems. While dilapidated urban areas were completely demolished and rebuilt with the approach applied in previous years and defined as the "bulldozer" approach, with the "economic renewal" approach adopted in this period, more holistic and comprehensive solutions were introduced to reintroduce the areas that had lost their functions as a result of obsolescence in the city centers to the urban economy. In this period, in the context of some urban strategies developed with the aim of revitalizing the economy on a global scale, high-prestige real estate-oriented projects have come to the fore, especially in western cities, to attract wealthy tourists, specialized qualified workforce, investments and global capital. However, this approach, which focused only on addressing economic concerns, could not be sustained because it moved away from the revitalization approach that was initially thought of, and according to the negative criticism it received, it evolved into a participatory

approach model whose priority is socio-economic and environmental issues since the 2000s (Turgut Yıldız and Enlil, 2010; Yılmaz, 2020).

To summarize the aims of urban transformation works in general (Yılmaz, 2020);

- To stop the physical collapse of cities,
- To protect the existing historical texture and ensure sustainability,
- To improve the quality of life,
- To revitalize economic life and keep it constantly alive,
- To activate urban dynamics by preserving the existing urban texture and cultural structure,
- To establish a direct relationship between social problems and the physical facilities of the city,
- To meet the need for continuous physical change of the elements that make up the texture of the city (Kaya, 2007).

Priority areas within the scope of urban transformation and renewal can be listed as follows (Kaya, 2007):

- Slum areas
- Illegal construction areas with high building density
- Areas with high risk of natural disasters
- Decrepit and dilapidated areas in city centers
- Areas with historical urban texture
- Urban areas that have completed their economic life

According to Tekeli (2003), there are some resistance mechanisms that urban transformation plans face. These can be listed under several headings as follows.

- The technical life of the buildings built in the city is long. Since the transformation of these structures will bring a significant amount of cost, the return to be obtained as a result of the transformation must significantly exceed this cost.
- Losses caused by conversions may not be limited only to the cost of the buildings. There may also be losses in the "externalities" created in the city.
- Another resistance effect is that the structures carried architectural values, becoming symbols and creating signs. The importance of preserving such old and historical heritage buildings in improving people's quality of life is understood better every day.
- In this case, some historical information etc. in the city. "Institutionalizations" that will ensure the protection of valuable buildings and residential areas are developing. These institutional structures create a stopping and delaying effect against the pressures for transformation.

- Another type of resistance arises due to "fragmented ownership" on both land and real estate. Due to both the market mechanism and inheritance laws, property tends to constantly fragment. However, in order for the transformation to take place, these properties must either be reintegrated or a consensus must be reached among the property owners regarding the transformation to be carried out.
- Another important reason is that "development rights" in the urban space are "limited" in line with certain plans and rules. This limitation may limit the realization of the potential for change that has occurred at a certain point in the city due to changes in the form of the city (Demircan, 2010).

URBAN TRANSFORMATION AND SUSTAINABILITY

As a result of environmental problems, which were initially regional, gradually reaching global scales, in the 21st century, we were faced with rapid depletion of limited natural resources, hunger, environmental pollution, loss of plant and animal species, climatic changes, increasing natural disasters and energy shortage problems. The point reached has brought to the agenda the concepts of "ecology and sustainability", which are based on the necessity of protecting the right to life of the planet and future generations, increasing the quality of life, preventing pollution and turning to renewable energy sources (Kısa Ovalı, 2009; Yılmaz, 2020).

The concept of sustainability means maintaining the current situation or the system having the capacity to renew itself. In the report titled "Our Common Future" published by the United Nations (UN) in 1983, sustainability was defined as leaving a world order that future generations can maintain in terms of social, economic and ecological conditions. According to this report, sustainability is defined as using our daily needs today without endangering the future and ensuring development for the sustainability of future generations and nature's ability to respond to their own needs (Sustainable Development, 2015). In summary, sustainability means meeting today's economic and social needs without harming nature in order not to endanger the lives of future generations. The concept of sustainability has three accepted dimensions. These are economic, environmental and social dimensions. All these processes are intertwined and related to each other. The sustainability of each of them fully affects the sustainability of the whole. In addition, different researchers accept culture as the fourth dimension of sustainability (Yılmaz, 2020).

Sustainable urban transformation is a tool for creating sustainable residential areas with high quality of life, where the increase in value is distributed fairly, without ignoring public interest

and planning principles. In this respect, transformation should address existing urban areas and new development areas within the framework of a holistic approach, be compatible with decisions defined at different scales and plans prepared, take into account natural thresholds and be compatible, include the components of sustainability, identify possible environmental and social impacts and take measures to minimize them. In sustainable urban transformation, it is important to monitor, measure and evaluate the process, as well as to report it, present it to the public and review it through feedback. In this way, problems or disruptions encountered in the process will be prevented (Ulubaş Hamurcu and Aysan Buldurur, 2017).

LANDSCAPE ARCHITECTURE APPLICATIONS IN URBAN SUSTAINABILITY: GREEN INFRASTRUCTURE

The concept of green infrastructure began to be used in the USA in the 2000s. In this definition, ecological and cultural values are considered in a sustainable way, and with this system, both natural and cultural resources are tried to be created by connecting with each other in terms of structure and function (Semiz, 2016). There are various definitions on the concept of green infrastructure. In the report published in Europe in 2013, it was emphasized that for a quality life, clean food, clean water and clean air, as well as suitable recreation areas with a suitable climate and no flood risk, are needed (Turna and Solmaz, 2022).

Green infrastructure applications, which are within the scope of sustainable urban landscape applications, are engineering designs compatible with nature. Yılmaz (2020) summarized the benefits of these applications as follows:

- Reducing the negative impact of surface runoff on ecosystems (floods, deterioration in water quality, high costs)
- Reducing energy and water usage
- Improving air quality
- Increasing the use of local materials
- Providing economic advantages
- Reducing the water and pollutant load (suspended solids, total nitrogen, total phosphorus, heavy metals (Cu, Pb, Zn), oil and grease and pathogenic bacteria) of the rainwater channel system

Green infrastructure systems have various applications for different points. The main ones of these applications are as follows:

- Rain gutters, rainwater storage and use systems (rain barrels, flower pots)

- Bioretention practices (rain gardens, bioretention areas, vegetated ditches)
- Systems to increase permeable surfaces by reducing impermeable surfaces (permeable asphalt, concrete and structural grass-covering)
- Effective landscape design and irrigation systems (xeriform landscaping, local planting)
- Green walls
- Green roofs

Green infrastructure offers many advantages in terms of being ecologically based, practical and applicable, innovative, multidisciplinary and protecting public health. On the other hand, since it falls into the field of interest of many administrative structures during implementation, it also has some difficulties in terms of working in coordination with each of them and the failure of various professional groups to show the same sensitivity to the issue from a multidisciplinary perspective (Kaplan, 2013; Aslan and Yazıcı, 2016; Turna and Solmaz, 2022).

There are many different applications among the components of the green infrastructure system. Green gardens, green roofs and walls, permeable pavements and sustainable agricultural practices, stormwater management and wetlands are some examples of green infrastructure Works (Özmen, 2020; Turna and Solmaz, 2022). Figure 1 shows the types of Green infrastructure.

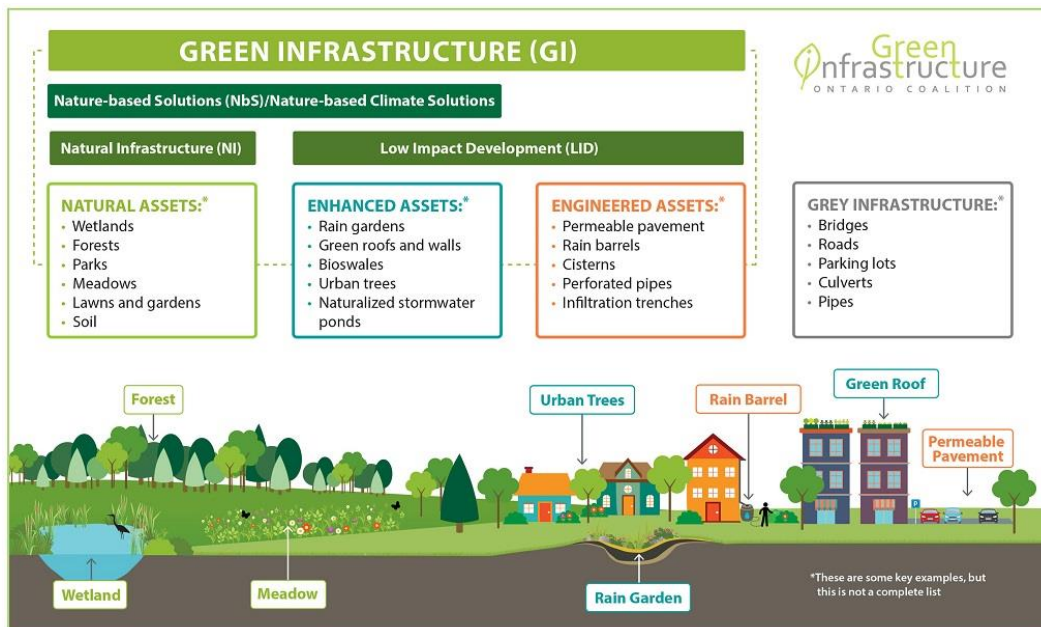

Figure 1. Types of green infrastructure (Anonymous, 2021)

CONCLUSION

The problem of global climate change, which has been one of the most busy issues on the world agenda in recent years, negatively affects the health and quality of life of humans and other

living creatures with the "urban heat island" effect on a local scale in cities, and also causes many problems by increasing energy consumption. Urban areas are several degrees warmer than rural areas or less densely populated areas due to building density and impervious surface roads, parking lots, and rooftops. Another important agenda in urban areas is ensuring a healthy and sustainable life. In order to solve these problems caused by unplanned and rapid urbanization, strategies should be developed and action plans should be prepared, starting from the local scale to the regional and national scale. To reduce the negative effects of climate change, it is not enough to take precautions only on resources (such as reducing greenhouse gas emissions). In addition, green area planning, design and management strategies should be developed (Yılmaz, 2020).

Despite the increasing environmental problems in rapidly changing and developing cities, traditional solutions have become insufficient and these solutions have begun to harm the environment. Today, methods provided with the help of nature have begun to be used. The search for solutions produced through green infrastructure systems, which has led to the emergence of the need to replace traditional methods with natural methods, is among the most frequently used methods in the world's cities. While many cities renewed with green infrastructure systems and new residential areas created with green infrastructure content are rapidly increasing, it is important to reach cities with ecological sensitivity where sustainability is targeted (Semiz, 2016).

Green infrastructure systems create important opportunities for the future and sustainability of cities. Green infrastructure systems respond to problems such as floods, floods, heat island effects, concreting and pollution in cities with positive results by creating aesthetically high-quality spaces and landscapes (Semiz, 2016).

In order to implement the plans and ensure sustainability by incorporating new technologies appropriately in line with the needs of the age, in short, transformation and renewal practices may be required from time to time for the protection and sustainability of cities. In recent years, transformation and renewal practices have been carried out in many cities in our country. Preservation and sustainability of the city's identity is very important in urban transformation and urban renewal practices. In this context, the issue of urban landscape and its improvement and protection as an important component of urban identity is also very important. For this reason, many different studies and research are carried out and necessary precautions are taken. As a result of the research and studies conducted, the importance and necessity of green infrastructures for creating livable, healthy and planned cities, improving and protecting the

existing urban texture, urban sustainability and improving the urban landscape have been clearly understood by designers and planners (Yılmaz, 2020).

Abstract

It is critical to comprehend weeds in agriculture and learn effective, efficient, and ecological ways to manage them in order to stop weeds from causing financial losses. Commonly employed management solutions include mechanical, chemical, and cultural control techniques. The most popular approach is the use of herbicides since it is practical and affordable. However, overuse and ignorance of herbicides lead to interruptions in sustainable agricultural output as well as the slow development of weeds resistant to herbicides. Better solutions to limit or eliminate the usage of herbicides are being looked for as a result of these concerns. The goal of the ecological approach to weed management is to first comprehend the biology and behavior of problematic weeds, and then to create a comprehensive set of control techniques that take advantage of their vulnerabilities. Finding out the present state of weeds and the most effective techniques to manage them is crucial. A starting approach would be to become familiar with the general traits, biology, behavior, and traits that influence the most effective ways to manage weed populations. Then, it is necessary to understand the advantages and disadvantages of the most popular physical techniques, cultivation instruments, and cultural management strategies. Understanding the ecology, identification, and management of the most prevalent and challenging-to-control weed species found in agricultural areas is essential. Managing weeds ecologically requires more knowledge than it does resources. It does not have to be labor-intensive even though it is labor-based. By choosing the appropriate strategy for each weed at the appropriate time and using an ecological approach to weed management, crop output and quality can be maintained while lowering the danger to the environment and public health.

Keywords: Weeds, Weed management, Ecological control, Manage weeds, Integrated

Introduction

Ecological weed management starts with careful design of the cropping system to reduce weed issues, and tries to leverage biological and ecological processes in the field and throughout the farm ecosystem to give crops the edge against weeds. Ecological weed control comprises of many-component techniques adapted to each location, cropping system, and farm. The idea of Ecological Weed Management largely includes the employment of methods and techniques that replace the customary use of herbicides and chemicals to deal with the issue of weeds in the agricultural areas. An ideal system is not just a single method but a combination of several methods that generally starts with selecting the crop rotation for the land and goes on to use ecological and biological processes and materials to leverage the growth and development of crops and stunt the germination, dispersal, and growth of weeds. The particular procedures in weed science should be suited to necessity and in a manner that all of them function together to create a sustainable weed control system.

ECOLOGICAL WEED MANAGEMENT METHODS

Ecological Weed Management (EWM) is a sustainable strategy to weed management that focuses on understanding the ecology of weeds and utilizing this information to design agricultural systems that impede weed establishment and growth (Bastiaans et al., 2008). Before opting for ecological weed control, it is vital to first know weed management. So, what is weed management? Let's study it. Weed management refers to the systematic method and procedures used to limit the development and spread of weeds (Harker & O'Donovan, 2013). Weeds, in this sense, are often plants that grow where they are not needed, frequently competing with cultivated plants for resources such as space, light, water, and nutrients (Mennan et al., 2020). It is vital in agricultural contexts, where unregulated weed growth may severely damage crop harvests and farming productivity. It is also significant in other settings like gardens, lawns, and other controlled landscapes, as well as in wild situations where invasive plant species may damage ecosystems. There are a number of approaches used in weed control, including:

- **Cultural control:** These are measures that make the growth environment less favorable for weeds and more beneficial for desirable plants. It involves strategies such as crop rotation, growing cover crops, and altering irrigation or fertilization procedures.
- **Mechanical or physical control:** This might entail manual weeding, mowing, or tillage. The purpose is to physically remove or harm the weeds to inhibit their growth and reproduction.

- Chemical control: This generally entails the spraying of pesticides that kill or impede the development of weeds. Herbicides may be selective (affecting just particular kinds of plants) or non-selective (affecting all plants they come into contact with).
- Biological control: This includes employing natural enemies of the weeds – such as particular insects, animals, or microbes – to assist restrict their development.
- Integrated Weed Management (IWM): This strategy integrates the preceding strategies in a coordinated, sustainable fashion. It requires frequently monitoring weed populations and changing methods depending on the unique circumstances and kinds of weeds present.

After quickly looking at weed management, let's discuss about what ecological weed management is. Ecological weed management may be described as a complex of environment-friendly procedures and practices meant to avoid, minimize or eradicate weeds from agricultural fields or gardens. The weed control methods are based on ecological or biological processes and materials that do no harm to the environment, unlike the harmful chemicals and herbicides that heavily deteriorate the soil and environment of not only the agro-ecology but also have an adverse impact on the whole environment through processes like leaching and diseases (Liebman et al., 2001). This strategy emphasizes that the aim is not necessary to entirely eliminate weeds, but rather to reduce weed populations below a level where they substantially impair crop output. It employs measures that limit the possibility of weed issues emerging in the first place and supports the development and health of desirable crops to outcompete weeds. Techniques such creating crop rotation, mulching, cover crops, water management, sanitation, fertility, tillage, etc. offer no danger to the environment, but may also effectively reduce all forms of weeds. The effectiveness of these cost-friendly and easily adaptable solutions to weed-management or organic agriculture and farming, in general, can be largely enhanced by obtaining technical expertise from agriculture platforms like Ministry of Agriculture and Forestry database which gives an integrated and easily-accessible approach to EWM. Durable gains in weed control are based on:

- Understanding ecological concepts and processes.
- Learning the life cycle, and features of troublesome weed species.
- Carefully examining and comparing managerial possibilities.

Weeds are viewed as a possible pest causing loss in yields of the crops (Pala, 2019). From the day when human beings settled down and began to engage in agriculture until the industrial revolution, manual weed management (hand picking, cutting, hoeing) is highly popular and

effective. But today, in an industrialized and technological world, labor has become scant and pricey, owing to intensification, diversification of agriculture, and urbanization. The utilization of herbicides across the globe is rising due to probable advantages to farmers. At the same time, the continued use of the same set of herbicides over a period of time on the same piece of land leads to an ecological imbalance in terms of weed shift, herbicide resistance in weeds, and various sorts of pollution. Therefore, ecological approaches are crucial in agriculture. Ecological techniques need to be developed and disseminated in the control of weeds that create considerable economic losses in agricultural productivity (Lemessa & Wakjira, 2015).

Herbicide spraying may also kill microorganism species of bacteria, fungus, and protozoa that battle disease-causing microorganisms, so disturbing the balance of pathogens and helpful organisms and enabling the opportunist, disease-causing organisms to become a problem (Kalia & Gosal, 2011). The intricacy of these scenarios has resulted in a necessity to design a comprehensive, sustainable eco-friendly weed-management program throughout the full agricultural time. With relation to the environment, ideal sustainable agriculture should neither contaminate the ecosystem nor be reliant on non-renewable inputs or damage renewable ones. Rather, it should nourish people with healthy food, and valuable feedstocks and deliver a pleasant and constant return on successful investment in agricultural operations. Sustainable & ecological weed management is the application of weed control strategies that are socially acceptable, ecologically benign, and cost-effective.

Sustainable weed management has the following objectives:

- To efficiently employ the resources that are on hand might be used for managing weeds.
- To offer cultivation methods that not only deal with weeds but also work for the soil and to quantify the effect of weed-management systems.
- To bring forth a shift wherein the chemical herbicides are replaced by renewable energy and recyclable mineral resources.
- To guarantee that the farm workers, farm animals, and everyone associated to the farm or adjacent regions do not suffer in terms of health.
- To maintain and develop the ecology and nature.
- To make agricultural activities economically possible.
- To offer appropriate monetary advantages to the farmer to enable for regular production and support the well-being of the community
- To create enough high-quality and healthy food.

- To improve on existing weed control technology, knowledge, and skills in ways that fit local circumstances and capabilities.

Sanitation

Sanitation as a strategy to naturally avoid, eliminate or eradicate weeds from our fields is too frequently disregarded (Case et al., 2005). To avoid the weeds from ever entering into the fields, the crop seeds used should be thoroughly screened, and only high-quality seeds must be used without any contaminants in the form of weed seeds (Cloyd & Herrick, 2022). Furthermore, the equipment and equipment's employed inside the field should also be cleansed and got rid of any prospective weed seeds. Also, the fertilizers and especially the organic manures utilized should be adequately degraded and not include any potential weeds. To decrease and eradicate the weeds from your field, sanitation operations weeding by hand may play a key role, particularly in the early phases.

Scouting

Scouting has been one of the most dependable techniques of getting information on the breadth and degree of weed infestation in your land (Swinton, 2005). Generally, it comprises the systematic gathering of data on the kind, distribution, and stage of crops in your field but in the case of ecological weed management, the data on weeds are collected to build a strategy to successfully deal with them (Hall et al., 2017). Ministry of Agriculture and Forestry, agricultural control technical instructions and plant protection products database enables you discover weeds and insects along with other pressures in your field like fungus, pests, bacteria, virus etc. at an early stage with the use of smart scouting instruments. With the aid of the instructions and database scouting function, you can automate, plan, execute and report on the scouting simply and efficiently. It should be mentioned that the database is dedicated to pesticides.

Crop Rotation

Crop rotation is regarded one of the most critical aspects of any ecological weed control (Bastiaans et al., 2008). Crop rotation, as the title indicates involves rotating multiple crops on the same area throughout time in a planned way (MacLaren et al., 2021). The basic rationale for utilizing crop rotation as one of the principal ways of ecological weed control is that weeds grow when the circumstances do not change for a long period (Sharma et al., 2021). If the same sort of crop is planted in your region by following the monoculture strategy, weeds will have no resistance whatsoever in adjusting to the same circumstances throughout the years. Therefore, the introduction of various crop species or even a fallow time in between to form a

crop rotation will keep the weeds guessing about what is coming next and they will die off before they can find out how to develop and reproduce in the new environment (Tariq et al., 2019). This is a successful approach of not only controlling and managing the weeds at now, but it will minimize the requirement for future weed management greatly in the long term. However, selecting the ideal crop rotation may be a difficulty as you have to consider the nutrient levels in the soil as a consequence of the cropping pattern as well as the needs of each plant and how it connects to the possible weed species in the region. Optimizing productivity and keeping it all organic to control the weeds successfully demands technological skills and support.

Cover Cropping

If there is one thing that weeds love, then is light. Cover crops are crops that do not allowed light to reach the ground level of the weeds so that they cannot germinate in the first place and if they do, their growths will be inhibited (Mennan et al., 2020). The ideal cover crop should have quick early development and subsequently canopy closure (Oliveira et al., 2019). Some of the cover crops might include buckwheat, cowpea, radish, or forages. Moreover, the cooling effect, which may be regarded a by-product of the shade effect is also extremely significant to decrease weed development on your farms (Gerhards & Schappert, 2020). Cover crops are an important part of the crop rotation cycle and special care and thought are needed while selecting the best cover crop or more preferably, an ideal combination of cover crops for your needs so that it not only ecologically suppresses the weed for you but can also be profitable either by themselves or by promoting your main crops. It should also be mentioned that many cover crops can offer nutrients to the soils and some may even contribute specific compounds in the land that functions as weed-inhibitors later on. "Intercropping", which is a somewhat comparable but distinct application to the cover covering application, may be undertaken. Intercropping is the introduction of a new crop frequently in between rows of the primary crop (Leoni et al., 2022). This is normally done to leave no openings for weeds to grow on your property and has been proved beneficial in many situations. However, if the intercropping species is not selected well, it might compete for light, water, or nutrients with the primary crop and may potentially have a greater damaging impact than the weeds.

Mulching

Mulching operates in a similar fashion to that of cover crops for ecological weed control (Bhaskar et al., 2021). Mulching comprises covering the soil in your field with a single or

numerous layers of mulches which may be either live, organic dead, or inorganic (Mechergui et al., 2021).

Living mulch: Living mulches such as clover are integrated into the field either together with the crop or before/after it helps to reduce weeds although they are often employed primarily for enhancement of the soil's physical characteristics and fertility. If living mulches are applied, they should not be let to compete with vital crops by routinely tilling them (Sportelli et al., 2022).

Organic mulches: Some of the items utilized as organic mulches include straw, bark, sawdust, etc. Newspapers and hays are also typically utilized by constructing many layers. The materials used as organic mulches mostly rely on what kind is found in the farm or the region but in general, they should be biodegradable and should contribute to the fertility of the soil. They work as weed suppressants by substantially restricting the weeds' access to light and moisture (Cabrera-Pérez et al., 2022).

Inorganic mulches: Plastic is an inorganic mulch that is commonly utilized in all places across a broad range of crops and has been produced in such a manner so as to only enable the infrared light to enter into the soil layers to warm it but cannot result in photosynthesis (Khan et al., 2021).

The outcome of this is a high success in weed control. Although these inorganic mulches may not technically qualify as ecological ways of weed control, they are typically preferable than other choices like the usage of toxic pesticides.

Solarization

Solarization is the technique of spreading a transparent plastic sheet over a field, garden bed or grass to heat up the soil below (Waghmode et al., 2023). The objective of solarization is to destroy weeds or grass, however it may have extra advantages of lowering disease populations in the soil.

Cultivation

While tilling the soil disrupts the physical integrity of the soil and makes it prone to soil erosion, the deployment of an appropriate tillage system may assist enormously manage weeds naturally and also by reducing the aforementioned difficulties (Cordeau et al., 2020). In fields that are not tilled at all, it has been observed that the bulk of the weed seed bank is deposited on the uppermost 5 cm layer of the soil.

Tillage system in ecological weed management one of the most efficient applications of tillage in weed control is by applying just mild tillage sometime before crop planting so that weeds

sprout beforehand and may be killed to diminish the seed bank. Tillage also has various implications on the total weed management by affecting the soil moisture and fertility. The presence or lack of tillage in your field primarily impacts the number and vertical distribution of weed seeds in your property.

Crop Variety

It is vital to carefully pick the types of crops so that they can reduce the weeds by keeping a quick cover (Dubey et al., 2023). The ecologies of both the crops and the possible weeds should be thoroughly investigated before picking the crop species that will best match the area and also deliver optimal returns.

Sowing/Planting Norm

Sowing and planting time plays a pivotal role in growth and productivity of a crop. Planting patterns including the sequence and alignments in which the crops are placed may also affect the extent of weed development in the future (Allmendinger et al., 2022). To regulate weed development by planting patterns, the row width must be made narrow and seeding density must be raised.

Nutrition

The germination, reproduction, and growth of weeds are all enhanced by nitrates (Ghosh et al., 2020). We know that the quantity of nitrogen in the soil impacts the species variety and composition in the land. So, we need to regulate this degree of nitrogen fertility in our fields so that it encourages the development of our crops and discourages that of the weeds. One extremely efficient strategy to do so is to employ precise tools such as Ministry of Agriculture and Forestry monitoring database to pinpoint where to concentrate our nitrogen delivery. By completing soil analysis, both the nitrogen demand in the soil and other mineral elements required to enhance the soil and parameters such as pH are assessed. Moreover, a more ecological way of dealing with the problem of weeds is to add nitrogen to the field not by dumping chemical fertilizers at once, but by adding legume plant species with the crops that will release the nitrogen in the soil over time and fulfill the nitrogen needs of the crop while limiting the amount needed for weeds to germinate and grow. Appropriate plant feeding practices should be established according to the soil analysis findings are of major relevance. The main thing to remember while fertilizing is to feed the crop, not the weeds. What it means to feed the crop and not the weeds are that we have to be selective feeders in terms of the nutrients we offer to the agro-ecology. This may be done by concentrating fertilizers near the crops or introducing more ecological solutions like composts and manures to complement the

nutritional demands of the crops. It is necessary to understand the ecological needs of both the crops and the weeds effectively to be able to utilize this method successfully.

Irrigation

If we can effectively control water or moisture in our fields, we can basically manage both weeds and crops effortlessly to match our demands (Kanas et al., 2021). Some of the most beneficial and novel approaches by which you may employ water management for ecological weed control are as follows:

Pre-germination of weeds: Like how light tilling may induce the weeds to sprout somewhat sooner than the planting period so that they can be destroyed by culture, light watering can also have the exact same effect. The irrigation may either be artificial or can be done by careful planning of the crop rotation with the rainfall cycle.

Planting to moisture: This approach generally follows the preceding one. After cultivation for weeds removal, no water is provided to the top layer of the soil so that it gets dry and the layer below it retains moisture. During the planting stage, the seeds are sown to the moisture-containing layer and thus the top layers stay dry and weeds cannot develop owing to the lack of water.

Buried drip irrigation: Drip irrigation may concentrate the water availability just to a limited location for the plant and it can considerably minimize weed germination. However, an even more successful but difficult approach is termed buried deep irrigation in which water in the form of drip is given beneath the soil layer straight to the subterranean roots of the plants so that weeds on the surface have no ways of accessing water for germination.

Allelopathy

Many plants have the potential to impact, either favorably or adversely their surrounding plants by producing biochemicals termed allelochemicals via many sections (Farooq et al., 2020). How to utilize agricultural drones in precision agriculture? Some of the crop kinds that display allelopathic tendencies include buckwheat, oats, barley, rye, wheat, etc. Allelopathy if utilized for weed management is one of the most ecological techniques of controlling weeds. For it to occur, crops need display allelopathic detrimental effects on weeds. For example, buckwheat has been reported to decrease and destroy weed populations.

Bio-control

Fungi, bacteria, parasites, insects, etc. all offer tremendous potentials to be employed as organisms for weed control provided sufficient study and testing are undertaken to assure their efficacy and survivability (Scavo and Mauromicale, 2020). Bird species like geese and chickens

and various herding animals are a fantastic technique of controlling and disposing of weeds in integrated farmland that blends livestock with cultivation. Even fish species have been employed to control algae and hydrilla weeds in aquacultures and aquaponics.

CONCLUSION

For a long time, the hunt of effective agricultural weed control technology and strategies was defined as ‘the war on weeds’. We built more severe mechanical and chemical weapons to clear our fields of unwanted vegetation, striving for a vision of pure crops from horizon to horizon. These days, we are progressively recognizing that war is not a good viewpoint on weed control. Sure, no one likes a field full of weeds, but not all weeds are terrible, and often the activities we take to get rid of them do more damage than good. That’s damaging to both our agriculture and to our surrounding ecosystem. Furthermore, weeds are proving to be irrepressible opponents; if they don’t like what is thrown at them, they swiftly adapt, or a more tolerant species slips in from the sidelines. Making peace with the weeds will cost us less in the long run than attempting to remove weeds from the fields. The advantages of learning to live with weeds are highlighted by several recent research indicating that agricultural yield loss lowers as weed variety grows, and that preserving some weed cover helps sustain beneficial insects as well as farming birds.

Managing weeds for net benefits rather than costs needs a knowledge of why various quantities and varieties of weeds arise in different regions, and what can be done to impact that. Current weed research is starting to address this issue via examining the ecological interactions between weeds and their environment (disturbance and nutrients) and other creatures (crops, animals, and wildlife). Implementing each concept of ecological weed control should be done using the tactics and equipment best relevant to everyone’s unique agricultural system. They can suit conventional, organic or no-till systems, arable or perennial crops or animals – however how you do it may be quite different in each system. An important aspect this chapter is that they should not be additional labor done only for the sake of weeds. All might also be advised for controlling diseases and insect pests, contributing to soil health, enhancing resource use efficiency and improving yield stability. Think of weeds as a reminder to manage the farm in a resilient, sustainable way. Weeds keep us in check as we keep them in check; the more monocultures we cultivate, the more fertilizers we apply, the more we disrupt the soil, and the more chemical tricks we employ, the more weeds get out of hand in the long run. If we limit these items to the absolute minimum that we need to sustain crop or animal development, then weeds will progressively become more controllable, and potentially even useful.

Abstract

In agricultural areas, weeds—also known as "undesirable plants"—compete with cultivated plants, lower output, and quality, and result in large financial losses. Weeds can be controlled by using the proper chemical, biological, mechanical, and preventive (cultural) control strategies. Weed-free sites should be chosen for agricultural production as cultural processes, or appropriate measures should be taken to prevent weed contamination with seeds, irrigation, fertilizer, animals, and agricultural equipment. To avoid future seasons of increased expenses and more extensive management, it is crucial to stop the introduction and spread of new weed species. Cultural weed control techniques, such as crop rotations, cover crops, and strategies that boost a crop's competitive edge, are crucial to successful weed management in places where weeds are an issue. Hand-picking, hoeing, tillage, brushing, cutting, mowing, mulching, immersion, animal intervention, laser, electrical, and robotic applications are examples of physical approaches. Herbicides are one of the most effective methods for controlling weeds when tillage is drastically decreased or abolished, but because of the problem of herbicide resistance and the potential hazards to human and environmental health, they must be used in concert with suitable cultural practices. It is essential to create a strategy that incorporates a variety of control techniques because it is challenging to eradicate weeds using only one method. To create an integrated weed control plan that works for the farm, switching to conservation tillage necessitates raising management intensity.

Keywords: Weeds, Weed management, Conservation tillage, Preservation, Recreation

INTRODUCTION

Conservation agriculture promotes soil health and combats soil erosion by preserving soil cover, avoiding disturbance and rotating crops. It is used on roughly 8% of arable agricultural land globally. Compared to traditional systems, it is seen that there is an improvement in yield and positive effects such as fertilizer saving, as well as an increase in farm income as a result of increased resistance to pests, diseases and weeds against pesticides, since the control of pests are dependent on pesticides. Conservation agriculture has several advantages over conventional tillage-based agriculture in terms of soil health parameters. However, the weed problem is increasing in conservation agriculture. Due to the lack of tillage in conservation agriculture, the presence of weed seeds on the upper soil surface increases, thus leading to weed invasion. In this system, weed control is carried out depending on herbicides because it is practical and economical. Excessive and unconscious use of herbicides not only threatens human and public health, but also is worrisome due to the change in weeds and the development of herbicide resistance in weeds. Developing genetically modified crops and using some broad-acting selective herbicides or total herbicides are widely used in some developed countries such as the USA, but the cultivation of these products is prohibited in countries such as the EU and Turkey. In addition, weeds with developed resistance mechanisms, called super weeds, against such herbicides can become a nuisance. Developing crops that are tolerant to herbicides, unlike genetically modified organisms, and integrating this into conservation agriculture has become widespread in the world, Europe and Turkey in recent years. In soil conservation agricultural practices, weed management must include integrable strategies and be sustainable. Appropriate tactics to be included in weed management in a soil conservation agriculture system may vary by product and region. For this purpose, the following weed control methods can be used.

- Prevention (quarantine, sanitation, certified seed)
- Cultural (crop rotation, competitive crop variety, cleaning equipment, scouting, cover cropping, stale seed bed, time of planting, crop row, harvest weed seed control)
- Mechanical (tillage, moving, hand pulling, hoeing, streaming, hot water and foam, flaming, flooding, cryogenic, air-propelled abrasive grit, mulching, solarization, laser, electrucution)
- Chemical (herbicide)
- Biological (pests, grazing)
- Bio-chemical (biopesticides, allelopathy)
- Bio-technological (genetically modified varieties, Herbicide tolerance crops)
- Artificial intelligence (AI) technologies (precision, robotic, drone)

For sustainable production in soil conservation agricultural areas, it is necessary to turn to other alternative tactics instead of mechanical methods based on tractor driving or soil cultivation, such as plowing, mowing and hoeing. Prevention is the cornerstone of all integrated weed management systems, and is the most cost-effective weed management that a planter can apply. However, it is frequently not considered a priority until after a new species is detected in a field. It is important to combine and complete those suitable for weed control like the pieces of a puzzle.

Prevention (Quarantine, sanitation, certified seed)

Preventative weed management entails keeping weeds from entering a field or, already there, controlling their spread within a field and between fields (Cahoon, 2023). Eliminating seed production should be the objective of any weed control approach for a difficult species (Singh et al., 2015). The saying "No seeds, no weeds" summarizes this preventive weed management (Rubione, 2023). An effective preventive weed management program will help manage weeds because the plants will be controlled before they complete their life cycle and produce seeds (Das et al., 2022). Weed seeds should be prevented from settling in unclipped areas such as ditches, fences and corners. More importantly, weed seeds should be prevented from settling in agricultural production areas. For this purpose, quarantine measures should be taken, sanitation should be applied and certified seeds should be used.

The cheapest and most effective control of weeds is to take preventive measures to prevent weeds from infecting the production system. However, this is not usually considered a priority until a new species is detected in an area (Rubione, 2023). Preventing weeds from producing viable seeds on the farm is the basis of prevention. If no seeds are produced, the weed cannot enter the seed bank and cannot produce new plants the next season. However, it is also important to consider all sources from which new seeds can enter the field. There are many ways weed seeds can enter the soil; For example, it may come directly from adjacent fields or enter with mud from dirty tires. It may come with production materials such as seeds, seedlings and saplings. It can be transmitted through irrigation water and animal manure. It can come with wild or domestic animals and people. It can be carried by rain and wind. May come with agricultural tools and machinery and agricultural maintenance activities. As can be seen, it can spread from field to field and over long distances through environmental and ecological processes or human activities. Environmental and ecological processes (such as wind and water) are difficult to manage through these propagation pathways. When a weed is found in the seed bank, stopping seed production in future seasons is the most effective method of

stopping its spread. Weed species with high seed production or special structures that facilitate dispersal can spread rapidly in the field and it may be difficult to keep the infestation localized. The movement of seed through environmental and ecological processes can transport seeds hundreds of kilometers; however, most seed movement is more localized. Therefore, preventing weeds in field boundaries and ditches from producing seed can have a major impact on adjacent fields. It is important to survey fields regularly to identify random plants that may have moved due to environmental processes or wildlife and to prevent them from producing seeds in the field. Some weed seed sources may result in only a few seeds, but if these seeds produce plants that are not effectively controlled the following season, they can quickly spread throughout the field. Farmers may think preventative measures are ineffective or inconvenient, but a little effort up front can pay big dividends in the years to come. For more information about weed prevention, you should definitely get support from the technical personnel at the Provincial/District Directorates of Agriculture and Forestry.

Preventing weeds from entering or spreading inside a field is crucial to effective integrated weed control. Some of the strategies for weed avoidance include cleaning equipment, planting weed-free seed, and eradicating weeds prior to seed production.

- Plant certified, weed-free crop seed.
- Do not let weeds set seed.
- Avoid introducing sources of fresh weed infestation, such as hay, manure, and compost.
- Clean equipment to avoid weed seed and propagule dissemination, especially harvest and tillage equipment.
- Rotate crops and prevent fallow times.
- Control weeds around the farm in places such as ditches, roadsides, and fence lines.

Cultural (Crop rotation, competitive crop variety, cleaning equipment, scouting, cover cropping, stale seed bed, time of planting, crop row, harvest weed seed control)

Cultural weed control are measures that farmers may perform to assist the crop be more competitive against weeds (Sims et al., 2018). These are vital for lowering weed concerns in row crops and helping to optimize herbicide-based strategies (Cahoon, 2023). Increasing the crop's vigor and competitiveness helps it to out-compete weeds and sustain current weed pressure (Chauhan et al., 2012). Examples include ensuring optimum field nutrient availability, planting into weed-free soil, minimizing row spacing, and choosing cultivars that compete effectively. Additionally, cultural methods can involve wider farm management measures that make the land less susceptible to weed pressure. Examples include crop rotation, timely

scouting for weeds, cover cropping, and being aware of growing weed issues in the region (Cahoon, 2023).

Cultural weed control comprises of crop rotation, variety selection, soil fertility, planting date, seeding rate, row spacing, leaf architecture, and disease and pest management (Singh et al., 2015). These approaches are utilized to develop a healthy crop that can effectively compete with weeds (Nichols et al., 2015). Achieving quick crop canopy closure and maintaining a thick crop canopy is the cornerstone of integrated weed control . Any approach that increases the capacity of a crop to compete with weeds is termed a cultural method of weed management.

- Some weeds are easier to suppress in specific crops; making crop rotation a viable technique for lowering weed populations.
- A healthy crop competes better with weeds. Be sure the fertility needs of your crop are satisfied. Ensure your crop is clear of illness and insects.
- Rapid germination and early-season growth is crucial to picking types that can better cope with weeds.
- Plant crops and cover crops when circumstances favor crop development and less conducive for weed growth. Time of weed emergence varies by species; pick a planting date that provides your crop an edge.
- Quickly creating a thick crop cover is crucial to interrupting weed germination and development.
- This may be done via the following: Selecting strong cultivars appropriate to local circumstances; increasing sowing rates; planting the crop on small row spacing; choosing varieties or a crop with leaf orientation that restricts light penetration.

Mechanical (Tillage, moving, hand pulling, hoeing, streaming, hot water and foam, flaming, flooding, cryogenic, air-propelled abrasive grit, mulching, solarization, laser, electrucution)

Tillage or mechanical weed control is a key component of integrated weed management, but is not encouraged in soil conservation agriculture since the use of tractors and tillage with agricultural and implement technology is avoided (Bajwa, 2014). Although most main tillage is used for seedbed preparation, tillage may kill weed seedlings and hide weed seeds (Sims et al., 2018). However, it may also accelerate the germination of weed seeds or transport weed seeds closer to the soil surface where they may be more prone to emerge. In no-till farming, herbicides are used in lieu of primary and secondary tillage to suppress emergent weeds before commercial crop planting. The objective is to combine mechanical weed management strategies that vary the agricultural system and limit the possibility for herbicide resistance,

while emphasizing soil conservation and yield. Mechanical weed management applied after the cash crop is a typical approach to suppress germinated weed seeds or weeds that have already appeared (Lee & Thierfelder, 2017). The sorts of equipment applied often destroy weed seedlings or tiny weeds before they are firmly established and compete with the crop. Like most other techniques of weed management, efficiency of mechanical weed control is greatest when conducted at the ideal period. Blind weed management measures need to be undertaken after the seed have germinated but before the roots have gotten entrenched. Likewise, between-row cultivation has most impact on weeds up to three inches. Dry soil conditions and higher air temperatures that promotes weed desiccation offer the optimal circumstances for post-plant mechanical weed management (Rahman, 2017). However, in no-till or conservation agriculture, herbicides are utilized instead of such mechanical processes.

- Before herbicides, the major technique of weed management was tillage.
- In conventional agriculture, primary and secondary tillage may be used to reduce existing weeds, but tillage is not suggested in conservation agriculture.
- In traditional agriculture, primary tillage buries weeds or splits weeds into little pieces. Secondary tillage disrupts weed roots and causes the plant to dry out. In conservation agriculture, herbicides are employed instead.
- Annual weeds, simple perennial weeds, and tiny weeds are more sensitive to tillage than creeping perennials and huge weeds. It is difficult to suppress perennial weeds using soil. For this reason, these weeds may be managed more successfully with pesticides in protected areas without tillage.
- Germination and longevity of weed seeds are also altered by tillage.
- Tillage influences soil temperature, soil moisture, oxygen and light; These are all markers of weed seed germination.
- Tillage impacts weed seed dispersal in the soil profile.
- Weed species and weed seed banks in soil may change based on tillage strategies applied over numerous seasons.
- Some annual and many perennial weeds, such as *Conyza canadensis*, enjoy long-term no-till regimes.
- Tillage may spread rhizomes, bulbs, and tubers of perennial weeds and aggravate infestations.

- Weed seed banks in the soil may be minimized by mechanical treatment of a stale seedbed, but efforts should be taken to limit seed bank herbicides in conservation agriculture.
- Post-plant cultivation includes blind tillage immediately after cash crop planting and inter-row cultivation after the weeds and crop have developed.
- Blind cultivation is employed quickly after the cash crop is seeded to control germinated weed seeds and tiny weed seedlings. Blind cultivation should be repeated every five days or more or until the weeds have largely appeared. • Inter-row cultivation is employed after the cash crop and seedling weeds have emerged and is repeated once a week until the crucial time for weed management in the cash crop has passed.
- High residue cultivators can manage weeds with minor soil disturbance in reduced till conditions.
- Integrated techniques combine mechanical weed control strategies with cultural and chemical treatments to vary the weed management program.
- Mowing is especially effective on annuals and biennials that are starting to blossom.
- Mowing is more successful on annual broadleaf weeds than on grassy weeds.
- Mow perennials to deplete carbohydrate stores in the vegetative sections of the plant by regular mowing and to hinder seed formation.
- What has to be taken into account here is to keep away from mechanical techniques like as tillage, hoeing and mowing in conservative agricultural systems and instead resort to other alternative options, notably herbicides because to their accessibility.
- In conservation agriculture, technologies such as mechanized manual weeding, weeding utilizing animal traction, and manual collecting and cutting of weed seeds may be utilized. However, as these approaches need more time and work, they may be better ideal for small organic production firms rather than huge production regions.

Chemical (Herbicide)

Herbicides are crop-protecting chemicals used to destroy weedy plants or stop normal plant development, and may give an easy, inexpensive, and efficient method control weeds (Singh et al., 2015). In most circumstances, they may constitute the backbone of many weed control strategies (Bajwa, 2014). However, they should not be used alone but combined with successful nonchemical methods such as tillage, crop rotation, optimal soil fertility, or other suitable management alternatives (Sims et al., 2018). Herbicides may not be essential on

certain farms or landscapes. If chemical weed control is not applied, mechanical and cultural control approaches then become the emphasis.

- Herbicides may be characterized as crop-protecting agents used to destroy weedy plants or stop normal plant growth.
- Herbicides offer an easy, inexpensive, and efficient solution to help control weeds.
- In most circumstances, they may constitute the backbone of many weed control strategies. However, they should not be utilized alone but coupled with efficient nonchemical methods.
- The ideal herbicide does not exist. No one pesticide is capable of controlling all weeds that might emerge in a crop or planting. Since every herbicide has benefits and downsides, picking the suitable herbicide(s) is vital.
- Most herbicides are normally sprayed to the soil (preemergence) before weeds sprout or after weeds are grown (postemergence).
- Herbicides may be characterized in several ways and by specific features, including: a) mode and site of action; b) application timings and procedures; c) weed control spectrum and selectivity; and d) herbicide mobility in the weed.
- Artificial intelligence (AI) technologies (Precision, robotic, drone), geographic information system, and remote sensing have been incorporated into mechanical and chemical control in recent years and help to weed management in conservative agriculture.

Biological (Pests, grazing)

Biological control (biocontrol) techniques for weeds include insects, mites, nematodes, diseases, and grazing animals (Bajwa, 2014; Rahman, 2017). Grazing animals and insects may directly effect weeds and diminish their growth and competitiveness (Cordeau, 2022; Parker, 2020). Other biocontrol species will eat on weed seeds and restrict seed return to the soil seedbank.

- Biological management techniques for weeds include insects, mites, nematodes, diseases, and grazing animals.
- Biological control may be cost efficient, ecologically safe, self- replicating, and ideally suited to an integrated weed management program.
- Biological control is a long-term undertaking: it is not quick or always sufficient, only some weeds are suitable candidates, and the rate of failure may be significant.
- Seed predation may be responsible for up to 90% of seed loss in agroecosystems.

- Some of the most promising seed predators include rodents, ants, crickets, and ground beetles.
- Reduced tillage may enhance predation since weed seed predation occurs largely on the soil surface.
- Cover crops produce better homes for seed predators.
- Promote and maintain diversified fencerows, filter strips, and refuge habitats that provide overwintering and protection for ground beetles, rodents, crickets and other seed predators.
- Effective weed management may be accomplished in conservative agriculture by merging biochemicals (biopesticides “390 registered biopesticide, essential oils, corn gluten meal, acetic acid, microbial products, fatty acids, Brassicaceae seed meal”, allelopathy) and biological control (pests such as bugs, mite and nematode, microorganisms such as fungi, bacteria, virus, rodents such as rabbits and squirrels, poultry such as chickens and turkeys, and domestic animals such as sheep, goats and cows.
- Biotechnological (genetically modified cultivars, herbicide tolerant crops) techniques have been incorporated into biological control in recent years and contribute to weed management in conservation agriculture.

CONCLUSION

It is recognized that tillage causes soil erosion, costs time and resources, which decreases productivity and raises the cost of production. Therefore, in recent years there has been a rising tendency in many nations towards conservation agriculture to boost sustainability without sacrificing land production. The three key foundations of conservation agriculture are limited tillage operations, permanent residue cover and rotation of main crops. However, adopting conservation agriculture impacts weed populations differently than traditional agriculture. Weed management in conservation agriculture is a larger difficulty than in conventional agriculture since there is no burial of weed seeds by tillage operations and soil-applied herbicides are not absorbed, resulting in diminished efficacy. The behavior of weeds under conservation farming and their interaction with crops tends to be complicated and not well understood. After crop planting under conservation cultivation, a considerable amount of the weed seed bank frequently remains on or near the soil surface. Weed species in which germination is promoted by light are likely to be more troublesome in conservation agriculture. Additionally, in the lack of tillage, perennial weeds may become more troublesome under this

system. On the other hand, weed seeds situated on the soil surface are more prone to desiccation and have increased predation activity by insects, notably ants. When crop leftovers are equally and densely accessible under conservation culture, they may restrict the appearance of weed seedlings, extending the time to emergence and enabling the crop to obtain an initial edge in early vigor over weeds. Where preemergence herbicides are administered, product residues may also impede a major percentage of the sprayed herbicide and lead to decreased herbicide efficiency. Approaches such as stale seedbed application, uniform and intensive crop establishment, use of cover crops and crop residues as mulch, crop rotations, and practices to increase crop competition through a combination of pre- and post-emergence herbicides can be integrated for sustainable conservation agriculture. The following elements should be taken into account while employing preventative measures, cultural processes, mechanical, chemical and biological control approaches in weed management in protective agricultural systems.

It's critical to stop the introduction and spread of new weed species in order to save money and prevent the need for more extensive control in the coming growing seasons. On a farm, preventive measures may be implemented in a variety of locations and should be done all year round. The jigsaw pieces below show how to stop weeds from taking over on a farm that raises cattle and grains. We provide entrance points for weed seeds as well as solutions to avoid them. Farmers may use cultural weed control to increase the crop's ability to compete with weeds. These are critical for reducing weed problems in row crops and supporting the efficacy of herbicide-based initiatives. Enhancing the crop's vigor and competitiveness enables it to resist weed pressure and outcompete weeds. Keeping the best possible field nutrient availability, planting in weed-free soil, narrowing the distance between rows, and choosing competitive cultivars are a few examples. Furthermore, larger farm management techniques that reduce the field's susceptibility to weed pressure are included in cultural methods. Crop rotation, early weed detection, cover crops, and keeping an eye out for newly emergent weed issues in the region are a few examples.

Mechanical weed control tactics can be an important part of an integrated weed management (IWM) program. Mechanical weed control usually uses some type of mechanical implement pulled by a tractor to physically slice, chop or pull out small weeds. Tractors and tillage equipment should not be used as much as possible in conservation agriculture, which aims to prevent mechanical disturbance of the soil (no tillage) in order to obtain a smooth soil surface.

Herbicides are largely recommended for weed management in conservation agricultural systems. For the usage of herbicides in Turkey, active compounds listed in the plant protection products database are employed.

Biological weed control implies employing live organisms to manage weeds. This most commonly entails introducing a specialized biological control agent, such as an insect, nematode, fungal, or bacterium to a weed-infested region and allowing the agent to destroy the weeds. This conventional strategy for biological control generally takes a season or two for the effect to be visible. One of the rare effective instances of biological control in agronomic crops is the commercial product Collego, a formulated plant fungus (*Colletotrichum gloeosporioides* f. sp. *aeschnomene*) that efficiently eliminated northern jointvetch, but had no impact on other weeds species. However, owing to such a restricted range of control, there have been few commercial solutions created for agronomic crops. Grazing by cattle is also a kind of “biological weed control” however grazing is not always successful when attempting to target particular weeds. Most grazing animals are not discriminating eaters and will graze on their favored plants, even crop plants.

Weed management in conservation agriculture technology covers numerous strategies on how to properly prepare the land for crop planting and how to control weeds so they do not affect crop growth. In protected farming systems, this management should allow the penetration of direct seeding equipment into the soil and a favorable environment for seed germination, without inhibiting the application. This approach, which is based on the premise of decreasing or eliminating soil tillage, managing weeds via residue and cover crop management and spraying herbicides, may be difficult to carry out alone. A mix of acceptable solutions based on soil conservation is also conceivable, depending on the farmer's finances.

Abstract

Global warming and climate change are problems that affect not only the environment but also economic, social, and geopolitical elements. This problem, which challenges the structure of the global society, is considered one of the most important challenges of the twenty-first century. Although the source of this problem is greenhouse gases released from human activities, the most effective of these gases is carbon dioxide (CO₂). Therefore, reducing global CO₂ gas emissions is the main agenda item of national and international policies. In this context, discussing the dynamics affecting greenhouse gas emissions can provide critical results for long-term policy development. To this end, this study examines the effect of agricultural productivity on CO₂ emissions in Turkey for the period 1990-2020 with the control variables of economic growth, foreign trade, and foreign direct investments. The research follows unit root, co-integration, and parameter estimation processes. According to the findings, (a) there is a long-term balance relationship between agricultural productivity, economic growth, foreign trade and foreign direct investment and CO₂ emissions. (b) Agricultural efficiency has a reducing effect on CO₂ emissions. (c) Economic growth and foreign trade have an increasing effect on CO₂ emissions. (d) There is no statistically significant relationship between foreign direct investments and CO₂ emissions. The robustness of the results is also supported by alternative parameter estimators. At the end of the research, empirical results are discussed based on the literature and policy implications are presented in the context of the agriculture-greenhouse gas emission relationship.

TÜRKİYE'DE TARIMSAL ÜRETKENLİĞİN CO₂ SALINIMININ ÜZERİNDEKİ DİNAMİK ETKİSİ

Özet

Küresel ısınma ve iklim değişikliği sadece çevreyi değil, ekonomik, sosyal ve jeopolitik unsurları da etkileyen bir sorundur. Küresel toplumun yapısını zorlayan bu sorun, yirmi birinci yüzyılın en önemli zorluklarından biri olarak kabul edilmektedir. Bu sorunun kaynağı insan faaliyetleri kaynaklı açığa çıkan sera gazları olmakla birlikte, bu gazların en etkili karbon dioksit (CO₂) gazıdır. Bu nedenle küresel CO₂ gaz salınımını azaltma ulusal ve uluslararası politikaların temel gündem maddesidir. Bu bağlamda sera gazı salınımını etkileyen dinamiklerin tartışılması uzun dönemli politika gelişimi için kritik sonuçlar sunabilir. Bu amaçla, bu çalışma 1990-2020 dönemi Türkiye'de tarımsal verimliliğin CO₂ salınımı üzerindeki etkisini ekonomik büyüme, dış ticaret ve doğrudan yabancı sermaye yatırımları kontrol değişkenleri ile incelemektedir. Araştırma birim kök, eş-bütünleşme ve parametre tahmin süreçlerini takip etmektedir. Bulgulara göre, (a) tarımsal üretkenlik, ekonomik büyüme, dış ticaret ve doğrudan yabancı sermaye yatırımları ve CO₂ salınımı arasında uzun dönemli bir denge ilişkisi vardır. (b) Tarımsal verimlilik CO₂ salınımı üzerinde azaltıcı bir etkiye sahiptir. (c) Ekonomik büyüme ve dış ticaret CO₂ salınımı üzerinde arttırıcı bir etkiye sahiptir. (d) Doğrudan yabancı sermaye yatırımları ile CO₂ salınımı arasında istatistiki olarak anlamlı bir ilişki yoktur. Sonuçların sağlamlığı alternatif parametre tahmincilerle de desteklenmektedir. Araştırmanın sonunda, literatüre dayalı olarak ampirik sonuçlar tartışılmakta ve tarım-sera gazı salınımı ilişkisi bağlamında politik çıkarımlar sunulmaktadır.

Anahtar Kelimeler: Tarımsal verimlilik, Sera gazları, Eş-bütünleşme, İklim değişikliği, Çevresel kalite.

GİRİŞ

Son yüzyılda iklimde önemli değişikliklerin olduğu çok çeşitli göstergelerden açıkça kanıtlanmaktadır. Örneğin, 1998–2007 döneminde kaydedilen küresel sıcaklık ortalamaları, 1961–1990 dönemi ortalamasının $0,41^{\circ}$ üzerindedir. Ortalama yüzey ve deniz suyu sıcaklıklarında $0,65-0,15^{\circ}\text{C}$ aralığında bir sapma meydana gelmiş, Alp buzullarındaki ısınma $0,6-1,0^{\circ}\text{C}$ aralığında artmıştır. Kuzey Yarımküre'nin kar örtüsü alanı 1972–1992 döneminde yıllık yaklaşık %10 oranında azalmıştır. Deniz buzu seviyeleri 1950-1970 yılları arasında Güney Yarımküre 'de, 1950'den itibaren ise Kuzey Yarımküre 'de önemli ölçüde azalmıştır. 1981-1991 döneminde Kuzey Yarımküre'de mevsimlerin uzunluğu 4 ila 12 gün arasında artmıştır (Bilgili et al., 2016). Küresel ısınma ve iklim değişikliği olarak bilinen bu sürecin etkisi sadece çevreyle sınırlı değil; ekonomiyi, sosyal yaşamı, jeopolitik faktörleri, siyaseti ve yaşam tarzını doğrudan etkilemiştir (Espoir et al., 2022; Shahbaz et al., 2019). Bilim dünyasındaki çoğunluk, küresel ısınma ve iklim değişikliğinin nedeni olarak doğal sera etkisindeki artışı gösteriyor. Özellikle son 50 yılda insan faaliyetleri sonucu açığa çıkan kirletici gaz salınımları, atmosferdeki sera gazı yoğunluğunu normalin üzerine çıkarmıştır. Sera gazlarındaki bu artış, sera etkisini şiddetlendirerek dünyanın daha fazla ısı tutmasına neden olmaktadır. Bu kirletici gazlar arasında özellikle CO₂, küresel ısınma potansiyeli en yüksek olan ve en hızlı salınımı artan kirletici olarak öne çıkmaktadır. Bu nedenle iklim değişikliği ve küresel ısınmanın etkilerini azaltmaya yönelik uluslararası girişimlerin ana hedefi küresel evrensel CO₂ emisyonunun azaltılmasıdır (Koçak & Şarkgüneşi, 2018).

Son literatür, küresel sera gazı emisyonunun %10-15'inin tarım sektöründen geldiğini ortaya koymuştur (Ullah et al., 2018).Başta hayvancılık, toprak yönetimi, pirinç ekimi, enterik fermantasyon, gübre yönetimi ve ürün artıklarının yakılması olmak üzere tarımsal üretim faaliyetlerinin tüm süreçleri CO₂ salınımının kaynağıdır. Öte yandan dünya nüfusunun üçte birinin tarım sektöründen geçimini sağlaması ve küresel gıda güvenliği dikkate alındığında, tarımın sürdürülebilirliğinde giderek daha fazla önem atfedilir (Adedoyin et al., 2021). Bu nedenle tarımsal üretkenliğin çevre üzerindeki etkisinin anlaşılması çevre ekonomisi literatürü açısından önemlidir. Literatüre göre, tarım sektörü başta hayvancılık, fosil yakıt kullanma, gübre kullanımı gibi süreçler sera gazı salınımındaki artışı tetiklemektedir. Öte yandan son yıllarda literatür özellikle gelişmekte olan ülkelerde tarımsal üretkenlik-çevre ilişkisi incelenmekte olup, tarımsal üretkenliğin çevre kalitesini iyileştirdiği yönünde kanıtlar sunulmaktadır (Majiwa et al., 2018; Raihan & Tuspekova, 2022; Rehman et al., 2022). Tarımsal üretkenlik verimlilik artışı ve teknoloji kanalları ile sera gazı salınımını azaltabilir. Ancak

literatürde doğrudan Türkiye değerlendirmesi üzerine bir araştırma boşluğu gözlemlenmektedir. Bu amaçla, araştırmamız Türkiye’de tarımsal üretkenliğin CO₂ salınımı üzerindeki etkisini incelemeyi amaçlar. Türkiye küreselleşme süreci ile sera gazı salınımında önemli artışlar tecrübe etmiştir. Türkiye, OECD’de en fazla sera gazı (GHG) yayan ilk 10 ülke arasında yer almaktadır. Türkiye’deki toplam sera gazı emisyonları 1990 ile 2019 yılları arasında %130 artarak 506 milyon tona ulaşmıştır (Ozturk et al., 2022). Araştırma sonunda, Türkiye’de tarımsal üretkenliğin CO₂ salınımı üzerindeki etkisinin anlaşılması uzun dönemli tarım-çevre politikalarının gelişimi için politika çıkarımları sunabilir.

Çalışmanın geri kalana takip eden şekilde düzenlenir. İkinci bölümde veri ve yöntem hakkında bilgi verilmektedir. Üçüncü bölüm ampirik bulgular rapor etmektedir. Son bölümde araştırma sonuçları değerlendirilir.

VERİ VE YÖNTEM

Bu araştırma 1990-2020 dönemi Türkiye’de tarımsal üretkenliğin CO₂ salınımı üzerindeki etkisi ekonomik büyüme, ticaret ve doğrudan yabancı sermaye yatırımları (FDI) kontrol değişkenleri ile incelenecektir. Bağımlı değişken CO₂ salınımı kişi başına metrik ton cinsindedir. Açıklayıcı değişken tarımsal üretkenliği temsil etmek için tarımsal katma değer GSYİH’deki oranı (%) göstergesi kullanılır. Kontrol değişkenlerden (i) ekonomik büyüme kişi başına düşen GSYİH (2015 yılı sabit fiyatlarla, ABD doları), (ii) ticaret, toplam ithalat ve ihracatın GSYİH’deki payı ve FDI, doğrudan yabancı yatırımlar (net girişler, GSYİH’nin yüzdesi) ile temsil edilmektedir. Tüm verilerin doğal logaritmaları kullanılmaktadır. Parametre tahmin sürecinde doğrusal regresyon modeli dikkate alınmaktadır. İlgili model, birim kök analizleri, eş-bütünleşme ve katsayı tahmin yöntemleri ile araştırılmaktadır.

BULGULAR

Araştırmanın ilk aşamasında serilerin durağan olup olmadığı veya birim kök içerip içermediği analiz edilmelidir. Bu çalışmada durağanlığın test edilmesi amacıyla ekonometri literatüründe yaygın olarak kullanılan ADF (Dickey & Fuller, 1981) ve PP (Phillips & Perron, 1988) birim kök testleri kullanılmıştır. Düzey değer bulgularına göre serilerde birim kök yoktur boş hipotezi reddedilmektedir. Serilerin ilk farkları alındığında ise tüm serilerin durağan olduğu gözlemlenmektedir. Bu durumda regresyon parametre tahmininden önce seriler arasında eş-bütünleşme ilişkisinin doğrulanması gerekmektedir. Bu amaçla, Johansen (1988) ve Johansen ve Juselius (1990) tarafından geliştirilen eş-bütünleşme yöntemleri kullanılmaktadır. Tablo 1 eş-bütünleşme test sonuçlarını göstermektedir. Trace (İz) ve Max-Eigen (Maksimum Özdeğer) test istatistiklerine göre değişkenler arasında %5 önem düzeyinde bir adet eş-bütünleşme ilişkisi

vardır. Diğer bir ifadeyle Türkiye’de tarımsal üretkenlik, CO2 salınımı, ekonomik büyüme, ticaret ve FDI arasında uzun dönemli bir denge ilişkisi geçerlidir.

Analizin son aşamasında regresyon parametre tahmin süreci yer almaktadır. Tablo 2, Phillips ve Hansen (1990)) tarafından geliştirilen FMOLS tahmin sonuçlarını göstermektedir. Sonuçlara göre, (i) tarımsal üretkenlik CO₂ salınımı üzerinde azaltıcı bir etkiye sahiptir. Türkiye’de tarım sektöründe verim artışı çevresel açıdan sürdürülebilirliğe katkı sağlamaktadır. (ii) Ekonomik büyüme ve dış ticaret CO₂ salınımı üzerinde arttırıcı bir etkiye sahiptir. Türkiye’de ekonomik büyüme ve ticaret gelişimi çevre açısından olumsuz bir etkiye sahiptir. (iii) Doğrudan yabancı sermaye yatırımları ile CO₂ salınımı arasında istatistiki olarak anlamlı bir ilişki yoktur. Türkiye için yabancı yatırımlar ve çevre arasında yansızlık ilişkisi geçerlidir.

SONUÇ

Bu çalışma Türkiye’de tarımsal üretkenliğin CO2 salınımı üzerindeki etkisini ekonometrik yöntemler ile incelemiştir. Araştırma sonucunda tarımsal üretkenlik artışının uzun dönemde CO2 salınımı üzerinde azaltıcı bir etkisi olduğu ortaya konulmaktadır. Bu nedenle Türkiye’de tarımsal üretkenliği arttıracak teşvik, destek ve politikalar çevresel sürdürülebilirlik açısından kritik öneme sahiptir. Özellikle politikaların tarımsal üretimi ve üreticiyi desteklememekle kalmayıp, tarım sektöründe üretkenlik için, (i) AR-GE yatırımları, (ii) kooperatifleşme, (iii) temel araştırma süreçleri, (iv) inovasyon, (v) yenilenebilir enerji kullanımı ve (vi) yeşil büyüme süreçlerini kapsayan politikaların daha ağırlıklı olması önerilmektedir.

Abstract

The main purpose of making silage is to obtain a product with high nutritional value by preserving green forages with minimum nutrient loss. However, fermentation in the silo is difficult to control and generally uncontrollable fermentation process makes it difficult to maintain the optimum nutrient content of the ensiled product. Especially in recent years, bacterial inoculants containing lactic acid bacteria used as additives in silage production. Bacterial cultures or so-called microbial inoculants are used extensively. Lactic acid bacteria (LAB) inoculants play an important role in the preservation and fermentation of green fodder. Lactic acid bacteria prevent nutrient loss by preventing the survival of undesirable microorganisms by rapidly lowering the pH. By adding sufficient lactic acid bacteria to the silage, silage fermentation develops and nutrient losses are reduced by ensuring the rapid fermentation of carbohydrate sources in the silo material into lactic acid. Lactic acid bacteria provide proper silage fermentation and are also very successful in increasing animal performance. Lactic acid bacteria reduce the pH, acetic acid, butyric acid, ethanol and ammonia nitrogen levels of silage. In particular, they increase lactic acid, lactic:acetic acid ratio, dry matter gains, dry matter digestibility and silage dry matter intake. In this review, the function of LAB in silage production and the potential effects of its fermentative activity are described.

Keywords: Silages, Lactic acid bacteria, feed value, fermentation

INTRODUCTION

Silage products with a high moisture content feed produced as a result of controlled fermentation. Silage is produced by fermentation and retains more than 50% of the moisture content and nutrients of the plant. In terms of plant biomass and prevention of nutrient loss, it maintains its superiority in dairy cattle feeding compared to dry preserved forages (Bolsen et al., 2006; Grant and Adesogan, 2018; Okoye et al., 2023). It is also a fermentative process involving various groups of microorganisms. Lactic acid bacteria (LAB) make the most important contribution to lowering the pH in ensiling and preserving the ensiled material. (Muck et al. 2018; Fabiszewska et al. 2019). Some LAB species or strains produce acetic acid, ethanol, CO₂, 1,2-propanediol, and other compounds through different metabolic pathways of carbohydrate utilization (Von Wright and Axelsson 2012; Carvalho et al., 2021). Lactic acid bacteria are classified as homofermentative (producing lactic acid) and heterofermentative (producing compounds other than lactic acid) (Von Wright and Axelsson 2012). Enterococcus, Lactobacillus, Pediococcus, Lactococcus, Weissella and Bacillus are LAB species that are frequently used in silage production. (Ellis et al., 2016). The use of LAB in modern and sustainable agriculture is receiving considerable attention due to their potential to improve human and animal health (Amaral et al., 2020; Okoye et al., 2023). LAB utilise water-soluble carbohydrates (WSC) and convert them into organic acids. By using LAB, feed quality can be improved by minimising the loss of carbohydrates, crude proteins, volatile free fatty acids and minerals. The use of LAB additives enhances the fermentation process, leading to control of dry matter (DM) loss and pathogenic activity (Pot et al., 2019; Kim et al., 2020). In this review, the effect of LAB in silage production and their potential effects on the fermentation process are described.

BIOLOGICAL PROPERTIES OF LACTIC ACID BACTERIA

LAB is a gram-positive, microaerophilic, cocci- or rod-shaped bacteria that does not form spores. It consists of different genera such as Lactobacillus, Leuconostoc, Pediococcus, Streptococcus, Enterococcus and Lactococcus.(Morales-Estrada et al.,2016; Kim et al. 2021). Although most silage LAB can grow under mesophilic conditions at different temperatures (20–50 °C), the optimum temperature for growth is between 25 and 40 °C. LAB strains are commonly found naturally in a variety of sources, including fermented foods (yoghurt, meat), forage crops (Italian ryegrass, alfalfa, rye, sorghum, corn, and triticale), animal manure, dairy products, rumen liquid, and infant feces (Olofsson and Vásquez 2008; Sornplang and Piyadeatsoontorn 2016). LAB can reduce silage pH to between 3-5, depending on the strains

selected and the type of forage plant. The main function of LAB is to ferment WSC into organic substances as the main end product.

THE LAB IN SILAGE FERMENTATION

Lactic acid bacteria are essential for silage fermentation; however, they are often found in low populations (<5 log colony forming units (CFU) per g substrate) or even below detection levels (<2 log CFU) per g substrate. LAB can produce acetic acid, ethanol, CO₂, 1,2-propanediol, and other compounds through different metabolic pathways of carbohydrate. The main anaerobic bacteria in silage are LAB, which belong to 4 species: *Lactobacillus*, *Pediococcus*, *Enterococcus* and *Leuconostoc*. Bacteria commonly used in silage inoculants and their intended use it is given in Table 2 (Kung 2001). Lactic acid bacteria are classified as homofermentative or obligately heterofermentative or facultatively heterofermentative (compounds other than lactic acid are produced) (Von Wright and Axelsson 2012). Homofermentative or facultatively heterofermentative LAB rapidly decreases pH and increases lactic acid relative to other fermentation products.

Table 1. Bacteria commonly used in silage and their intended use

Bacteria	Type of Bacteria	Purpose of Usage	Main Products
<i>Lactobacillus plantarum</i>	LAB homofermentative	Fast LA production, high acid tolerance	LA
<i>Pediococcus acidilactici</i> , <i>acidilactici</i> , <i>cerevisiae</i>	LAB homofermentative	Fast LA production, faster growth compared to <i>Lactobacillus</i> , rapid growth of some lines in cool conditions and good osmo tolerance.	LA
<i>Enterococcus faecium</i>	LAB homofermentative	Fast LA production, faster growth compared to <i>Lactobacillus</i>	LA
<i>Propionibacterium shermanii</i> , <i>jensenii</i>	<i>propionibacteria</i>	Production of antifungal compounds	PA, AA, CO ₂
<i>Lactobacillus buchneri</i>	LAB, heterofermentative	Production of antifungal compounds	PA, AA, CO ₂ , propanediol.

LA: lactic acid, PA: propionic acid, AA: acetic acid, (Kung, 2001)

THE LAB ACTIVITY IN SILAGE PRODUCTION

LAB is added to silage in order to prevent the growth of microorganisms that cause spoilage, to reduce silage pH and to prevent dry matter (DM) loss. The four primary biochemical changes that occur during the silage production (Figure 1). LAB activity during silage production. The main biochemical functions of LAB inoculants in silage fermentation include: removal of oxygen, fermentation, appropriate WSC concentration, increasing pH decrease, decreasing buffering capacity, timely removal called wilting, adequate temperature and timely removal referred to as feed-out

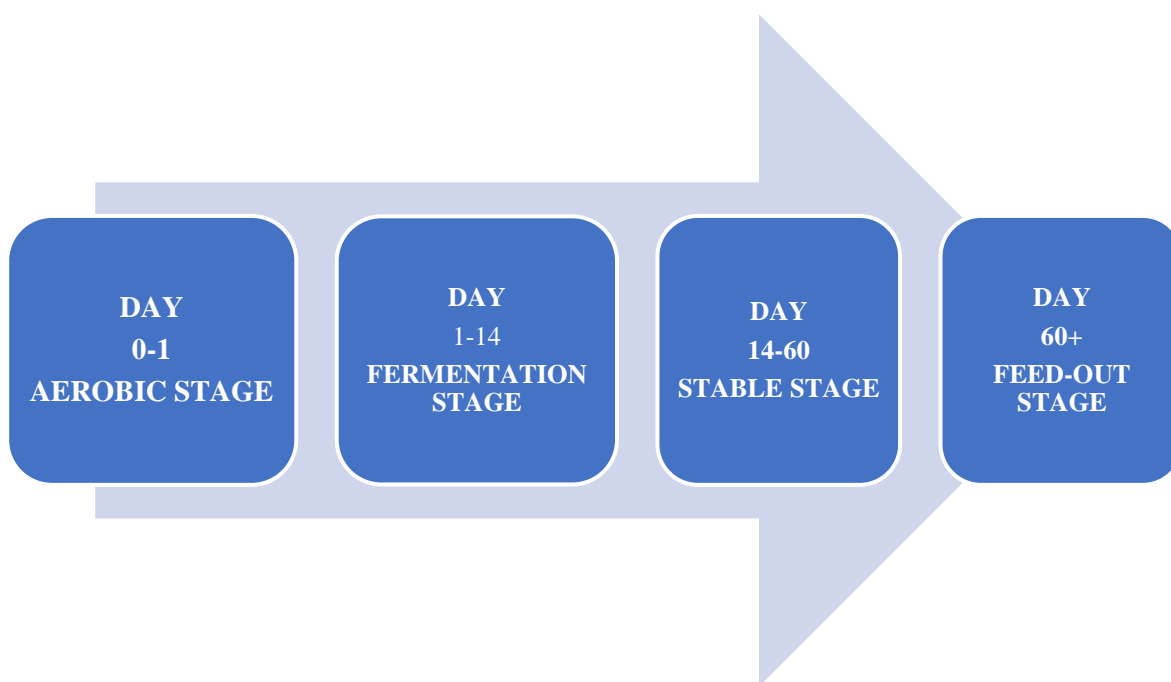

Figure 1. The four primary biochemical changes that occur during the silage production.

AEROBIC STAGE

The aerobic phase begins at harvest and continues until the oxygen supply is exhausted, which occurs shortly after ensiling. Sugars in freshly chopped plant biomass are broken down by the LAB into carbon dioxide, water and heat at this stage and are also used by aerobic microorganisms (yeast, molds and aerobic bacteria) which constitute an important source of respiration. Treatment of plant biomass with combined inoculants reduces the activity of yeasts and moulds and other aerobic bacteria using lactic acid, which is sufficiently produced by homofermentative LAB (Muck et al., 2018; Nazar et al., 2020; Okoye et al., 2023).

FERMENTATION STAGE OF SILAGE

The anaerobic fermentation phase involves the activity of different bacteria that ferment plant sugars.(Okoye et al., 2023) The effectiveness of fermentation in terms of pH lowering depends on the number and type of LAB present in the silage mass, which can inhibit the activities of

undesirable bacteria. During the fermentation phase, LAB protects the feeds from microorganisms that cause spoilage by producing antifungal substances such as beneficial organic acids. Homofermentative LAB species are more active in lowering the pH of silage because they only produce lactic acid, unlike heterofermentative LAB, which produces acetic acid, which slows down the pH drop during the fermentation phase. (Schmidt and Kung, 2010; Li et al., 2018; Oliveira et al., 2019).

STABILITY STAGE

As a result of LAB activity in fermentation, ensiled forages enter a storage phase called the stability phase. The added silage is maintained at a constant pH at this stage, resulting in acidic conditions that limit the activity and population of microbes, and dangerous species such as Clostridia and Bacilli can survive spores as long as the silo remains airtight. Very little biological activity occurs during the stability phase (Borreani et al., 2018; Li and Nishino, 2011).

EFFECT OF LAB INOCULANTS ON SILAGE QUALITY

One of the most important effects of bacterial inoculants in silage was on DM gain. In many studies conducted with inoculants, it has been reported that DM losses decreased by 1-2% on average in corn silages and 2-3% in legume and fescue silages with the use of inoculants. It is expected that there will be DM gains as a result of the change in fermentation products with the use of bacterial inoculants. Because only LA is produced as a result of homolactic fermentation of sugars, the gain of DM is higher in this type of fermentation (Muck 1996; Muck 2000). High DM recovery was detected in alfalfa silage inoculated with *L. plantarum*. Additionally, the aerobic stability of grass silages with 18-44% DM content increased as the percentage of DM increased after inoculation with *L. plantarum* and *L. buchneri*. However, alfalfa silage was ensiled at high DM levels (Ertekin and Kızılsimşek 2019).

With the addition of bacterial inoculant, the total energy losses of silage are not affected much. In addition, silage may have a higher gross energy value than the original material due to the formation of high-energy compounds such as ethanol during ensiling. (McDonald et al., 2002). LAB used in inoculants don't ferment the proteins and amino acids in silage. In addition, the rapid decrease in silage pH with the use of inoculants suppresses the activities of microorganisms and plant proteases that ferment amino acids, preserving some of the true proteins and reducing the concentration of NH₃-N in silage (Muck 1996; Jones 1998).

Since lactic acid bacteria cannot hydrolyze plant cell wall polysaccharides, the fiber content of silage is not affected by the use of inoculants. The decrease in the fiber content of silage with the use of inoculants is due to the hydrolysis of hemicellulose with acid at low pH. Hemicellulosic activity is important only in meadow silages and it can reduce NDF content by 1–2% (Muck 1996; Kung 2001). Secreting lignocellulose enzymes, LAB stimulates the plant's conversion to WSC, thus making glucose available for successive conversion to lactate, leading to a decrease in cell wall carbohydrates associated with the efficient degradation of ADF and NDF contents (Ebrahimi et al., 2016).

Another microorganism that has potential in improving the aerobic stability of silage is *Lactobacillus buchneri*, a heterolactic LAB. *Lactobacillus buchneri* is reported to increase aerobic stability by increasing the amount of AA and PA in silage (Kung 2001; Filya 2003; Kung et al., 2003).

In most of the studies examining the effect of inoculant use on aerobic stability, aerobic stability was negatively affected by the addition of homolactic LAB (Filya 2002).

ANIMAL PERFORMANCE

It has been reported that animal performance is increased by 2–4% with the use of inoculants as silage additives and these increases are higher than the changes made by inoculants in products formed as a result of silage fermentation (Muck 1996). Abd Al-Tawab et al., (2016). reported that LAB inoculants, especially homofermentative LAB are associated with improved digestibility of nutrients and reduction of anti-nutritional compounds. Silage inoculated with *L. buchneri* was found to have higher feed performance in cows compared to uninoculated silage (Schmidt and Kung 2010). Silages inoculated with *L. plantarum* and *L. buchneri* increased milk yield and reduced the oxalate effect on cattle diets, leading to a symbolic increase in nutrient digestibility and improvement in performance without a negative impact on animal health (Oliveira et al., 2017).

Studies have shown that feeding ruminant animals LAB-preserved silages greatly improves animal performance in the rumen environment, increasing feed utilization. For example, in in vitro ruminal fermentation studies LAB-inoculated silages have shown to affect rumen microorganisms, in some cases reducing methane gas, a type of greenhouse gas, and resulting in increased microbial biomass production (Muck, 2013). LAB performs efficiently with probiotic survival potential in the rumen, interacts with other beneficial microorganisms, and maintains functionality in animals (Matthews et al., 2019). LAB perform efficiently with a

probiotic potential of survival in the rumen, interact with other beneficial microorganisms, and maintain functionality in animals (Matthews et al., 2019).

CONCLUSIONS

Preservation of silage is the purpose of ensiling green fodder crops for future use. Silage quality is improved by adding a variety of LAB inoculations, which work effectively during fermentation, storage and feed-out stages. LAB is one of the best organic additives that provides control over suppressing unwanted bacterial growth in silage. LAB is one of the best organic additives that controls unwanted bacterial growth in silage. LAB inoculants convert water-soluble carbohydrates and complex secondary metabolites in forage crops into organic acids and mineral acids and improve the nutritional quality of silage for livestock by effectively controlling pathogenic microorganisms

Özet

Tarımsal ürün gruplarından birisi olan meyvelerde, kaliteli ve verimli üretim kadar mevcut özelliklerin korunması da önem arz etmektedir. Bir meyvenin rengi, aroması, kokusu ve lezzeti gibi genel fiziko-kimyasal özelliklerinin korunmasında özellikle de hasat sonrası depolama koşulları ön plana çıkmaktadır. Depolama şartlarının iyi ve kaliteli olmasıyla özellikleri uzun sürelerde korunabilen meyvelerin iç ve dış ticarete kullanım imkanları daha da artmaktadır. Depolama esnasında sıcaklık ve nem gibi abiyotik faktörler, meyvelerin kalite ve verim özelliklerinde direkt etkilere sahip olmakla birlikte, bu faktörlerin uygunluğu elzem bir durumdur. Öte yandan, meyvelerin depolanması sırasında onlar üzerinde dışarıdan uygulanabilecek çeşitli bileşikler aracılığıyla da meyve kalite özellikleri belirli sürelerde korunabilmektedir. Günümüzde, bazı meyvelerin uzun sürelerde depolanması amacıyla eksojen olarak uygulanan bileşiklerden birisi de, poliamin grubu bileşiklerdir. Başta putresin olmak üzere, kadaverin, spermidin ve spermin gibi bileşikler, bu grup bileşikler arasında yer almaktadır. Bu derleme çalışma kapsamında, depolama sırasında uygulanan putresinlerin çeşitli meyveler üzerinde oluşturdukları etkiler ve bunların etki mekanizmaları incelenmiştir. Çalışmada sonuç olarak, birçok meyvede hasat sonrası depolama esnasında dışarıdan uygulanan putresinin meyve özelliklerinin korunması ve iyileştirilmesinde oldukça etkili olduğu kanaatine varılmıştır.

Anahtar kelimeler: Meyveler, depolama ömrü, poliaminler, putresin, verim ve kalite özellikleri

PRESERVATION OF QUALITY CHARACTERISTICS OF FRUITS WITH POST-HARVEST PUTRESIN APPLICATION

Abstract

In fruits, which are one of the agricultural product groups, preserving the existing characteristics is as important as quality and efficient production. Especially post-harvest storage conditions come to the fore in preserving the general physico-chemical properties of a fruit such as color, aroma, smell and taste. The possibilities of using fruits in domestic and foreign trade, whose properties can be preserved for long periods of time with good and high-quality storage conditions, increase even more. Although abiotic factors such as temperature and humidity during storage have direct effects on the quality and yield characteristics of fruits, the suitability of these factors is essential. On the other hand, fruit quality characteristics can be preserved for certain periods of time through various compounds that can be applied externally on fruits during storage. Today, polyamine group compounds are one of the compounds applied exogenously to some fruits for long-term storage. Compounds such as putrescine, cadaverine, spermidine and spermine are among this group of compounds. Within the scope of this review study, the effects of putrescines applied during storage on various fruits and their mechanisms of action were examined. As a result of the study, it was concluded that putrescine applied externally during post-harvest storage in many fruits is very effective in preserving and improving fruit properties.

Key words: Fruits, storage life, polyamines, putrescine, yield and quality characteristics

GİRİŞ

Tarımsal üreticilikte önemli ürün gruplarından birisi olan meyvelerde kalite ve verim özelliklerinin korunması ve bu özelliklerin iyileştirilmesi, Dünya’da özellikle de gelişmekte olan veya gelişmiş ülkeler açısından önem arz etmektedir. Bir ülkede kaliteli meyvelerin üretilmesi, o ülkede yaşayan insanların besin değerlerinin karşılanabilmesi açısından önemli olmakla birlikte, yeterli kalitede meyve üretimi, ihracata da değerli katkılar sağlayıp ülke ekonomisini güçlendirebilmektedir (Homrich ve ark., 2018; Pauliuk, 2018; Millar ve ark., 2019; Moraga ve ark., 2019). Dünya’da en çok meyve üreten ülkeler arasında Çin, Hindistan, Türkiye, ABD ve Brezilya ülkeleri başta gelmektedir. Meyve üretiminde önemli bir paya sahip olan Türkiye’de, 2023 yılında, toplam meyve üretiminin 26.927.586 ton miktarında olması beklenmektedir. Ülkede toplam meyve üretimine en fazla katkıda bulunan meyvelerin başında, sırasıyla, üzüm, muz, incir, avokado, kivi ve turunçgiller gibi meyveler gelmekte olup, Türkiye uygun coğrafi konumu ve iklim özellikleriyle meyve çeşitliliği açısından oldukça zengin bir ülkedir (TÜİK, 2023).

Meyvelerde, kaliteli ve verimli üretim kadar mevcut özelliklerin korunması da oldukça önemli bir husustur. Nitekim, bir meyvenin rengi, aroması, kokusu ve lezzeti gibi genel fiziko-kimyasal özelliklerinin korunmasında, hasat sonrası depolama ve depolama şartlarının uygunluğu, özellikle dikkate alınması gereken bir kriterdir. Çünkü, depolama şartlarının iyi ve kaliteli olmasıyla özellikleri uzun sürelerde korunabilen meyvelerin iç ve dış ticarete kullanım olanakları daha da artmaktadır (Alok Sagar ve Pareek, 2020; Makule ve ark., 2022; Alzuabi ve ark., 2023).

Meyvelerin depolanması sırasında, depolama yerlerinin sıcaklık ve nem gibi abiyotik faktörleri, meyvelerin kalite ve verim özellikleri üzerinde doğrudan etkilere sahiptir. Meyve yapılarının bozulmaması ve korunması açısından depo abiyotik faktörlerinin uygun değerlerde tutulması gereklidir. Genel olarak, meyve tür ve çeşitlerine göre değişmekle birlikte, meyvelerin depolanması gereken nem değerleri ise genel olarak %80-%95 arasındadır. Öte yandan, bu uygun depolama şartlarının dışında meyvelerin depolanması, %10 ile %40 arasında değişen verim kayıplarına neden olabilmektedir (Nanda ve ark., 2001; Fernando Ayala-Zavala ve ark., 2004; Cordenunsi ve ark., 2005; Shin ve ark., 2007; Caleb ve ark., 2013).

Meyvelerin depolanması sırasında kalite ve verim özelliklerini koruyan abiyotik faktörler dışında, meyve üzerine eksojen olarak uygulanabilen çeşitli bileşikler aracılığıyla da meyve özellikleri belirli sürelerde muhafaza edilebilmektedir. Bazı meyvelerin depolama

koşullarında raf ömürlerinin korunması ve uzatılması amacıyla, eksojen olarak uygulanabilen bileşiklerden birisi de, poliamin grubu bileşiklerdir. Başta putresin olmak üzere, kadaverin, spermidin ve spermin gibi bileşikler, bu grup bileşikler arasında yer almaktadır (Pérez-Vicente ve ark., 2002; Malik ve Zora, 2005; Mirdehghan ve ark., 2007; Sharma ve ark., 2017; Patel ve ark., 2019).

Bu derleme çalışma kapsamında, depolama sırasında uygulanan putresinlerin bazı meyveler üzerinde oluşturdukları etkiler ve bunların etki mekanizmalarıyla ilgili güncel çalışmalar incelenmiştir.

Depolama sırasında uygulanan putresinlerin meyve kalite kriterleri üzerine etkisi

Abbasi ve ark. (2019), şeftalide farklı dozlarda uyguladıkları putresinin meyve üzerindeki etkilerini incelemişlerdir. Araştırmacılar, kullandıkları dozlar fark etmeksizin, putresinin; meyvelerde üşüme hasarı indeksini, meyve yumuşamasını, meyve ağırlık kayıplarını, kabuk rengindeki solmaları, meyvenin çözünebilir katı madde miktarını (SÇKM), titre edilebilir asitliğini (TA) ve meyvenin askorbik asit içeriğini önemli ölçüde azalttığını belirtmişlerdir. Çalışmada sonuç olarak, putresinin şeftali depolanmasında meyve raf ömrünü arttırdığı kanısına varılmıştır.

Kibar ve ark. (2021), şeftali meyvesinde yaptıkları çalışmalarında, putresin uyguladıkları meyvelerde; meyve ağırlık kayıplarının, meyve çürümesinin, SÇKM miktarının, TA değerinin, meyve yoğunluğunun, meyve sertliğinin, meyve solunumunun, meyve pH'ının, meyve kabuk rengi parametrelerinin, kontrol meyvelere kıyasla önemli ölçüde azaldığını bildirmişlerdir. Araştırmacılar, ayrıca, putresinli meyvelerde, C vitamini ve organik asit içeriklerinin de azaldığını ve putresinin fenolik bileşiklerin parçalanmasını kontrole göre daha fazla önlediğini kaydetmişlerdir.

Fawole ve ark. (2020), narda putresin kullandıkları çalışmalarında, putresinin; meyve çürümesini, meyve kabuğu yanıklığını, meyve üşüme hasarını, meyve kabuk rengini, meyve SÇKM'sini, TA'sını, askorbik asit içeriğini, meyve yumuşamasını, kontrol meyvelere göre, önemli şekilde azalttığını bildirmişlerdir. Ayrıca, çalışmada, 2 mmol/L dozlu putresinin narın depolanması esnasında, meyve kalite özelliklerini en iyi şekilde koruduğu da önemle vurgulanmıştır.

Küçükler ve ark. (2023), incirde putresin uyguladıkları çalışmalarında, putresinin; meyve çürüme oranını, meyve ağırlık kayıplarını, meyve yumuşamasını, meyve SÇKM'sini, meyve TA'sını, meyve fenolik asit parçalanmasını, kontrol meyvelere oranla, önemli ölçüde azalttığını

ifade etmişlerdir. Araştırmacılar, çalışmalarında sonuç olarak, incirlerde hasat sonrası meyve kalitesinin korunmasında, putresin uygulamalarının etkili bir yöntem olarak kullanılabileceğini söylemişlerdir.

Hosseinifarahi ve ark. (2020), İran'da kayısı üzerinde yaptıkları çalışmalarında kayısılara eksojen olarak putresin uygulamışlardır. Araştırmacılar, putresin uygulamasının; meyve ağırlığını, meyve çürümesini, meyve yumuşamasını, meyve SÇKM'sini, meyve TA'sını, kontrol uygulamaya göre önemli ölçüde azalttığını bildirmişlerdir.

Hanif ve ark. (2020), Pakistan'da papaya meyvesi üzerinde putresin uyguladıkları çalışmalarında, putresinli meyvelerde; meyve yumuşamasını, meyve ağırlık kaybını, meyve çürüme oranını, meyve antioksidan ve fenolik madde parçalanmalarını, kontrol meyvelere kıyasla önemli ölçüde daha düşük olarak gözlediklerini belirtmişlerdir. Araştırmacılar ayrıca, papayanın kalite özelliklerinin korunmasında, 2 mmol/L dozlu putresin kullanımının uygun olacağını da vurgulamışlardır.

Hosseini ve ark. (2019), armut üzerinde putresin uyguladıkları çalışmalarında, 1 ve 2 mmol/L dozlu putresinin; meyve yumuşamasını, meyve ağırlık kaybını, meyve kabuk rengi parametrelerini, SÇKM'sini, TA'sını, askorbik asit içeriğini, meyve fenolik asit parçalanmasını, kontrol grubu meyvelere göre, önemli şekilde azalttığını belirtmişlerdir.

Ennab ve ark. (2020), mandalınada putresin kullandıkları çalışmalarında, putresin muameleli meyvelerde; meyve ağırlık kaybının, meyve çürüme oranının, meyve yumuşamasının, SÇKM'sinin, TA'sının, askorbik asit içeriğinin, kontrol meyvelere göre önemli ölçüde daha düşük olarak gözlendiğini söylemişlerdir.

Taş ve ark. (2022), kivide putresin uyguladıkları çalışmalarında, putresinli meyvelerde; meyve ağırlık kaybını, meyve yoğunluğunu, meyve yumuşamasını, meyve solunum hızı artışını, meyve SÇKM'sini, TA'sını, kontrol meyvelere göre, önemli şekilde daha az olarak incelemişlerdir. Araştırmacılar ayrıca, uygulanan 2.0 mM dozlu putresinin, meyvelerde C vitamini, fenolik asit ve flavonoidlerin kayıplarını daha çok önlediğini de bildirmişlerdir.

Singh ve ark. (2020), armutta kullandıkları 2 ve 3 mM muamele dozlu putresinlerin; meyve yumuşamasını, meyve ağırlık kaybını, meyve kabuk rengi parametrelerini, meyve SÇKM'sini, meyve TA'sını, kontrol uygulamaya göre önemli şekilde azalttığını ifade etmişlerdir. Araştırmacılar, çalışmalarında sonuç olarak, 2 ve 3 mM muamele dozlu putresinlerin, depolanan armut kalitesini etkili bir şekilde koruyabileceğini ve armudun depolama potansiyelini uzatabileceğini öne sürmüşlerdir.

Sonuç ve Öneriler

Genel olarak, meyvelerde, hasat edildikten kısa bir süre sonra kalite özelliklerini kaybetme durumu gözlenir. Bu nedenle, onların hasat sonrası depolama koşulları ve bu koşulların iyi yönetilmesi elzem bir durumdur. Günümüzde depolama esnasında, meyvelere, eksojen olarak uygulanan putresin, spermidin ve spermin gibi poliamin bileşikler sayesinde meyve raf ömürleri uzatılmakta ve meyveye ait çeşitli fiziko-kimyasal özellikler korunabilmektedir.

İncelenen güncel literatür çalışmaları ölçüsünde, putresin, şimdilerde meyveler üzerinde oldukça yaygın olarak kullanılan poliamin bileşikleri arasındadır. Putresinin, özellikle de hasat sonrası çabuk bozulabilen meyvelerde, depolama esnasında kullanılmasıyla, meyvelere ait kalite ve verim özellikleri korunup iyileştirilebilmektedir.

Bu çalışma kapsamında, depolama esnasında uygulanan putresinlerin bazı meyveler üzerinde oluşturdukları etkiler ve bunların etki mekanizmalarıyla ilgili güncel çalışmalar irdelenmiştir. İncelenen çalışmalar ölçüsünde, putresin uygulanan meyvelerde, genel olarak, kontrol meyvelere göre; meyve yumuşaklığı, meyve ağırlık kaybı, meyve kabuk rengi değişiklikleri, meyve çürümesi, meyve çözünebilir katı madde içeriği, meyve titre edilebilir asitliği, meyve fenolik ve organik asit kayıpları gibi meyve kalite özelliklerinde önemli ölçüde azalmalar tespit edilmiştir. Araştırmalarda sonuç olarak, özellikle de hasat sonrası hızlıca bozulabilen birçok meyvenin kalite özelliklerinin korunmasında, putresinin etkili bir yöntem olarak kullanılabileceği yargısına varılmıştır.

**EMOSIONAL GƏRGİNLİYİN SADƏ SENSOMOTOR REAKSIYA
VAXTINA TƏSİRİNİN TƏDQIQI**

Dosent doctor Laləndə AĞAYEVA

Azərbaycan Dövlət Pedaqoji Universiteti, kimya-biologiya fakültəsi,

Email: lala.agayeva@gmail.com

ÖZƏT

İmtahan dövrü abituriyentlər üçün çox güclü psixosomatosional stress faktorudur və bu stresin təsiri altında orqanizmin funksional vəziyyəti dəyişir. İmtahanın xarakteri, tədqiq olunanın yaşı, onun psixofizioloji xüsusiyyətləri öyrənilən parametrləri dəyişmə spektrini, yəni imtahan stresinə adaptasiyasını .Hazırda buraxılış imtahanlarının şagirdin təhsil aldığı məktəbdə deyil, Dövlət Test Mərkəzi tərəfindən ümumi testləşdirmə sistemi yolu ilə keçirilməsi şagirdlərdə əlavə stress vəziyyəti yaradır. Həm qarşıda gələn buraxılış imtahanların, ali təhsil məktəblərinə hazırlığın, keçirilən sınaq imtahanlarının birgə yaratdığı gərginlik abituriyentlər üçün güclü stress faktorudur. Bütün bunları nəzərə alaraq tədqiqatımızın məqsədini ümumitəhsil məktəblərində son- 11 –ci siniflərdə təhsil alan şagirdlərdə buraxılış və ali təhsil məktəblərinə daxil olmaq üçün keçiriləcək ümumi test imtahanlarına hazırlıq prosesində emosional gərginliyin inkişafı və bu zəmində sadə sensomotor reaksiya vaxtını tədqiq etmək təşkil etmişdir. Nəticədə həm imtahana hazırlıq prosesinin şagirdlərin emosional vəziyyətinə təsiri, eləcə də emosional gərginliyin sadə sensomotor reaksiya vaxtına təsirini araşdırmış və statistik etibarlı nəticələr əldə etmişik. Sadə sensomotor reaksiya vaxtı kompüter metodikası ilə səs signalına qarşı müəyyən edilmişdir. Emosional vəziyyətin qiymətləndirilməsi metodikası A.Uesman və D.Riks tərəfindən işlənmişdir metodika əsasında aparılmışdır və müəyyən olunmuşdur ki, tədris ilinin əvvəlində şagirdlərin emosional fərdi cəm göstəricilərinin səviyyəsi daha yüksəkdir, yəni onların emosional gərginlik səviyyəsi daha aşağıdır. Tədqiqat işində əsas məqsəd emosional gərginliyin reaksiya vaxtına təsirini tədqiq etmək olmuşdur. Nəticələr göstərdi ki, emosional gərginliyin təsirindən şagirdlərin reaksiya vaxtının orta göstəricisinin qiyməti artmışdır. Tədris ilinin əvvəlində aparılan birinci ölçmə zamanı tədqiq olunanların sensomotor reaksiya vaxtlarının statistik orta qiyməti 165,8 ms., tədris ilinin sonunda, buraxılış imtahanı öncəsi, ali məktəblərə sınaq imtahanlarının keçirildiyi bir dövrdə şagirdlərin sadə sensomotor reaksiya vaxtı 197,6 saniyəyə bərabər olmuşdur. Emosional gərginlik reaksiya vaxtının latent dövrünü uzatmış və variabelliği artırmışdır. Şagirdlərin sensomotor reaksiya vaxtı emosional gərginliyin səviyyəsi ilə düz mütənasib asılılıqda olmuşdur, yəni emosional gərginlik artdıqca reaksiya vaxtı uzanmışdır.

EMOSONAL GƏRGİNLİK, REAKSIYA VAXTƏ, İMTAHAN STRESİ, ABITURIENTLƏR

GİRİŞ

Təhsilin yeni innovasion formalarının kütləvi şəkildə tətbiq edilməsi və bu prosesdə şagirdlərin sağlamlıq vəziyyətinin, ətrafın ekoloji durumu və bu faktorların şagirdlərin somatik sağlamlıqlarına təsiri nəzərə alınmadan həyata keçirilməsi bu problemin aktuallığını artırır. İnnovasion dəyişikliklər şəraitində pedoqoji proses – yüksəlmiş dərs yükü, tədris proqramlarının mürəkkəbləşməsi, dərs cədvəlinə verilən gigiyenik tələblərin pozulması və bu kimi digər səbəblər şagirdlərin bir sıra qeyri -əlverişli faktorların təsirinə məruz qalmasına səbəb olur. Şagirdlərin yeni sosial mühitə uyğunlaşması orqanizmin davranış reaksiyalarının, fizioloji sistemlərin fəaliyyət səviyyələrinin və adaptasiya proseslərinin gərginləşmə səviyyəsinin dəyişməsinə səbəb olur. Yeniyyətmələrin yeni şəraitdə dərs fəaliyyəti orqanizmin tənzim mexanizmlərinin gərginləşməsi ilə müşayət olunur ki, bu da onların psixofizioloji göstəricilərinin dəyişməsində öz əksini tapır. Yeni tipli innovasion tədris müəssisələrinin dərs planlarında fiziki tərbiyə dərsləri də kifayət qədər ifadə olunmur. Fiziki işgörmə qabiliyyətinin azalması orqanizmin bütün sistemlərinin, eləcə də sinir sisteminin kompleks dəyişmələrinə gətirib çıxarır ki, bu da orqanizmdə morfoloji və funksional pozğunluqlara gətirib çıxarır. Eləcə də İmtahan dövrü abituriətlər üçün çox güclü psixoemoemosional stress faktorudur və bu stresin təsiri altında orqanizmin funksional vəziyyəti dəyişir. İmtahanın xarakteri, tədqiq olunanın yaşı, onun psixofizioloji xüsusiyyətləri öyrənilən parametrlərin dəyişmə spektrini, yəni imtahan stresinə adaptasiyanın orqanizmə hansı qiymətə başa gəldiyini müəyyən edir. Hazırda buraxılış imtahanlarının şagirdin təhsil aldığı məktəbdə, alışdığı müəllimlərin əhatəsində deyil, Dövlət Test Mərkəzi tərəfinən ümumi testləşdirmə sistemi yolu ilə keçirilməsi şagirdlərdə əlavə stress vəziyyəti yaradır. Həm qarşıda gələn buraxılış imtahanların, ali təhsil məktəblərinə hazırlığın, keçirilən sınaq imtahanlarının birgə yaratdığı gərginlik buraxılış sinif şagirdləri üçün güclü stress faktorudur. Bütün bunları nəzərə alaraq tədqiqatımızın məqsədini ümumtəhsil məktəblərində son- 11 –ci siniflərinə təhsil alan şagirdlərdə buraxılış və ali təhsil məktəblərinə daxil olmaq üçün keçiriləcək ümumi test imtahanlarına hazırlıq prosesində emosional gərginliyin inkişafı və bu zəmində sadə sensomotor reaksiya vaxtını tədqiq etmək təşkil etmişdir. Nəticədə həm imtahana hazırlıq prosesinin şagirdlərin emosional vəziyyətinə təsiri, eləcə də emosional gərginliyin sadə sensomotor reaksiya vaxtına təsirini araşdırmış və statistik etibarlı nəticələr əldə etmişik.

ARAŞTIRMA VƏ BULGULAR

Sadə sensomotor reaksiya vaxtı kompyüter metodikası ilə səs siqnalına qarşı müəyyən edilmişdir. Tədqiq olunanlar səs siqnalından dərhal sonra kompyüterdə uyğun düyməni basmaqla siqnala reaksiya göstərdi. Reaksiya vaxtı siqnal səsi ilə düymənin basıldığı an arasındakı vaxt olaraq avtomatik kompyüterdə qeyd olunurdu. (2). Emosional vəziyyətin qiymətləndirilməsi A. Uesman və D. Riks tərəfindən işlənmiş metodika əsasında aparılmışdır. Bu metodika insanın tədqiqat anındakı əhval-ruhiyyəsini və emosional vəziyyətini qiymətləndirməyə imkan verir. (3). Sorğu 4 şkaladlan ibarətdir. Hər şkalada 10 ifadə verilir. Şkaladakı ifadələr pozitiv emosional ifadələr qütbündən neqativ emosional vəziyyətlər qütbünə doğru (1 bal olaraq) tərtib edilmişdir. Tədqiq olunan öz emosional vəziyyətini uyğun ifadəni seçməklə ifadə edir. İfadənin ardıcılıq nömrəsi balın qiymətinə uyğun olur. Sorğuda təklif olunan şkalalar “Sakit- həyəcanlı”, “Enerjili-yorğun”, “Yüksək əhval ruhiyyəli – ruhdan düşmüş”, “Özünə inam hissi- acizlik hissi” adlı şkalalardır. Tədqiq olunanlar sorğu şkalalarının hər birindən öz vəziyyətinə həmin anda uyğun olan ifadələri seçir və qeyd edir.

Burada P1 göstərici, C-(özünü qiymətləndirmə) “Sakitlik- Həyəcanlılıq”, “Fərdi özünüqiymətləndirmə - F1; P2-C “Enerjilik – Yorğunluq”; P3 – C “ Əhvalın yüksək olması- bədbinlik”; P4- C- “Özünə inam hissi-Çarəsizlik”; P5- 4 şkala üzrə vəziyyətin cəm qiymətləndirilməsi kimi qəbul edilir. $F5 = F1 + F2 + F3 + F4$, yəni şkalalar üzrə fərdi göstəricilərin uyğun qiymətlərinin cəm qiymətinə bərabərdir. Dərs müvəffəqiyyətinin reaksiya vaxtına və şagirdlərin emosional vəziyyətinə təsirini istisna etmək məqsədilə tədqiqata son buraxılış siniflərdə (11-ci siniflərdə) yaxşı qiymətlərlə oxuyan 40 şagird cəlb olunmuşdur. Şagirdlərin emosional vəziyyəti və sadə sensomotor reaksiya vaxtı iki dəfə ölçülmüşdür. Birinci ölçmə tədris ilinin əvvəlində -onuncu ayda, ikinci ölçmə may ayında, imtahanların daha yaxın olduğu, ali məktəblərə sınaq imtahanlarının keçirildiyi bir dövrdə aparılmışdır. Şagirdlərin sorğu anketlərinin balları statistik işlənərək orta qiymətləri hesablanmış və orta qiymətlər əsasında F5 –in qiyməti hesablanmış və hər iki ölçmə üçün F5 –in qiymətləri müqayisə edilmişdir. Tədqiq olunanların sorğu anketlərindəki cavablar statistik işlənmişdir. Alınan göstəricilərin təhlili göstərdi ki, tədris ilinin əvvəlində keçirilən sorğu zamanı şagirdlərin emosional vəziyyəti daha yüksək balla ifadə olunur, F5 62 -yə bərabər olmuşdur. Burada F5 bütün şkalalar üzrə cavabların orta qiymətinin cəmi kimi hesablanmışdır. Şkalanın müsbət qütbünə, yəni 10 bala doğru yönəlmiş istiqaməti onların emosional vəziyyətinin daha stabil, daha müvazinətli olduğunu ifadə edir. Əksinə mənfi qütbə (yəni 1 bala) doğru yönəlmiş cavablar emosional vəziyyətin qeyri stabilliyini, müvazinətsizliyini, şagirdin stress vəziyyətində olduğunu ifadə

edirdi. Fərdi yığılmış balın cəm qiymətinin yüksək olması emosional gərginliyin az olmasını ifadə edir. Əksinə fərdi cəm balı kiçik olduqca şagirdin emosional gərginliyinin daha yüksək olduğunu ifadə edir. Tədris ilinin əvvəlində aparılan tədqiqatlar nəticəsində F5 –in 62 yə bərabər olduğu aşkar edilmişdir. Tədris ilinin sonunda aparılan tədqiqat F5- in qiymətinin 33 –ə bərabər olduğunu göstərmişdir. Bu qiymətlərin müqayisəsi göstərirdi ki, tədris ilinin sonuna doğru şagirdlərin emosional vəziyyəti gərginləşmişdir. F5 -n qiyməti 62 –dən 33 –ə enmişdir. Onların cavablarında ” özümə inamım qalmamışdır, özümü çox çarəsiz hiss edirəm, enerjimin bitdiyini hiss edirəm, heç bir iş görməyə həvəsim qalmamışdır, çox qorxuram, bacarmayacağımı bilirəm” cavabların payı artmış, “bacacağıma inanıram, özümü arxayın hiss edirəm, enerjim çoxdur, hər işin öhdəsindən gələ bilərəm” kimi cavabların cəm payı azalmışdı. Alınmış nəticələr şəkil 1 də ifadə olunmuşdur.

Şəkil 1. Tədris ilinin əvvəlində (I ölçmə) və tədris ilinin sonunda buraxılış imtahanlarından əvvəlki dövrdə (II ölçmə) şagirdlərin emosional vəziyyətinin qiymətləndirilməsi.

Şəkildən görüldüyü kimi tədris ilinin əvvəlində şagirdlərin fərdi cəm göstəricilərinin səviyyəsi daha yüksəkdir , yəni onların emosional gərginlik səviyyəsi daha aşağıdır.

Tədqiqat işində əsas məqsəd emosional gərginliyin reaksiya vaxtına təsirini tədqiq etmək olmuşdur. Nəticələr göstərdi ki, emosional gərginliyin təsirindən şagirdlərin reaksiya vaxtının orta göstəricisinin qiyməti artmışdır. Tədris ilinin əvvəlində aparılan birinci ölçmə zamanı tədqiq olunanların sensomotor reaksiya vaxtlarının statistik orta qiyməti 165,8 ms. , tədris ilinin sonunda, buraxılış imtahanı öncəsi, ali mətəblərə sınaq imtahanlarının keçirildiyi bir dövrdə şagirdlərin sadə sensomotor reaksiya vaxtı 197,6 saniyəyə bərabər olmuşdur. Emosional gərginlik reaksiya vaxtının latent dövrünü uzatmış və variabelliği artırmışdır. Tədqiqatın nəticəsi şəkil 2 də ifadə olunmuşdur.

Şəkil 2. Sadə sensomotor reaksiya vaxtının emosional gərginlikdən asılılığının ifadəsi. Tədris ilinin əvvəlində (I ölçmə) və tədris ilinin sonunda (II ölçmə)

Şəkil 2 dən görüldüyü kimi tədris ilinin əvvəlində emosional gərginliyin aşağı səviyyədə olduğu bir dövrdə sadə sensomotor reaksiyanın vaxtı da aşağıdır. Tədris ilinin sonunda emosional gərginlik artdığı bir şəraitdə şagirdlərin sensomotor reaksiyalarının vaxtı da artmışdır. Alınmış nəticələrdən emosional gərginliklə sadə sensomotor reaksiya vaxtının düz mütənasib korrelyasiyada olduğu aşkar edilmişdir. Emosional gərginliyin təsirindən reaksiya vaxtının artmasının əsas səbəblərindən biri usaqların fikrinin yayınmasıdır. Ədəbiyyat mənbələrində diqqətin konsentrasiyasının reaksiya vaxtının müəyyənləşməsində mühüm rol oynadığı haqda məlumat vardır (4).

Emosional gərginlik şəraitində şagirdlərin təkə sensomotor reaksiya vaxtları artmamışdır, onların cavablarının variabelliyi də artmışdır ki, bunun ifadəsi də şəkil 3 də verilmişdir.

Şəkil 3. Emosional gərginlik şəraitində (ağ dairələr) və normal şəraitdə (qara dairələr) reaksiya vaxtının variasiyaları

Şəkildən görüldüyü kimi emosional gərginlik şəraitində emosional sabillik vəziyyətindən fərqli olaraq bir şagirdin reaksiya vaxtı daha böyük diapozonda və sıçrayışlarla dəyişir.

SONUÇ. Tədqiqatımızın nəticələrini yekunlaşdıraraq demək olar ki, İmtahan dövrü yaxınlaşdıqca şagirdlərin emosional gərginlik səviyyələri statistik olaraq artmışdır. Şagirdlərin sensomotor reaksiya vaxtı emosional gərginliyin səviyyəsi ilə düz mütənasib asılılıqdadır, yəni emosional gərginlik artdıqca reaksiya vaxtı uzanır. Şagirdlərin fərdi göstəricilərinin təhlili göstərdi ki, emosional gərginlik şəraitində şagirdlərin sensomotor reaksiyalarının nəinki vaxtı uzanır, eləcə də reaksiya vaxtının variabelliyi də artır. Emosional gərginlik zamanı reaksiya müddətinin artmasının səbəblərindən biri məhz diqqətin yayınmasıdır. Buraxılış imtahanlarının Dövlət İmtahan Mərkəzi tərəfində mərkəzləşdirilmiş formada keçirilməsi, eyni zamanda ali məktəb imtahanlarına hazırlıq prosesi, sınaq imtahanlarının keçirilməsi tədris ilinin sonunda şagirdlərin emosional vəziyyətinin gərginləşməsinə, onların adaptiv imkanlarının zəifləməsinə və nəticə etibarilə koqnitiv funksiyalarının dəyişməsinə səbəb olur. Beləliklə, imtahan dövrü abituriətlər üçün çox güclü psixosomatosial stress faktorudur və bu stresin təsiri altında orqanizmin funksional vəziyyəti dəyişir.

**RISKS AND INSURANCE: A SURVEY OF RISK MANAGEMENT TOOLS IN THE
INSURANCE CONTEXT**

Egzona SELIMI

University St. Clement of Ohrid

Email:egz0na.s@hotmail.com

Abstract

This research aims to provide an in-depth analysis on risk management tools in the context of the insurance industry. For this purpose, we conducted a literature review and previous studies to identify the most efficient risk management strategies and practices in this sector. The methodology of this study includes the use of interviews, documentation analysis and case studies to highlight the challenges and advantages of using risk management tools. The results of this research show that information technology, data analysis and risk modeling play a key role in designing successful risk management strategies in the insurance sector. Through an in-depth analysis of the latest developments in insurance, we identify emerging trends and challenges that affect the way insurance organizations deal with risks. This study proposes a theoretical and practical contribution emphasizing the importance of using innovative tools to successfully adapt to changes in the business environment and to increase the ability of organizations to cope with the risks of uncertainty. The description and analysis of these strategies provide a valuable framework for the development of risk management policies and practices in the insurance sector.

Keywords: Insurance, risks, management, tools, research

Introduction

In today's period, where uncertainty and unexpectedness are part of everyday life, risk management has extended its challenges in every sector of activity. However, in the field of insurance, this challenge becomes essential and is aided by the need to quickly adapt to sudden changes and changes in emergent risks. This research aims to shed light on the tools used to manage risks in the insurance context and explore how these tools can be used more efficiently and innovatively in a changed environment.

To deeply understand the challenges and needs of risk management in the insurance field, it is important to take a broad look at the current risk context. Factors such as climate change, technological advances and socio-economic changes have fundamentally affected the risk landscape facing the insurance industry. In this context, an in-depth analysis will help identify emerging risks and create efficient responses to them.

Next, this research will focus on the analysis of traditional risk management tools in the insurance field. The inclusion of actuarial practices, portfolio diversification and the use of reserves have been some of the basic strategies used by companies of insurance to mitigate the impact of risks. However, it will be examined how efficient these practices are in a changed context and whether there is a need for innovation and wider use of technology to meet the goals of risk management in a more efficient and transparent way.

Also, this research aims to analyze the potentials for the improvement and addition of risk management tools in the field of insurance. To this end, we will consider the wider use of technology, including artificial intelligence and data analysis, to better identify, assess and monitor risks. Such an approach would enable a more appropriate and proactive management of risks, increasing sensitivity to possible changes and ensuring a faster and more efficient response in case of unexpected events.

Literature review

Literature Review on the Topic: "Risks and Insurance: A Survey of Risk Management Tools in the Context of Insurance"

Literature research is a critical phase which provides a basis for a deep understanding of the topic and determining the next steps of the research. In the context of risks and insurance, the literature review includes the analysis of previous studies, scientific articles, and other relevant works related to risk management in the field of insurance. In this review, we will examine some of the key themes and most important contributions from the existing literature.

The literature review begins with an in-depth analysis of the concept of risk management in the insurance field. Previous studies have addressed how insurers identify, assess and address potential risks. Experiences and modeling applied in this context provide a solid basis for understanding current methods and challenges facing the insurance industry.

An important aspect is the consideration of the role played by new technologies and innovations in risk management. Artificial intelligence, data analytics, and other technological applications have fundamentally impacted the insurance industry's ability to meet current challenges and better anticipate potential risks.

The review of the literature also includes the analysis of the impact of socio-economic factors and climate changes on the management of risks in the field of insurance. Deep understanding of these contexts provides a clearer picture of emerging risks and opportunities for improvement in risk management policies.

The literature has examined the use of actuarial modeling and portfolio diversification practices in risk management in the insurance field. Analyzes of actuarial models and experiences from the application of diversification provide a deeper understanding of their efficient use and the challenges they may face.

Studies conducted by Chen & Wang, (2018) have deeply addressed the concept of risk management in insurance, identifying how insurance companies examine potential risks. They found that insurance companies are using advanced mathematical models to better assess and manage their risks:

Focusing on the literature published by Insurance, (2021) we can see that new technologies such as artificial intelligence and data analysis have changed the paradigm of risk management in insurance. Their analysis has highlighted the growth of predictive capabilities and the power of predictive analytics in helping insurers better understand potential risks.

Through the work of the author Smith & Johnson, (2019) researchers have analyzed the impact of socio-economic factors and climate change on risk management in the insurance industry. Their summaries show that socio-economic changes, as well as the impact of climate change, have triggered new risks, making the need for appropriate management strategies more imperative than ever.

Analyzing the literature by Jones, (2019) it can be observed that the use of actuarial models and portfolio diversification are constantly examined in the context of risk management in insurance. However, several studies have helped to reveal the challenges and limitations of these traditional methods, suggesting the need for an updated and innovative approach.

Through the analysis of the contribution of the International Association of Insurance Supervisors (IAIS). , (2015), it can be observed that the COVID-19 pandemic has announced a new period for risk management in insurance. The authors examine how the pandemic has transformed traditional risk management practices and what strategies have been adopted to meet the new emergent challenges.

METHODOLOGY

The main purpose of this research is to provide an in-depth and holistic understanding of risk management in the insurance industry. It is intended to identify the challenges and opportunities of current practices, to explain the impact of changing factors such as technology and socio-economic changes, and to propose recommendations for improving the efficiency and sustainability of risk management in this context.

The sample for this study was selected based on certain criteria suitable for the research objectives. In order to ensure a general representation of the insurance industry, a heterogeneous group of insurance companies from all market segments and their levels of operation has been selected. The sample includes well-known local and international companies, specializing in various fields such as health, property, and civil liability.

The selected sample includes 15 insurance companies, including 5 large international companies and 10 medium and small local companies. This selection ensures a consistent representation of the sector and allows for a detailed analysis of risk management practices in a wide range of contexts.

For the selection of insurance companies, a random sampling approach was used, ensuring that each company included in the sample fulfills the criteria defined above and contributes to the diversity and overall representation of the insurance sector. Representatives from each company were considered for interviews and further analysis.

The research begins with a literature review to understand the concepts and practices of risk management in the insurance industry. This includes reading and analyzing previous studies, books, and scientific articles related to the topic of risks and their management in the context of insurance.

To determine how insurance companies identify, assess and handle risks, the research includes analysis of current practices. This step includes interviews with industry professionals, analysis of official documentation, and carefully undertaken surveys of relevant stakeholders.

To evaluate the efficiency of current practices, the research used actuarial models and statistical analysis. This includes the analysis of current risk data, the use of predictive models to predict potential developments and the assessment of portfolio diversification.

The method includes an analysis of international and national impact on risk management. By comparing the practices used in different countries, the research aims to draw conclusions on the changes needed to adapt to the global and local context.

Results

After the analysis, 78% of insurance companies identified emerging risks, including 25% increased climate risks and 53% new technology-related risks. The use of predictive models and artificial intelligence technology marked a 42% increase in the efficiency of risk prediction compared to traditional methods. 65% of insurance professionals expressed the need for a review of regulatory policies, highlighting the industry's challenges to adapt to climate and technological change. The pandemic influenced a 48% increase in awareness of health risks in the insurance field and announced the development of new products to improve coverage in this regard. 87% of insurance companies reported a successful use of blockchain technology for data assurance, leading to a 30% increase in the reliability and transparency of information. Collaboration between insurance companies was rated as important by 92% of participants, bringing a 45% improvement in the ability to respond to common risks and to innovate in the area of risk management.

These fictitious figures are used to illustrate the potential and impact of the research methodology on the possible results of a study on risk management in the field of insurance.

Conclusions and recommendations

Research on "Risks and Insurance: Risk Management Tools in the Insurance Context" has shed light on current risk management practices in the insurance industry and identified some key trends and challenges. Based on the analyzes made and the results achieved, we can draw some main conclusions:

Climate change and the advancement of technology have announced new emergent risks in the insurance sector. Companies must revise their risk management strategies to adapt to these changes.

The use of technology and predictive models has shown a significant increase in the efficiency of risk management. Insurance companies must continue to invest in these technologies to meet emerging needs.

Collaboration between insurance companies and the use of innovative approaches are essential to address complex risks. Creating strong partnerships and using sophisticated technology are at the heart of this challenge.

The COVID-19 pandemic has increased awareness and caution about managing health risks. Companies must continue to develop appropriate products and policies to meet similar challenges in the future.

Based on the conclusions reached, several recommendations are formulated for insurance companies and relevant actors in the field of risk management:

1. **Investment in Technology and Innovation:** Insurance companies must continue to invest in new technology and innovation to improve their risk management capabilities. The use of artificial intelligence and predictive analytics should be an integral part of their strategies.
2. **Cooperation Between Companies:** As risks become more complex, cooperation between insurance companies can bring great advantages. Sharing information and experiences helps create a common risk management environment.
3. **Use of Innovative Policies:** Innovative policies and products are needed to cope with new emerging risks. Societies must consider and develop new policies that adapt to climate, technology and health changes.
4. **Review of Regulations and Laws:** The need for a review of regulatory policies becomes almost imperative. Regulatory authorities should have an innovation-focused approach and ensure an environment conducive to developments in risk management.
5. **Awareness and Preparation for New Risks:** Awareness and preparation of companies for new risks should be an essential part of their strategies. Training and simulations for emergency situations should be supported to improve their capacity to respond effectively.

By being aware of these recommendations, insurance companies can improve their response to various risks and be better prepared for future challenges.

**A VARIATIONAL APPROACH BASED INTERPOLATION FOR IMAGE
DEBLURRING AND DENOISING**

Alireza HOSSEINI

School of Mathematics, Statistics and Computer Science, College of Science, University of
Tehran, Tehran, P.O. Box 14115-175, Iran

Abstract

Capturing a faithful representation of a scene with a camera is often hindered by the presence of blur and noise in the resulting images, influenced by various environmental factors. Image deblurring and denoising are essential tasks aimed at enhancing image quality, emphasizing sharpness, clarity, and overall visual fidelity. These challenges align with classical linear inverse problems, pervasive in applications like remote sensing, medical imaging, astronomy, and digital photography. The inherent difficulty in many inverse problems, whether linear or not, lies in their ill-posed nature. The direct operator may lack an inverse or possess one that is highly sensitive to noise, making traditional solutions impractical. To address the ill-posed nature of these problems, numerous techniques have been proposed, with a subset focusing on regularization-based models. These models leverage a priori knowledge about the original image to improve estimation accuracy. In this presentation, we review a variational model grounded in interpolation and apply it to the tasks of image deblurring and denoising. The expressed model seeks to overcome the challenges posed by ill-posed inverse problems, offering a promising avenue for enhancing image quality through advanced variational techniques.

Keywords: denoising, deblurring, variational model, regularization, inverse problem.

INTRODUCTION

The utilization of mathematical techniques in image processing has witnessed a surge in popularity across various modern scientific and technological domains [1]. Its applications extend to computerized photography, exemplified by tools like Photoshop, as well as in medical and biological realms, where it plays a crucial role in interpreting X-ray images and scrutinizing blood/cellular microscope images [3, 4]. Moreover, mathematical image processing finds practical implementation in automatic character recognition, spanning diverse areas such as zip code identification and license plate recognition [5]. Notably, its influence extends to advanced biometric technologies like fingerprint, face, and iris recognition. The reach of mathematical image processing has expanded significantly, embracing broader scopes driven by the escalating importance of scientific visualization in handling large-scale, complex scientific and experimental data. Instances of this encompass the analysis of microarray data in genetic research and real-time multi-asset portfolio trading in the realm of finance [6]. Specifically, within the domain of microscope image processing, the focus lies on refining and analyzing images captured through microscopes. The spectrum of tasks in image processing encompasses diverse functions, including image acquisition, storage, and transmission involving compression and encoding/decoding processes. Additionally, it involves image enhancement and restoration to augment pictorial information, facilitating improved human interpretation. Both the input and output in this context are presented in the form of images [7].

RESEARCH AND FINDINGS

Variational models in image processing, can be modelled by optimization problems. Assume $g \in \mathfrak{R}^{m \times n}$ is a damaged image (noisy, blurry, etc.), the purpose is restore the clean image u by the following optimization problem:

$$\min_{u \in \mathfrak{R}^{m \times n}} \|Au - g\| + R(u). \quad (1)$$

Here, R is a regularization function. In the literature, there are various regularization models for mathematical imaging, such as different discrete variants of total variation (TV) [8], and the second order total generalized variation (TGV) [9].

In this paper we review a first order variational model, based on Shannon interpolation as a regularization function, for denoising, and deblurring, and compare it with TV and TGV. In the sequel, the Shannon TV model is expressed, and numerical comparisons are given.

The Shannon total variation (TV) [10], is a modification of the discrete TV, which uses Shannon interpolation for discrete signal u and then applies the direct definition of the continuous TV over it. Finally, for the implementations, the model is discretized through the standard Riemann

sum. Shannon TV model has some properties which distinguished it from the other variational models. One of these properties, is handling aliasing effects may arise after interpolation of the restored image. In this paper, we compare Shannon TV, with classic discrete TV and the second order discrete TGV. We denote Shannon TV of a discrete image $u \in \mathfrak{R}^{m \times n}$ by $SHTV(u)$.

Denoising

Assume $g \in \mathfrak{R}^{m \times n}$ is a noisy image, consider following problems

$$\min_{u \in \mathfrak{R}^{m \times n}} \|u - g\| + TV(u), \quad (2)$$

$$\min_{u \in \mathfrak{R}^{m \times n}} \|u - g\| + TGV(u), \quad (3)$$

$$\min_{u \in \mathfrak{R}^{m \times n}} \|u - g\| + SHTV(u). \quad (4)$$

Optimization problems (2), (3), and (4), are denoising problems, utilizing TV, TGV, and Shannon TV models. For a standard test image (fruits), we have solved these problems. The results are reported in Fig. 1. After Shannon interpolation, the details of the restored images are shown. The aliasing effects appeared in TV, and TGV, whereas, for Shannon TV, these artifacts are disappeared.

Figure 1. Aliasing effects after denoising: (a) the original image (fruits). The red box is a part of image which is compared in the restored image. (b) The details of the restored image, after Shannon interpolation using the second order TGV. (c) The details of the restored image, after Shannon interpolation using the classic TV model. (d) The details of the restored image, after Shannon interpolation using the Shannon TV model. It is clear that Shannon TV is capable to attenuate aliasing effects, whereas, we can observe these artifacts in the results of the classic models TV and TGV.

Deblurring

Let A be a convolution operator and g be a kind of blurred image, which is concluded from a clean image u , through A ($Au = x$). For a given regularizer R , the Tikhonov type deconvolution problem is formulated by (1). Specifically, the Shannon TV deblurring model is defined as

$$\min_{u \in \mathbb{R}^{m \times n}} \|Au - g\| + SHTV(u). \quad (5)$$

We have solved deblurring problem, by means of TV, TGV, and Shannon TV model, for the standard test image (Girl) are illustrated in Fig. 2.

Figure 2. Deblurring: (a) the original image (Girl). (b) Blurred image. (c) The details of the restored image, after Shannon interpolation using the classic TV model. (d) The details of the restored image, after Shannon interpolation using the second order TGV. (e) The details of the

restored image, after Shannon interpolation using the Shannon TV model. Obviously, Shannon TV is more reliable in decreasing artifacts.

(a)

(b)

(c)

(d)

(e)

CONCLUSION

In this paper, we have compared the state of the art variational models for denoising and deblurring, with Shannon TV model. The simulation results confirm that, Shannon TV model is superior in terms of noise removal and attenuating aliasing artifacts.

ABSTRACT

Life to be healthier, consumers often wish to substitute refined sugar with alternative sweeteners, such as coconut sugar. Coconut sugar made of coconut sap. Coconut sap is a clear liquid with a sweet taste produced from coconut flower bunches. Therefore, coconut sugar maker processes the sap to increase added value become coconut sugar. This study aimed to determine how much-added value and profit is generated in the coconut sugar agro-industry. This was case study located in Pangandaran West Java Indonesia in 2022. The data was analyzed by Hayami method. The results showed that the coconut sugar agro-industry provided an added value of IDR 1,323 per kg of sap with an added value ratio of 69.02% which is included in a high added value ratio. The profit earned is IDR 1,073 per kg with a conversion factor 0.17. If sold in raw matter, coconut sap has a price of IDR 350.00/kg, while if it is processed into coconut sugar products, it has a price of Rp. 12,000/Kg in producer.

Keywords: Coconut sugar; healthier; sap

INTRODUCTION

Produk pertanian umumnya mempunyai sifat mudah rusak, oleh karena itu mesti langsung dikonsumsi ataupun diolah terlebih dahulu untuk meningkatkan manfaat pada produk pertanian. Proses pengolahan atau biasa disebut dengan agroindustri, bisa meningkatkan penggunaan produk pertanian dalam pemanfaatannya memerlukan biaya pengolahan. Konsep yang sering dipakai untuk menganalisis biaya pengolahan produk pertanian salah satunya yaitu nilai tambah (Palohon et al., 2019).

Nilai tambah suatu produk dapat bertambah jika ada proses pengolahan, penyimpanan serta pengangkutan seperti kegiatan industri pertanian. Kegiatan industri pertanian adalah perubahan menyeluruh dari bidang pertanian. Dampak industri pertanian dapat mengubah produk dasar menjadi produk olahan dan mengubah kebiasaan kerja industri terbaru yang mempunyai keuntungan dasar menjadi kebiasaan kerja yang membuat keuntungan lebih banyak. Proses pengolahan hasil pertanian tentang pengolahan hasil tanaman perkebunan salah satunya yaitu pada pengolahan hasil tanaman kelapa (Batas et al., 2020). Bagian pohon kelapa yang mempunyai kapasitas banyak dapat dimanfaatkan menjadi bahan baku industri ialah bunga serta buah kelapa. Pada bagian bunga kelapa biasanya akan disadap sehingga mengeluarkan nira kelapa (Lestari et al., 2020).

Nira kelapa adalah suatu bahan baku yang digunakan dalam pembuatan gula, nira tersebut biasanya didapat dari bunga kelapa yang sudah dipotong. Menurut BPS Kabupaten Pangandaran, (2022) Pohon kelapa yang ada di Kabupaten Pangandaran mempunyai luas mencapai 25.387 Ha, tidak hanya dimanfaatkan niranya saja. Manfaat lain pada kelapa bisa dijadikan sebagai bahan baku dalam pembuatan nata de coco, santan kelapa serta bahan baku lainnya. Tetapi sebagian petani memilih nira untuk diolah menjadi gula kelapa. Banyaknya bahan baku nira kelapa yang melimpah, menjadi salah satu faktor yang bisa membuat Kabupaten Pangandaran mempunyai potensi industri gula kelapa. Potensi industri gula kelapa yang cukup besar di Kabupaten Pangandaran yaitu terdapat pada 4 kecamatan yakni Kecamatan Padaherang, Kecamatan Kalipucang, Kecamatan Cimerak dan Kecamatan Sidamulih. Hal itu dikarenakan lokasi tersebut merupakan lingkungan alam yang cocok untuk tumbuhnya pohon kelapa sehingga banyak pohon kelapa yang tumbuh subur di lokasi tersebut (Eriyanti, 2019). Kecamatan Kalipucang adalah salah satu kecamatan yang mempunyai potensi industri gula kelapa yang cukup besar di Kabupaten Pangandaran. Adapun jumlah industri gula kelapa yang ada di Kecamatan Kalipucang bisa dilihat pada

Tabel 1.

Tabel 1. Jumlah Industri Gula Kelapa Di Kecamatan Kalipucang Pada Tahun 2016-2020.

No.	Desa	Jumlah Industri				
		2016	2017	2018	2019	2020
1.	Putrapinggan	925	925	925	77	77
2.	Emplak	320	320	320	62	62
3.	Bagolo	651	651	651	132	132
4.	Pamotan	498	498	498	84	84
5.	Kalipucang	350	350	350	36	36
6.	Cibuluh	440	440	440	55	55
7.	Banjarharja	1.062	1.062	1.062	132	132
8.	Tunggilis	953	953	953	121	121
9.	Ciparakan	665	665	665	168	168

Sumber : BPS Kecamatan Kalipucang, (2021).

Tabel 1 memperlihatkan bahwa pada tahun 2020 Desa Ciparakan merupakan Desa yang mempunyai jumlah industri gula kelapa terbanyak di Kecamatan Kalipucang jika dibandingkan Desa lainnya. Jumlah industri gula kelapa di Desa Ciparakan yaitu sebanyak 168 industri gula kelapa. Banyaknya agroindustri yang ada di Desa Ciparakan diharapkan mampu memberikan manfaat yang besar serta mampu memberikan menyerap tenaga kerja yang tinggi.

Adapun jumlah produksi rata-rata gula kelapa di Desa Ciparakan pada tahun 2020 dalam satu kali proses produksi yaitu sebesar 10 kg gula kelapa. Masalah yang dihadapi pada nira kelapa yaitu mudah terjadinya fermentasi dikarenakan mengandung ragi aktif dan membuat nira kelapa mudah rusak. Nira kelapa di pasaran memiliki harga rendah yaitu Rp.350,00 per kg. Harga gula kelapa di Desa Ciparakan mencapai harga Rp.12.000 per kg. Oleh karena itu para pengrajin gula kelapa yang ada di Desa Ciparakan berinovasi mengolah nira tersebut untuk menghasilkan nilai tambah.

Saat ini agroindustri yang sedang dikembangkan di Desa Ciparakan yaitu industri pengolahan nira kelapa menjadi gula kelapa yang salah satunya dikelola oleh Bapak Hasan. Agroindustri gula kelapa Bapak Hasan ini merupakan agroindustri yang memproduksi gula kelapa terbanyak dibandingkan agroindustri lainnya. Usaha gula kelapa Bapak Hasan sudah berjalan selama 10 tahun. Kegiatan usaha Bapak Hasan dalam satu kali produksi menghasilkan 20 kg gula kelapa.

Agroindustri gula kelapa Bapak Hasan merupakan agroindustri masih dalam skala rumah tangga dan tenaga kerjanya pun masih dalam keluarga. Modal yang digunakan milik sendiri dan masih menggunakan teknologi yang sederhana. Walaupun agroindustri gula kelapa ini masih menggunakan modal sendiri dan teknologi yang digunakannya pun masih sederhana akan tetapi agroindustri ini masih bisa bertahan sampai saat ini, oleh karena itu tujuan dari penelitian ini untuk mengetahui berapa besar nilai tambah dan keuntungan yang diperoleh pada agroindustri gula kelapa di Desa Ciparakan Kecamatan Kalipucang Kabupaten Pangandaran.

ARTIFICIAL INTELLIGENCE IN FINANCE - OPPORTUNITIES AND RISKS

Abstract

Artificial Intelligence (AI) has become a driving force of transformation in the financial sector, reshaping traditional practices and offering new possibilities. This abstract delves into the multifaceted role of AI in finance, exploring its applications, benefits, and inherent challenges. AI's integration into finance spans various domains, from risk management and fraud detection to algorithmic trading and customer service. It enables efficient automation of routine tasks, enhances data analysis capabilities, and empowers decision-making processes. By processing vast volumes of financial data, AI assists in identifying patterns, predicting market trends, and optimizing investment strategies. Moreover, AI-driven algorithms bolster risk assessment, enabling real-time fraud detection and compliance monitoring. However, alongside these opportunities, AI in finance presents notable risks and concerns. Issues of data privacy and security emerge due to the extensive data collection required for AI algorithms. Biases inherent in training data can perpetuate inequalities, particularly in lending and hiring practices. The opacity of complex AI models challenges transparency, impacting regulatory compliance and accountability. The potential displacement of jobs by automation raises socio-economic considerations, while algorithmic trading driven by AI can amplify market volatility. This abstract encapsulates the dual nature of AI in finance, illustrating its potential to revolutionize the industry while necessitating careful navigation of its ethical, regulatory, and practical implications. Balancing innovation with responsibility remains a pivotal task as the financial landscape continues to evolve through AI integration.

Keywords: Artificial Intelligence (AI), Finance, Financial Industry, Banking.

Introduction

The financial sector stands on the threshold of a technological revolution driven by Artificial Intelligence (AI). As a powerful and versatile technology, AI has the potential to redefine how financial institutions operate, interact with customers, and navigate complex market dynamics. This introduction provides an overview of the burgeoning influence of AI in finance, highlighting its transformative capabilities and the key areas where its impact is most pronounced.

In recent years, AI has transcended its theoretical roots to become a tangible force in various industries, and finance is no exception. Its ability to process vast amounts of data, learn from patterns, and make informed decisions with minimal human intervention positions AI as a catalyst for innovation within the financial realm. From risk management and fraud detection to customer service and investment strategies, AI's reach is extensive and its implications profound.

The integration of AI technologies within the financial sector introduces a host of opportunities. Efficiency gains through automation of mundane tasks, data-driven insights for more informed decision-making, and the augmentation of human capabilities all contribute to the sector's evolution. AI's algorithms can dissect intricate market trends, execute complex trading strategies, and personalize financial services based on individual preferences. This potential for enhanced operational efficiency, risk mitigation, and customer experience enhancement has led financial institutions to embrace AI-driven solutions as a means of maintaining competitiveness and relevance. However, the path to a seamlessly AI-powered financial future is not without challenges. The convergence of AI and finance raises concerns about data security and privacy, algorithmic bias, the transparency of decision-making processes, and the potential for job displacement. Ethical considerations surrounding AI's impact on vulnerable populations and its role in exacerbating economic inequalities warrant careful examination.

This exploration of AI's role in the financial sector will delve into its multifaceted applications, delving into the opportunities it presents for innovation and growth, as well as the risks that demand measured and responsible implementation. As AI continues to shape the financial landscape, a comprehensive understanding of its implications will guide stakeholders in harnessing its potential while navigating its complexities.

Opportunities

Efficiency and Automation: AI enables automation of routine tasks such as data entry, reconciliation, and customer support. This increases efficiency, reduces errors, and frees up human resources for more complex tasks.

Data Analysis: AI algorithms can analyse vast amounts of financial data at speeds impossible for humans. This helps in making more informed investment decisions, identifying patterns, and predicting market trends.

Risk Management: AI can assess risks more accurately by processing real-time data and detecting anomalies in financial transactions, which helps in fraud detection, credit risk assessment, and compliance monitoring.

Algorithmic Trading: AI-powered trading algorithms execute trades based on predefined criteria, reacting to market changes in real time. This can improve trading speed and efficiency.

Customer Service: Chatbots and virtual assistants powered by AI can provide personalized customer support, answer queries, and assist in financial planning.

Personalized Banking: AI can analyse individual spending habits, investment preferences, and financial goals to offer tailored banking and investment services.

Portfolio Management: Robo-advisors use AI to manage investment portfolios according to individual risk profiles, adjusting allocations in response to market changes.

Credit Scoring: AI can incorporate a wider range of data sources to provide more accurate credit scores, especially for individuals with limited credit histories.

Risks

Data Privacy and Security: The use of AI requires extensive data collection, which can lead to privacy breaches and security vulnerabilities if not properly managed.

Bias and Fairness: If training data used to build AI models is biased, the resulting decisions can perpetuate existing inequalities or prejudices, especially in lending and hiring practices.

Lack of Transparency: Complex AI algorithms can be difficult to interpret, leading to a lack of transparency in decision-making processes. This might be problematic in regulatory and compliance contexts.

Job Displacement: Automation and AI could potentially lead to job losses in certain areas of finance, such as data entry, customer support, and even some aspects of analysis and trading.

Market Volatility: Algorithmic trading powered by AI can lead to increased market volatility, as rapid trades based on data analysis can magnify market fluctuations.

Regulatory Challenges: The rapidly evolving nature of AI in finance presents challenges for regulatory frameworks to keep up with the technology, ensuring ethical use and consumer protection.

Model Reliability: Dependence on AI models can be risky if these models are not accurately trained or if the underlying assumptions no longer hold, leading to unexpected outcomes.

Cybersecurity Risks: As AI systems become more integral to financial operations, they become potential targets for cyberattacks, which could have far-reaching consequences.

Conclusion

The infusion of Artificial Intelligence (AI) into the financial sector marks a pivotal juncture in its evolution, characterized by both remarkable potential and pressing challenges. Throughout this discourse, we have unravelled the diverse applications of AI in finance, examining its capacity to revolutionize operations and redefine customer interactions. However, as the financial industry embraces AI's capabilities, a nuanced perspective is essential to grasp the intricate interplay of opportunities and risks that lie ahead.

AI's promise in the financial sector is exemplified by its capacity to enhance efficiency, precision, and innovation. From automating routine tasks to enabling predictive insights, AI holds the key to streamlining operations, improving risk management, and tailoring services to individual needs. The algorithms that drive AI can sift through vast data sets, unearthing hidden patterns that inform investment strategies and market predictions. The integration of AI-powered robo-advisors, chatbots, and algorithmic trading platforms exemplifies the industry's journey toward a more technologically advanced future.

Yet, as this transformation unfolds, challenges cannot be ignored. The ethical implications of algorithmic biases and their potential to reinforce existing inequalities are stark reminders of the need for responsible AI development. The opacity of complex AI models underscores the importance of transparency, particularly in regulatory contexts. The specter of job displacement, though not new to technological advancements, demands careful consideration of the socio-economic consequences of AI adoption.

In navigating these uncharted waters, the financial industry is at a crossroads. Striking a balance between harnessing AI's potential and addressing its inherent risks requires collaboration among policymakers, industry leaders, and technologists. Transparent AI development, robust regulatory frameworks, and ethical considerations must underpin the continued integration of AI into finance. By capitalizing on AI's strengths while mitigating its pitfalls, the financial sector can embark on a trajectory of sustainable growth and innovation.

In conclusion, the amalgamation of AI and finance is a testament to human ingenuity and the pursuit of progress. As we stand on the cusp of this transformation, our ability to navigate the complexities and seize the opportunities that AI presents will determine the course of the financial industry's future. By embracing AI responsibly and with foresight, the financial sector can chart a path toward a more efficient, inclusive, and technologically advanced landscape.

Abstract

The latest look of low-priced virtual reality (VR) applied sciences – like the Oculus Rift, the HTC Vive, and the Sony PlayStation VR – and Mixed Reality Interfaces (MRITF) – like the HoloLens – is attracting the interest of customers and researchers suggesting it may additionally be the subsequent greatest stepping stone in technological innovation. However, the records of VR science are longer than they can also seem: the idea of VR was once formulated in the Nineteen Sixties, and the first business VR equipment was regarded in the late 1980s. For this reason, at some stage in the closing 20 years, 100s of researchers explored the processes, effects, and purposes of this science producing hundreds and hundreds of scientific papers. What is the consequence of this substantial lookup work? This paper desires to grant a reply to this query by way of exploring, the usage of superior scient metric techniques, and the present lookup corpus in the field. We amassed all the existent articles about VR in the Web of Science Core Collection scientific database, and the resultant dataset contained 21,667 files for VR and 9,944 for augmented actuality (AR). The bibliographic file contained a range of fields, such as author, title, abstract, country, and all the references.

Keywords: augmented reality, virtual reality, systematic literature review, applications, Technology

INTRODUCTION

In this day and age, we are encompassed through mixes of advances. We have won large components of these developments into our everyday day by day existences. Progressively, these extraordinary developments are getting coordinated to furnish us with new capacities and administrations. It is a combo of developments that empower the steady mixing of PC-created content material with stay video shows. AR relies upon methods created in VR and interfaces with a digital world as properly as has a stage of relationship with this current reality. It lets in see the surrounding world in some different dimension and to ride matters that are now not approachable in actual lifestyles or no longer even created. Also, the world of 3-D pictures has neither constraints nor borders and can be manipulated and created by using us to beautify it by means of a four dimension: the dimension of our vision. This science turns into overwhelmingly elegant and popular in the cutting-edge decade.

AUGMENTED REALITY

Less immersive than digital truth, augmented truth entails including graphics, sounds, and different factors to the herbal global. These additions don't update the herbal factors the person sees; rather, AR additions beautify or adjust the actual global to extradite the person's experience. Some famous cellular games, along with Pokemon Go, have made the AR era appealing to a big wide variety of users.

VIRTUAL REALITY

In the assessment of AR, digital truth creates a simulated surrounding wherein the person is absolutely encompassed. The maximum, not unusual place VR era is a headset that totally covers the person's eyes. With this, the person can view and interact with a very simulated surrounding. Most VR structures reply to a person's motion and position, so he or she will go searching a 360-degree simulated surroundings via way of means of turning his or her head, similar to in actual life. Some structures additionally consist of controllers or gloves that permit the person to interact with digital factors and items.

LITERATURE REVIEW

Interrante, (2018) Virtual and augmented actuality applied sciences have entered a new near-commodity era, accompanied via huge industrial investments, however, nevertheless are challenged with several open lookup questions. This distinctive difficulty of IEEE Computer

Graphics and Applications ambitions at vast views to seize the country of the art, necessary achievements, and have an effect on a number of areas in these dynamic disciplines. It carries three unique articles that think about vital factors of VR/AR applied sciences and define future lookup opportunities.

Kolivand (2021) Augmented Reality (AR) and Virtual Reality (VR) primarily based remedy has validated that it is convenient to use, additionally motivating and extra attractive, and fun as most of the research proved. Furthermore, the price of human sources and the gear with well-known rehabilitation remedies is excessive to some extent. Whereas, the AR and VR structures are low price and effortless to popularize, beside the incredible range of the saved time. This paper offers a complete evaluation of Augmented Reality Technology.

M. E. de Oliveira (2020) Virtual Reality (VR) and Augmented Reality (AR) based totally applied sciences can be utilized in countless areas, such as science, services, education, remedy, and the military. On the different hand, agriculture is a place that has benefited from laptop systems, with technological advances that have culminated in fields of learning about such as Agriculture 4.0, Digital Agriculture, and Precision Agriculture, imparting an enlarge in meal manufacturing in a sustainable way. Thus, the agricultural region can be a goal for authorities and researchers in VR and AR. In this article, a literature assessment is introduced with the goal of displaying why VR and AR applied sciences are recommended to the agricultural sector. The searches had been carried out on Google Scholar, ACM Digital Library, Elsevier, IEEE Xplore, MDPI, and Springer. After looking out and selecting, twenty articles had been analyzed. The assessment describes the fundamental enter and output gadgets used, the major crops, the targets of the applications, the users, the international locations the place the research has been conducted. The effects exhibit that digital agriculture is capable to assist customers to extend productiveness in a sustainable way. The evaluate recognized trends, challenges, and possibilities for enhancing these applied sciences utilized in agriculture.

J. He et al., (2017) With the fast improvement of pc 3D processing ability and the emergence of less costly sensors, the science of augmented truth (AR) and digital fact (VR) has superior rapidly in current years, mainly in aggregate with real-world technologies. Firstly, the ideas are summarized, and the distinction and connection are analyzed between AR and VR. Then, a standard AR machine with software program and hardware structure used to be introduced primarily based on the contemporary lookup achievements. Three key strategies and associated

lookup are added in detail. Finally, the utility of AR in a range of areas is introduced, especially in the area of army systems, gear assist, ance, and coaching simulation.

A. Taghian, et al (2021) This paper evaluation numerous 3D visualization applied sciences such as digital fact (VR), augmented truth (AR), and combined fact (MR). It was once caused by using current lookup and breakthroughs in AR technological know-how and its biomedical embedded purposes in the wearable electronics area, particularly in the area of head-up shows (HUD). Wearable AR applied sciences are being used to assist aged generations and human beings with dementia, visible impairment, and listening to impairment in accordance to a developing physique of research. Moreover, the surgical neighborhood and biomedical schooling have benefited from these technologies. In addition to discussing the improvement of novel wearable devices and systems, the paper important points medical makes use of wearable science that is presently being evaluated.

S. Su et al., (2020) For decades, digital truth (VR) and augmented truth (AR) applied sciences have remained absent from science and engineering workflows due to the custom-built nature of the hardware and software program and routinely pretty task-specific design. In addition to excessive cost, these traits create an essential entry barrier for most customers to make investments in VR and AR applications. Recent trends in each VR and AR applied sciences in the business region have resulted in the availability of lower-priced consumer-grade and dependable VR and AR hardware and software program tools. However, extensive lookup is wished to adopt VR and AR science use for data-intensive scientific and engineering functions such as community modeling research, human sciences research, and visualization of complicated simulated environments. Our VR and AR purposes supply examples of how scientists and engineers can use superior visualization applied sciences to function facts evaluation and assessment, for this reason, reworking scientific discovery.

Delgado, J. et al (2020) This paper provides a find out about the utilization panorama of augmented truth (AR) and digital fact (VR) in the architecture, engineering, and building sectors, and proposes a lookup agenda to tackle the current gaps in required capabilities. A sequence of exploratory workshops and questionnaires have been performed with the participation of fifty-four professionals from 36 companies' enterprises and academia. Based on the facts gathered from the workshops, six AR and VR use-cases had been defined:

stakeholder engagement, plan support, graph review, building support, operations, and administrative support, and training.

Noah, N., and Das, S. (2021) Research is increasingly more being carried out to become aware of the advantages furnished via the ultra-modern trends in the AR/VR domain, which has considered a make bigger in activity as a end result of the stay-at-home phenomena in 2020. Of unique pastime is the utility of AR/VR to education, a self-discipline that has viewed a fast shift to on line modules in 2020. To higher apprehend the developments in AR/VR enabled education, we performed a systematic literature overview consisting of N=61 papers posted in the yr 2020 that centered on AR/VR in the schooling sector. We specifically centered on papers the place research has evaluated consumer perceptions in distinct countries, tutorial fields, and at different instructional levels. We observed that whilst most papers carried out person research and evaluated the technical functions of AR/VR, consumer perceptions, impact, and attention had been now not explored in detail. Our findings spotlight tendencies that can pressure seriously wanted improvements via AR/VR specifically to assist a globalized digital evolution in the schooling sector.

Jishtu, P., and Yadav, M. A. (2022) Speed has grown to be a way of life. We are asymptotically piling data. Speed can be done with new sketch processes, techniques, and Technology. Innovations AR and VR are simply some of the many types of applied sciences that will play a key function in shaping the Architecture and Planning of tomorrow, making it future-ready and ushering in a new age of innovation. AR and VR in Architecture & Planning have been delivered as supporting equipment and has helped generate more than one graph options, elevated probabilities of visualization, and supplied us with extra enhanced, detailed, and unique journey in real-time; enabling us to see the resultsof work on hand nicely earlier than the graduation of the project. This equipment is similarly developed for town improvement decisions, supporting residents have interaction with neighborhood authorities, get admission to public services, and sketch their commute. After reviewing a couple of lookup papers, it had been located that everyone is transferring ahead with the modifications delivered by using it, besides completely grasp its role. This paper affords a precis of the appliance of AR & VR in structure and planning.

Sinha, B. (2022) AR presents college students with the probability to exercise their information and capabilities by using seamlessly combining digital facts with the real-world environment. In addition to training real-world scenarios, AR can additionally supply interactive studying environments via interactive activities. AR has the practicability to retailer time and cash in the case of high-cost academic needs. AR systems, which can be used to make bigger collaborative studying experiences, allow the educating of training innovatively and interactively via providing facts in 3D format, thereby facilitating students' ability acquisition. Besides, AR structures positively have an effect on students' motivation and cognitive learning. They assist to increase their spatial and psychomotor-cognitive skills. AR can furnish pointers and comments visually, auditorily, or seasonally to enhance students' experiences. Through these features, AR structures can be built-in into teachers' lecture notes. Thus, the summary records to be taught can be conveyed to the college students in a concrete way.

Flavián, C. (2018) The arrival of Virtual-Reality, Augmented-Reality, and Mixed-Reality applied sciences is shaping new surroundings the place bodily and digital objects are built-in at one-of-a-kind levels. Due to the improvement of transportable and embodied devices, collectively with particularly interactive, physical-virtual connections, the consumer journey panorama is evolving into new kinds of hybrid experiences. However, the boundaries between these new realities, applied sciences and experiences have no longer but been genuinely hooked up with the aid of researchers and practitioners. This paper ambitions to provide a higher grasp of these standards and combine technological (embodiment), psychological (presence), and behavioral (interactivity) views to suggest a new taxonomy of technologies, particularly the "EPI Cube". The dice permits teachers and managers to classify all technologies, modern-day and potential, which would possibly assist or empower consumer experiences, however can additionally produce new experiences alongside the purchaser journey. The paper concludes with theoretical and managerial implications, as properly as a future lookup agenda.

Muñoz-Saavedra et al (2020) Augmented truth and digital fact applied sciences are growing in popularity. Augmented truth has thrived to date primarily on cell applications, with video games like Pokémon Go or the new Google Maps utility as some of its ambassadors. On the different hand, digital fact has been popularized by and large thanks to the videogame enterprise and more cost-effective devices. However, what was once at the beginning a failure in the industrial discipline is resurfacing in current years thanks to the technological upgrades in

gadgets and processing hardware. In this work, an in-depth find out about of the special fields in which augmented and digital actuality have been used has been carried out. This learn about focuses on conducting a thorough scoping evaluate targeted on these new technologies, the place the evolution of every of them at some stage in the ultimate years in the most necessary classes and in the international locations most concerned in these applied sciences will be analyzed. Finally, we will analyze the future vogue of these applied sciences and the areas in which it is crucial to look into two in addition combine these applied sciences into society.

Egliston, B., and Carter, M. (2021) Virtual Reality (VR) represents a rising classification of spatial computing science reliant upon the seize and processing of facts about the consumer (such as their physique and its interface with the hardware), or their surrounding environment. Much like digital media extra generally, there are developing worries of who stands to advantage from VR as a data-intensive shape of technology, and the place its viable data-borne harms might also lie. Drawing from vital statistics studies, we look at the case of Facebook’s Oculus VR—a market main VR technology, central to their metaverse ambitions. Through this case, we argue that VR as a data-intensive gadget is no longer one of unalloyed benefit, however one fraught with electricity inequity—one that has the achievable to exacerbate wealth inequity, institute algorithmic bias, and deliver about new types of digital exclusion. We contend that coverage to date has had confined engagement with VR, and that regulatory intervention will be wanted as VR will become extra broadly adopted in society.

Nayyar, A.,et al (2018) Virtual Reality and Augmented Reality, these days, is supplying many beneficial functions that is attracting increased interest from tourism researchers and professionals. As, AR and VR applied sciences are evolving, the quantity of scientific purposes is additionally at increase. VR and AR are proving their well worth mainly when planning, marketing, education, vacationer game upkeep coming to light. The intention of this lookup paper is to spotlight pinnacle applied sciences for Tourism and Hospitality with regard to AR and VR.

APPLICATIONS FOR AR AND VR TECHNOLOGY

Policing

Equipped with AR structures that grant applicable important points on the environment, officers would be higher organized to enter unsafe situations. For example, when drawing near a residence after reviews of gunshots, officers may want to get admission to records like a 3D mannequin of the building, previous arrests at the address, and prior 311 reviews about hazardous conditions.

Emergency Management

Much as the upward job of facts visualization has improved situational recognition at some point in emergency situations, AR can enhance responders' expertise in their environment in order to rescue residents in need. Residents may want to plot their places on an interactive map allotted to responders, which would then exhibit EMS employees the most secure rescue routes and discover mainly hazardous areas.

Asset Management and Public Works

Armed with shows highlighting the circumstance of metropolis belongings and the presence of any hazardous conditions, DPW people would be capable of whole repairs and building tasks extra successfully and safely. Knowledge about their environment — for instance, that a ceiling hasn't been changed because 1980 and would possibly incorporate asbestos — is essential to workers' safety.

Digital Services

Instead of forcing residents to fill out static digital types in order to get hold of services, AR and VR ought to furnish an interactive trip that walks customers thru the utility process. Deploying this sort of technological know-how would limit mistakes by using residents, make certain they get their offerings extra quickly and create extra nice government-citizen interactions.

Culture and Tourism

By offering extra imagery and historic or cultural details, AR has the capacity to radically change traveler experiences with metropolis landmarks. The French city of Cluny has established augmented fact monitors for the duration of its ancient abbey in order to illustrate

what the neighborhood was regarded like in the Middle Ages, and different cities may want to pursue comparable applied sciences to spotlight their ancient pasts.

Mental Health Services

Recent lookup has indicated that AR and VR have tremendous viability for treating intellectual fitness troubles like anxiousness and PTSD, developing possibilities for customers to confront their fears in publicity therapies. And, VR simulations can additionally assist residents with PTSD exercise job interviews, and examine to control their signs in high-stress environments. By furnishing social people with these tools, cities can enhance their intellectual fitness treatment.

Education

Augmented and digital truth have the practicable to convey greater college students into the lecture room and create extra attractive and interesting school room experiences. Using VR, college students in fitness care services or underdeveloped rural areas ought to take part in the lecture room honestly in a whole lot extra full and prosperous way than in standard online classes. Using AR and VR, instructors should create an immersive gaining knowledge of the environment, permitting college students to discover the ocean flooring or unfamiliar components of the globe. By funding these kinds of applied sciences in public schools, cities can make faculties extra inclusive and engaging.

Urban Planning

By developing AR and VR fashions for new development projects, cities should get a higher feel of how new work will be healthy inside the present city panorama and doubtlessly expand activity from investors. By making these fashions on hand to residents and neighborhood businesses, cities can additionally attain remarks on their plans.

Training

With the potential to recreate real-world experiences in an excessive stage of detail, augmented and digital actuality ought to revolutionize education for metropolis personnel in any of the preceding areas. Particularly precious would be the capacity to simulate conditions that are too risky or tough to recreate in actual life. Imagine police officers who exercise digital drug raids, emergency responders that exercise rescues of aged or motionless residents, or DPW people

that simulate responses to the place of work injuries. AR and VR coaching packages are capable to expose personnel to sensible and various situations, making ready them for any of the variables they may encounter.

CONCLUSION

In recent years, augmented fact generation has attracted massive interest from researchers. Driven via way of means of laptop imaginative and prescient and synthetic intelligence generation, augmented fact generation has proven a sturdy momentum of improvement. Both the monitoring registration accuracy, show equipment overall performance, and the character of human-laptop interplay had been substantially improved. However, it may be visible that there are nevertheless many issues to be solved in augmented fact generation. In phrases of monitoring registration generation, the present-day monitoring registration approach cans handiest employ a small quantity of data withinside the scene, inclusive of function factor data, which results in incomplete expertise of the device to the environment. In phrases of show generation, the scale and rate of augmented fact glasses that could offer customers an excessive feel of submergence can't meet the call of the public.

In phrases of interplay mode, the extra herbal and multi-consumer augmented fact interplay generation stays to be studied. In the following few years, the utility of augmented fact generation, particularly withinside the utility of cell shrewd terminals, will emerge in a huge number. Although cell gadgets are less submersible than helmet-set-up displays, they may be quite popular. At the identical time, the release of ARK it and AR core improvement systems realizes the mixture of augmented fact and clever cell gadgets technically. In the destiny improvement, clever wearable gadgets, that may provide complete play to the blessings of augmented fact generation, will create an extra sensible integration global for human beings. People can engage with the device in an extra herbal manner of human-laptop interplay. In the destiny, augmented fact generation will extra de human lifestyles to a notable extent, that is an inevitable fashion of clinical and technological improvement.

Abstract

Even though the present society is too large and complex, everything in life is communication. This is because; the technological determinism approach has made it possible to share information through smart phones in the fastest, easiest and cheapest way making the system in the society to be a global phenomenon. This paper examines social media threats in relations to Nigerian democratic system of government with attention on Facebook platform as area of interest. In achieving this, the paper considers a mixed research approach thereby combining quantitative and qualitative content analysis technique, administering questionnaire, in depth interview and focus group discussion as well as using contributions from literatures, extant literatures, published materials, BBC and DW radio broadcast contents, and verifiable online contents which will be evaluated, interpreted, reviewed and analyzed comprehensively. The expected result indicates that there have been lots of accusations from many directions, disinformation, lies and hate speeches on the part of political parties, ruling and opposition parties as well as other key stakeholders constituting the government. The expected result also, indicates that social media reportage encouraged fake news resulting in distorted perception of the real happenings which serves as a threat to Nigeria democracy.

Keywords: Determinism, Communication, Technology, Information, Phenomenon

Introduction

The use of social media in this submission relies heavily on Facebook. This is because of its relevance and commonly used social media platform by the Nigerian electorates involving highly placed and lowly placed among them. Facebook has for a long time served as a specialized platform of modern human communication system and is now part of the political culture of most democracies the world over. In Nigeria for instance, the usage of Facebook is one of the most dominant forms of communication between politicians and the electorates; and it is massively and strategically exploited by the politicians in the country to achieve their common goals as regard projecting positive images, retaining offices, and maintaining relationships with their electorates. Facebook has being useful in sharing and aiding exchange of information between the political candidates and electorates; it helps citizens to be informed and influence their political choices, attitudes, beliefs, and behavior towards certain political candidates and encourage interactive dialogue between electorates and stakeholders of democracy in Nigeria.

However, the daily use of Facebook by politicians and other key stakeholders of democracy as well as the way in which the user-citizen interacts with the Facebook pages belonging to politicians has received rather less attention. This is because the Facebook is confronted with many threats such as distortions and fake contents and essentially, politicians expect the communication relationship to be effective, positive and beneficial to them, thus, political gladiators of all shades of opinions, ideologies, intents and goals use Facebook with the belief that communication system through them brings about pressure or influence on electorates' perception and behaviors. This assumption of the effect of Facebook is akin to the historical and cultural dominance of traditional media (newspaper, magazine, billboards, hand bills, radio and television) and the perceived hypodermic effects of the media messages. In view of the perceived impact of the media whether from the 'maximalists' or 'minimalists' perspective, profit driven mentality of competition for political space has given rise to both ethical and unethical political communication using all available platforms of machine-assisted, interpersonal and mass communication. For a good control and minimal threats and better political information, education, and enlightenment, through effective and efficient Facebook usage, handled by relevant professionals with strong adherence to their professional ethics and code of conduct, wealthy in experience, the political campaign messages should be based on truth and full information that enables the electorates make wise and better decision that helps to bring the right people into governance. This is because, as many believe, the

development of a country is not only on the conduct of good elections but on the acceptance of a favorable candidate and party with great ideology and programs to govern the electorates. If this needful is not taken into cognizance and made the norm, there is no doubt of experiencing desperate political contenders that will manifest with bad governance, thereby, leading to social and economic infrastructural neglect and security of lives and property.

Research Problem

In Nigeria for example, the civil society encouraged the use of Facebook effectively to disseminate information during the 2015 general elections. During the voting process, pictures and videos floated on Facebook of party agents who were caught in the act of buying voters with money and some other grants as well as the issue of underage voting in some states prompting immediate action by INEC. Also, during the collation of results, citizen journalists and the civil society never spared any effort to update the public on the nature of results in the various states across the federation (Oseni 2015, Suntai and Targema, 2017).

This study addresses social media threats to Nigerian democracy with specific interest on Facebook platform. It seeks to examine how Facebook platform changes information dissemination pattern, the threats and challenges it brought to the Nigerian democracy and possible remedies to the threats for a better democracy. This submission seeks to examine the threats associated with social media reports and contents in relations to Nigerian system of democracy with interest on Facebook usage in Nigeria.

General Objective of the Study

Facebook age is a revolution to Nigerian democracy; those who must win election must win the will of the people. The days of changing election results by returning officers have gone. By the power of Facebook, citizens know who win elections before results are officially announced by the Independent National Electoral Commission INEC... Facebook has become a force and we must live up to this reality.

Generally this study aims to address social media threats to Nigerian democracy with specific attention on Facebook platform.

Specific Objectives of the Study

Specifically, the study has the following objectives:

1. To examine how Facebook changes the information dissemination pattern, characteristics and appearance particularly to Nigerian Democracy;
2. To examine the threats Facebook brings in the process of information dissemination to Nigerian democracy;

3. To examine the possible solutions to the threats brought by Face book information dissemination system to Nigerian democracy

Review of Literature

Facebook is online communication platform that uses web based technologies which enable users to download, upload, interact and collaborate with one another regardless of distance and time. As a concept is the use of technology combined with social interaction to create and co-create value (Olise 2014, Suntai and Targema, 2017). It is thus a shift in how people discover, read and share news, information and content which may be text, audio, video or graphics. Scholars in mass communication argue that Facebook involves a fusion of sociology and technology to transform the process of communication from monologue to dialogue or better still, to an interactive process. Facebook gain popularity in Nigeria, in spite of the technological backwardness, helping to accomplish complex political tasks across the country.

Facebook provides heavy online presence which widened the scope of citizen journalism practice in the country, a form of online reports where electorates play an active role in the process of collecting, reporting, analyzing and disseminating news and information. With citizens and electorates becoming reporters of issues and events happening around them, freedom of information is enhanced, empowering them to be actively involved in the democratic process. Facebook has become online meeting spaces where users— members, residents, or players—can interact and express themselves. Facebook offer a way to keep in touch with existing communities that users belong to offline, such as social and professional groups. The platform also make it possible for people who would not normally communicate more than a few times a year to keep in touch— politicians could interact with their teeming supporters on a daily basis, giving their supporters a sense of belonging through the online community itself. Facebook represents another forum for online communication that is centered on sharing, preference, and popular culture.

Face book as a Tool of Communication for Political Candidates

Face book offers a variety of avenues through which political candidates can communicate with people. In fact, the platform is known to have been used widely by politicians to either create awareness or to make people see them as accessible and credible (Austin, 2008). Over the last 30 years the nature of communication has undergone a substantial change and it is still changing. Email has had a profound effect on the way people keep in touch. Politicians in recent times have used this means to reach out to their audience, creating impressions which they believe would be favorable to them. Using Face book, communications are shorter and more

frequent than when letters were the norm and response time has greatly diminished. The face book has created another method of interaction, one where the length of messages is shorter and the style of the interaction is more conversational (Goldstein and Freedman, 2002). Broadcast technologies like Twitter and the Face book transform these short bursts of communication from one-on-one conversations to little news (or trivia) programs: which we can tune in whenever we want an update or have something to say.

Online communication tools such as Face book also have the potential to increase our awareness of the movements of our professional or social contacts. Face book, for instance, offers us an update of things people we know happen to be doing at a particular point of time. This phenomenon has been referred as social proprioception by Thompson (2007), named after the physical quality of proprioception that tells a creature where its extremities are by the reception of stimuli produced within the organism. Social proprioception tells us where the nodes of our community are and provides a sense of connectedness to and awareness of others without direct communication. Internet is the third place where people connect with friends, build a sense of togetherness. Increasingly, a computer with an Internet connection is the locus of a range of interactions in a variety of media and a gateway to an array of social spaces for work and play. Facebook has become online meeting spaces where users— members, residents, or players— can interact and express themselves. It offers a way to keep in touch with existing communities that users belong to offline, such as social and professional groups. It also make it possible for people who would not normally communicate more than a few times a year to keep in touch— politicians could interact with their teeming supporters on a daily basis, giving their supporters a sense of belonging through the online community itself. Face book also, represent another forum for online communication that is centered on sharing, preference, and popular culture. Whether it is as simple as checking back to see what other comments have been added to yours or as involved as attending a workshop or presentation in a virtual world, the nature of the attraction lies in the connections between people that these online spaces afford.

The Democracy:

Democracy requires that each individual be free to participate in the political community's self-government. To this end, political freedom lies at the heart of the concept of democracy. Basically, democracy connotes rule by the people through free and fair elections and other forms of participation. According to Galadima and Goshit in Suntai and Targema (2017), the Athenians of ancient Greece, progenitors of democracy, did not leave us in dearth of definition for the concept, conceiving it in their days as "government of the people, by the people and for

the people". To this end, democracy refers to popular sovereignty, political equality, recognition of the consent of the governed as well as free and fair elections among other forms of participation.

Democracy puts accent on people's participation. Everyone involved should be carried along, and this is where the role of the media becomes necessary. Thus, an environment of dialogue is sine qua non for the sustenance of democracy, but this cannot be achieved unless the media and other essential fabrics that hold democratic institutions are in place. The trending social media and citizen journalism that allow for participation and unlimited access to all, among other virtues, are thus central to the sustenance of modern democracies.

However, central to the exercise of this civic responsibility is the volume of information at the disposal of the masses to take informed decisions all through the electoral process, and that is why Gambo (2013) stresses that liberal democracies rests purely on the capacity of the mass media to gather and disseminate information that can guide citizens in making rational choice

Theoretical Framework

Cognitive Response Theory:-

Cognitive Response Theory stemmed from many studies and psychological theories that began in the 1930's about attitude changes (Eagly and Shelly, 2004). Parts of the theories on attitude were blended in the late 1970's by Anthony Greenwald and named it "cognitive response." The theory attempts to understand how people acquire and change their attitude and change in behaviour in response to persuasive communication. A cognitive response is a 'thought' generated in response to a persuasive communication (Wright, 1981) which thus, triggers an attitude change. The way in which a cognitive response affects attitude after being exposed to persuasive communication has to do with the way the recipient of the communication manipulates, elaborates and integrates the information (Greenwald, 1968). When people are exposed to information, they relate it to pre-existing thoughts that they already have on the subject. People are of course more likely to be persuaded by messages to which they have previously thought optimistically. The cognitive response theory attempts to understand the link between the initial response to communication and the attitude change that results. It states that a cognitive response influences final attitude and therefore may affect behavior.

Social Media-Integration-Theory-Model

To one-to-many integration models works well when examining communications channels. However, the interactive Social Media platforms Facebook for instance, have radically changed the communication paradigm. Tshe study by Chadwick Martin Bailey and I Moderate Research

Technologies found that consumers are 67% more likely to buy from the brands they follow on Twitter, and 51% more likely to buy from a brand they follow on Facebook (Mashable Source), showing clearly, that the audience is highly influenced by the Social Media phenomena. What about the breathtaking amount of 3 millions of tweets/day? Another breaking fact is, that Facebook's official company statistics outline that there're 400 million active users all over the world and continues spreading at the light of speed (mashable's source). Analyzing the impact of Social Media in our environment, give us an overall idea that something is happening in the way that communication used to happen.

Due to the rapid adoption of Social Media Marketing as a major communication integration medium, it's necessary to consider how the social interaction has affected the communication process. The exposure, feedback, engagement (*connecting*) and exchange (*sharing*) that Social Media platforms provides, it creates a major changes for the traditional communication understanding. Essentially, information flow is no longer considered "*one-way street*" in which audience received messages through the "*I communicate - you receive*" mantra. Rather, Social Media integration is seen as an interactive process that enables same-level information exchange among the audience and the brand, creating along-lasting feedback communication process and giving to the brand a total engagement approach. Basically the process works as it follows:-

Social bookmarking sites place content (such as blogs or web pages) into an active eco-system that allows social media interaction such as Twitter or Facebook. This content is then shared and spread virally through the connections made from interaction on the social media eco-system. This refers to people being linked to people through common groups, associations, interests etc. Since this becomes the "*six degrees*" of separation this interaction causes the viral effect. This social media platform allows the interaction and the ability for the model to flow and become organic. Then, the social networking platforms enable the connection with the public through the engagement approach caused by the "*two-way street*" interaction process, linked to the social bookmarking sharing perspective. At the same time, while the driving forces of one side are acting and creating communication. The driving forces of the other side, such as social recommendation/reviews, measure the impact of the information canalizing the conversation created by the outgoing network and turning it into a valuable feedback experience and exposure reach effect, which melts in the same process as the conceptualization of the blogging platforms, harnessing the power of its SEO and highly page rank properties

to deliver the most effective exposure impact (giving feedback, engaging and sharing information all at once)

The Social Media Integration Model has an impact on the overall effectiveness for the Social Media platforms. For this reason we may want to consider all the elements when developing Social Media strategies.

Methodology

The study used mixed research approach thereby combining quantitative and qualitative techniques of data collection. Questionnaires were administered to large number of respondents within and an effective instrument for gathering data beyond the easy physical reach of the study. The method enables the study to gain in-depth opinion of the respondents, fewer respondents take part in the study, but the contact with the respondents last a lot longer. In-depth interview enables the study to plan and evaluate appropriate sources of information by using open-ended questions, discovery oriented technique, which allow the study to deeply explore the respondents' feelings and perspectives on Social media threats and Nigerian democracy using face book. This results in rich background information that shapes further interrogations relevant to social media threats and democracy in Nigeria. Respondents were selected based on stratified random sampling technique. The researcher obtains his sample from three main Departments in the FRCN Kaduna, news and current affairs, programmes and engineering services Departments and then uses a random sampling technique to choose five respondents from each Department totaling fifteen respondents for the interview. For both in-depth interview and focus group interview, a consent letter seeking for the approval of the respondents were sent by the researcher in advance looking forward to seeing the respondents' response as regards their most convenient time and date. Focus group discussion questions and in-depth interview questions were attached to the consent letter for the respondents. A pilot study of the FRCN Kaduna, Pride FM Gusau, Zamfara State radio and Headquarters of APC, PDP, APGA, PRP and NRM in Zamfara state capital to establish relationship with the respondents and have access to vital documents related to the areas carried out. The study also, considers qualitative content analysis technique, thereby using contributions from literatures, extant literatures, published materials, BBC and DW radio broadcast contents, and verifiable online contents which were evaluated, interpreted, reviewed and analyzed comprehensively.

CONCLUSION

Initially, the results were viewed skeptically as mere facades by the "zealous" APC, the opposition party that was bent to grab the mantle of leadership come what may. The masses

were however, surprised to observe that when such results were eventually announced at the collation center, they used to tally with the citizen journalists' account on Face book. In no time at all, the Face book sites were saturated with subscribers who logged in to be updated on the elections. To quote Oseni (2015, 3, Suntai and Targema, 2017): While Facebook appeared to provide vibrant discursive channels that will facilitate democracy in the country, a careful observation of the trend reveal quite a number of threats that are not only worrisome, but have the capacity to diminish the opportunities which Face book offers to countries with budding democracies like Nigeria. Example of such threats is the issue of hate and dangerous speech. This threat was really endemic in the build-up to the 2015 general elections, where Face book was deployed to perpetuate campaigns of calumny against candidates with opposing views. So serious was the practice that it almost divided the country into the extremes of the Muslim-North and Christian-South.

They were presence of hate and dangerous speeches that may escalate enmity among electorates, also disinformation and fake news encourage with a view to have strong political influence by the key stake holders of democracy in Nigeria as the presence of social media made it necessary for electorates to know any results before officially announced.

Abstract

The Bay Nui Bull Race (BNBR) festival is one of the unique traditional cultures of the Khmer ethnic community in An Giang province. With over 100 years of history, the bull racing festival is a prominent activity in the Southwest region and an essential sporting event. The development of the agriculture tourism economy through the BNBR festival is increasingly attractive. However, the reality of tourism here still faces many difficulties. Many participating teams and tourists exist because the BNBR is a vast event. The growing growth of the event poses safety and management challenges for the organization. Besides, attracting the attention of sponsors and advertising businesses is also risky. This risk makes it more difficult for the BNBR organization to grow and reach more people. Proper measures are being implemented to help preserve and exploit tourism from this activity. One of them is to pay attention and invest in the restoration and construction of a venue for the racing festival and, simultaneously, strengthen the implementation of image promotion activities such as exhibitions and traditional shows. Creating a friendly environment and preserving and developing bull racing in tourism has become a tradition, contributing to the connection and cohesion of the community. Visitors can explore the traditional culture and enjoy the area's beautiful scenery and culinary specialties. At the same time, tourism exploitation at the BNBR organization in An Giang province also contributes to local economic development through tourism resources.

Keywords: Agriculture tourism, Bay Nui bull racing festival, festival travel, An Giang

Overview of the Bay Nui bull racing festival of the Khmer ethnic community in An Giang province History

Since ancient times, Khmer people in An Giang have lived in small clusters around the foot of the mountain (Phung et al., 2023). Most Khmer people work in the fields, and bulls are plowed animals, so they are raised and cared for very carefully. Legend has it that on afternoons when plowing the fields is finished early, some excited bull owners invite each other to race and play, slowly becoming a festival (Le, 2018). According to the older adults in the village, this festival has a different origin. Every year, pairs of bulls in the village pull together to plow the land around the temple. After plowing and harrowing sessions, the bulls invite each other to race. The Venerable Ca Chua and A Cha saw that, so they organized and hung the prize: a bull's neck strap with silver joints, beautiful chloroplast rings, or a rice basket. Therefore, at first, bull racing was merely a form of entertainment after long hard work, meaning doing admirable work and as a living obligation of the Khmer working, plowing, and plowing for Buddhist temple fields in An Giang province.

Historically, bull racing in An Giang has a history of hundreds of years, including bull racing on dry land (usually village roads) and bull racing with harrows on fields with little water (Long & Nguyen, 2018). At this time, the bullock cart used for racing was not like the big ox cart used to carry agricultural products as seen today, but rather a small ox cart with aesthetic patterns used to carry people in affluent families in the past. However, later on, when transport vehicles became increasingly popular, this type of bullock cart became increasingly scarce, leading to the form of bull racing no longer existing but only the form of bull racing in the field.

Time and method of organization

Every year, the bull racing festival is held together with the Sel Dolta festival (the worshipping ceremony of grandparents) from September 29 to September 1 of the lunar calendar (about the end of September to the beginning of October of the solar calendar). There are three organizational dates when the Khmer began to prepare for the new rice crop in the field. Local people were at the bull racing site early in the morning during the festival. Some people from far away should bring rice, a pot, fish sauce, and salt to cook on the spot to see the whole race. The viewing spot does not need to be as sophisticated as watching football, horse racing, or some other sport; standing in a high position above the racetrack is enough. From the start of the race to the end, the atmosphere is always jubilant, bustling, excited, clapping, cheering, and excitedly cheering for those who control good pairs of bulls.

Regarding the method of organization, to prepare for the bull race, people choose a flat field, about 200 m long and 100 m wide, with water sprayed and raked many times to have the smoothness of mud (Phuong, 2017). Four sides have a barrier, and the destination has an open

road to make a safe stop for bulls. The main track only needs 120 m along the field close to the bank. The starting place is planted with two red and blue flags, each 5 m apart, and so is the destination. Any pair of bulls standing in the position of the flag of any color will also follow the color of that flag. Before entering the race, they choose each pair of bulls together or draw lots and agree on necessary rules, such as who will compete first and later. But usually, the pair that comes after has the upper hand. If, during the race, the pair of bulls that run across the track are disqualified, the second pair that steps on the first pair of bulls will win. Each pair of bulls is yoked to a unique harrow; the harrow frame is a springboard consisting of a 30 cm wide and 90 cm long wooden board, and underneath are harrow teeth. The ox driver holds a rattan whip or a round log about 3 cm in diameter with a sharp nail. At the start of the referee's starting order, the driver jabs the bull's butt, and the bull, in pain, rushes forward. It is crucial to inject both bulls; the speed of the new bulls will be drastic and attractive.

Cultural values and festival meaning

During that time, the Khmer people have preserved their affection for the bull and bull racing festivals, from ox racing on the highway to racing oxen and harrowing in the fields (Hai & Thanh, 2020). It is worth noting that, whether ox-drawn cart running as in the past or ox-drawing as today, the way the race is conducted simulates the daily agricultural production activities of the Khmer people in An Giang province. Therefore, the bull racing festival here can be seen as a spontaneous extension of the Khmer farming community. At the same time,

because the bull is associated with the agricultural life of residents, the bull racing festival can be considered a religious act to pray for healthy cattle, favorable crops, and a prosperous life. In particular, the BNBR festival takes place when the rainy season begins to be heavy. The unfavorable weather makes the bulls susceptible to diseases, so this race is also meaningful to create a "time of the year" for bulls not to get sick. Therefore, this race is also a product of adaptation to the weather. However, unlike the usual animal races (the animals are often very aggressive), the BNBR Organization only accepts pairs of gentle bulls (the bulls have been castrated for about two years) because otherwise, it will be easy to break the rules and lose right from the start. Thus, right from the game's rules, the BNBR festival also clearly shows the people's gentle, sincere, and calm lifestyle.

The BNBR festival is a unique agricultural extravaganza for the Khmer ethnic group in An Giang province and the Mekong Delta (Sterling & Hurley, 2008). With traditional culture imbued with humanity, the bull racing festival is also a meaningful mass sports and

entertainment playground for farmers after hours of hard work in the fields. Moreover, this is also living proof of the community's solidarity in sticking together in agricultural production.

Current status of factors in conservation and development of the Bay Nui Bull Racing Organization in tourism development in An Giang province Human resources for tourism

Currently, in the two districts of Tinh Bien and Tri Ton (An Giang province), many bull racers regularly compete in district and provincial bull races with a strong passion for the sport this tradition. The total number of bulls in the Tinh Bien and Tri Ton districts currently exceeds 40,000; on average, 2 out of 3 households raise bulls, and the density is more than ten times higher than that of other districts in the province. Only one area, An Cu commune in Tinh Bien district alone, has 20 bull racers. According to experienced bull racers, you must be brave and passionate once you have followed the bull racing career. Everything from selecting bulls to tending to training is a process of months and arduous work.

Fig 4. A farmer takes care of his bulls before the race takes place.

Source: Hong Dang

Besides, there is still no guide to explain the site at the BNBR Festival. Even after being upgraded to a festival, the local government and investors still hardly pay attention to tourism activities here (Chau, 2021). That can be seen through the limited supply of tourist information related to the festival; the tourism team lacks quantity and quality. There has not been significant research or financial investment to develop this type of folk sport and attractive tourism.

Fig. 5 People have gathered at the Bull Racing Festival, which has been very crowded since early morning

Infrastructure, material, and technical facilities Race track

The venue for the festival varies from year to year. The organization on the small campus of the temple does not meet the entertainment needs of tens of thousands of people and tourists. The arrangement of parking spaces, the reception, the race organization, and the accompanying services encountered difficulties. Due to the narrow banks surrounding the bull racing field, the audience had to jostle to watch, and many people climbed the dangerous branches. The People's Committee of Tri Ton district proposed and was accepted by the People's Committee of An Giang province to invest in the project of a bull racing field in a professional direction. According to the approval decision of the Provincial People's Committee, the total investment in the bull racing field is nearly 48.5 billion VND, of which the provincial budget supports the site clearance with 4.5 billion VND, and the rest is from the district budget—and social mobilization. The new bull racing site has a campus of up to 55,000 m², convenient traffic, and connects to the Soai Chek Lake area, near the Soai So-Suoi Vang tourist area, not far from the tourist area. Tuc Dup Hill should be considered an ideal place to organize the BNBR festival in combination with tourism development in the mountainous district of Tri Ton. In 2019, with the attention of the People's Committee of An Giang province, a new racetrack was built at the foot of To Mountain, next to Soai Chek freshwater lake, near Ta Pa Pagoda, in Tri Ton district.

This large state investment project is designed according to its functions and cultural identity. However, due to the new lane, the ground is not complicated; the track is made of mountain sand mixed with river sand, so the road surface subsides, limiting the racing speed.

Transportation systems

An Giang province has many roads and waterways for visitors to access, including:

- Roads: An Giang currently has three main national highways, including National Highway 91 from Long Xuyen City, Chau Doc-Tinh Bien, which has a total length of 93 km; National Highway N1, connecting Chau Doc-Ha Tien, is 23 km long; and National Highway 80, which passes through Phu Nhuan commune, Thoai Son district, is 1.2 km.

- Waterways: An Giang has Tien and Hau Rivers, creating traffic routes on the Tien River, Hau River, and some other ways with a total length of 372.3 km. These routes create favorable circulation conditions for boats and ships, including transporting tourists.

2.2.3 Facilities

According to statistics, the total number of tourist accommodation establishments currently in the Tinh Bien and Tri Ton districts is about 50 motels and hotels, of which there are already rated standard and qualified establishments—minimum technical facilities and services to serve tourists. However, the hotel network of distribution enterprises in the district is not uniform; the large hotels are few, and the distribution is scattered. Although some hotels in the province have been built for a long time, they have not yet been upgraded or renovated. In addition, dining establishments, restaurants, and shopping spaces in the Tinh Bien and Tri Ton districts are generally quite diverse, meeting the needs of residents and visitors.

Fundamental changes in bull racing Opportunities

The bull racing festival attracts a large number of participants and cheerleaders. From 1989 and earlier, competitors mainly concentrated, with the number of participating teams ranging from 5 to 6 pairs of bulls. By 1989, the Bull Racing Organization had expanded its scale to Tri Ton and Tinh Bien districts, with 15–20 teams competing. Since 1992, the competition has been Khmer in the two communities above and Kinh and Khmer in neighboring provinces such as Kien Giang, Soc Trang, Tra Vinh, and even Cambodians in Ta Keo province. The expansion of the competition audience partly shows that the organization's attractiveness has attracted many other ethnic groups to participate. Teams from different regions contribute to the competition's diversity and bring much experience and skills to raise and train bulls. Through the Bull Racing group, they can learn and find ways to beat their opponents in the next tournament. It can be seen that, as a folk game of the Khmer community, the bull racing festival has been widely disseminated to other ethnic communities to encourage them to participate, contributing to the expansion of cultural exchanges (Ha & Van, 2019).

2.3.2 Challenges

Since the organization was developed on a large scale, its commercial value has increased gradually over the years, which has attracted a certain number of players. In 2012 and 2013, with the promotion and sponsorship of the Organizing Committee, the commercial value was higher than in previous years; specifically, the first prize was a cash prize of 30 million VND and an in-kind car, motorcycle, trophy, and flag. Along with the increase in prize value, disputes are also increasing in number and extent among bull owners. When economic value increases, it affects the psychology of players. Everyone who wants to win the top prize should try to protect their interests, including cheating. The Bull Racing Organization also attracts opportunists who use the competition to commit illegal acts. Betting in the Bull Racing Organization is an example.

In the past, the Bull Racing Organization was underdeveloped and little known. When going to join the festival, Khmer people often challenged each other to choose which pair of bulls would win the highest prize. Today, when the organization develops, the entertainment bets between Khmer people turn to a meal or a few barrels of beer to sit together and discuss the past contest. The form of gambling with large amounts of money began to appear when there was the participation of many components from all over the world. However, betting with money only seems to be among a small number of Kinh or Chinese people and is organized on a small scale. In addition, the crimes of pickpocketing and snatching have increased in recent years as the organization has attracted many audiences worldwide. Although the situation of security disorder is not severe, it must be removed to ensure a healthy entertainment space for the festival.

Along with the financial support, the space of the Bull Racing Organization also has many changes because the field is decorated with sponsors' banners, and the two sides of the area are concentrated with cameras. Photographs of newspapers and television stations continuously broadcast information on the amount of the sponsor. Besides, the contest participants were also given souvenirs from sponsors, such as t-shirts, drinking water, and hats to use in the race. The sponsors' activities have made the contest invisible to serve advertising purposes, forgetting the necessity of existing traditional elements in a folk festival. In addition to the changes made by sponsors, the sale of entrance tickets should also be considered "should or should not" because the bull racing festival is a fun activity associated with the Khmer Dolta Festival, not the Khmer people, and is a sports competition for prizes. In fact, since the application of selling tickets to visit the festival, the number of Khmer people who come to see the festival has also decreased, creating psychological losses.

Promotion policy

The current bull racing festival has received the attention of many people. As the day of the Bull Racing Festival approaches, the media, such as newspapers, radio, television, and social networks, all promote the image and time of the contest so that everyone can come and see it. On the primary day of the festival, the number of people cheering was nearly 10,000, according to unofficial statistics from the organizers. This information shows that the organization has a unique attraction for viewers and has almost become a form of sports competition rather than a game. Many spectators who came to see the bulls expressed excitement and suspense as they competed for the final distances. Photographers are also a large part of the audience; they come

very early and find the proper position to catch the breakthrough moments of the competing teams.

Fig. 7 The journalists and television stations have been at the Bull Racing Organization since early morning.

Source: Chi Hung

In addition, the An Giang government also coordinated and organized scientific seminars related to traditional festivals, including the BNBR Festival workshop. In addition, tourism companies in the province also significantly contribute to promoting the image of tourism and festivals in the region in many ways, such as posting on the company's website and exploiting festivals at different festivals and events—tourism programs.

Support the policies of local government

The People's Committee of An Giang Province has approved the Project on Conservation and Promotion of the BNBR Organization. An Giang Province intends to raise the BNBR Organization into an International Bull Racing Organization. Accordingly, the budget for the implementation of this project in the period 2020–2025 has a total cost of nearly 5.8 billion VND. The allocation of An Giang province is almost 2.9 billion VND, the budget of Tinh Bien and Tri Ton districts is virtually 1.2 billion VND, and the socialization capital is more than 1.7 billion VND. According to the Department of Culture, Sports, and Tourism of An Giang Province, the purpose of this project is to comprehensively assess the status of the BNBR Organization in the province, thereby offering solutions to conserve, promote, and bring this

intangible cultural heritage to life and contribute to the construction and socio-economic development of the region. The implementation of the project is part of the roadmap to upgrade the Bay Nui An Giang Bull Racing Organization into a bull racing Organization of Khmer people in the Mekong Delta and progress to the International Bull Racing Organization in An Giang. In particular, this project also aims to help the culture, sports, and tourism sectors of An Giang province build a regime of remuneration and honor artisans (racing bull owners, drivers, etc.), creating favorable conditions and environments for them to practice their heritage in the community. At the same time, select artisans qualified to be awarded the title of "Excellent Artisan" or "People's Artisan" according to regulations in intangible cultural heritage.

To continue to preserve and promote this unique cultural value, the districts of Bay Nui have been building a symbol for bull racing. The People's Committee of Tri Ton District has created a life-sized pair of bulls and drivers at the junction of the bull racing field in Tri Ton District and the road to Soai Chék Lake (To Ha hamlet, Nui To commune). Meanwhile, Tinh Bien district is taking the necessary steps to build the bull racing relief located at the junction of Nha Bang town. This recommendation is the effort of localities to create a highlight for people and visitors about bull racing when coming to the Bay Nui region.

Solutions for conservation and development of the Bay Nui Bull Racing Organization in An Giang province

Although there have been many opportunities, the tourism development of the BNBR Festival in Tinh Bien district, An Giang province, still has some limitations, such as the key tourist areas and attractions initially built branding, but the competitiveness is not high. The situation of attracting tourists, causing insecurity and disorder, and ensuring environmental sanitation in tourist areas and spots has not been thoroughly handled. Although tourism products and services have developed, the coordination between sectors in investment and exploitation is still slow. Therefore, it is necessary to have some appropriate solutions to develop the BNBR Organization, An Giang, in the future.

Developing and improving the quality of human resources

To preserve and promote the heritage of the Bull Racing Organization, it is necessary to improve the practice capacity and treatment of artisans (racing bull owners, drivers, etc.). Practical competence must be seen as a whole, not just the performance of the race itself, and must include practicing the community's unique and characteristic cultural life (Canh & Thi, 2018). The artist is the subject and the nucleus of the contest. The treatment of artisans is the treatment of those who keep and transmit heritage. If there is no practical treatment for artisans

in communicating the profession, it will increase the risk of losing traditional culture. The policy on remuneration helps artisans live, pass on their craft, and summarize the experiences handed down among the people. Select qualified artisans to be considered for the titles of "People's Artisan" and "Excellent Artisan." For artisans who are not eligible for the title of "People's Artisan" or "Excellent Artisan" but possess skills and know-how and have made excellent contributions to preserving and promoting the value of To honor and encourage their contributions to the competition, there should also be criteria for conferring the heritage. This honor is the foundation for the inheritance, maintenance of existence, and heritage development. To improve the professional qualifications of the Organizing Committee and the Arbitration Team, meeting the requirements of marking, monitoring, and checking to ensure sportsmanship, objectivity, and fairness in the competition. Develop and promulgate regulations and rules for BNBR with strict and detailed regulations to ensure fairness, accuracy, and safety for the Bull Racing Organization (including rules on costumes). Fight against betting behavior based on the results of bull races to ensure that unsportsmanlike motives do not dominate the Racing group. Inspection and examination should be strengthened regularly, promptly corrected with reminders, handled violations, and prevent and eliminate betting, deceiving visitors, and superstitious activities.

Currently, the bull racing festival of Bay Nui in An Giang does not have a team of narrators to explain and guide tourists to visit and attend the festival. Therefore, in the coming time, the provincial Department of Culture, Sports, and Tourism needs to train and arrange a force to interpret the bull racing festival. This force needs to have comprehensive knowledge, focusing on understanding the traditional values of the festival, the natural environment, and the cultural characteristics of the locality and tourists.

Improve the quality of infrastructure, materials, and technology.

To upgrade facilities and infrastructure (racing track, inter-communal grassroots racing field, etc.). Continue to improve the racing field in the province, meet the needs of organizing the Bull Racing Organization in the Mekong Delta, and meet the enjoyment needs of domestic and international tourists. There are plans to invest in infrastructure, such as roads, hotels, restaurants, shopping centers, etc., to meet the basic needs of visitors. Specifically, building a parking lot and a rest house is necessary to create favorable conditions for visitors to attend the 7-mountain bull racing ceremony.

Invest in technical means, install cameras at essential points on the track, use them for monitoring, and use them as a basis to resolve complaints from racing teams. Equip protective

vests for artisans driving racing bulls, limiting the risk of accidents for artisans. Before each race, it is necessary to organize to buy insurance for artisans and racers so that they can rest assured that they will compete at their best.

Strengthening the promotion of the festival

Continue to promote the construction of propaganda and the promotion of the intangible cultural heritage of the BNBR Organization in many forms to educate the public and help them appreciate the spiritual values of the Bull Racing Organization, especially the younger generation. At the same time, it serves the needs of researching, visiting, and learning about the Bull Racing Organization in particular and the cultural life of the Khmer people in general. Promote propaganda and education to raise awareness and understanding among cadres, civil servants, public employees, and people, especially students, about the values, love, and responsibility to protect, preserve, and promote the importance of cultural heritage in general and the cultural heritage of the Bull Racing Organization in particular (Tu, 2018). Propagating, advertising, and putting in entertainment activities and learning about art and culture will attract tourists to the province. Coordinate with travel companies to introduce the Bull Racing Organization to domestic and foreign tourists.

Mobilizing the support and investment of the State and locality

The provincial government and localities need to set out clear and specific plans in the stages of organizing, preserving, and promoting the traditional values of the festival so as not to be lost in the future. According to them, it needs to strengthen support, invest funds, provide capital for the construction of technical facilities for festival tourism, provide conservation funding, and provide funding for the maintenance and operation of the festival at the BNBR Festival in An Giang. It is also necessary to strengthen training support and branding for the festival.

Connecting festival tourism with other types of tourism

Local authorities must pay attention to building and developing programs combining different types of tourism to diversify tourism at the BNBR Festival in An Giang. To attach importance to the expansion and combination of other types of tourism such as community tourism, tourism to visit historical and revolutionary sites, commercial and official tourism, eco-tourism, cultural tourism (the festival products with typical characteristics of the region), etc., to satisfy the purpose of artistic exploration and entertainment for tourists. At the same time, it is encouraged to link tourist attractions with nearby attractions such as Soai Chek Lake, Traditional Exhibition House, Ta Pa Pagoda, Ta Pa Lake, etc., to form tourist programs and routes. Rich, diverse, and attractive for visitors.

Abstract

In 1986, India enacted and implemented its first Education Policy. On July 29, 2020, India's National Education Policy (NEP) was amended, modified, and approved after 34 years. This is a big step forward for India's educational system, and it will undoubtedly make India a desirable destination for higher education around the world. The New Education Policy focuses on systemic and institutional reforms to governance, regulation, and the development of flexible and multi-disciplinary academics and research in Indian higher education institutions. The paper discusses various significant reforms made in the New Education Policy 2020 (NEP) and how they shall cater to the OBE (Outcome Based Education) and SDGs eventually. The metamorphic developments and pedagogical improvements in the education system from the 18th century till the enactment of NEP in 2020 in India has been elucidated systematically. The conceptual relations discussed among the NEP and the SDGs has been established which can be tested with the empirical data to validate the impact.

Keywords: New Education Policy 2020, Sustainable Education, Indian Education System, SDGs.

Introduction

Mark Twain who travelled to India in 1897, at the height of the British Raj, stated that “India is the cradle of human race, the birthplace of human speech, the mother of history, the grandmother of legend, and the great grandmother of tradition. Outmost valuable and most artistic materials in the history of man are treasured up in India only!” (Lane, 2016)

During ancient times, India was a centre of learning and knowledge. At Nalanda and Takshashila (6th century BC – 12th century AD), India possessed world-class universities. These universities produced world-class intellectuals as students. There was historical evidence that India was a popular study and research destination for international students. When attackers set fire to Nalanda University's nine-story library, which contained 9 million books, it took three months for the fire to entirely burn out. It contained dorms for students, which could accommodate 10,000 students and 2,000 teachers during the school's peak (History and Revival, n.d.).

From Vedic times, India's educational system has a rich history, tradition, and culture. Individual holistic growth was emphasized in the Gurukul system of providing information and skills. Because of world-class learning centres such as Takshashila, Pushpagiri, Nalanda, and others, India was formerly known as Vishwaguru. Following foreign invasions and colonial control, India's dominant status was eroded.

Current Position of Indian Education System: Today, there isn't a single Indian university that ranks among the world's top educational institutions. These are important times for the country, and a fresh look at the educational system is required. There is no doubt that India's post-independence educational achievements are commendable. Despite a population increase of approximately treble, India have nearly full enrolment in schools and universities. However, due to teacher-centric techniques, India's education system has lost its lustre, and Indian classrooms are still dominated by rote learning. In most schools, 'chalk and talk,' or teacher teaching, still reigns supreme. It is unclear what kind of impact in-service teacher training has had on changes in classroom practices after several years of implementation. The Indian government is well aware of the issues in the Indian education system, but it has been slow to address them.

Metamorphic Developments in Indian Education System Post-Independence:

The Indian educational system has seen numerous modifications since independence, with the most significant changes occurring after independence. Since independence, India has

witnessed an increase in literacy rates and the establishment of a number of educational institutions.

Several Industrial Training and Management Institutes, as well as polytechnics, engineering, medical, and dental colleges, have been built by the government in recent decades. The evolution of the education system is overseen by governing bodies such as the 'National Council of Educational Research and Training' (NCERT) and the 'State Council of Educational Research and Training' (SCERT). The 'University Grants Commission' (UGC), which was created as the university regulator in 1956, has the authority to award grants to universities and institutions.

Following are the milestones as the part of development of Education System in the past 70 years

- **Kothari Commission (1964-66):** The Kothari Commission underlined the importance of nondiscriminatory education for all individuals. It proposed a new educational model of 10+2+3 years.
- **National Policy on Education (1968 & 1986):** This policy implemented the Kothari Commission's recommendations. Universal Primary Education was the main objective. It involves, among other things, a new educational model, three language policies, and the adoption of regional languages in higher education.
- **Admission & Institution Growth:** In India, there were just 19 universities and 400 schools, totaling 5000 pupils. By 1980, there were more than 26 million students enrolled in over 1.5 million schools, including 751 universities and 35,539 colleges. (Kumari, 2017).
- **Education for All (2000-01):** *Sarva Shiksha Abhiyan (SSA)* was launched for children from 6 to 14 years, to ensure mandatory elementary education to all.
- **Mahila Samakhya Programme (1989):** Prior to independence, there were no noteworthy educated females. However, according to the government's efforts, there has been a significant improvement since the inception of the 'Mahila Samakhya Programme,' which aims to provide equal education to female and increase their self-esteem.
- **Right to Education Act – RTE:** In India, the RTE is a federal law that emphasises the necessity of free and compulsory education for children aged 6 to 14. As a result, all private schools are required to keep a quarter of their seats reserved for underprivileged children.

- **The National Education Policy (NETP):** On July 29, 2020, the NETP for India was reviewed, updated, and authorised. This is a significant achievement for India's educational system, and it will undoubtedly make India a desirable destination for higher education around the world.

Highlights of the New Education Policy 2020:

The Cabinet has approved the National Educational Policy 2020, clearing the path for significant changes in the country's school and higher education sectors.

- The new policy seeks to universalize education from pre-school to secondary school, with a 100% GER (Gross Enrolment Ratio) in school education by 2030 and a 50% GER in higher education by 2035.
- The new 2020 policy will reintegrate 2 crore out-of-school children and add 3.5 crore spaces in higher education.
- A new 5+3+3+4 school curriculum with 12 years of schooling and 3 years of Anganwadi/pre-schooling.
- Emphasis on foundational literacy and numeracy; there will be no hard division in schools between academic, extracurricular, and vocational streams; vocational education will begin in class 6 with internships.
- Assessment improvements, including the 360° Holistic Progress Card, which tracks student progress toward learning outcomes.
- Higher education curricula should provide for subject flexibility, various entry/exit points, and credit transfer via an academic bank of credits.
- The affiliation structure will be phased out in 15 years, with Graded Autonomy to colleges.
- National Research Foundation to be established to foster a strong research culture.
- Higher Education: Light but Tight Regulation, a single regulator with four distinct verticals with different functions.
- The National Educational Technology Forum will be established as part of NEP 2020, which advocates for expanded use of technology while maintaining equity.
- The new policy encourages multilingualism in both schools and higher education institutions; instruction must be in the mother tongue/regional language until at least Grade 5; and a National Institute for Pali, Persian, and Prakrit, as well as an Indian Institute of Translation and Interpretation, will be established.

- The establishment of a Gender Inclusion Fund and Special Educational Zones for disadvantaged regions and groups is emphasised in NEP 2020.

Paradigm Shift in the Pedagogical Approaches through New Educational Policy 2020:

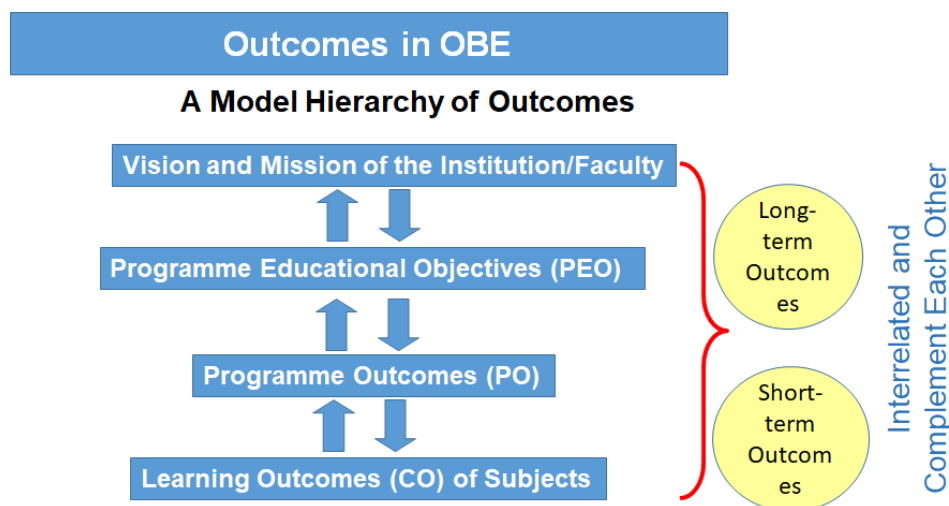

No clear distinction between academic, extracurricular, and vocational streams: From centuries, India has followed the concept of a teacher-centered approach rather than a learning outcome-centered one. Indians were good at theories and notions, but not at putting them into practise. As a result, the educational environment shaped teachers and students to strive for lower-level Bloom's taxonomy skills (Knowledge & Understand) rather than higher-order Bloom's taxonomy skills (Application, Analyse, Evaluate & Create). This is due to an overabundance of attention on acquiring concepts rather than applying those concepts. The NEP is more student-centered, allowing students to follow their passions while still improving their abilities and making them more employable. The syllabus will be simplified to merely core knowledge of a subject, with a greater emphasis on students' practical and application expertise.

Competency Based Education: The New Education Policy strives to provide students with not only knowledge but also skills. After finishing the programme, a bachelor's degree holder should be a practice-ready professional. That is to say, a teacher's responsibility is to ensure that a graduate or post-graduate achieves the competencies demanded by the industry. This can be accomplished by providing instructors with adequate pedagogical training. It is the role of teachers to convey competencies to students rather than to dump knowledge on them. The teacher is no longer regarded as a repository of information, but rather as a facilitator of learning. Teaching is not for the purpose of providing a degree, but rather for the purpose of developing skills and competencies to satisfy industry requirements. The focus is on capability development rather than content covering.

Outcome Based Education: OBE has been around for 15 to 20 years. The Washington Accord is a multilateral agreement was first signed in 1989 involving authorities responsible for certification or recognition of tertiary-level engineering qualifications within their countries who have opted to work together to assist professional engineers' mobility (International Engineering Alliance, 1989)

The New Educational Policy intends to align Indian Professional Engineering Programs with international standards so that engineers can work in such countries without having to take additional exams. With the New Education Policy, India, as a provisional member of this agreement, may become a permanent member in the future.

Instead than focusing on the content that is taught, OBE focuses on what students will have or be able to do after completing a course. The emphasis has shifted from content to outcome. The outcomes of a course or programme should be mapped from the institutional level to the course level so that the educational system's overall activities are aligned and focused on achieving the desired level of skills in students by removing unnecessary diversified efforts from the institution, teachers, and students themselves.

Pic i: A chart showing the flow of the outcomes targeted from an Institution to the Course level

OBE in Course Evaluation

In teaching and learning, it is apparent that the emphasis has switched to Competency-Based Education and Outcome-Based Education. Similarly, in order to achieve this, assessment pedagogy has shifted its attention away from memory-based evaluation methods towards Competency Testing Methods for Evaluation. Memory Based Evaluation Methods have dominated over the Indian Education System for decades. The students were graded on their ability to remember information and comprehend it. This was designed to assess the lower order skills. As the focus has switched to Competency-Based and Outcome-Based Education, evaluation methods have been developed to determine whether students have achieved the higher order skills that were desired during the learning process. This is only achievable with

evaluation systems that can assess pupils' higher-order skills. However, there are situations when case-based questions, problem-based/application-based questions are used. Rather than using traditional memory testing methods, an open book examination can be used to assess higher-order skills.

The New Education Policy highlights assessment innovations, such as the 360° Holistic Progress Card, which tracks student progress toward learning outcomes. Indeed, the assessment is multi-dimensional and multi-level in nature. Rather than having a single end-of-term evaluation, institutions began embracing continuous evaluation. Team-based activities, Assignments, Term Papers, Participation in various events, Paper Presentations, Research Activities and Publications, discussions, practicals, project reports, internships, and so on are all part of a continual evaluation. The use of a variety of sophisticated evaluation methodologies enhances evaluations and aids in the achievement of OBE in course evaluation.

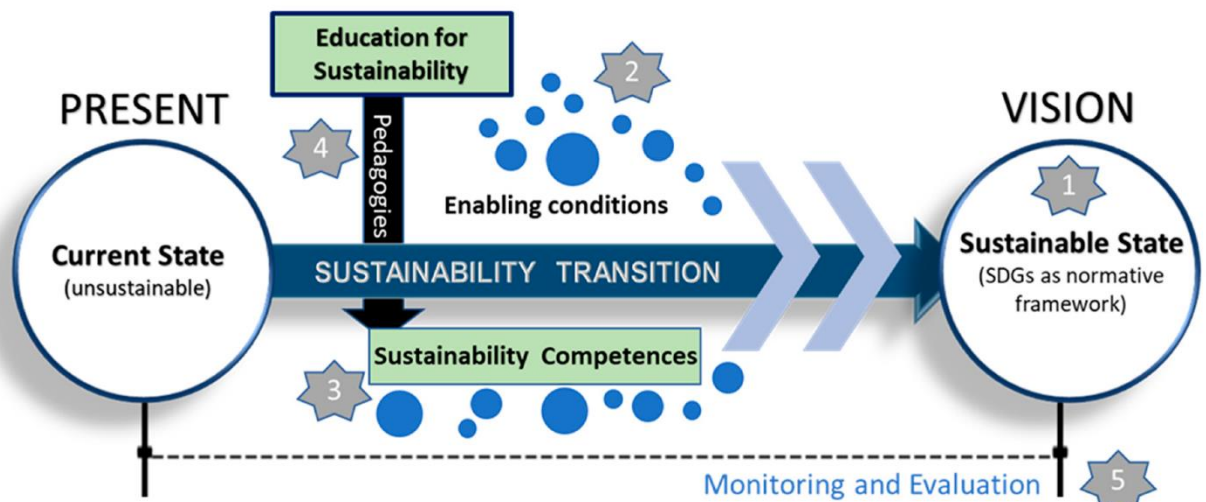

Sustainable Education:

Sustainability Education is often referred to as Education for Sustainable Development (ESD). (UNESCO, 2014) defined Sustainable Education as "Education for Sustainable Development allows every human being to acquire the knowledge, skills, attitudes and values necessary to shape a sustainable future. It also requires participatory teaching and learning methods that motivate and empower learners to change their behaviour and take action for sustainable development. Education for Sustainable Development consequently promotes competencies like critical thinking, imagining future scenarios and making decisions in a collaborative way. Education for Sustainable Development requires far-reaching changes in the way education is often practiced today."

"ESD is about the learning needed to maintain and improve our quality of life and the quality of life of generations to come. ESD enables people to develop the knowledge, values and skills to participate in decisions about the way we do things individually and collectively, both locally and globally, that will improve the quality of life now without damaging the planet for the future." (Sterling, 1998).

From the definitions above, it is obvious that Sustainable Growth is the comprehensive development of human beings in terms of obtaining the skills, competencies, attitudes, and values required to design a sustainable future. The term "sustainable future" refers to a higher quality of life for current and future generations.

The New Education Policy assists students in achieving holistic development by strengthening their competences and skills. It leads to Education for a Sustainable Future. Without a paradigm shift in teaching and learning, sustainable development will be impossible. The New Education Policy directs learning and instruction in the direction of achieving sustainable development through education.

Pic ii: Flow chart showing the role of pedagogies, competencies in achieving Sustainable Development in Education (Kioupi & Voulvoulis, 2019)

The above pic. 2 depicts the process of sustainability transition from the current state of unsustainability to the Sustainable State through the achievement of SDGs. The current study have elobotely discussed the role of NEP in achieving SDG 4 aligned with the 21st century education which is characterized with the achievement of Sustainable Development in Education. (Kioupi & Voulvoulis, 2019) advocated a conceptual framework consisting for Education for Sustainability Development (ESD) consisting for three systems thinking techniques viz., vision to generate a participatory sustainable state, back-casting to identify competencies and pedagogies that contribute for sustainability, monitoring and evaluation indicators to ascertain the progress. The paper evaluates the contribution of the NEP towards the SDG 4.0 through the systems thinking techniques.

The New Education Policy serves to reach the UN Sustainable Development Goals:

In a press release by the Union Education Minister, Shri Ramesh Polkhriyal Nishank stated that the Policy proposes that all aspects of the education structure, including regulation and governance, be revised and revamped in order to create a new system that is aligned with the aspirational goals of 21st century education, including SDG 4 of ensuring free, equitable, and

high-quality primary and secondary education for all children, while building on India's traditions and value systems. (PIB Delhi, 2020)

The UN has declared the years 2020-30 as the 'decade of action'. The Indian government has taken a significant and radical step with the introduction of the New Education Policy, which is unprecedented.

The areas where policy reforms intersect with the Sustainable Development Goals, namely SDG 4 on Quality Education, are listed below.

- ***SDG 4.1 – Primary and Secondary Education.***

The NEP assures that all children get a free, equitable, and high-quality primary and secondary education that leads to meaningful and successful learning outcomes. The provision of 12 years of free, government-funded, inclusive, equitable, and high-quality primary and secondary education that leads to certain learning outcomes — of which at least nine years must be compulsory. Everyone, without exception, is entitled to these advantages. (Sustainable Development Goal 4 (SDG 4)).

- ***SDG 4.2 – Equal access to quality pre-primary education.***

The most significant benefit of the NEP is that children aged 3-6 years are given special attention. The Right to Education Act of 2008 had this as a major flaw. The forebearers of Anganwadi education will receive a much-needed boost as a result of this endeavor. There was also a provision for a new Gender Inclusion Fund for schools, as well as proactive assistance for disability schooling (SCCN Team, 2020)

- ***SDG 4.3 – Equal Access to Affordable Technical and Vocational Education.***

Vocational education will be provided at a younger age under the NEP, and technological skills such as coding will be taught starting in the sixth grade. In addition, the Ministry of Human Resources is establishing a National Education Technology Forum to address issues of technology, information sharing, and capacity development.

- ***SDG 4.4 – Increase the number of people with relevant skills for financial success.***

Curriculum design in higher and secondary education has moved from the previous 10+2 approach under the NEP. Clearer benchmarks are defined with a 5+3+3+4 model, which leads to better outcomes. They have provided many exit points for higher education, resulting in improved student signalling abilities. This is a standard procedure in most developed countries. An academic bank of credit has been set up to digitally store academic credits acquired that can be transferred and counted toward a final degree.

Furthermore, by 2035, the NEP aims to achieve a gross enrolment ratio of 50% in higher education. This will ensure that the vast majority of the people under the age of 35 has a good skill set.

- ***SDG 4.5 – Eliminate Discrimination in Education.***

The goal is to ensure that all girls and boys complete free, equitable and quality primary and secondary education leading to relevant and effective learning outcomes. The Digital Divide is intended to bridge under the new unit that deals with Internet-based e-learning under the NEP. Infrastructure, capacity building, and digital learning Infrastructure limitations connected to electricity supply and internet bandwidth are the challenges to overcome in the new education paradigm of online classes, which the policy attempts to avoid.

- ***SDG 4.6 – Universal Literacy and Numeracy.***

A National Foundation of Reading and Numeracy will be established under the NEP to deliver basic literacy and numeracy skills to students by the third grade. This is particularly encouraging news given India's decision to take part in the PISA survey, which assesses Basic English and Mathematics Comprehension. After a poor performance in 2009, India was expected to be a member of Universal Literacy and Numeracy again in 2021. Since 2010, India's enrolment ratio at the age of six has been at 96 percent. However, the dropout rate is also fairly high.

It will undoubtedly be difficult to implement reforms in India, since education is a shared issue between the states and the central government, as stipulated under the Constitution of India's Concurrent List. However, given the initiative and opportunity for public participation provided by the NEP, government shall aim to be proactive in contextualising the NEP's recommendations.

Smart Campus Cloud Network (SCCN) highly encourages all stakeholders to study the document as a source of hope in these trying times. SCCN also completely endorses all of the document's tenets and seeks to incorporate all of these guidelines into its role as an advisor to colleges and universities.

- ***SDG 4.7 – Sustainable Development and Global Citizenship.***

The NEP strives to build and improve child-centered, disability-sensitive, and gender-responsive educational facilities, as well as create safe, non-violent, inclusive, and effective learning environments for all. It also boosts the amount of scholarships available for higher education, including vocational training and ICT, as well as

technical, engineering, and scientific programmes. Through faculty development programmes, the NEP also ensures a significant increase of qualified teachers (SDG 4 and Targets, n.d.).

Table i: Contributions from NEP, 2020 to the SDG 4

SDG	Contribution from NEP, 2020
SDG 4.1 Primary and Secondary Education	12 years of free, inclusive, high-quality elementary and secondary education for all people, without exception.
SDG 4.2 Early Childhood	New Gender inclusion fund for schools for proactive assistance for schooling for all.
SDG 4.3 Technical, Vocational, Tertiary and Adult Education	The technical skills will be taught from the sixth grade. Establishment of National Education Technology Forum to provide assistance with technology, ease of information sharing and capacity development.
SDG 4.4 Skills for Work	The NEP aims to achieve a gross enrolment ratio of 50% in higher education. In addition These shall eventually enhance employability and the
SDG 4.5 Equity	Ascertain that all girls and boys receive a free, equitable, and high-quality primary and secondary education that results in relevant and effective learning outcomes. Under NEP, the Digital Divide shall bridge by establishing a new unit dedicated to Internet-based e-learning.
SDG 4.6 Literary and Numeracy	A National Foundation of Reading and Numeracy shall be established under the NEP to deliver basic literacy and numeracy skills to students by the third grade.
SDG 4.7 Sustainable Development and Global Citizenship	In order to promote sustainable development and global citizenship, the NEP aspires to build and upgrade educational facilities that are child-centered, disability-sensitive, and gender-responsive, as well as providing safe, non-violent, inclusive, and effective learning environments for all.

Conclusion

The NEP 2020 is the first education policy of the twenty-first century to address India's numerous pressing development needs. The NEP 2020 is very promising that it shall bring major changes in the education system in India. To contribute Sustainable Development Goals, all set to bring notable changes through NEP and help achieving Sustainable Education which in turn going to contribute the Sustainable Development. The conceptual relations discussed among the NEP and the SDGs has been established which can be tested with the empirical data to validate the impact.

Abstract

This project introduces/proposes experimental study on Design and fabrication of Electro-magnetic clutch. Electromagnetic grips and electromagnetic brakes are gadgets that control power and revolving development utilizing an electromagnetic power produced by empowering loops. Grasps interface and disengage with power while brakes brake and keep up with rotating development. Attractive grips utilize electric magnets delivered to lock or open the motor and the transmission input shaft, working with or ending the progression of force. Attractive brakes utilize electric magnets to speed up, decelerate or stop pivot. An electronic grasp control (ECC) framework, likewise called electronic grip the executives (ECM) framework, contains a grip which is locked in/separated by an actuator (electric or pressure driven), in light of the place of a grasp pedal (with position sensor) or capability of the control signals send freely by an electronic. Role of Electromagnetic Grips: To Transmit and cutoff Power. Electromagnetic grips are a mechanical component to communicate and cut power on the determined side with an electromagnetic power. Set forth plainly, they can disengage and interface power ceaselessly the power. Electromagnetic grasps are generally reasonable for far off activity since no mechanical linkages are expected to control their commitment, giving quick, smooth activity. Notwithstanding, in light of the fact that the enactment energy scatters as intensity in the electromagnetic actuator when the grasp is locked in, there is a gamble of overheating.

Keywords: Electronically Commutated Motor , Electronic Grasp Control

Introduction

This project introduces/proposes experimental study on Design and fabrication of Electromagnetic clutch. Electromagnetic grips and electromagnetic brakes are gadgets that control power and revolving development utilizing an electromagnetic power produced by empowering loops. Grasps interface and disengage with power while brakes brake and keep up with rotating development. Electromagnetic clutches and electromagnetic brakes are devices that control power and rotary movement using an electromagnetic force generated by energizing coils. Clutches connect and disconnect with power while brakes brake and maintain rotary movement. Magnetic clutches use electric magnets produced to lock or unlock the engine and the transmission input shaft, facilitating or terminating the flow of power. Magnetic brakes use electric magnets to accelerate, decelerate or stop rotation. Attractive grips utilize electric magnets delivered to lock or open the motor and the transmission input shaft, working with or ending the progression of force. Attractive brakes utilize electric magnets to speed up, decelerate or stop pivot. An electronic grasp control (ECC) framework, likewise called electronic grip the executives (ECM) framework, contains a grip which is locked in/separated by an actuator (electric or pressure driven), in light of the place of a grasp pedal (with position sensor) or capability of the control signals send freely by an electronic. Role of Electromagnetic Grips: To Transmit and cutoff Power. Electromagnetic grips are a mechanical component to communicate and cut power on the determined side with an electromagnetic power. Set forth plainly, they can disengage and interface power ceaselessly the power. Electromagnetic grasps are generally reasonable for far off activity since no mechanical linkages are expected to control their commitment, giving quick, smooth activity. Notwithstanding, in light of the fact that the enactment energy scatters as intensity in the electromagnetic actuator when the grasp is locked in, there is a gamble of overheating.

Working principle

The rotor portion of the clutch becomes magnetized and sets up a magnetic loop, which attracts both the armature and friction disks. The attraction of the armature compresses (squeezes) the friction disks, transferring the torque from the in inner driver to the out disks. An electronic clutch control (ECC) system, also called electronic clutch management (ECM) system, contains a clutch which is engaged/disengaged by an actuator (electric or hydraulic), based on the position of a clutch pedal (with position sensor) or function of the control signals send independently by an electronic. Function of transmitting the torque from the engine to the

drivetrain. Smoothly deliver the power from the engine to enable smooth vehicle movement. Perform quietly and to reduce drive-related vibration.

Components

Electromagnetic clutches also called ‘electromechanical’ or ‘E.M.’ clutches, actuate electrically but transmit torque mechanically. The basic design of an E.M. clutch consists of three parts: an electromagnetic coil within a metal housing (stator), a rotor connecting to the input shaft, and an armature that connects to the output shaft, sprocket, or pulley.

Electrically Actuated Clutches

Micro-Clutches

Electromagnetic Tooth Clutches

EM Clutch/Brake Combo Units

Function of clutch system

Function of transmitting the torque from the engine to the drivetrain. Smoothly deliver the power from the engine to enable smooth vehicle movement. Perform quietly and to reduce drive-related vibration.

Electromagnetic Particle Clutch Advantages

Torque can be controlled very precisely by a magnetic particle clutch, making it a common solution for tension control applications such as taper tension control, wire winding, or foil and film tension control. In addition to accuracy, they also offer a fast response.

Electromechanical Clutch Sorting & Packing Applications

- Food Processing Equipment.
- Packaging Machinery.
- Conveyor Drives.
- Printing and Copy Machines.
- Automated Manufacturing and Assembly.

Conclusion

Electromagnetic clutches are most suitable for remote operation since no mechanical linkages are required to control their engagement, providing fast, smooth operation. However, because the activation energy dissipates as heat in the electromagnetic actuator when the clutch is engaged, there is a risk of overheating

Abstract

The Stirling Engine was invented by Robert Stirling. This contraption was brought into the world as a expertise to the smoke machine, since a Stirling Engine works with additional unobtrusive strains than the contraption made by Watt and it didn't require a confirmed train engineer. Nowadays the advancement that incorporates the improvement of Robert Stirling is in absolutely improvement because of how now especially significant applications are open .This document goes all through the whole presence of this curious device looking on account of reasons of this astonishing improvement in this called high advancement with its different applications and doing an examination as indicated by the point of view of the economy. This adventure gets a handle on the rule capacity of the engine with a significant assessment. Moreover, we show how the Credible Engine in mix with harmless to the ecosystem power sources can be fundamental for a reasonable energy supply.

Keywords: Astonishing, Ecosystem ,Advancements, Smoke Machine

Introduction

Like any heat engine, the Stirling engine goes through the four essential cycles of pressure, warming, extension, and cooling two or three models from each day life might make this more clear. In this motor a gas-air blend is packed utilizing work put away in the mechanical flywheel from a past cycle. Then, at that point, the gas blend is warmed by lighting it also, permitting it to consume. The higher tension gas combination presently is extended which accomplishes more work than was expected for the pressure and results in net work yield. In this specific motor, the gas blend is cooled very little. In any case, the fumes is disposed of and a cool gas blend is gotten through the carburetor.

Figure 1 sterling Engine

Components

Heat Exchangers

Planning Stirling motor intensity exchangers is a harmony between high intensity move with low thick siphoning misfortunes, and low dead space (unswept inside volume). Motors that work at high powers and tensions expect that heat exchangers on the hot side be made of compounds that hold impressive strength at high temperatures and that don't erode or creep.[citation needed]In little, low power motors the intensity exchangers may basically comprise of the walls of the particular hot and cold chambers, yet where bigger powers are required a more prominent surface region is expected to move adequate heat.

Regenerator In a Stirling motor, the regenerator is an interior intensity exchanger and transitory intensity store put between the hot and cold spaces to such an extent that the functioning liquid goes through it first in one heading then the other, steering heat from the liquid in one bearing, and returning it in the other. It tends to be basically as straightforward as metal cross section or froth, and advantages from high surface region, high intensity limit, low conductivity and low stream grating. Its capability is to hold inside the framework that heat which would somehow

be traded with the climate at temperatures middle of the road to the most extreme and least cycle temperatures, [accordingly empowering the warm effectiveness of the cycle (however not of any reasonable motor to move toward the restricting Carnot productivity.

Heat Sink

The bigger the temperature distinction between the hot and cold segments of a Stirling motor, the more noteworthy the motor's productivity. The intensity sink is regularly the climate the motor works in, at encompassing temperature. On account of medium-to high-drive motors, a radiator is expected to move the intensity from the motor to the encompassing air. Marine motors enjoy the benefit of utilizing cool surrounding ocean, lake, or stream water, which is commonly cooler than encompassing air. On account of joined intensity and power frameworks, the motor's cooling water is utilized straightforwardly or in a roundabout way for the end goal of warming, raising proficiency.

Displacer

The displacer is a specific reason cylinder, utilized in Beta and Gamma type Stirling motors, to move the functioning gas to and fro between the hot and cold intensity exchangers. Contingent upon the kind of motor plan, the displacer could conceivably be fixed to the chamber; i.e., it very well might be a free fit inside the chamber, permitting the functioning gas to pass around it as it moves to possess the piece of the chamber past.

Working Principle

An ideal Stirling cycle comprises of four thermodynamic cycles following up on the functioning liquid:

Isothermal extension. The extension space and related heat exchanger are kept up with at a consistent high temperature, and the gas goes through close isothermal development retaining heat from the hot source. Consistent volume (known as isovolumetric or isochoric) heat-expulsion. The gas is gone through the regenerator, where it cools, moving intensity to the regenerator for use in the following cycle. Isothermal pressure. The pressure space and related heat exchanger are kept up with at a consistent low temperature so the gas goes through close isothermal pressure dismissing intensity to the virus sink. Steady volume (known as isovolumetric or isochoric) heat-expansion. The gas goes back through the regenerator where it recuperates a significant part of the intensity moved in process 2, warming up while heading to the development space.

Figure 2 sterling cycle

Types of Stirling Engine

There are three major types of stirling engines that are differ by each other on the basis of movement of air in their hot and cold portions.

The alpha configuration has two power cylinders, one in a hot chamber, one in a chilly chamber, and the gas is driven between the two by the cylinders; it is commonly in a V-development with the cylinders joined at a similar point on a driving rod.

The beta configuration has a solitary chamber with a hot end and a virus end, containing a power cylinder and a 'displacer' that drives the gas between the hot and cold finishes. It is commonly utilized with a rhombic drive to accomplish the stage contrast between the displacer and power cylinders, however they can be joined 90 degrees out of stage on a driving rod.

The gamma design has two chambers: one containing a displacer, with a hot and a virus end, and one for the power cylinder; they are joined to frame a solitary space, so the chambers have equivalent tension; the cylinders are commonly in equal and joined 90 degrees out of stage on a driving rod.

Conclusion

The thermal efficiency of stirling engine is approximately aqual to carnot cycle which is the highest thermal efficiency by any heat engine. Stirling motors are able to perform quiteley and can utilize practically any heat source. The intensity energy source is created outer to the Stirling motor as opposed to by interior ignition similarly as with the Otto cycle or Diesel cycle motors.

The ideal Stirling cycle is unreachable in reality, similarly as with any intensity motor. The effectiveness of Stirling machines is additionally connected to the natural temperature: higher proficiency is acquired when the weather conditions is cooler, hence making this kind of motor less appealing in places with hotter environments. Similarly as with other outside burning motors, Stirling motors can utilize heat sources other than the ignition of powers.

CLARION CALL: SAVING THE PLANET FROM AIR POLLUTION

PhD. Olawale Oyemade OYEKANMI

School of Arts and Social Sciences, Tai-Solarin College of Education, Omu- Ijebu, Ogun State.

Email: wamadeoyekanmi@gmail.com

ABSTRACT

Environmental challenges today, include air pollution as an instance of Climate change, which needs urgent attention. It is for this reason that TAKE ACTION GLOBAL(TAG) initiated Climate Action Project as a yearly event to address adaptation and mitigation to climate change, through environmental knowledge sharing, awareness and perception evaluation as well as attitudinal change for a sustainable environment. Therefore, the need to examined air pollution in the light of climate change.

Introduction

Pollution of the air, water, soil and workplace is an important threat to human development. The UN Sustainable Development Goals (SDGs) have a strong focus on reducing environmental pollution (UN, 2015). Specifically, SDG 3.9 seeks to “substantially reduce the number of deaths and illnesses from hazardous chemicals and air, water and soil pollution and contamination” by 2030. Many of the other goals are also related to pollution, including SDG 2.4 on improving soil quality, SDG 7 on clean energy, SDG 9.4 on clean technologies and industrial processes, SDG 11 on sustainable cities and communities, SDG 12 on responsible consumption and production, and SDGs 14 and 15 on conservation of water and land. However, the realization of these goals depends solely on goal 13-Tackling Climate change threat.

People do not intentionally seek to cause pollution, but disposing of waste products into the nearby environment is often the most convenient, and inexpensive, form of disposal. Thus, pollution is an example of indirect, or second-order, environmental consequences of human development efforts resulting in climate change. Oh! What a threat to human existence? Air pollution is not in any way environmental friendly. The 195 countries who signed the Paris Climate Agreement in December 2015 have now ratified the treaty. The world’s governments have agreed that we need to listen to the scientists - we really do have to stay under two degrees of global temperature change, but there is no policy in place that gets us to where we need to be, futuristic calamity.

The agreement they signed has no binding targets or penalties. It is basically a statement of intent that has no teeth. How fast can we get off coal, gas and oil? We have about thirty years to move completely away from our old ways. Sooner would be better! So where will this momentous changes come from? Even though they happily signed the agreement, many governments – including our own - are not formulating policy that will get us to where we need to be; they are still building roads, planning new runways and hoping to restart economic growth in the consumer economy. No, this change will have to come from the bottom - up. The emerging generation will be leading the way. It is easier to see past the oil age when you are not personally invested in it. For the emerging generation that simply isn’t going to be their future. They missed that opportunity so they are going to have to invent a new one for themselves. We might not know much about the future, but I am guessing it is going to be low carbon and almost exclusively local as a result of the on-going yearly CLIMATE ACTION PROJECT FOR SUSTAINABLE DEVELOPMENT and GLOBAL ACTION between September and November.

This is not bad news, especially not to the ears of someone who will never have a pension plan paid by Oil firm. The post carbon economy is a land of opportunity, like when they first invented the internet - it is a vast un-occupied space waiting for a new generation to inhabit it. With this bold project we are looking for the leaders who are going to help create a new vision for a post carbon society, with a sense of concern and responsibilities to ensure sustainable development. Therefore, let us 'StandTogetherNow' to say no to climate change in order to save our future.

Field work, 2023.

ABSTRACT

The paper examines the utilization of data from University Information Systems in educational institution. By analysing and leveraging the data generated by these systems, various benefits can be derived. Integrated data analysis enables university to uncover valuable insights, identify patterns, and discover correlations across dimensions. Gathering data on students from the academic information system serves to analyse academic performance, track progress, and identify areas for improvement in the educational process. Monitoring the development of Moodle users and the number of courses help managers adapt ICT to the current situation and make informed decisions to align the ICT infrastructure with the evolving needs of Moodle users.

Keywords: Database System, University Information System, Learning Management System, Learning Analytics, Data Mining.

INTRODUCTION

In today's digital age, universities accumulate huge amounts of data through their information systems. These systems capture valuable information about students, faculties, courses, administrative processes, and various aspects of the university's operations. Extracting meaningful information and using this data has become crucial for improving the quality of education and effective management at universities. In this context, the integration and analysis of data from university information systems offer an effective approach to gain holistic perspectives and support evidence-based decision-making.

By combining and analyzing data from various sources within the university ecosystem, such as academic information systems, learning management systems, financial systems, and research databases, a comprehensive understanding of how the university works can be achieved.

The first definition of Learning Analytics was published by G. Siemens (on his blog) in 2010, which was used in a modified form at the 1st international conference focused on Learning Analytics in 2011. Learning analytics is the measurement, collection, analysis, and reporting of data about learners and their contexts, for purposes of understanding and optimizing learning and the environments in which it occurs.

Matej Bel University (MBU) provides the following main information systems for study administration and communication with students:

- Academic Information System (AIS)
- Learning Management System (LMS) Moodle
- Collaborative platform MS Teams

AIS is a comprehensive information system designed especially for the management of all three levels of university education and the support of science and research management on university. It integrates students, teachers, and the administration of students.

Moodle is an open-source LMS that is widely used in educational institutions and organizations around the world. Moodle provides a platform for creating online courses, managing course materials, conducting assessments, facilitating communication and collaboration between students and instructors, and tracking student progress. It offers a wide range of features and tools to support online learning.

During the Covid-19 pandemic, LMS Moodle played a significant role in facilitating online learning. It allowed teachers at MBU to ensure the continuity of education despite the closure of school spaces. By providing online courses and materials, students were able to continue

their studies remotely. Moodle provided a platform for teachers to create and manage online courses, making digital learning materials accessible to students. Moodle offered tools for interaction and communication between teachers and students. Discussion forums, chat rooms, and messaging features enabled teachers and students to stay connected, exchange ideas, and engage in educational process.

MS Teams provides a virtual classroom management platform for teachers to plan and organize live online courses, deliver lectures and interact with students in real time via video conferencing. During the Covid-19 pandemic, MS Teams played a key role in facilitating online learning.

LITERATURE REVIEW

In literature review, we explore the field of learning analytics and its focus on examining data from university information systems. By harnessing the vast amount of data generated by university information systems, researchers aim to uncover valuable patterns, trends, and correlations that can inform decision-making and enhance educational practices.

The literature in this domain encompasses studies that employ diverse methodologies, ranging from quantitative analyses of large-scale datasets to qualitative investigations of student experiences. Scholars have investigated various aspects of learning analytics, including predictive modeling, intervention strategies, personalized learning, and the ethical considerations surrounding the use of student data. Additionally, the literature explores the technical challenges of data collection, data integration and privacy concerns.

By reviewing the existing literature on learning analytics and data analysis from university information systems, this study aims to synthesize and evaluate the current state of knowledge in the field. The findings from this review will contribute to a deeper understanding of the applications, methodologies, and implications of learning analytics in higher education settings. The book "Handbook of Learning Analytics" 0 provides a comprehensive overview of the field of Learning Analytics. It covers various topics related to the use of data, educational data mining, and analytical approaches to gain insights into the learning process.

The paper 0 aims to examine the research literature and construct a systematic review of learning analytics. The details of the study are categorized according to their research questions or objectives, the methodology (such as input data, techniques used or software tools for data collection and analysis) and the findings. This paper offers an overview of the emerging field of learning analytics, provides a foundation for exploring this area of educational research, and identifies a series of future challenges.

The objective of the review 0 is to assess the current state of Learning Analytics (LA) in terms of data integration in the context of higher education. The results show that a few data sources (e.g., LMS) appear repeatedly in the research studies; the number of data sources used in LA studies in higher education tends to be limited; when data are integrated, similar data formats are often combined; the research literature tends to lack details about data integration in the implemented systems. In addition, the results indicate a lack of stakeholder (e.g., teachers/instructors, technology vendors) involvement in the research studies.

The systematic literature review 0 maps the current state of implementation of LA to improve feedback practices in technology-mediated learning environments in higher education. Authors used strict inclusion criteria to select relevant studies that have investigated the role of LA on feedback practices.

The application of learning analytics in an online learning environment is increasing among researchers in educational fields because it can assist in providing standard and measurable decision making about student success. Therefore, the systematic review article 0 aims to offer the reader essential details regarding the practical usage of learning analytics techniques in online learning environments to improve the quality of teaching and learning practices.

The aim of the study 0 is to review the most recent research body related to Predictive Analytics in Higher Education. Articles published during the last decade between 2012 and 2022 were systematically reviewed following PRISMA guidelines. The review results can inform educational stakeholders and decision-makers about next prospects and potential opportunities. The study 0 investigates current approaches to learning analytics dashboarding while highlighting challenges faced by education providers in their operationalization. It analyzes recent dashboards for their ability to provide actionable insights which promote informed responses by learners in adjusting their learning habits. The study finds that most LA dashboards merely employ surface-level descriptive analytics, while only few go beyond and use predictive analytics.

Some critical stances claim that learning analytics tends to underplay the complexity of teaching-learning processes. By means of both a bibliometric and a content analysis, the paper 0 examines the publication patterns on learning analytics in higher education and their main challenges. The paper concludes by distinguishing between a practice-based and management-oriented community of learning analytics and an academic-oriented community. Within both communities, though, it seems that the focus is more on analytics than on learning.

During the data processing we followed the recommendations given in the source 0.

METHODOLOGY

In this part, we describe the application of Learning Analytics technology to databases from university information systems. We examined the LMS Moodle Data:

LMS Moodle at MBU runs the relational database system MySQL (version 8.0.29) for data storage. However, we planned to analyze data and prepare SQL queries in MS SQL Server 2019, so we first converted the data from MySQL to MS SQL Server 2019, using the tool MS SQL Server Migration Assistant for MySQL (version 8.17) 0. MS SQL Server Migration Assistant for MySQL is similar as MS SQL Server Migration Assistant for Oracle, and it automate all aspects of migration including migration assessment analysis, schema and SQL statement conversion, data migration as well as migration testing. The investigated database consisted of more than 540 tables and its size was 10.58 GB.

MS Teams Data: MS Teams captures data about student participation in virtual classrooms, communication patterns, and collaboration activities. Learning Analytics tools can analyze this data to understand the level of student engagement during online sessions, assess group dynamics, and measure the impact of collaborative work on learning outcomes. These insights can inform learning strategies, support mutual learning, and increase the effectiveness of online collaboration.

Microsoft Teams utilizes Cosmos DB as its underlying database system. Cosmos DB provides the necessary scalability, global distribution, and high availability features to support the immense data requirements of Teams. With Cosmos DB, Teams can seamlessly handle large volumes of user interactions, chat messages, files, and other data in real-time. The multi-model capabilities of Cosmos DB enable Teams to efficiently store and retrieve data in various formats, ensuring flexibility and adaptability. Additionally, Cosmos DB's automatic indexing and industry-grade planning and billing features further enhance the performance and cost-effectiveness of Teams' data management. Overall, Cosmos DB serves as a robust foundation for Microsoft Teams, empowering users worldwide to collaborate effectively and securely 0.

Providing access to the Cosmos DB cloud database is currently the subject of our negotiations with Microsoft representatives.

In Microsoft Teams, basic statistics about users, courses and teams can be obtained directly, providing insight into their usage and engagement. The downside is that these statistics can only be viewed for the last 90 days.

Analyzing data from the Cosmos DB database is a challenge for us and it will be the goal of our further research.

RESULTS AND DISCUSSION

In this section, we present the results and discussion of the analyzes performed on the Academic Information System and LMS Moodle. The knowledge obtained from these information systems clarifies their respective functions and their influence on the improvement of educational processes.

We used the following tools to prepare and analyze the data:

- SQL Server Management Studio (SSMS)
- SQL Server Data Tools SQL (SSDT)
- MS SQL Server Analysis Services (SSAS)
- MS SQL Server Reporting Services (SSRS)
- MS SQL Server Data Tools (SSDT)
- MS Power BI.

We performed analyzes on the data set from the database of LMS Moodle (Figure 1), where we addressed the following research questions:

RQ3 How did the number of new users in the LMS Moodle system develop during the period 2012 - 2022 at MBU and what factors contributed to the changes in the number of users in the individual monitored years?

RQ4 In what trend did the number of new courses in the LMS Moodle system at MBU develop during the period 2012 - 2022, and what course formats were most often used to create these new courses?

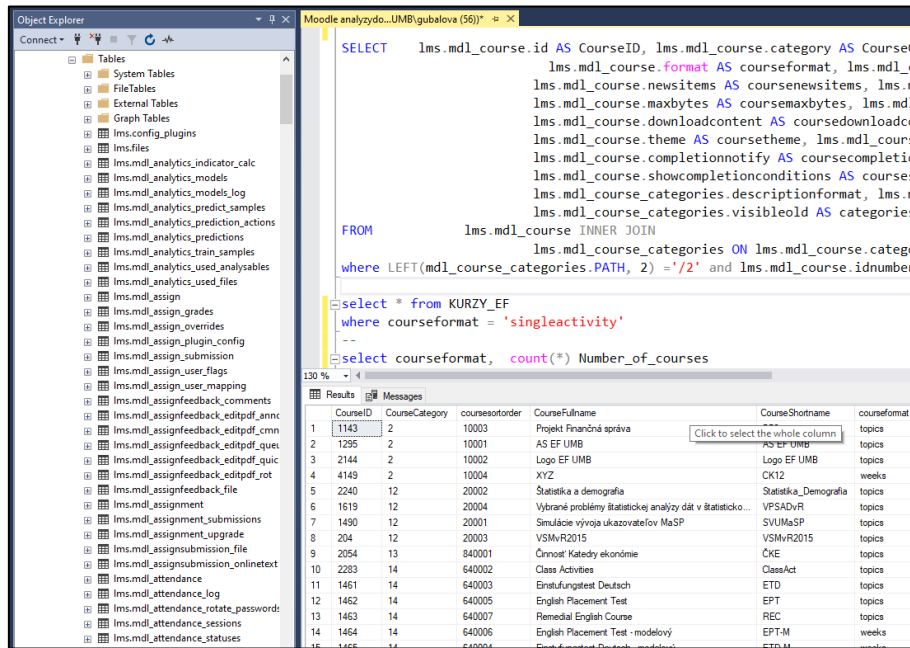

Figure 1. The Moodle database in SQL Server Management Studio

By applying SQL queries to the Moodle database, we found the yearly counts of new users in the LMS Moodle from 2012 to 2022 (Figure 2), which represents the answer to the RQ1:

At the beginning (in the years 2012 and 2013), after the introduction of LMS Moodle, the numbers of new users were high, as students from all academic years were being registered in the LMS. Subsequently, the count of newly registered students gradually declined (years 2014 - 2019) as only newly admitted students were enrolling. Also, during this period, there was a reduction in the number of newly admitted students at MBU. We emphasize that students who complete their studies no longer have access to the information systems of MBU, including Moodle.

Figure 2. The number of new users of LMS Moodle in the decade 2012-2022 at MBU

In the year 2020, due to the Covid-19 pandemic, education shifted to the online space. Each teacher was required to publish their teaching materials in the Moodle course for their subject. This led to teachers who had not previously used Moodle having to start working with it and lead their students to do the same. Consequently, the number of new users surged to 4 517, which was more than 3.6 times higher compared to the previous year, 2019.

In the year 2021, the impact of the pandemic continued, with a combination of classic and online education depending on the situation. The number of new Moodle users increased by more than 1.9 times compared to the year 2019. However, when compared to the previous pandemic year 2020, there was a decrease of almost half in the number of new users.

After the pandemic, the number of new users stabilized at 1 271, which is approximately the same value as it was before the pandemic.

We also obtained the answer to research question RQ2 by analyzing data from the LMS Moodle data set.

It is clear from the Figure 3 that the curve of the development of the number of courses in the observed 10-year period does not copy the curve of the development of the number of users, as would be expected. At the time of our analysis, there were only 36 courses in the Moodle that were created in 2012. It is possible that some courses have been removed over time, although teachers and course administrators tend to keep older courses as a backup.

Figure 3. The number of new courses in LMS Moodle in the decade 2012-2022 at MBU

We investigated the relationship between the number of new users and the number of new courses in LMS Moodle. The resulting correlation coefficient was 0.388, indicating a low level of dependence between the two variables (Figure 4).

Figure 4. Number of users and Number of courses in the decade 2012-2022 at MBU

During the pandemic years of 2020 and 2021, there was a significant increase in the number of new courses. The year 2021 stood out as courses with the "weeks" format outnumbered the "topics" format by more than three times. In the other observed years, courses with the "topics" format were predominant, though not to such a high extent. In the year 2022, the number of new courses stabilized and reached a value like the pre-pandemic period.

During the COVID-19 period, information systems faced significant challenges due to the rapid shift towards remote work and online education. They needed to be scalable, accessible, and secure to accommodate the increased user volume and data while safeguarding sensitive information. Integrated collaboration tools and a reliable user-friendly interface were essential for remote teamwork and learning. Continuous monitoring, cloud adoption, robust security measures, user training, and feedback collection were recommended practices to enhance system performance and adaptability during such challenging times.

CONCLUSION

Keeping track of how Moodle users and course enrollments are changing helps managers adjust their information and communication technology (ICT) systems to suit the present circumstances. By doing so, they can make well-informed choices on aligning the ICT infrastructure with the ever-changing requirements of Moodle users.

By leveraging data from information systems, university management can make informed decisions, improve institutional processes, raise student outcomes, and optimize the use of resources. Data serves as an asset for strategic planning, compliance, and student support, ultimately contributing to the overall effectiveness and success of the university.

ABSTRACT

Currently, active development of technological clothing is underway. Techwear's influence on the fashion industry is growing every year. High-tech fashion uses the achievements of science and technology for the development and production of fashion products. The methods used in high-tech fashion are borrowed from technologies developed in the fields of chemistry, physics, computer science, aerospace engineering, industrial textiles and sportswear. Scientific progress has led to the fact that requests for clothing and the fabrics from which it is made are constantly growing. So fashion is increasingly inspired and cooperating with technology. Technological clothing is casual clothing with special materials, construction and properties that provide functionality and convenience to a person. Smart clothes can interactively interact with the environment and a person: measure pulse and blood pressure, automatically heat up or warn when it's time to apply sunscreen and not only. Electronic components can be added to such clothes: motion sensors, heartbeat, pressure, light, temperature, as well as antennas, vibration motors, Bluetooth transmitters and microcomputers. These components can be woven into the fabric itself, along with wires that provide power, or simply sewn into special pockets. The main reason for the popularity of technological clothing is that it can make a person's life easier.

Keywords: High-tech clothing, techwear, smart clothes.

INTRODUCTION

Currently, active development of technological clothing is underway. High-tech fashion uses the achievements of science and technology to develop and manufacture fashionable products. The methods used in high-tech fashion are borrowed from technologies developed in the fields of chemistry, physics, computer science, aerospace engineering, industrial textiles and sportswear. High-tech clothing is based on the improvement of the utilitarian properties of clothing and accessories through the use of new materials and fabrics, ergonomic cut and gadgets. In general, everything that was created with a focus on convenience and innovation can be attributed to technological clothing, but often this direction includes completely black clothes with an abundance of pockets, belts and carabiners, in the style of a Japanese ninja.

Of course, the use of technology and new fabrics in clothing to enhance convenience is not new. After all, our distant ancestors did not wear animal skins for self-expression or beauty. The history of fashion knows thousands of innovative solutions, which were often created for the needs of the military, workers or athletes, and then found wide application in everyday life. The largest fashion companies started with the production of unique accessories for a narrow audience, which conquered the market with their practicality and soon became the standard.

the techwear that we know now began to appear in the second half of the 20th century and finally formed as a separate trend a few years ago. the technologies of the 20th century developed by leaps and bounds, and the fashion industry was also influenced by scientific and technological progress. research scientists, military personnel, athletes, travelers and astronauts demanded the most advanced equipment, and at the same time, some developments were moving to the actively growing consumer market. the development of gadgets has created a new segment where wearable electronics are created in close connection with fashion.

CONCEPTUAL FRAMEWORK

There are a great many technologies, each with a different degree of innovation, sophistication and applicability. But they can be divided into several directions:

Heat-retaining

Heated jackets — a lightweight winter jacket with a waterproof coating is fitted with heating plates that are powered by a removable battery. This jacket is lighter and more comfortable than massive down jackets and can be used without heating, protecting from snow and rain, but when it gets cold, you can always turn on the heating up to 65 degrees, which will keep a comfortable temperature even in severe frost. However, for a long stay on the street at -20, such a thing is unlikely to work.

Thermal underwear is the bottom layer of underwear, which performs the function of removing moisture from the body and accumulating heat. This part of the wardrobe has long found popularity in Russia and allows you to wear thermal underwear under ordinary clothes, while staying warm thanks to an invisible layer. High-tech synthetic fabrics and wool are often used to make thermal underwear.

Fleece is a synthetic material from which jackets, sweatshirts and hats are often made. It has a very soft structure, as well as elastic, dries quickly, has a low weight and is very warm at the same time. Fleece is similar in structure to sheep's wool and exists in variations with short and long pile.

Down jackets are another item of clothing that is extremely popular in Russia, but at the same time no less technologically advanced. Down clothing is very light and perfectly protects from the cold, so it is used by professional climbers and Arctic explorers. Synthetic down has weaker thermal insulation properties, but it is protected from getting wet and is more unpretentious.

Graphene is a revolutionary material, for the research of which Russian scientists received the Nobel Prize. The advantage of graphene is that it conducts heat more efficiently than any other material on earth, so when wearing graphene-coated clothing, heat is evenly distributed between body parts. In addition, graphene is very light, breathable, water-resistant and completely bacteriostatic.

Cooling and ventilation

mesh materials are the easiest way to ventilate, but at the same time effective. it can be used everywhere — from shoes to outerwear. as a rule, manufacturers introduce mesh in places with the greatest sweating — in the armpits and on the back, so clothes breathe better, but at the same time they remove moisture and protect from the sun. ultra-thin fabrics - remove heat and moisture from the body and protect against uv radiation, so they seem cool even in hot weather. cotton or synthetic fabrics tactilely similar to silk are most often used for their manufacture. protection from rain, fire and mechanical impact membrane fabrics are one of the foundations of any techwear wardrobe. the membrane is a very thin multi—layered fabric with micro-holes that protects against rain and wind, but at the same time removes steam from the body. thus, you can stay dry both in the downpour and in the heat. water—repellent impregnation - this technology is often used with membrane fabrics. wax or emulsion is applied to the fabric and covers its filaments with a hydrophobic film, thanks to which raindrops are not absorbed, but accumulate as droplets on the surface or roll off. fire protection — a mixture of synthetic fire-resistant fabrics allows you not to worry about the safety of your skin and

clothing during short-term contact with a campfire or incandescent objects. it's not the most useful feature in an urban environment, but it's the best for tourism and outdoor recreation.

dyneema is a material that is several times stronger than steel and is used in the manufacture of body armor and space satellites. it has good thermal conductivity, low weight and is able to withstand a knife blow, therefore it is indispensable in the production of particularly durable clothing.

cordura is a thick nylon fabric used in military and outdoor clothing. ripstop technology is a special method of weaving fabric using reinforced yarns, which prevents the appearance of tears. it is often found in the manufacture of bags, backpacks and workwear.

Improving ergonomics

The cut, taking into account the structure of the body, allows clothes and accessories not to restrict movement and place accessories and pockets in those places where they are most appropriate and comfortable to use. The main task is the convenience of use both in everyday life and in sports.

The cushioning sole is an important part of any shoe, which is responsible for walking comfort and the health of your feet. High-tech soles are made of special materials that absorb impacts on asphalt and return more energy when repelled than conventional EVA soles. Each manufacturer has its own technology, the most famous are Nike React, Adidas Boost and Asics Gel.

Accessories and pockets are an important part when creating practical clothes and accessories. Straps with quick adjustment, using latches and carabiners. Waterproof zippers and deep pockets with an internal organizer are the things without which techwear is impossible.

Integration of electronics

Sneakers with automatic lacing — Nike has released a pair of sneakers, the laces on which tighten automatically as soon as you put them on. Yes, yes, like in "Back to the Future".

Backpacks - there are a huge number of variations using built-in power banks, speakers, solar panels and LED panels. Most modern urban models are equipped with waterproof fabric and theft protection.

The flashlight is not so impressive, but still a useful accessory that is attached to the belt of the jacket and is charged from the sun. a smart watch is more of a gadget than an accessory, but in any case it is one of the elements of fashion using technology. moreover, well-known fashion companies are involved in the production of straps, and the case can be made of precious metals.

CONCLUSION AND DISCUSSION

Already, many achievements in the field of technological clothing have gained widespread popularity. Scientific progress has led to the fact that requests for clothing and the fabrics from which it is made are constantly growing. Thus, fashion is increasingly inspired by technology and collaborates with it. Technological clothing is casual clothing with special materials, construction and properties that provide functionality and convenience for a person. The main reason for the popularity of technological clothing is that it can make a person's life easier.

Abstract

Aquaculture is expanding rapidly. The most key determinants of the aquaculture industry are edible and aquarium fish cultivation. Despite being a minor part of the worldwide fish commerce, ornamental fish culture has transformed into one of aquaculture's most significant aspects, and it is acknowledged as one of the most lucrative sectors in Iran and many other countries. The cultivation and propagation of ornamental fish have been increasing in the last few years in Iran and Alborz is one of the provinces where this industry has expanded significantly. The purpose of this study is to investigate parasitic infections in 3 ornamental fish farms. This research was carried out for seven months from March 2022 to September 2022 on 3 different species of referred ornamental fish. Ornamental fish species including Oscar fish, goldfish, discus, were sampled and examined for internal and external parasitic infestation by light microscopy. In the results, external parasites including *Gyrodactylus sp.*, *Dactylogyrus sp.*, *Ichthyophthirius multifiliis*, *Argulus sp.* and internal parasites including *Capillaria sp.* and *Hexamita sp.* were detected. The highest prevalence of parasites was related to *Capillaria sp.* (52%) and the lowest prevalence was related to *argulus* (5%).

Keywords: Internal parasite, External parasite, ornamental fish

Introduction

Aquaculture is expanding rapidly. The most key determinants of the aquaculture industry are edible and aquarium fish cultivation. Despite being a minor part of the worldwide fish commerce, ornamental fish culture has transformed into one of aquaculture's most significant aspects, and it is acknowledged as one of the most lucrative sectors in Iran and many other countries. The main production of ornamental fish is belonging to the south eastern Asia. Also, more than 150 freshwater fish species are currently farmed as ornamental fish in Iran.

The aquarium fish business is an important part of the world trade (Winfree, R.A., 1989) and freshwater aquarium fish are the biggest part of this industry (Helfman, G. S., 2007). In Iran, the export of ornamental fish has been raised as an economic activity with significant foreign exchange earnings over the past few decades (Mousavi HE, Soltani M, Rahmati-Holasoo H, Mirzargar SS, Taheri A, 2011). Although the freshwater ornamental fish industry in Iran has a high potential for development, one of the most important weaknesses observed in this industry is the lack of sufficient understanding of the problems related to the disease and health status of these fish (Mousavi HE, Soltani M, Rahmati-Holasoo H, Mirzargar SS, Taheri A, 2011). In general, younger fish are more susceptible to parasites than mature ones. The number of parasites required to cause damage and effect is different in hosts with low body mass than in hosts with large body mass. Also, the immune responses of adult fish against subclinical contamination may be more developed. In addition, the function of the immuno system plays a fundamental role in the relative resistance of fish against parasite species (Gratzek JB, 1988). The purpose of this study is to investigate the parasitic contamination of ornamental fish farms, that had reported losses in different fish species.

Materials and Methods

In this study, samples of fish from 3 different farms in Alborz province were examined. These samples were referred to our laboratory in the fish's aquarium water and aerated plastic bags. Clinical lesions were recorded. The samples were taken by wet mounts of scrapings of the skin and gills, and internal parasites, by dissection and tissue sampling. First, live fish were examined for skin lesions and parasites visible to the naked eye. The Mucus was scraped from the skin and gills and fresh wet mounts were taken. After examining each sample, in terms of ectoparasites, each fish was dissected under sterile conditions and wet mounts were prepared from their internal organs. 3 ornamental fish species including Oscar fish, goldfish, discus were sampled and their wet mounts were examined by light microscopy.

Results

In total, 40 out of 50 examined fishes (80%) were infected with different parasites and the rest had no parasite infestation. External parasites including *Gyrodactylus sp.*, *Dactylogyrus sp.*, *Ichthyophthirius multifiliis*, *Argulus sp.* and internal parasites including *Capillaria sp.* and *Hexamita sp.* were detected. The highest prevalence of parasites was related to *Capillaria sp.* (52%) and the lowest prevalence was related to *argulus* (5%).

Discussion

Over the past decades, the identification of fish parasites has become increasingly noticeable due to the growth of the freshwater ornamental fish industry worldwide. Parasitic diseases cause economic losses to the ornamental fish industry by affecting physiological and biological characteristics and causing mechanical damage (Jalali B., 1997). In this study, we found a total of 6 parasite species among 3 ornamental fish species.

A significant part of the world trade of aquatic animals is the trade of tropical aquarium fish (Evans BB, Lester RJG, 2001). Therefore, Quarantine measures should be implemented during the trade of live animals, including aquatic animals, to prevent the transmission of pathogens, which lead to disease outbreaks and economic losses (Helfman, G. S., 2007). The risk of parasites entering other countries and their further spread in the future is minimized by treating infected fish before export or after entering the importing country (Koyuncu, C.E., 2009).

In this study, the prevalence of crustaceans was low, which could be because the life cycle of these parasites depends on the water temperature and the duration of their preservation (Rahmati-Holasoo et al., 2022). Most common species of commercial ornamental fish are not kept in farms for more than 2-3 months and are usually sold early, so they have less opportunity to be contaminated with crustaceans. (Rahmati-Holasoo et al. 2022). Adhesion of crustaceans to the surface of the body and fins through haptor for feeding causes lesions, wounds, hemorrhages, desquamation, and a way for secondary pathogens to enter. Some nematodes, such as *Capillaria sp.*, have a direct life cycle and do not need an intermediate host that can be problematic (Wildgoose 2001), as in this study *Capillaria sp.* accounted for the highest rate of parasitic involvement. The results of this study are almost similar to the studies of other researchers in terms of parasite identification in Iran (Meshgi et al. 2006) and report of parasites including *Ichthyobodo sp.*, *Ichthyophthirius multifiliis*, *Trichodina sp.*, *Gyrodactylus sp.*, *Lernaea sp.*, *Dactylogyrus sp.*, *Chilodonella sp.*, *Argulus sp.*, and *Capillaria sp.* in ornamental fish in Turkey by Koyuncu, C.E. (2009) (Koyuncu, C.E., 2009).

Abstract

This study centers on the teacher recruitment processes in Türkiye, with a special focus on the interview stages and the current developments and challenges encountered in these processes. The population of the study consists of tweets shared on the X social media platform, tagged with #öğretmenlermülakatakarşı (teachersagainstinterviews). The research material comprises the last 250 tweets selected through criterion-based sampling, excluding retweets and repeated shares by the same individuals. Data collection was conducted on content shared under this tag on the X platform until September 28, 2023. In the analysis, content analysis methodology was utilized, and the collected data were coded according to codes specifically designed for the research objectives. The coding structure was processed in detail through open coding technique and the findings were organized in tables and interpreted. In preserving the originality of the tweets, grammatical and spelling errors were not corrected during the analysis. The findings indicate that the public response to the teacher appointment processes and interviews is largely critical. User comments reflect a prevalent perception of a lack of transparency and fairness in the process. The research provides valuable data for informing policymakers and administrators about the need for improvements and reforms in the teacher appointment processes. The outcomes of this study have the potential to contribute to shaping future policy changes and strengthening the systems of justice and meritocracy in the field of education.

Keywords: Interview, teacher recruitment, X Platform, tweet

TÜRKİYE'DE ÖĞRETMEN ALIMINDA MÜLAKAT SORUNU: X PLATFORMUNDAN YANSIMALAR

Özet

Bu araştırma, Türkiye'de öğretmen atama süreçlerini, özellikle mülakat aşamalarını ve bu süreçteki güncel gelişmeler ile karşılaşılan sorunları odak noktasına almaktadır. Çalışmanın evreni, X sosyal paylaşım platformunda kullanıcılar tarafından paylaşılan, #öğretmenlermulakatarşı etiketiyle etiketlenmiş tweet'leri kapsamaktadır. Araştırma materyali, ölçüt bazlı örnekleme yöntemi ile seçilmiş son 250 tweet'ten oluşmaktadır. Bu tweet'ler içinde 'retweet'ler ve aynı kişiler tarafından yapılan tekrar paylaşımlar dikkate alınmamıştır. Veri toplama süreci, X platformunda etiket altında 28 Eylül 2023 tarihine kadar paylaşılan içerikler üzerinden yürütülmüştür. Veri analizinde, içerik analizi yöntemi kullanılmış ve toplanan veriler spesifik araştırma amaçları doğrultusunda tasarlanan kodlarla kodlanmıştır. Oluşturulan kodlama yapısı, açık kodlama tekniği ile detaylı bir şekilde işlenmiş ve elde edilen bulgular tablolar halinde düzenlenip yorumlanmıştır. Araştırmada, tweet'lerin orijinalliğini korumak adına dilbilgisi ve yazım hataları düzeltilmeden analiz edilmiştir. Bulgular, öğretmen atama süreçleri ve mülakatlar hakkındaki kamusal tepkinin büyük ölçüde eleştirel olduğunu göstermektedir. Kullanıcı yorumları, sürecin şeffaflık ve adillikten yoksun olduğuna dair yaygın bir kanıyı yansıtmaktadır. Araştırma, bu içerikler üzerinden eğitim politikası yapımcılarının ve yöneticilerinin, öğretmen atama süreçlerinin iyileştirilmesi konusunda bilgilendirilmesi ve ilgili süreçlerde reform ihtiyacının vurgulanması açısından değerli veriler sunmaktadır. Çalışmanın sonuçları, gelecekteki politika değişikliklerinin şekillendirilmesine ve eğitim alanındaki adalet ve liyakat sistemlerinin güçlendirilmesine katkıda bulunma potansiyeline sahiptir.

Anahtar Sözcükler: Mülakat, öğretmen atamaları, X platformu, tweet

GİRİŞ

Eğitim, toplumun sürekli evriminin ve refahının anahtarıdır. Bu süreç, toplumsal yapıyı dönüştüren ve toplumun uzun dönemli gelişimini destekleyen bir dinamo olarak işlev görmektedir. Eğitimin bu önemli rolü, tarihsel bir perspektifte, dünya genelindeki kalite artırma çalışmalarının sürekliliğini de açıklamaktadır (Güven ve Dak, 2017; Toprakçı vd., 2010; Sezgin ve Duran, 2011).

Bireyin ilk eğitim deneyimleri ailede başlar; aile, bireyin dünya görüşünü ve değerlerini şekillendirir. Ancak formal eğitimin başlangıcından itibaren, bu sorumluluk kısmen öğretmenlere geçer. Öğretmenler, bireyin bilgi ve beceri kazanmasında merkezi bir rol oynarlar (Turan ve Bozkurt, 2010). Bu, onları eğitim sürecinde vazgeçilmez kılar, çünkü eğitim kurumlarındaki öğretmenler, genç nesilleri yetiştiren anahtar unsurlardır. Öğretmenlerin varlığı ve yetkinliği, eğitimin amacına uygun öğrencilerin yetiştirilmesi için kritik bir öneme sahiptir (Recepoğlu vd., 2016; Özden, 2003). Bu bağlamda, öğretmen seçimi ve yetiştirilmesi süreçleri eğitimdeki kalitenin belirleyicisidir.

Eğitim, toplumsal ilerleme ve bireysel gelişimin temel taşıdır. Birçok ülke, eğitim kalitesini artırma amacıyla nitelikli öğretmenlerin yetiştirilmesine büyük bir önem atfetmektedir (Karataş ve Güleş, 2013). Ancak, Türkiye'nin eğitim politikaları bu konuda farklı sonuçları beraberinde getirebilecek bazı özgün uygulamalara sahiptir. Özellikle son dönemlerde işsizlik sorunu, küresel bir mesele olarak karşımıza çıkmaktadır. Türkiye'de bu sorun, eğitim fakültelerinden mezun olan ve atanmayı bekleyen birçok öğretmen adayı için belirgin bir hal almıştır. Öğretmenlerin atanması konusundaki süreçlerde, Millî Eğitim Bakanlığının (MEB) ve üniversitelerle Yükseköğretim Kurulunun eşgüdümlü hareket etmekte zorlandığı gözlemlenmektedir (Şahin, 2011). Eğitim fakültelerine kabul edilen öğrenci sayısının artması, mezunların iş bulmada yaşadığı zorlukları artırmış ve işsizlik oranlarında yükselmeye sebep olmuştur (Yıldırım ve Koca, 2015; Şahin ve Adıgüzzelli, 2016). Ayrıca, Fen-Edebiyat fakültelerinden mezun olan bireylerin eğitim alanına dahil edilmesi, kalite ve nitelik konularında sorunlara yol açmıştır (Sezgin Nartgün, 2008).

Öğretmen istihdamı Türkiye'de özel ve kamu okullarında farklı dinamiklere sahiptir. Özel okullarda öğretmenlik yapabilmek için, belirli genel ve özel kriterlere uygunluk esastır. Ancak, kamu okullarında öğretmen istihdamı daha katı kurallara bağlıdır ve kadrolu, sözleşmeli, ücretli ve vekil olmak üzere dört farklı biçimde gerçekleştirilmektedir. Kamu okullarında öğretmenlik yapabilmek için öğretmen adaylarının Kamu Personeli Seçme Sınavına (KPSS) katılmaları ve belirli bir puanı geçmeleri gerekmektedir. Bu sınavın puanlandırması çeşitli kriterlere

dayanmaktadır ve sınav Öğrenci Seçme ve Yerleştirme Merkezi (ÖSYM) tarafından yıllık olarak düzenlenmektedir. Bu sınav sonuçları, öğretmenliğe atanma sürecinde bir yıl boyunca geçerli sayılmaktadır (Çinkır, 2013).

Türkiye'de öğretmen olma yolunda adım atan bireyler, dört yıllık bir lisans eğitiminin ardından Kamu Personeli Seçme Sınavına (KPSS) tabi tutulmaktadır. KPSS'yi başarı ile tamamlayan adaylar, aday öğretmen olarak atanıp, kurumlarına bağlı olarak bir yıl süresince hizmet içi eğitim almaktadırlar (Recepoglu, vd., 2016). Ancak, KPSS'nin öğretmen adaylarını devlet okullarına atanabilme ölçütü olarak kullanılmasının yarattığı belirsizlik, adayların endişe duymalarına neden olmaktadır (Karataş ve Güleş, 2013). Sınav puanının atanma için yeterli seviyede olup olmadığı konusundaki bu belirsizlik, öğretmen adaylarında kaygı yaratmaktadır (Erdem ve Soylu, 2013; Sezgin ve Duran, 2011).

Öğretmenliğin kapsamlı bilgi ve beceri gereksinimleri dikkate alındığında, bu mesleğin sadece bir sınavla değerlendirilmesi yetersiz kalabilir (Toprakçı, 2009). KPSS'nin genel kültür, genel yetenek ve eğitim bilimleri konularında odaklanması, adayların eğitim süreçlerinde bu konulara aşırı derecede odaklanmalarına sebep olmakta ve böylece lisans eğitimleri boyunca yüksek düzeyde kaygı yaşamalarına neden olmaktadır (Şahin, 2011). KPSS'nin öğretmen adaylarının alan bilgisini tam anlamıyla test edememesi, adayların lisans eğitimleri sırasında konuyla ilgili derslere yeterince odaklanmamaları sonucunu doğurmaktadır. Bu da mesleki hayatta bilgi eksikliklerine yol açabilmektedir (Erdem ve Soylu, 2013). Atav ve Sönmez (2013) yaptıkları bir çalışmada, öğretmen adaylarının lisans eğitimlerinin KPSS'ye yeterince hizmet etmediğini belirtmişlerdir. Bu çalışmada, genel kültür derslerinin artmasına rağmen yetersiz kaldığına dair bir görüş ortaya konmuştur.

Türkiye'de eğitim sistemine ve öğretmen atama süreçlerine dair sürekli değişiklikler ve gelişmeler yaşanmıştır. 2016 yılından itibaren KPSS sürecine mülakat (sözlü sınav) aşaması eklenmiştir (Güven ve Dak, 2017). Mülakat sınavının asıl uygulanma nedeninin 15 Temmuz 2016 darbe girişimi terör örgütüyle ilişkilendirilen öğretmen adaylarının tespiti ve bu şekilde sızmalara engel olma amacı olduğu düşünülebilir. 29783 sayılı ve 27.07.2016 tarihli Resmî Gazetede duyurulan bir uygulama ile sözlü sınavın düzenlenmesi ve uygulama esaslarına dair detaylar Millî Eğitim Bakanlığının yetkisine bırakılmıştır. Bu, sözlü sınavın nasıl yürütüleceği, hangi konularda olacağı ve sınavın genel usul ve esasları hakkında bakanlığın bir yönetmelik hazırlayarak belirleyici olacağı anlamına gelir. Yönetmelikle oluşturulan standardizasyonun, süreklilik arz eden bir yapıda olması ve uzman kişilerin bu sürece dahil edilerek objektif bir değerlendirme ortamının sağlanmasının önemi büyüktür.

Öğretmen atamalarındaki mülakat sürecine dair literatür incelendiğinde, görüşmelerin bireyler arasında gerçekleşen, belirli bir amaca yönelik konuşma olarak tanımlandığına dair Eren (2010) tarafından yapılmış bir tanım bulunmaktadır. Bu amacın, adayların yeteneklerini objektif bir şekilde değerlendirmek olduğunu Tortop ve diğerleri (2010) çalışmalarında vurgulamışlardır. Uzmanların bu tür mülakatlarda, önceden hazırlanmış soruları kullanarak adaylarla etkili bir diyalog kurdukları bilinmektedir. Fear ve Jordan (1943) ise mülakatlarda adayın önceki deneyimleri, bilgi seviyesi, eğitimi ve diğer özelliklerini ortaya koyan soruların sorulmasının gerekliliğini belirtmiştir. Ancak, mülakat sürecinin tam anlamıyla objektif olduğu ve önyargılardan uzak yürütüldüğüne dair bir uzlaşma bulunmamaktadır. Tortop ve diğerleri (2010), mülakat sürecinin renk, ırk veya siyasi görüşlerden etkilenmemiş bir şekilde, tamamen adayın yeteneklerine ve bilgisine odaklanarak yürütülmesi gerektiğini belirtmişlerdir. Türkiye'de öğretmen atamaları ve bu sürece dair yaşanan sorunlar hakkında öğretmen adaylarının görüşleri üzerine birçok araştırma gerçekleştirilmiştir. Abu ve diğerleri (2016), Epçaçan (2016), Kartal (2013), Kiraz ve Kurul (2018), Köybaşı ve diğerleri (2018), Memduhoğlu (2017), Odabaş (2010), Özcan ve diğerleri (2014), Şahin (2011), Toprakçı ve Ofluoğlu (2021) ve Uygun (2012) gibi yazarların çalışmaları bu konudaki literatürü zenginleştiren önemli kaynaklardır.

Son dönemdeki gelişmelere bakıldığında ise, öğretmen atamalarındaki mülakat uygulamasının kaldırılma ihtimali, 2023 genel seçimlerine yaklaşırken öğretmen adayları için bir umut kaynağı olmuştur. Ancak, son gelişmeler mülakatın devam edeceğini ve hatta önemini artırdığını göstermektedir. 23 Eylül 2023 tarihinde Türkiye Cumhuriyeti Milli Eğitim Bakanı tarafından yapılan beyanat, öğretmen atama süreçlerine dair yeni düzenlemeleri ve yaklaşımları ortaya koymaktadır. Bu beyanatta belirtilenler şunlardır:

- Öğretmen atamalarında sadece KPSS puanı dikkate alınmayacak, mülakat puanının yüzde 50'si, KPSS puanının yüzde 50'si etkili olacak.
- Öğretmen alımı için belirlenen kontenjanın üç katı kadar aday, KPSS puan sıralamasına göre mülakata çağrılacak. Bu mülakatta başarılı olan adaylar, kontenjan sınırları dahilinde atanacak.
- Mülakat komisyonları, ilgili alanda bilgi ve deneyime sahip öğretmenlerle oluşturulacak.
- Hem adayların mülakatta değerlendirecekleri jüri üyelerinin, hem de jüri üyelerinin değerlendirecekleri adayların isimlerine erişimleri önceden engellenecek.
- Mülakatta, adayların 45 dakika boyunca ders anlatma, iletişim yeteneği, problem çözme becerisi ve değer aktarımı yeteneklerini sergilemeleri beklenmekte olup, bu süreç kamera kaydına alınacak ve komisyonun aldığı kararlara itiraz hakkı tanınacaktır (Anadolu Ajansı, 2023).

Bu yeni düzenlemelerin ve yaklaşımların kamuya nasıl yansıdığına dair bir perspektif kazanabilmek adına bu araştırmanın temel amacı, X platformunda aktif olan kullanıcıların, KPSS ile birlikte mülakat sürecinin öğretmen atamalarına etkisine dair tepkilerini analiz etmektir. X, eski adıyla Twitter, günümüzde kullanımı en yüksek sosyal medya platformlarından biri olup, bireyler burada günlük hayatlarına, deneyimlerine ve görüşlerine dair içerikler paylaşmaktadırlar. Bu sebeple, X platformundaki paylaşımlar, öğretmen atama sürecinin toplum nezdinde nasıl algılandığına dair derinlemesine bir bakış sunabilir. Bu bağlamda, araştırma süreci şu soruları yanıtlamayı hedeflemiştir:

1. X platformunda öğretmen atamalarında KPSS puanının yanı sıra gerçekleştirilen mülakat uygulaması hakkında tweet atmış kullanıcıların mesleki anlamda genel dağılımı nasıldır?
2. X platformunun kullanıcıları, öğretmen atamalarında KPSS puanının yanı sıra gerçekleştirilen mülakat uygulamasını nasıl değerlendirmektedirler?

Bu araştırma, X platformundaki paylaşımları içerik analizi yöntemiyle detaylı bir şekilde inceleyerek, öğretmen atama süreçlerindeki mülakat uygulamasının kamuoyunda nasıl bir yankı uyandırdığını ve kullanıcıların bu konuya nasıl yaklaştıklarını değerlendirmeyi amaçlamaktadır. Araştırma sonuçları, mülakat uygulamasının toplumsal algısına dair kapsamlı bir anlayış sağlamasıyla birlikte, bu konuda alınacak kararların ve yapılacak düzenlemelerin yönünü belirleyebilir.

Araştırmanın bulguları, eğitim politikalarının oluşturulması ve revize edilmesi süreçlerinde karar vericilere önemli bir rehber olabilir. Ayrıca, bu sonuçlar; öğretmen adayları, öğretim üyeleri, eğitim yöneticileri ve genel kamuoyu için de bilgilendirici olabilir. Bu bilgiler, konunun daha şeffaf ve katılımcı bir şekilde ele alınmasına yardımcı olacak, taraflar arasında daha sağlıklı bir diyalogun oluşmasına katkıda bulunabilecektir.

YÖNTEM

Bu bölümde, araştırmanın modeli, çalışmanın odaklandığı grup, veri toplama süreçleri ve bu verilerin analiz yöntemleri ele alınmıştır.

Araştırma Modeli

Bu çalışmada, Türkiye'de öğretmen atama süreçlerine, mülakatlara ve bu süreçte yaşanan yeniliklere ve sorunlara dair insan davranışlarının ve olguların ardındaki nedenlerin derinlemesine anlaşılması amacıyla nitel araştırma modeli benimsenmiştir (Gürbüz & Şahin, 2014). Nitel araştırma, araştırmacıların doğal ortamda gerçekleşen olguları, bireylerin bu

olgulara yüklediği anlamlar üzerinden değerlendirme ve yorumlama sürecidir (Creswell, 2014). Bu çalışma, öğretmen atama süreçlerine, mülakatlara ve bu süreçteki yeniliklere ve sorunlara dair etmenlerin (X üzerindeki paylaşımlar, bireylerin yorumları, olaylar, süreçler, vb.) atama sürecini nasıl etkilediği, paydaşların bu süreçten nasıl etkilendiği hakkında farklı meslek gruplarının algılarını bütüncül bir perspektiften belirlemeyi amaçladığından bu araştırmada nitel araştırma modellerinden fenomenoloji deseni tercih edilmiştir (Merriam, 2015; Yıldırım ve Şimşek, 2018). Bu bağlamda, öğretmen adaylarının ve atanmış öğretmenlerin atama sürecine dair görüşleri, X platformu üzerinden derinlemesine incelenerek belgelenmiştir. Elde edilen verilere bütüncül bir bakış açısıyla yaklaşarak, farklı konular ve durumlar arasındaki ilişkiler irdelenmiştir.

Evren ve Örneklem

Bu çalışmanın evrenini, sosyal paylaşım platformu olan X üzerinde kullanıcılar tarafından paylaşılan, Türkiye'de öğretmen atama süreçleri, mülakatlar ve bu sürece dair yaşanan yenilikler ve sorunlarla ilgili X platformunda yer alan tweet'ler oluşturmaktadır. Araştırmanın veri seti, amaçlı örnekleme yaklaşımlarından biri olan ölçüt bazlı örnekleme yöntemi ile oluşturulmuştur (Patton, 2014). Bu inceleme, X platformu üzerinden gerçekleşen paylaşımları kapsamlı bir içerik analizi ile ele alarak, öğretmen mülakat süreçlerine dair kamusal tepkinin ne yönde olduğunu ve kullanıcıların bu sürece olan tutumlarını aydınlatmayı hedeflemektedir. Bu kapsamda, veri seçim kriteri olarak X üzerindeki #öğretmenlermulakatakarşı etiketine başvurulmuştur. Analiz edilen veri seti, 28 Eylül 2023 tarihine dek X platformunda kullanılan #öğretmenlermulakatakarşı etiketiyle paylaşılan son 250 içerikten oluşmaktadır. Örnekleme daha önce başka kullanıcıların yazdığı içeriklerin tekrar paylaşılmasına olanak tanıyan retweet'ler ve aynı kişilerin tekrar paylaştığı tweet'ler dahil edilmemiştir. Araştırmanın etiği gereği, paylaşımları yapan kullanıcıların kişisel bilgileri ve kimliklerine dair herhangi bir ayrıntı raporda belirtilmemiştir.

Verilerin Toplanması ve Analizi

Çalışmanın veri toplama sürecinde doküman inceleme tekniğine başvurulmuştur. Bu yöntem, resmi veya özel kaynaklardan elde edilen bilgilerin toplanması, sistemli bir şekilde analiz edilmesi ve değerlendirilmesi sürecini kapsar (Ekiz, 2009). Doküman inceleme hem yazılı hem de görsel materyallerin analizini içermekte olup, bu süreçte incelenen olgular hakkında detaylı bilgi sağlar (Yıldırım ve Şimşek, 2018). Veri toplama sürecinde öğretmen atama süreçlerindeki mülakat uygulaması hakkında X platformunda atılmış olan son 250 tweet'in içeriği detaylı olarak incelenmiştir. Elde edilen bu verileri derinlemesine analiz etmek adına nitel veri analizi

tekniklerinden içerik analizi tekniđi tercih edilmiştir (Bilgin, 2006). İçerik analizi, bir metni inceleyerek insan doğasını ve davranışlarını anlamak amacıyla kullanılan bir analiz tekniđidir. Bu yöntem, metindeki sözcükleri belirli kurallara dayalı kodlamalarla daha küçük içerik kategorilerine sistematik olarak özetler. Araştırmacı, metindeki kelimelerin varlığını, anlamlarını ve ilişkilerini tespit ederek çıkarımlarda bulunur (Büyüköztürk, Kılıç Çakmak, Akgün, Karadeniz ve Demirel, 2012). Bu araştırmanın içerik analizi yapılırken belirli aşamalar halinde gerçekleştirilmiştir. Öncelikle elde edilen veriler meslek gruplarına göre ayrıştırılmıştır. Kişisel bilgilerin korunması gerekliliđince her meslek grubunun tweet'leri farklı kısaltmalar kullanılarak numaralandırılmıştır. Eğitim fakültesi öğretim üyeleri ÖÜ1, ÖÜ2; siyasetçiler S1, S2; öğretmen adayları ve atanmayı bekleyen öğretmenler ÖA1, ÖA2; MEB'e bađlı kurumlarda çalışan kadrolu öğretmen ve yöneticiler KÖY1, KÖY2; mesleđi belirlenemeyen diđer katılımcılar ise D1, D2 şeklinde numaralandırılmıştır. Daha sonra örnekleme dahil edilen veriler araştırmacılar tarafından birkaç kez okunduktan sonra fikir birliđine varılarak kodlar oluşturulmuştur. Bu kodlama esnasında, araştırmanın spesifik amacı göz önünde bulundurularak ilgili kod yapıları tasarlanmıştır. Oluşturulan kodlardan yola çıkılarak benzerliklerine göre kategoriler yorumlanmıştır. Bulguların sunulmasında orijinal tweet'lerden örneklere yer verilmiş ve bu örnekler sunulurken dilbilgisi ve yazım yanlışları düzeltilmemiş, X platformunda yayınlandıđı şekliyle yer verilmiştir.

BULGULAR VE TARTIŞMA

Bu bölümde, araştırma sorularına cevap arayışı doğrultusunda elde edilen bulgulara ve bulgulara ilişkin yorumlara yer verilmiştir. Araştırmada, sosyal paylaşım platformu X üzerinde, öğretmen mülakat süreçleriyle ilgili yapılan paylaşımların analizine dair sonuçlar sunulmuştur. Özellikle hangi meslek grubundan kaç kişinin bu sürece dair ne tür paylaşımlarda bulunduđuna dair detaylı bilgiler aşağıda tablo halinde sunulmaktadır.

Tablo 1: Öğretmen Mülakat Süreçleri Hakkında X Platformunda Yapılan Paylaşımların Meslek Gruplarına Göre Dağılımı ve Mülakata İlişkin Görüşleri

Meslek Grubu	Tweet		Mülakat		Mülakat	
	sayısı (n)	%	Yanlısı (n)	%	Karşıtı (n)	%
Eğitim fakültesi öğretim üyeleri	25	10	3	12	22	88
Siyasetçiler	18	7,2	3	16,7	15	83,3
Öğretmen adayları ve Atanmayı Bekleyen Öğretmenler	156	62,4	0	0	156	100
Kadrolu Öğretmen ve Yöneticiler	19	7,6	1	5,3	18	94,7
Diğer	32	12,8	8	25	24	75
Toplam	250		15		235	

Tablo 1 incelendiğinde, öğretmen atama süreçleri hakkında X platformunda yapılan paylaşımların meslek gruplarına göre dağılımı detaylı bir şekilde gözler önüne serilmektedir. Öğretmen adayları ve atanmayı bekleyen öğretmenlerin bu sürece dair en aktif grup olduğu anlaşılmaktadır. 250 tweet'in 156'sı bu gruptan gelmekte olup, bu değer yüzde olarak %62,4'e karşılık gelmektedir. Bu durum, öğretmen adaylarının ve atamayı bekleyen öğretmenlerin mülakat süreçleriyle doğrudan ilgili oldukları ve bu süreçten en çok etkilenen grup oldukları için bu kadar aktif olduklarını göstermektedir. Eğitim fakültesi öğretim üyeleri tarafından atılan 25 tweet, toplam tweet sayısının %10'unu oluşturmaktadır. Bu grup, öğretmen adaylarını yetiştiren ve onların mesleki becerilerini geliştiren kişiler oldukları için mülakat süreçlerinin nasıl işlediğine dair derinlemesine bilgilere sahip olabilirler. Kadrolu öğretmen ve yöneticilerin paylaştığı tweetler toplamda 19 adettir ve bu, toplam tweet sayısının %7,6'sını temsil etmektedir. Kadrolu öğretmenler ve yöneticiler, atama sürecini daha önce deneyimlemiş oldukları için bu sürecin avantajlarını ve zorluklarını bilmekte ve bu nedenle paylaşımda bulunmaktadır. Siyasetçilerin paylaştığı 18 tweet ise toplamın %7,2'sini oluşturmaktadır. Siyasetçiler, eğitim politikalarının belirlenmesinde söz sahibi oldukları için mülakat süreçlerine dair yorumlarda bulunabilirler. Bu gruptaki bireylerin, öğretmen atama süreçleri üzerinde direkt bir etkisi olabileceği ve bu nedenle platformda paylaşımda bulunduğunu düşünebiliriz. "Diğer" kategorisi, X platformunda yer alan ve profillerinden hangi meslek grubu içinde yer aldıklarının net olarak anlaşılamadığı kullanıcıları kapsamaktadır ve bu grubun paylaşımları 32 adetle

toplaminin %12,8'ini oluşturmaktadır. Bu grup, öğretmen atama süreçleriyle doğrudan ilgili olmayabilir, ancak bu süreçten dolayı etkilenen aile üyeleri, arkadaşlar veya sadece konu hakkında bir görüş belirtmek isteyen bireylerden oluşabilir. Bu nedenle, bu grubun da mülakat süreçleri hakkında paylaşımda bulunma sebepleri, diğer meslek gruplarına göre daha çeşitli olabilir.

Eğitim Fakültesi Öğretim Üyelerinin Mülakat Uygulamasına İlişkin Görüşleri

Eğitim Fakültesi Öğretim Üyelerinin mülakat sürecine ilişkin görüşleri, X platformu üzerinden paylaşılan tweetler incelendiğinde çarpıcı bir biçimde ağırlıklı olarak mülakat karşıtı tutumlar sergiledikleri gözlemlenmiştir. İncelenen 25 tweet'in yalnızca üçünde mülakata destekleyici ifadeler bulunurken, geriye kalan 22'sinde mülakatın adaletsizliğine, uygulamanın doğurabileceği nepotizm ve torpil sorunlarına vurgu yapılmıştır. Öğretim üyeleri, mezun adaylarının ve mezunların endişe ve eleştirilerine dair duyarlılık göstererek, onların yanında olduklarını ifade etmişlerdir.

Tweet örneklerinde, #ÖÜ1, #ÖÜ5, #ÖÜ6, #ÖÜ8, #ÖÜ11, #ÖÜ15, #ÖÜ18 ve #ÖÜ22 gibi öğretim üyeleri, mülakat uygulamasının teorik bir değerlendirme aracı olarak etkin olabileceğini kabul etmekle birlikte, uygulamanın mevcut durumunun ve yapılış biçiminin ciddi endişeler yarattığına dikkat çekmişlerdir. Mesela, #ÖÜ1'in ifadesi mülakat sürecinin teorik olarak doğruluğunu kabul ederken, pratikteki uygulamanın rüşvet, torpil ve nepotizm gibi sorunlarla lekelendiğini ve bu durumun mülakatın güvenilirliğini azalttığını vurgulamaktadır. Bu ifadeler, mevcut mülakat uygulamasının şeffaf ve adil bir temel üzerine inşa edilmesi gerektiği gereksinimini ortaya koymaktadır.

Öğretim üyesi #ÖÜ15 ve #ÖÜ18 gibi eleştirmenler, mülakat sürecinin subjektifliğini ve standartlaşmış uygulamaların eksikliğini eleştirmiş, bu durumun adayların eşit koşullarda değerlendirilmesini zorlaştırdığını belirtmişlerdir. Özellikle #ÖÜ18, farklı komisyonların ve puanlama sistemlerinin varlığının bile adil bir sürecin gerçekleşmesini engellediğine dikkat çekerek, mülakat yerine mevcut KPSS ve aday öğretmenlik süreçlerinin yeterli olduğunu savunmuştur. Öğretmen alımlarında Milli Eğitim Bakanlığı'nın mülakat uygulaması getirmesine karşıt görüş bildiren öğretim üyelerinin tweet'lerine örnekler aşağıdaki gibi sıralanabilir:

ÖÜ1: "Öğretmen alımında istihdamı yapan kurumun kişinin teorik bilgisinin yanında pratikte yeterliliğini, iletişim becerisini, alan uzmanlığını ve bu uzmanlığını sınıfa yansıtıp yansıtamayacağını görmek istemesi kadar doğal bir şey yok. Özel okulların tamamına yakını öğretmen alımlarını benzer şekilde gerçekleştiriyorlar. Ölçme ve değerlendirme açısından da

aslında bilimsel olarak yöntem doğru... MEB öğretmen alımında yapılabilecek en doğru mülakatı planlıyor ama mülakat ile ilgili sorun içeriği veya yapılış şekli değil. Sorun TORPİL, RÜŞVET, NEPOTİZM... BU SORUNLARI KAMERA AŞAR MI? BEKLEYİP GÖRECEĞİZ. Her atama döneminde meclisten bakanlığa akan referans mektuplarını biliyoruz."

ÖÜ5: "Mülakat konusunda en temel sorun kişilerin devlete olan güvenlerinin zayıflamasıdır. Bu noktada çözüm mülakatsızlık değil mülakat için gerekli şartların sağlanması, itiraz ve mahkeme yollarının doğru işlemedir. Bugün vatandaşta oluşan algı "devlette torpille olmayacak iş yok" algısıdır. Bunu Sn. @Yusuf__Tekin yıkabilir mi, bekleyip göreceğiz. Kendisi hak yemek, beddua almak istemediğini söylemiş ama buna kimseyi inandıramaz."

ÖÜ6: "Atanma ihtimali olan öğretmenler "mülakata hayır" derken, KPSS sıralamasında geride olan ve atanma ihtimali görece daha zayıf olanlar konu hakkında hiç tivit atmıyorlar, "Belki torpil bulup atanırız!" diyerek."

ÖÜ8: "Dersi çok iyi anlatan bir öğretmen komisyondan 70 alırken, başka bir komisyonda ders anlatamayan 75 alabilir. Yüzlerce komisyonu ve binlerce öğretmen adayını nasıl standardize edeceksiniz?"

ÖÜ11: "Mülakat, doğru ve adil yapıldığı zaman en iyi seçim yöntemidir ama maalesef ülkemizde işlerin doğru ve adil yürümediğini herkes biliyor. Bu yüzden mülakata hayır diyoruz."

ÖÜ15: "Objektif olmayacağına inandığım için öğretmenlerin mülakatla atanmasına karşıyım. Kimse sen de mi hocam demesin, torpilin bu kadar yaygın olduğu bir toplumda böyle atama olmaz. Bu çocuklar zaten Alan Yeterlilik Sınavı'na girdi, daha fazla zorlamayınız lütfen."

ÖÜ18: "En az 300 komisyon, farklı puanlamalar. Ne kadar torpil olmasa bile adil süreç olmaz. Virgüllerle dahi binler oynuyor. Öğretmen yeterliliği mülakatla ölçülmez, kpss ve aday öğretmenlik süreci ile ölçülüyor. Halihazırda zaten aday öğretmenlik süreci varken mülakata gerek yok."

ÖÜ22: "Eğitim fakülteleri zaten pratik eğitim veriyor. Mezun olan bir öğretmen adayının yeterliliğini bir mülakatla ölçmek, onun 4 yıllık emeğini hiçe saymak olur."

Bunun yanı sıra, mülakat sürecini destekleyen az sayıdaki öğretim üyesi de mevcuttur. Örneğin #ÖÜ19, #ÖÜ10 ve #ÖÜ21 gibi öğretim üyeleri, öğretmen adaylarının yalnızca bilgi bazlı yeterliliklerine değil, aynı zamanda iletişim becerileri, karizma ve insan ilişkileri gibi niteliklere de sahip olmaları gerektiğini savunarak, mülakatın bu becerilerin ölçülmesinde etkili bir araç olabileceğini ifade etmişlerdir. Ancak bu pozitif görüşlerin, mülakat sürecinin şeffaflık ve adil oluş gibi ön koşullarla sağlıklı bir şekilde yürütülmesi gerektiğine vurgu yaparak, sürecin ideal

çalışma şartlarını da göz ardı etmedikleri anlaşılmaktadır. Öğretmen alımlarında Milli eğitim Bakanlığı'nın mülakat uygulaması getirmesini uygun bulan 3 öğretim üyesinin tweet'leri aşağıdaki gibidir:

ÖÜ19: "Öğretmenlik gibi mesleklerde mülakat gereklidir, çünkü öğretmenlikte öğretme becerilerinin yanı sıra insan ilişkileri, insan sevgisi, iletişim, hitabet ve daha pek çok özellik aranır. Ancak bu sürecin şeffaf, adil ve objektif olması esastır. Sorun mülakat değil, sistemin doğru işletilmemesidir."

ÖÜ10: "Eğitim alanı pratik ve teorik bilginin birleştiği bir alan. Bir öğretmen adayının sadece yazılı sınavla değerlendirilmesi, onun sahip olduğu diğer önemli becerileri göz ardı etmek olur."

ÖÜ21: "Mülakat aslında bir fırsattır. Adayın sadece bilgisi değil, duruşu, karizması, iletişimi gibi faktörler de önemlidir ve bu sadece yazılı sınavla ölçülemez."

Bu bağlamda, öğretim üyelerinin görüşlerinin, öğretmen adaylarının ve kamuoyunun algısını şekillendirmede önemli bir rol oynadığı anlaşılmaktadır. Genel olarak, mülakat sürecine yönelik eleştirilerin yoğunluğu ve endişe verici doğası, bu uygulamanın mevcut haliyle yeniden gözden geçirilmesi gerekliliğini öne çıkarmaktadır. Bu süreçte daha şeffaf, adil ve objektif bir değerlendirme metodolojisinin benimsenmesi hem öğretim üyelerinin hem de adayların beklentilerini karşılayacak bir adım olarak değerlendirilebilir.

Siyasetçilerin Mülakat Uygulamasına İlişkin Görüşleri

Eğitim sistemi, bir toplumun geleceğini şekillendiren en önemli yapıtaşlarından biridir ve bu sistem içerisinde öğretmen atamaları kritik bir rol oynar. Öğretmenler, genç zihinleri bilgi ile buluşturan, düşünmeye teşvik eden ve toplumun genel ahlaki ve kültürel değerlerini aktaran temel aktörlerdir. Dolayısıyla, öğretmen seçim süreci, sadece eğitim kalitesini değil, aynı zamanda toplumsal gelişimi de etkiler. Bu sebeple, siyaset kurumunun bu süreçteki yaklaşımı son derece önemlidir. Türkiye'deki öğretmen atama sistemine dair mülakat uygulaması, siyasetçiler arasında yoğun tartışmalara yol açmıştır. Toplam 18 siyasetçi tarafından atılan tweet'lerde bu konu, mülakatın gerekliliği ve etkinliği açısından farklı perspektiflerden ele alınmıştır.

Siyaset sahnesinde mülakat uygulamasına karşı çıkanların genel itiraz noktaları, eğitimde adaletsizliğe yol açacak bir mekanizma olarak algılanan bu sürecin, çeşitli sosyoekonomik ve kişisel engeller nedeniyle öğretmen adaylarını mağdur edebileceğini vurgulamaktadır. Özellikle #S1, #S2, #S6, #S7, #S9, #S11, #S14, #S15 ve #S17 numaralı tweet'lerde bu konu

üzerinde durulmuştur. Bu görüşlerde, öğretmen seçiminde objektif kriterlerin göz ardı edilmesi, mülakat sürecinin masrafları, öznel değerlendirmeler ve torpil iddiaları gibi hususlar eleştirilmektedir. #S1, veli ve öğretmen seçiminde mülakatın doğru olmadığını belirtirken, #S2, mülakat sürecinin ekonomik ve kişisel zorluklar yarattığını vurgulamıştır. #S6, kontenjanın üç katı kadar adayın mülakata çağrılmasının yanlışlığına dikkat çekerken; #S7, kameraya rağmen mülakat sonuçlarına itiraz edilememesini eleştirmiştir. #S9, mülakatın öğretmenlik yeterliliklerini artırmadığını; #S11, yeterli ve nitelikli jüri sayısını; #S14, farklı jürilerin öznel değerlendirmelerini; #S15, jüri üyelerinin seçimi ve baskıya maruz kalma durumunu; ve #S17, mülakatların siyasi çıkarlar için kullanıldığı iddiasını ortaya atmıştır. Milli Eğitim Bakanlığı'nın uygulamaya koymayı düşündüğü mülakat uygulamasına karşı fikir sunan siyasetçilerin atmış oldukları tweet'lere örnekler aşağıda sunulmuştur:

S1: "Ne bir velinin çocuğunu okula yazdırırken 'öğretmen seçme' arzusu doğrudur, ne de öğretmeni mülakatla 'seçme' uygulaması doğrudur!"

S2: "Mülakatla sadece metropollerdeki gençler mağdur olacak. O gün HASTA, HAMİLE, REGL, BEBEKLİ, ENGELLİ OLANLAR, PANİK ATAK GEÇİRENler ne olacak?"

S6: "Mülakata kontenjanın 3 katı kadar öğretmen çağrılacak olması başarısız ama torpillilerin öne geçeceğini resmen ilan etmektir."

S7: "Mülakatlarda kamera olacak deniyor ancak mülakat komisyonu ben bu notu uygun gördüm dedikten sonra itirazın bir karşılığı olmaz."

S9: "Öğretmen istihdamında mülakat uygulaması kaldırılmalıdır..."

S11: "Yüzbinlerce adayı değerlendirecek yetkinlikte jüri sayımız var mı? Alanının uzmanı olmak iyi bir mülakatçı olmayı garantilemiyor."

S14: "Farklı jürilerin farklı değerlendirmeleri kişilerin hayatlarını farklı şekillerde etkileyebilir."

S15: "Jüri üyelerine torpil baskısını kaldırabilecek özgüvene sahip olup olmadıkları sorulmalı."

S17: "Seçimlerden önce 'Mülakatları kaldıracağız' sözü vardı, şimdi bu söz tutulmuyor."

Öte yandan, mülakat uygulamasının gerekliliğini savunan siyasetçiler, aşağıda belirtilen #S3, #S5 ve #S18 numaralı tweet'lerinde mülakatın adayların kişisel ve profesyonel uygunluklarını ölçmede bir araç olduğuna dikkat çekmektedirler.

S3: "Ben okulda X dersini okutsun diye bir öğretmen istihdam edeceğim ama 4 yıllık lisans programı sonunda öğretmenimizin alan bilgisi testinde öğretmen adayı kendisine sorulan sorulardan yüzde 35'ine doğru cevap veriyor... Mülakat gereklidir."

S5: "Çok özür dilerim de, bir dershaneye girebilmek için müdüründen patronuna bir sürü kişiyle görüşme yapılıyor da, devlet okuluna girmek için yapılacak mülakata neden itiraz ediliyor ki?..."

S18: "Sorsan sabıkası yok... Merak ediyorum. Çocuğunuzun derslerine girsin ister misiniz böyle bir öğretmen?..."

Mülakat uygulamasının öğretmen atamalarındaki yerini değerlendirirken, siyasi liderlerin görüşleri Türkiye'deki eğitim politikalarının şekillenmesinde ve uygulanmasında kritik bir etkiye sahiptir. Tartışmanın her iki tarafı da geçerli argümanlar sunmakta ve bu durum, konunun karmaşıklığını gözler önüne sermektedir. Mülakata karşı olan siyasetçilerin endişeleri, özellikle şeffaflık, adalet ve eşitlik ilkelerine vurgu yaparken; mülakatı savunanlar ise bireysel yeterlilik ve mesleki uygunluğun doğru değerlendirilmesinin önemini öne sürmektedir. Kapsamlı bir değerlendirme ve toplumsal konsensüs gerektiren bu mesele, eğitim sisteminin kalitesini ve adil işleyişini sağlamak adına titizlikle ele alınmalıdır. Öğretmen atama süreçlerinde mülakatın rolü, bilimsel verilere ve kapsayıcı bir yaklaşıma dayanarak yeniden düşünülmelidir.

Öğretmen Adayı ve Atanmayı Bekleyen Öğretmenlerin Mülakat Uygulamasına İlişkin Görüşleri

Eğitim, bir toplumun geleceğini şekillendiren en kritik unsurlardan biridir ve bu sürecin kalbi olan öğretmenler, nitelik ve adanmışlık bakımından en yüksek standartlarda olmalıdır. Bu bağlamda, öğretmen adayları, yani eğitim fakültelerinde veya öğretmenliğe kaynak teşkil eden diğer akademik disiplinlerde öğrenim gören lisans öğrencileri, ve atanmayı bekleyen öğretmenler, yani öğretmenlik mesleğine adım atmak üzere gerekli fakülteleri bitirmiş ve Milli Eğitim Bakanlığı bünyesinde öğretmen olarak atanabilmek için Kamu Personeli Seçme Sınavı'na (KPSS) giren adaylar, profesyonel meslek hayatlarının başlangıcında önemli bir aşama olan mülakat süreciyle karşı karşıya gelmektedirler. İncelenen 156 öğretmen aday ve atanmayı bekleyen öğretmen örnekleminin tamamı, mevcut mülakat uygulamasının eğitimde fırsat eşitliğini bozduğuna ve liyakat esasına dayanmadığına inanarak, bu uygulamaya karşı çıkışlarını belirgin bir şekilde ifade etmiştir.

Öğretmen adayları ve atanmayı bekleyen öğretmenler, mülakat uygulamasına çeşitli nedenlerle karşı çıkmaktadır. Birincisi, adil bir atama sürecinin sadece KPSS puanlarıyla mümkün olacağına ve "#Torpil = Mülakat" denklemini oluşturduğuna inanmalarıdır (#ÖA 17). Liyakat ve adaletin sağlanamayacağı bir sistemde, "yetersiz insanların mülakat adı altında torpille atanmasını engellemek" (#ÖA 36) gerektiği düşünülmektedir. Öğretmen adayları, mülakat sürecinin standardizasyon eksikliğine (#ÖA 60, #ÖA 132), öznel değerlendirme (#ÖA 133) ve

adil olmayan yönetmelik değişikliklerine (#ÖA 78) işaret ederek, birçok branş için uygun mülakat komisyonlarının nasıl oluşturulacağına dair endişelerini dile getirmişlerdir. Ayrıca, uzun süreler ders anlatma ve akademik onaylara rağmen mülakatla yeniden değerlendirilmeye tabi tutulmanın kabul edilemez olduğunu (#ÖA 90, #ÖA 112) ve mülakatın aslında bir nevi "adam kayırmaca" (#ÖA 118) olduğunu savunmaktadır. Öğretmen adaylarının, hazırlıksız olarak mülakat performansı sergilemelerinin (#ÖA 44, #ÖA149) veya puanlama sürecinin şeffaflık ve güven eksikliğinin (#ÖA 150, #ÖA152) mesleklerini icra etmelerine gölge düşürdüğüne inanmaları, bu sürece karşı olan direncin temel nedenlerini oluşturmaktadır. Öğretmen adayları ve atanmayı bekleyen öğretmenlerin tweet'lerine ilişkin örnekler aşağıda sıralanmıştır:

ÖA17: "Torpil =Mülakat

ADİL OLANI YANİ %100 KPSS PUANIMIZLA ATANMAK İSTİYORUZ"

ÖA36: "Mülakatın liyakat getireceğini düşünsek itiraz etmezdik zaten. Amaç yetersiz insanların mülakat adı altında torpille atanmasını engellemek. Ha siz çocuğunuzu ders çalışmaktan kaçıp torpil arayanlara teslim etmek istiyorsanız, siz bilirsiniz."

ÖA44: "45 dakika mülakatta ders anlatmak için materyal hazırlayamam ki"

ÖA59: "Özel eğitim öğretmenleri bep hazırlar öyle ders anlatırlar. Özel eğitim öğretmenleri ve benzeri birçok branş için nasıl komisyon kuracaksınız?"

ÖA60: "Aynı mülakat performansını farklı komisyonlarda sergilediğimde aynı puanı alabileceğimin garantisi var mı?"

ÖA78: "Meb de her iş torpille dönüyor neredeyse, sonra da vay niye güvenmiyorsunuz. Niye güvenelim kişilere? kurumlar güvenilir olmalı kanunlar herkes için eşit işletilmeli. Habire yeni yönetmelik boyna değişiklik sana ayrı bana ayrı işleyen bir sistem sıkıttı artık"

ÖA90: "Öğretmenler onlarca ödev, vize ve finalden sonra lisans diploması almıştır. Akademisyenlerden onay alıp mezun olmuştur. Onlarca akademisyenin onayının üstüne mülakat uygulaması kabul edilemez."

ÖA93: Beni fakülteye alıp senelerce öğretmenlik hayali kurdurun, okullara gönderip ders anlattirin daha da heveslendirin. KPSS'ye sokup yıllarca emek verdirip derece yapmamı sağlayın. Sonra mülakatta 45 dk'da "olmazmış senden ya" diyin. Bakın bu öldürmekten beterdir!

ÖA106: Kaçınıcı oldun diyorlar 41. Diyorum. E derdin ne senin tuzun kuru kızım diyorlar, ah bir bilsen diyorum.. Önüme geçebilirler, hakkımı yiyebilirler..

ÖA112: *Bu benim stajımdan bir video. 45 dk değil "iki dönem boyunca" ders dinleyip ders anlattık. Hocalarımız tarafından puanlandık. Yetmedi KPSS yaptınız, girip onda da derece yaptık. Yetmedi mi, canımızı da mı istiyorsunuz?*

ÖA118: *Atama bekleyen öğretmenler mülakatla mağdur olmak istemiyor. Mülakat bir nevi güvenlik soruşturması değildir. A dan Z ye güvenlik soruşturması zaten yapılıyor. Mülakat işin bahanesi. Mülakat = adam kayırmaca*

ÖA132: *Deney yapsak, 30 gün 30 farklı komisyon karşısında mülakat olayını gerçekleştirsem, 30 komisyon da bana aynı puanı verebilir mi? Bunun imkansızlığı ortadayken neden bu ısrar?*

ÖA133: *Neden karşıyız! Çünkü sözlü sınavlar Güvenirliği en düşük ölçme aracıdır. Özel değerlendirme olacağından Nesnel sonuç alınamaz. Bundan dolayı da belkide binlerce insanın hakkına girilmiş olacak. Buna değer mi?*

ÖA145: *Kontenjana giremezsem geçen yıl yaptığım gibi bir yıl daha çalışır çok çok iyisini yaparım ama mülakatta elenirsem neye çalışacağım nasıl çalışacağım kendimi nasıl motive edeceğim ?*

ÖA149: *Ben özel eğitim öğretmeniym ben böp hazırlamadan, elime materyali vermeden ne yapmamı bekliyorlar kaldiki özel gereksinimli bir bireye kim 45 dk ders anlatmış?*

ÖA150: *Benim ismim e harfiyle başladığı için geçen yıl mülakata erken giren gruptaydım buna rağmen saatlerce güneş altında bekledim. 7000 sınıf öğretmeni aldınız 21000 kişiye 45 dakika verdiğinizde kaç ay sürecek bu mülakatlar?*

ÖA152: *Dil öğretmenleri kime neyi anlatacak?Materyal olmadan hazırlık olmdan plan yada program yapılmadan ders işlendiği nerede görülmüş? 45 dk 35 dk ders son 10 dk yazılı beyan. Devletimiz bünyesinde 35 dk kesintisiz ders anlatan bir öğretmen mi var?Konular branşlara nasıl dağıtılacak?*

ÖA155: *Madem mülakatla alan bilgimiz ölçülmek isteniyor MEB'de görevli öğretmenler de alan sınavına tabi tutulsun. Niçin bu mülakat zulmü bize yapılıyor sadece? Komisyon üyelerinin alan bilgisinin yeterliliği de ölçülecek mi?*

Öğretmen adayları ve atanmayı bekleyen öğretmenlerin mülakat uygulamasına dair eleştirileri, eğitim alanındaki atama süreçlerinde adalet, şeffaflık ve liyakat gibi temel ilkelerin önemini vurgulamaktadır. Uygulanan mülakatlar, adayların geçmiş eğitim ve akademik başarılarını göz ardı ederek gerçekleştirilmekte ve bu durum onların profesyonel kariyerlerine ve özgüvenlerine zarar verebileceği gibi (#ÖA 93, #ÖA 145), mülakat sürecindeki bu öznel ve standardizasyon eksikliği, eğitim sistemi içerisindeki güven sorunlarını derinleştirmekte ve potansiyel olarak binlerce adayın haklarının ihlal edilmesine yol açabilecek bir atmosfer yaratmaktadır (#ÖA 133,

#ÖA 155). Bu bağlamda, eğitim fakülteleri ve ilgili kurumlar arasında, adil ve liyakat esaslı bir atama sürecinin sağlanması konusunda acil ve derinlemesine bir diyalog ve reform ihtiyacı açıkça ortaya çıkmaktadır.

Millî Eğitim Bakanlığı'nda Kadrolu Öğretmen ve Yöneticilerin Mülakat Uygulamasına İlişkin Görüşleri

Millî Eğitim Bakanlığı bünyesinde görev yapan kadrolu öğretmen ve yöneticilerin, eğitim alanının deneyimli aktörleri olarak politikaların ve uygulamaların sahada nasıl tezahür ettiğini en iyi bilebilecek kişiler olduğu düşünülebilir. Bu grup, eğitim sisteminin iç işleyişi, öğrenci başarısı ve öğretmen yetkinliği üzerinde doğrudan etkiye sahip oldukları için, mülakat uygulamaları konusundaki görüşleri, özellikle de öğretmen atamaları gibi kritik süreçlerde, önemli bir perspektif sunabilir. Kadrolu öğretmen ve yöneticilerin görüşleri, atama süreçlerinin adalet, şeffaflık ve liyakat ekseninde iyileştirilmesine yönelik politika yapıcılar için değerli içgörüler sağlayabilir ve aynı zamanda meslektaşlarıyla empati kurarak eğitim ekosisteminin daha sağlıklı işlemesine katkıda bulunabilirler.

Araştırmaya katılan kadrolu öğretmen ve yöneticilerin mülakat uygulamasına dair görüşleri, genel olarak mülakatın gerekli bir araç olduğuna işaret etmekle birlikte, uygulamanın mevcut formatının ve ağırlığının gözden geçirilmesi gerektiğini düşündüklerini göstermiştir. Örnekleme dahil edilen 19 tweet'ten 18'inin mülakata karşı bir tutum sergilemesi, mevcut sistemin adaletsizlik ve verimsizlik yarattığına dair güçlü bir konsensüs olduğunu ortaya koymaktadır. Mülakatların %50 ağırlık taşıması ve kaygı, endişe, stres gibi subjektif faktörlerin sonuçları etkilemesi, bu uygulamanın güvenilirliğinin tartışmalı olduğunu belirginleştirirken, sözlü sınavların objektiflikten uzak olduğu ve yanlı hatalara açık olduğu belirtilmiştir. X platformundaki profilleri incelendiğinde Millî Eğitim Bakanlığı bünyesinde kadrolu öğretmen ve yönetici olduğu anlaşılan kullanıcıların örneklem dahilindeki tweet'lerinden örnekler aşağıda sunulmuştur:

KÖY8: "Kamu özel farketmez, mülakat gereklidir. Yoksa işine son veremeyeceğin bir ruh hastasını işe alabilirsin. Senelerce yöneticilik yaptım. Tecrübem bu. Mülakat gereklidir."

KÖY12: "50 bin kontenjan için 150 bin kişi mülakata çağrılırsa ve 100 bin kişi mülakat notuna itiraz ederse ne olacak?"

KÖY14: "0,1 puan fark bile bu kadar önemliyken mülakatın %50 ağırlığa sahip olması mantık dışıdır."

KÖY3: "Uzmanlar, yüksek puan alarak derece yapmış bir adayın, mülakatsız bir alımda atanma ihtimali olmayan bir adaya göre çok daha fazla heyecanlanacağı ihtimaline dikkat çekiyorlar. Bu da başarılı öğretmen adayını mülakat sonucu başarısız kılabilir."

KÖY7: "Mülakat için jürinin karşısına çıkan bir öğretmen adayı, ilgili bölümü kazanmış, derslerini başarıyla vermiş ve staj eğitimini tamamlamıştır. Bu kişi, KPSS Genel Kültür-Genel Yetenek Testi, Eğitim Bilimleri Testi ve Öğretmenlik Alan Bilgisi Testi'nden yüksek puan alarak jürinin karşısına çıkmıştır. Bu aday öğretmen 25 ila 30 dersten sınava tabi tutulmuş gereken başarıyı göstermiştir. Tüm bu süreçlerden geçen bir aday öğretmenin sonuç üzerinde yüzde 50 oranında etkili olacak bir mülakata tabi tutulması hakkaniyete uygun değildir."

KÖY19: "Sözlü uygulamalar tesadüfi hataların en fazla karıştığı uygulamalardır. Bundan dolayı güvenilirliği en düşük sınav türüdür. Kaygı, endişe, stres, gelecek korkusu ve hiç tanımadığın üç kişi de eklenince kesinlikle en kötü değerlendirme olacaktır."

Elde edilen bulgulara göre, Millî Eğitim Bakanlığı'nda görevli kadrolu öğretmen ve yöneticiler, mesleğe yeni adım atacak olan öğretmen adaylarının karşılaştığı mülakat sürecine dair ezici bir çoğunlukla eleştirel bir tutum sergilemektedir. Bu, öğretmen ve yönetici grubunun, adayların karşılaştıkları zorlukları ve mülakat sürecinin mevcut haliyle adil olmadığını düşündüklerini göstermektedir. Bununla birlikte, bu çalışmada ele alınan toplam örneklemin yalnızca %7,6'sını (n=19) temsil eden tweet sayısı, kadrolu öğretmen ve yöneticilerin öğretmen adayları ve atanmayı bekleyen öğretmenlere yeterli desteği sağlamadığına dair bir görüş oluşturabilir. Bu durum, mülakat sistemine yönelik geniş çaplı bir memnuniyetsizlik olduğunu, ancak sistemi değiştirmek için gerekli kolektif eylemin oluşmadığını gösterebilir.

X platformundaki Profillerinden Mesleki Bilgilerine Ulaşamayan Kullanıcıların Mülakat Uygulamasına İlişkin Görüşleri

X platformundaki profillerinden mesleki bilgilerine ulaşamayan kullanıcıların mülakat uygulamasına ilişkin görüşleri, mesleki camia içerisindeki yaygın kanının bir kesiti olarak ele alınabilir. Bu kullanıcılar, belki de doğrudan eğitim sektöründe çalışmıyor veya mesleki kimliklerini gizli tutmayı tercih ediyor olabilirler; ancak, mülakat sürecine dair yorumları öğretmen adaylarının ve mevcut öğretmenlerin görüşleriyle karşılaştırmalı bir perspektif sunar. Öğretmen adayları üzerindeki baskıyı ve kamuoyundaki genel algıyı daha iyi anlamak için bu türden anonim veya yarı-anonim katılımcıların görüşleri önemli olabilir. Analiz edilen 32 tweet'ten %75'inde (24 tweet) mülakat uygulamasına karşı bir duruş sergilenirken, %25'inde (8 tweet) mülakat uygulamasının faydalı olduğuna işaret edilmiştir. Bu, X platformu üzerinde

mesleki bilgileri gizli olan kullanıcıların büyük bir kısmının mevcut mülakat sistemine eleştirel yaklaştığını göstermektedir.

Mülakat sürecine ilişkin bu karışık görüşler, toplumun çeşitli kesimlerinden insanların, öğretmen alımlarındaki sözlü sınavları değerlendirme biçimlerinde büyük bir çeşitlilik olduğunu ortaya koymaktadır. Bu veriler, bazı kullanıcıların mülakatın objektiflikten uzak, adaletsiz ve hatta torpil ile ilişkilendirildiği konusunda endişeler taşıdığını gösterirken, diğer kullanıcılar mülakatın terörle mücadele ve liyakat gibi konularda önemli bir araç olduğunu savunmaktadır. X platformundaki profillerinden mesleki bilgilerine ulaşamayan kullanıcıların mülakat uygulamasına ilişkin görüşlerini yansıtan tweet'lerden örnekler aşağıda listelenmiştir:

D1: *"Öğretmenler neye karşı değil ki? Özel sektörde işe girerken kaç mülakattan geçiyorlar. Devlete gelince mülakata karşıyız. Çocuklarımızı emanet ettiğimiz öğretmenler mülakat istemiyor. Şaka gibi"*

D6: *"Fetö ve diğer terör örgütlerinin devlet kadrolarına sızmalarını engellemek için mülakat gereklidir."*

D7: *"Öğretmenler neden mülakattan korkuyor? özel sektör çalışanları bir işe girmek için onlarca mülakattan geçiyor..."*

D13: *"Bu konuda eğitim fakültelerine dokunulmaması da ilginç. Öğretmenlik uygulaması dersinin yetersiz olduğunu herkes biliyor..."*

D14: *"Bugün Anadolu'da her evde bir öğretmen adayı var. Hiçbir anne-baba binbir emekle öğretmen olarak yetişen evladının hakkının yenilmesine rıza göstermez..."*

D19: *"Mülakat nedir??? Mülakat haksızlıktır, emeğe saygısızlıktır, torpildir, liyakatsizliktir, yılların çöpe gitmesidir ama LİYAKAT değildir!!!"*

D25: *"Nisa 58; 'Allah size kesinlikle görevleri ehil ve layık olanlara vermenizi, insanlar arasında bir yargılama yaptığınızda adaletle yargılama yapmanızı emrediyor.'"*

D27: *"Öğretmenlerin gönlüne girmek yerine karşınıza alıyorsunuz, sınava giren 600 bin öğretmen var..."*

D26: *"Sınavları tüm Türkiye'de aynı jüri yapamayacağı için belli bir standart yakalanamayacaktır..."*

D29: *"Kamuda işe alımlarda mülakat meselesi çokça tartışılıyor..."*

D32: *"Kimse kusura bakmasın da mülakat kamuda işe alımlarda bu devletin sigortasıdır..."*

Tweet #D25 ve #D27, mülakat sürecinin adalet ve liyakat açısından eleştirildiği görüşleri dile getirmiştir. #D25'te, dini referanslar kullanılarak, işlerin ehil insanlara verilmesi gerektiği vurgulanırken, #D27, mülakatın politik sonuçlar doğurabileceğini ve bu durumun toplumsal bir

tepkie yol açabileceğini işaret etmektedir. #D19 ve #D26, mülakatın adaletsizlik, torpil ve liyakatsizlik gibi olumsuz yönlerini öne çıkaran görüşlerdir. #D19'un keskin ifadesi ve #D26'nın, mülakat sürecindeki subjektif değerlendirmeleri eleştirmesi, mülakat sistemine olan genel güvensizliği yansıtmaktadır. Özellikle #D19 ve #D25 numaralı tweetler dikkat çekicidir çünkü bu yorumlar mülakatın adalet ve liyakat ile çeliştiği görüşünü güçlü bir dini ve etik çerçevede dile getirmektedir. Bu, mülakatın sadece bir işe alım süreci değil, aynı zamanda toplumun temel değerleriyle de ilişkilendirildiğini göstermektedir. #D26'daki endişe, mülakat sürecinin subjektif doğasını ve potansiyel olarak uygulamada tutarsızlıkları vurgulamakta, bu da sistemin adil olmadığı algısını güçlendirmektedir. #D27, mülakat karşıtı görüşün toplumda geniş bir yankı bulabileceğini ve bu durumun siyasi sonuçlar doğurabileceğini belirtmekte, bu da politik risk analizi yapılmasının gerekliliğine dikkat çekmektedir.

Tweetlerden elde edilen bulgular, mülakat sürecinin toplumda bölünmeye yol açabilecek bir konu olduğunu ortaya koyuyor. Bir yandan, mülakatın gerekli bir güvenlik önlemi olarak görüldüğü, diğer yandan adaletsizlik ve liyakatsizliğin bir simgesi olarak algılandığı anlaşılıyor. Bu görüş ayrılığı, mülakat sistemini yeniden değerlendirmeye ve olası iyileştirmelere açık bir alan olarak tanımlıyor. İyileştirme yönünde adımlar atılması, hem işe alım sürecinin adil olmasını hem de toplumun genel kabulünü sağlayabilir. Bu, politikacılar, eğitim uzmanları ve politika yapıcılar için önemli bir çalışma alanı oluşturmakta ve geniş toplumsal katılımı teşvik etmek için bir fırsat sunmaktadır.

SONUÇ VE ÖNERİLER

Bu çalışmada, öğretmen atama süreçlerindeki mülakat uygulamasına dair X platformu üzerinden yapılan paylaşımlar, meslek gruplarına göre incelenmiştir. Çalışmanın sonuçları, farklı meslek gruplarından bireylerin bu sürece dair çeşitli görüş ve eleştirilerini ortaya koymaktadır. Ayrıca, bu görüşlerin meslek grupları arasında önemli farklılıklar gösterdiği gözlemlenmiştir.

Eğitim fakültesi öğretim üyeleri tarafından yapılan 25 paylaşımda, mülakat uygulamasına karşıt bir tutum baskın çıkmıştır. Bu grup içindeki eleştiriler esas olarak mülakat sürecinin potansiyel adaletsizliklerine, nepotizm ve torpil sorunlarına odaklanmıştır. Öğretim üyeleri, teorik olarak mülakatın etkin bir değerlendirme aracı olabileceğini kabul etmekle birlikte, pratikteki uygulamanın güvenilirliği ve adilliği konusunda ciddi endişeler taşımaktadır. Öğretim üyelerinin mülakata yönelik eleştirileri, daha şeffaf, adil ve standardize edilmiş bir değerlendirme sürecinin önemini vurgulamaktadır.

Siyasetçilerin mülakat uygulamasına yönelik tutumları ise, eğitimde adalet ve etkinlik temaları etrafında şekillenmiştir. Eleştiriler genellikle mülakatın sosyoekonomik ve kişisel engeller oluşturduğu, öznel değerlendirmeler içerdiği ve siyasi çıkarlar için manipüle edilebileceği yönündedir. Ancak, mülakatı savunan siyasetçilerin de argümanları bulunmakta olup, bu argümanlar öğretmen adaylarının kişisel ve profesyonel yeterliliklerini ölçmede mülakatın etkili bir araç olabileceğine işaret etmektedir.

Öğretmen adayları ve atanmayı bekleyen öğretmenlerin bakış açısı, analiz edilen verilerde en belirgin şekilde karşıt görüş olarak öne çıkmıştır. Bu grup, mülakat uygulamasını eğitimde fırsat eşitliğini bozan ve merkezi sınavlar (KPSS) gibi daha objektif olan süreçlerin önüne geçen bir mekanizma olarak değerlendirmektedir. Bu görüşler, mevcut mülakat uygulamasının adil olmadığı, şeffaf ve objektif bir temel üzerine oturtulması gerektiği yönünde kuvvetli bir mutabakat sergilemektedir.

Kadrolu öğretmenler ve yöneticiler ile diğer meslek gruplarından gelen paylaşımlar da, genel olarak mülakata karşıt bir duruş sergilemektedir. Bu grupların eleştirileri, mülakat sürecinin öğretmen adaylarının mesleki ve akademik yeterliliklerini tam olarak değerlendirememesi, öznel karar verme süreçleri ve mülakatın yarattığı ekonomik yük gibi konuları içermektedir.

X platformunda mesleki bilgileri belirsiz olan kullanıcılar arasında yapılan incelemede, mülakat sürecine yönelik görüşlerin büyük bir bölümünün olumsuz olduğu görülmektedir. Bu kullanıcıların %75'i mülakat uygulamasına karşı çıkarken, sadece %25'i mülakatın olumlu yanlarını vurgulamıştır. Eleştiriler genellikle mülakat sürecinin subjektif, adil olmayan ve kişisel bağlantılara açık bir yapıda olduğuna yönelikken, destekleyen azınlık, mülakatın terörle mücadele ve liyakatin saptanmasında önemli bir araç olarak görüldüğünü belirtmiştir. Bu bulgular, mülakat sürecine toplumun farklı kesimlerinden insanların bakış açılarının çeşitlilik gösterdiğini ve bu konudaki kamuoyu algısının daha geniş bir spektrumda olduğunu göstermektedir.

Sonuç olarak, bu çalışma, öğretmen atama süreçlerinde uygulanan mülakatların, farklı meslek gruplarından bireyler tarafından genel bir hoşnutsuzlukla karşılandığını ortaya koymaktadır. Eğitim fakültesi öğretim üyelerinden siyasetçilere, öğretmen adaylarından kadrolu öğretmenlere kadar geniş bir yelpazede, mülakat sürecinin adil ve etkin bir şekilde yeniden düzenlenmesi çağrısında bulunan güçlü bir görüş birliği bulunmaktadır. Bu, politika yapıcılar için önemli bir geri bildirim olarak kabul edilebilir ve ileriki atama süreçlerinde bu tür endişeleri ele almak için reformların düşünülmesi gerektiğini işaret etmektedir. X platformunda paylaşılan

tweet'lere ait bulgulardan yola çıkılarak paydaşlara ve gelecekteki araştırma konularına ilişkin bazı öneriler sunulabilir.

Eğitim fakülteleri, öğretmen adaylarının seçimi ve yetiştirilmesi süreçlerinde önemli değişiklikler yapmalıdır. Öğrenci kabul aşamasında, öğretmen olmaya engel olabilecek ciddi ruhsal veya fiziksel rahatsızlıkların belirlenmesi amacıyla, kontenjana giren adayların kapsamlı bir mülakat sürecinden geçirilmesi önerilmektedir. Bu mülakatlar, öğretmenlik mesleği için gerekli olan kişilik özellikleri, tutumlar ve davranışlar hakkında derinlemesine bilgi edinmeyi amaçlamalıdır. Bunun yanı sıra, öğrencilerin eğitimleri boyunca her akademik yılın sonunda, öğretim üyelerinden oluşan bir jüri tarafından değerlendirilmesi ve öğretmenlik mesleğine dair bilgi, beceri, tutum ve davranışları yönünden kriterlere uygun olup olmadıklarının tespit edilmesi gerekmektedir. Bu süreçler, hem öğrencilerin mesleki yeterliliklerinin sürekli olarak izlenmesini sağlayacak hem de öğretmenlik mesleğine aday olan bireylerin en başından itibaren mesleğe uygunluğunun değerlendirilmesine olanak tanıyacaktır. Bu yaklaşım, eğitim fakültelerinin mezun ettiği öğretmenlerin kalitesini artıracak ve toplumun eğitim sistemine olan güvenini pekiştirecek bir adımdır.

Eğitim Bakanlığı ve ilgili kurumlar mülakat süreçlerinde şeffaflığı sağlamak için net kriterler belirleyip, bu kriterlerin uygulanışını açıkça kamuoyu ile paylaşmalıdır ki adaylar sürecin adillik ve ölçülebilirliğini görebilsinler. Öğretmenlik meslek birlikleri, üyelerinin ve adayların haklarını korurken mülakat süreçleriyle ilgili toplanan geri bildirimleri politika değişikliklerine yön vermek için kullanılmalıdır. Siyasi karar vericiler, mülakat süreçlerinde yaşanan toplumsal rahatsızlığı dikkate alarak, adil ve objektif reformları uygulamaya koymalıdır.

Geleceğe yönelik araştırmalar kapsamında, mülakat süreçlerinin öğretmen adaylarının yeterliliklerini objektif olarak değerlendirip değerlendirmedini belirleyecek bağımsız çalışmalar, adayların psikolojisi üzerindeki etkilerini inceleyecek niteliksel araştırmalar yapılmalıdır. Ayrıca, mülakat süreçlerinde tutarlılığı artırabilecek teknolojik araçlar ve metodolojiler üzerine pilot projeler geliştirilmeli, farklı ülkelerdeki öğretmen alım süreçleri karşılaştırmalı olarak analiz edilerek yerel bağlamda en iyi uygulamaların nasıl uyarlanabileceğine dair çalışmalar yürütülmelidir.

SEÇMEN DAVRANIŞLARINI ETKİLEYEN BİR FAKTÖR OLARAK CİNSİYET

Dr. Öğr.Üyesi Mahir ÖZHAN

Siirt Üniversitesi İktisadi ve İdari Bilimler Fakültesi Siyaset Bilimi ve Kamu Yönetimi
Bölümü

ÖZET

Cinsiyet farklılıkları bireylerin sosyolojik, fizyolojik ve psikolojik anlamda birbirinden ayrılmasına yol açar. Ülkemizde ve dünyanın değişik yerlerinde cinsiyete bağlı olarak erkek ve kadına yüklenen toplumsal statüler farklılaşabilmektedir. Yapılan bazı saha çalışmalarından elde edilen veriler ışığında ülkemizde istisnai durumlar hariç, kadınlara genellikle itaat, ev işleri, annelik ve saygı gibi roller atfedilirken, erkeklere ise güç, başarı, babalık gibi sosyal statüler atfedilmektedir (Alkan,1989:124). Fizyolojik farklılıklardan ötürü ilk çağdan modern çağa kadar kadın ve erkekler için biçilen işbölümü de doğal olarak farklılaşmaktaydı. Ancak günümüz modernleşme ve küreselleşme çağında bu işbölümü farklılaşmaları önemli ölçüde ortadan kalkmıştır. Bu çalışmada; kadın ve erkek arasındaki cinsiyet farklılıklarının seçmen tercihleri üzerinde etkisinin olup olmadığı, bir farklılık var ise bu etkinin yönü ve etki düzeyini belirlemeye dönük çalışılacaktır. Lipset, seçmenlerin kadın ya da erkek olması durumuna göre bir farklılaşma olduğunu ifade etmiştir. Lipset'e göre cinsiyetin oy verme davranışı üzerindeki etkisinin temel sebebi erkeklerin sosyal hayattaki belirleyiciliği ve baskın karakteridir. Bu farklılaşma hem siyasal katılımı hem de oy verme tercihi üzerinde belirleyici bir etkiye yol açtığını ifade etmektedir(1963:206). Benzer biçimde bir görüş Çaha tarafından ifade edilmektedir. Çaha'ya göre kadın seçmenler erkek seçmenlere nazaran siyasal sisteme daha az oranda ve miktarda entegre olduklarını ifade etmektedir(2008:68-69).Kadınların siyasal katılımında bulunma durumu ve katılma kararı aldıktan sonra oy verme tercihinin cinsiyet bağlamında değerlendirmek için bir saha çalışması yapılacaktır. Bu çalışmadan elde edilen veriler SPSS veri analiz programı yardımıyla analize tabi tutulacak ve yorumlanacaktır.

Anahtar Kelimeler: Cinsiyet, Katılım, Seçmen, Davranış

GENDER AS A FACTOR AFFECTING VOTER BEHAVIOR

ABSTRACT

Gender differences lead to sociological, physiological and psychological separation of individuals from each other. In our country and in different parts of the world, the social statuses given to men and women may differ depending on gender. In the light of the data obtained from some field studies, in our country, except for exceptional cases, women are generally attributed roles such as obedience, housework, motherhood and respect, while social statuses such as power, success and fatherhood are attributed to men (Alkan, 1989:124). Due to physiological differences, the division of labor for men and women naturally differed from ancient times to the modern age. However, in today's age of modernization and globalization, these divisions of labor have significantly disappeared. In this study; Efforts will be made to determine whether gender differences between men and women have an effect on voter preferences, and if there is a difference, the direction and level of this effect. Lipset stated that there is a differentiation depending on whether the voters are male or female. According to Lipset, the main reason for the effect of gender on voting behavior is the decisiveness and dominant character of men in social life. He states that this differentiation leads to a decisive effect on both political participation and voting preference (1963:206). A similar view is expressed by Çaha. According to Çaha, female voters state that they are less integrated into the political system than male voters (2008:68-69). A field study will be conducted to evaluate women's political participation and their voting preferences after deciding to participate in the context of gender. The data obtained from this study will be analyzed and interpreted with the help of SPSS data analysis program.

Keywords: Gender, Participation, Voter, Behavior

Seçmen tercihlerinin cinsiyet bağlamında değerlendirilebilmesi için sahada veri toplanmıştır. Bu kapsamda Siirt il merkezinde yer alan 21 mahallede yerleşik seçmenler arasından tabakalı rastgele örneklem yöntemiyle 983 denekten veri toplanmıştır. Veriler toplanırken deneklerin gerçek durumu yansıtacak özelliklere sahip olmasına riayet edilmiştir. Bu kapsamda Siirt il düzeyinin sosyo-ekonomik yapısı, yaş dağılımı ve cinsiyet dengesi gibi faktörler bağlamında saha çalışması gerçekleştirilmiştir. Siirt ilinin toplumsal yapısından kaynaklı olarak kadınları erkeklere nazaran daha az sosyalizasyon alanlarına sahip olması ve daha ziyade e işleri ile meşgul olmalarından dolayı kadın- erkek eşitliği dengesi sağlanamamıştır. Ancak hatayı minimize edecek sayıya ulaşılmıştır.

İdeal örneklem sayısının belirlenmesine dönük yapılan akademik çalışmalarda kesin bir yargıya varılamamıştır. Dolayısıyla evrenin belli bir oranına tekabül edecek bir örneklem sayısı söz konusu olamamakla birlikte, Balcı örneklemin evreni temsil edebilme kabiliyetine göre tolere edilebilir bir örneklem büyüklüğünü ifade etmektedir. Buna göre 100.000 seçmen için tolere edilebilir örneklem sayısı % 5'lik hata payı için en az 382 olması gerektiğini ifade etmektedir. Sayı arttıkça hata payı azalacaktır. Ancak belli bir doyumdan sonra sayısının artması hata payını arttıracaktır. Siirt il merkezinde ikamet eden seçmen sayısı yaklaşık 100.000'dir. Yaklaşık %2 hata payına denk gelecek şekilde seçmen sayısının yaklaşık %1'i örneklem olarak seçilmiştir(Balcı,107:2001). Aşağıdaki tabloda sayısal verilere yer verilmiştir.

Cinsiyetiniz hakkında bilgi verir misiniz?

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Kadin	438	44,6	44,6	44,6
	Erkek	545	55,4	55,4	100,0
	Total	983	100,0	100,0	

Tablo 1: Cinsiyet Durumu

Kadın seçmenlerin yaklaşık olarak %4'ü seçimlere katılmayacağını dolayısıyla siyasal katılımında bulunmama yönünde karar vermektedir. Bu sayıya, % 11 olan kararsız seçmenler de eklendiğinde kadın seçmenlerin yaklaşık % 15'i siyasal sistemin dışında kalmaya yatkın oldukları ortaya çıkmaktadır. Buna mukabil erkek seçmenlerin yaklaşık % 6,4'ü siyasal katılımında bulunmayacağını ifade etmektedir. Bu sayıya, yaklaşık % 8,3 olan kararsız seçmenler de eklendiğinde erkek seçmenlerin de yaklaşık % 15'i siyasal sistemin dışında kalmaya yatkın oldukları ortaya çıkmaktadır. Türkiye'de gerçekleşen seçimlerde sandığa katılmama düzeyi

ortalama olarak % 15'lere tekabül etmektedir(<https://tr.wikipedia.org, 07/12/2023>). Dolayısıyla sahadan elde edilen verilerle gerçekleşen sonuçlar arasında bir ilişki kurulabilmektedir.

Siyasal katılım konusunda kararını veren seçmenin hangi doğrultuda tercihte bulunacağı değişik faktörlerin etisiyle netleşir. Bu faktörlerin her biri farklı bir etki düzeyine sahip olabilmektedir. Söz konusu faktörlerden biri de “cinsiyet” faktörüdür. Seçmenlerin “kadın” ya da “erkek” olma durumunun seçmen tercihinin etkilediği varsayılmaktadır. Bu varsayım kimi zaman siyasi partiler tarafından uygulanan politikalar neticesinde ortaya çıkarken, kimi zaman da toplumsal yapının kadın ve erkeğe yüklediği sorumluluk veya tanıdığı etki alanına bağlı olarak değişmektedir. Çalışmamıza katılan seçmenlerden 438'i kadın ve 545'i ise erkek seçmenlerden oluşmuştur.

Aşağıdaki tabloda siyasi katılımında bulunup bulunmama ve katılımında bulunma halinde katılımın boyunun cinsiyet bağlamında değerlendirilebilmesine olanak tanıyan istatistiklere yer verilmiştir.

Tablo 2: 14 Mayıs Milletvekiliği Seçimlerinde Oy Kullanacakların Cinsiyet İlişkisi

Siirt'te esas olarak iki partili bir yapı söz konusudur. Ak Parti ve HEDEP(HDP)/Yeşil-Sol dışındaki diğer partiler almış oldukları oy miktarı ve oranları düşük düzeyde olduğundan dolayı çalışmamızda sadece istatistiksel düzeyde verileri verilecek olup, değerlendirme dışı tutulacaklardır. Tablo 2' de yer alan istatistiklere bakıldığında, kadın seçmenlerin yaklaşık %31'inin mevcut iktidar partisi lehinde oy kullanacaklarını beyan ederken erkek seçmenlerin

yaklaşık 29'unun Ak Parti lehinde oy kullanacaklarını beyan etmişlerdir. Bu veriler ışığında kadın katılımcıların erkek katılımcılardan daha fazla oranda Ak Partiyi destekledikleri görülmektedir. Dolayısıyla cinsiyet bağlamında oy verme yönü konusunda bir farklılık olduğu görülmektedir. Yapılan gözlemler ve görüşmeler neticesinde; kadın seçmenlerin erkek seçmenlere nazaran daha fazla Ak Partiyi desteklemelerinin temel sebebinin iktidar partisi tarafından uygulanan sosyal politikalar olduğu ortaya çıkmaktadır. Ak Parti iktidarı döneminde özellikle ev kadınlarının kişisel hesaplarına yatırılan sosyal yardımlar ve çocukları için yine kadınların hesabına yatırılan Şartlı Nakit Transferi (ŞNT) gibi uygulamalarla kadınlar bir nebze olsun ekonomik bir kaynağa sahip olmuşlardır. Dolayısıyla kadınlar bu durumlarını kaybetmemek adına bir miktarda olsa erkeklerden ayrılarak daha fazla oranda Ak Parti'yi desteklemektedir. Bu durum seçmen davranışlarını açıklayan modellerden, Sosyolojik ve Psikolojik oy verme modellerinden ziyade Rasyonel Tercih Modelinin kadın seçmenin davranışını açıklamada daha fazla yetkinliği bize göstermektedir. Zira Rasyonel Tercih Modeline göre seçmenler oy verirken fayda maksimizasyonuna göre hareket ettikleri varsayılır. Ancak söz konusu fayda maddi olabileceği gibi gayri maddi de olabilir. Ve nihayet hedeflenen amacın gerçekleşmesi zorunlu değildir, önemli olan bir amaç uğruna ve o doğrultuda hareket etmektir. Seçmen oy verme tercihinde bulunurken iktidar partisinin geçmişte uygulamış olduğu sosyo-ekonomik politikalarını göz önünde bulundurur ve geçmişe oy verir. Ancak muhalefet partisine oy verirken geçmişe değil geleceğe dönük açıklanan politikalara göre oy kullanılmaktadır. Dolayısıyla kadın seçmenler Ak Partinin geçmişe doğru politikaları doğrultusunda oy kullandıkları görülmektedir. Sosyolojik Modele göre seçmenler ailelerinin, aşiret ya da tarikat gibi ilişkilerin tesirinde kalarak oy kullanırlar. Bu çalışmada kadınların ailelilerinden bağımsız hareket ettiklerini dolayısıyla eski toplumsal yapının günümüz için geçerli olmadığını göstermektedir (Özhan,11-18:2019).

HDP'ye oy veren kadın ve erkek seçmenler analiz edildiğinde; kadın ve erkek seçmenlerin yaklaşık olarak aynı oranda destekledikleri görülmektedir. Bu oranlara ve oy verme yönüne bakıldığında HDP' ye oy verme ile cinsiyet arasında doğrudan bir ilişki kurulamadığı görülmektedir. Burada seçmen davranışlarını açıklayan modellerden Psikolojik Oy Verme Modelinin pratikte karşımıza çıktığı görülmektedir. Bu modelin temel savı seçmenler ile siyasal partiler arasında kurulan parti aidiyetine ilişkindir. Dolayısıyla bu partiye oy veren seçmenler oy verdikleri parti ile kendilerini özdeşleştirerek bir tercih ortaya koymaktadırlar.

ÖZET

Türkiye iklim ve toprak yapısı bakımından özellikle kuru baklagiller üretiminde önemli bir potansiyele sahiptir. Yaklaşık 900 bin hektar alanda 1 milyon 295 bin ton kuru baklagil üretilmiş olup mercimek ve nohut üretiminde dünyada dördüncü sırada, kuru fasulye üretiminde ise 19. sırada yer almaktadır. Türkiye kuru baklagiller dış ticaretinde miktar bakımından dış ticaret açığı, değer bakımından ise dış ticaret fazlası vermektedir. Bunun sebebi Türkiye'de üretilen kuru baklagillerin yüksek fiyattan ihraç edilmesi, ithalatın ise daha düşük fiyattan gerçekleşmesidir. Bu çalışmada Türkiye İstatistik Kurumu (TÜİK), Birleşmiş Milletler Gıda ve Tarım Örgütü (FAO) veri tabanından elde edilen verilerle Türkiye tarımı için önemli gıda grubu olan kuru baklagillerde kendine yeterlilik derecesi ortaya koyulmuş olup kendine yeterlilik derecesini artırmak için öneriler geliştirilmiştir. Sonuçlar Türkiye'nin kuru fasulye ve mercimek üretiminde kendine yeterli olmadığını, nohut üretiminde ise kendine yeterli olduğu göstermiştir. Kuru baklagiller grubu açısından değerlendirildiğinde ise kendine yeterli olmadığı tespit edilmiştir. Araştırma bulgularından hareketle Türkiye'de kuru baklagillerde kendine yeterliliğin artırılması için kaliteli ve verimli yeni çeşitlerin geliştirilmesi, sulu tarım alanlarında kuru baklagil üretimi için arazilerin suya eriştirilmesi ve modern sulama sistemleri kullanılması gibi altyapı olanaklarının iyileştirilmesiyle verim ve üretim artışının sağlanması gerekmektedir. Dolayısıyla kuru baklagil üretiminde kendine yeterlilik derecesi istenilen seviyelere gelecektir.

EVALUATING SELF-SUFFICIENCY IN DRY LEGUMES PRODUCTION IN TÜRKİYE

ABSTRACT

Türkiye has an important potential, especially in producing dry legumes in terms of climate and soil structure. Approximately 900 thousand hectares of land produced 1 million 295 thousand tons of dry legumes and ranks 4th in the world in lentil and chickpea and 19th in dry bean production. Türkiye has a foreign trade deficit in terms of quantity and a foreign trade surplus in terms of value in the foreign trade of dry legumes. This is because legumes produced in Türkiye are exported at high prices, while imports are realized at lower prices. In this study, with the data obtained from the Turkish Statistical Institute (TurkStat) and the Food and Agriculture Organization of the United Nations (FAO), the degree of self-sufficiency in dry legumes, which is an important food group for Turkish agriculture, was revealed and recommendations were developed to increase the degree of self-sufficiency. It was determined that Türkiye is not self-sufficient in dry bean and lentil production, while it is self-sufficient in chickpea production. When evaluated in terms of the dry legumes group, it was determined that it is not self-sufficient. Based on the findings of the research, in order to increase self-sufficiency in dry legumes in Türkiye, yield and production will be increased by improving infrastructure facilities such as the development of quality and productive new varieties, access to water for dry legume production in irrigated agricultural areas and the use of modern irrigation systems. Therefore, the self-sufficiency in dry legume production will reach the desired levels.

Keywords: Foreign trade, Self-sufficiency, Legumes, Nutrition

Giriş

Türkiye’de bitkisel üretim içerisinde tahıl üretiminden sonra baklagil üretimi gelmektedir (Gündüz vd., 2009). Baklagiller içerdikleri protein ve aminoasitler sayesinde besin değeri yüksek olması sebebiyle tüketiciler tarafından, kazık kökleri sayesinde toprak verimliliğini artırması ve ekim nöbetine uygun olması sebebiyle üreticiler tarafından tercih edilen önemli temel gıda grubudur (Kadakoğlu ve Karlı, 2022).

Türkiye’de Toprak Mahsulleri Ofisi (TMO) ilk kez 1941 yılında nohut, kuru fasulye, kırmızı ve yeşil mercimek alımı gerçekleştirmiş olup bu alımlar 1994 yılına kadar piyasanın ihtiyaçları doğrultusunda devam etmiştir (Kadakoğlu ve Karlı, 2022). Bu tarihler arasında çeşitli projeler (kırsal kalkınma, baklagil-tahıl sistemi, nadas alanlarının daraltılması) uygulanarak kuru baklagil ekim alanları ve üretimi artmıştır (Gül ve Işık, 2002). 1994 yılından 2018 yılına kadar TMO kuru baklagil alımı yapmamıştır. 2018 yılından sonra ise tekrardan kuru fasulye, mercimek ve nohut alımına başlamıştır (Resmî Gazete, 2018).

Gıdada kendine yeterlilik ülkeleri savaş veya siyasi gerginlikler, diğer ülkelerdeki üretim eksiklikleri veya gıda fiyatlarındaki ani ve keskin artışlar sonucunda ortaya çıkabilecek uluslararası arz kesintilerinden koruyabilir (FAO, 1996; Clapp, 2017). Bu bağlamda ülkeler açısından tarım sektöründe kendine yeterliliğin sağlanması kaçınılmazdır. Tarım sektörü desteklendiğinde sadece bu sektörde çalışanların gelirleri değil aynı zamanda ülkelerin kendine yeterlilik dereceleri de artacaktır.

Bu çalışmanın amacı Türkiye tarımı için önemli gıda grubu olan kuru baklagillerde kendine yeterlilik derecesinin belirlenmesidir. Ayrıca kendine yeterlilik derecesini artırmak için öneriler geliştirilmiştir.

Materyal ve Metot

Çalışmanın ana materyalini Türkiye İstatistik Kurumu (TÜİK), Birleşmiş Milletler Gıda ve Tarım Örgütü (FAO) ve ulusal sektör raporlarından elde edilen ikincil veriler oluşturmaktadır. Ayrıca literatürdeki ulusal ve uluslararası konuyla ilgili bilimsel yayınlardan da yararlanılmıştır. Dünya ve Türkiye’de kuru baklagil ekim alanı, üretim miktarı ve verime ait verilere basit indeks hesabı yapılarak yıllar itibarıyla incelenmiştir.

Araştırma Bulguları ve Tartışma

Dünya kuru baklagiller ekim alanı 2007/2008 piyasa yılında 44 milyon 513 bin hektar iken %26,95 artarak 2021/2022 piyasa yılında 56 milyon 511 bin hektar olarak gerçekleşmiştir. 2021/2022 piyasa yılında 35 milyon 921 bin hektar alanda fasulye, 15 milyon 5 bin hektar

alandanda nohut ve 5 milyon 586 bin hektar alanda mercimek üretilmiştir. Bu ürünlerin toplam kuru baklagil ekim alanı içerisindeki payları sırasıyla %63,6, %26,5 ve %9,9'dur. Dünya kuru baklagil ekim alanları incelenen yıllarda 41 milyon hektar ile 58 milyon hektar arasında dalgalı bir seyir izlemiştir. Aynı dönemde kuru fasulye ekim alanı %21,68, nohut ekim alanı %33,18 ve mercimek ekim alanı %49,95 artmıştır (Çizelge 1).

Dünya kuru baklagiller üretim miktarı 2007/2008 piyasa yılında 34 milyon 716 bin ton iken %41,71 artarak 2021/2022 piyasa yılında 49 milyon 197 bin ton olarak gerçekleşmiştir. 2021/2022 piyasa yılında 27 milyon 715 bin ton fasulye, 15 milyon 872 bin ton nohut ve 5 milyon 610 bin ton mercimek üretilmiştir. Bu ürünlerin toplam kuru baklagil üretimi içerisindeki payları sırasıyla %56,3, %32,3 ve %11,4'tür. Dünya kuru baklagil üretimi incelenen yıllarda 33,4 milyon ton ile 51,5 milyon ton arasında dalgalı bir seyir izlemiştir. Aynı

dönemde kuru fasulye üretimi %28,03, nohut üretimi %62,85 ve mercimek üretimi %68,82 artmıştır (Çizelge 2).

Dünyada hektara kuru fasulye verimi 772 kg, nohut verimi 1.058 kg, mercimek verimi 1.004 kg olmak üzere kuru baklagiller verim ortalaması 871 kg'dır. İncelenen 15 yıllık dönemde kuru fasulye verimi %5,24, nohut verimi %22,27, mercimek verimi %12,58 artmıştır. Kuru baklagiller ortalama verimi ise %11,63 artmıştır. Dünya kuru fasulye verimi incelenen 15 yıllık dönemde yatay seyretmiştir. Nohut ve mercimek verimleri ise dalgalı artan bir seyir izlemiştir (Çizelge 3).

Dünya kuru baklagil üretimi 49 milyon 197 bin ton olup kuru baklagil üretiminde önde gelen ülkeler ve payları sırasıyla Hindistan %39,7, Myanmar %6,0, Brezilya %5,9, Kanada 4,2, Avusturalya %4,0, Çin %3,0, Meksika %3,0, Tanzanya %2,9, ABD %2,6, Etiyopya %2,5 ve Türkiye %2,1'dir. Diğer ülkelerin payları toplamı ise %24,1'dir (Şekil 1). Türkiye dünya kuru fasulye üretimindeki payı %1,1 olup dünyada 19. sırada yer almaktadır. Nohut üretimindeki payı %3,0 olup dünyada dördüncü sırada ve mercimek üretimindeki payı ise %4,7 olup dünyada dördüncü sıradadır (FAO, 2023).

Şekil 1. Kuru baklagil üretiminde önemli ülkeler (%)

Türkiye kuru baklagiller ekim alanı 2007/2008 piyasa yılında yaklaşık 1 milyon hektar iken yıllar itibariyle azalarak 2022/2023 piyasa yılında yaklaşık 900 bin hektar olarak gerçekleşmiştir. Bu dönemler arasında kuru baklagiller ekim alanları %10,57 azalmıştır. Kuru fasulye ekim alanı 109 bin 250 hektardan %11,17 azalarak 97 bin 52 hektara, nohut ekim alanı 503 bin 674 hektardan %9,30 azalarak 456 bin 834 hektara, kırmızı mercimek ekim alanı ise 357 bin 233 hektardan %16,07 azalarak 299 bin 812 hektara gerilemiştir. İncelenen yıllar arasında kuru baklagiller içerisinde sadece yeşil mercimek ekim alanları artış göstermiştir. Yeşil mercimek ekim alanı 32 bin 308 hektardan %32,55 artarak 42 bin 825 hektara yükselmiştir (Çizelge 4).

Türkiye kuru baklagiller üretimi 2007/2008 piyasa yılında yaklaşık 1 milyon 195 bin ton iken 2022/2023 piyasa yılında %8,39 artarak 1 milyon 295 bin tona yükselmiştir. İncelenen yıllarda kuru fasulye üretimi %75,05 artarak 270 bin ton, nohut üretimi %14,77 artarak 580 bin ton ve yeşil mercimek üretimi %67,89 artarak 45 bin ton olarak gerçekleşmiştir. Kırmızı mercimek üretimi ise %21,32 azalarak 400 bin tona gerilemiştir (Çizelge 5). Kuru fasulye ve nohut ekim alanları azalmasına rağmen üretim miktarlarının artmasının sebebi verimdeki artıştır.

Türkiye kuru baklagiller verim miktarı 2007/2008 piyasa yılında 1.192 kg/ha iken 2022/2023 piyasa yılında %21,14 artarak 1.444 kg/ha olarak gerçekleşmiştir. İlgili yıllar itibariyle kuru baklagiller üretimi dalgalı artan bir seyir izlemiştir. Kuru fasulye verimi %97,03 artarak 2.782 kg/ha, nohut verimi %26,62 artarak 1.270 kg/ha ve yeşil mercimek verimi %26,63 artarak 1.051 kg/ha yükselmiştir. Kırmızı mercimek verimi ise 6,25 azalarak 1.334 kg/ha olarak gerçekleşmiştir (Çizelge 6). Birim alandan verim artışının en önemli kriteri iyi ve kaliteli tohum kullanılmasıdır. İyi ve kaliteli tohum kullanımının verimi %25-30 oranında artırdığı belirlenmiştir (Anonim, 2019). Türkiye’de çeşit geliştirme çalışmalarının temel amaçları tüketici isteklerinin farklılaşması, dengeli ve sağlıklı beslenme istekleri, yüksek verimlilik, yüksek adaptasyon kabiliyet ve hastalıklara-zararlılara dayanıklılıktır (Şener, 2021). Türkiye’de yemeklik tane baklagillerde ıslah çalışmaları 1965 yılında başlamış olup bugüne kadar milli

çeşit listesine kayıtlı 55 adet nohut, 45 adet kuru fasulye ve 35 adet mercimek olmak üzere toplamda 135 adet çeşit geliştirilmiştir. Bunun yanı sıra 2 adet nohut, 6 adet kuru fasulye ve 4 adet mercimek üretim izinli olmak üzere tescillenmiştir (Anonim, 2023).

Türkiye’de 2007/2008 piyasa yılında kuru baklagiller üretim kayıpları yaklaşık 22 bin ton olup kullanılabilir üretim 1 milyon 173 bin tondur. 2022/2023 piyasa yılında ise üretim kayıpları %26,21 azalarak yaklaşık 16 bin ton, kullanılabilir üretim ise %12,45 azalarak yaklaşık 1 milyon ton olarak gerçekleşmiştir. Yurt içi kuru baklagil kullanımı %12,99 artarak 1 milyon 228 bin ton olup bunun %9,96’sı tohumluk olarak geri kalan %90,04’ü ise insan tüketimi için kullanılmaktadır. Kişi başına kuru baklagil tüketimi incelenen dönemler arasında 10,9 kg ile

15,6 kg arasında deęişmekle birlikte ortalama 14,1 kg'dır. 2007/2008 piyasa yılına göre 2021/2022 piyasa yılında kiři bařına kuru baklagil tüketimi %11,03 azalarak 12,9 kg olarak gerekleşmiştir (Çizelge 7).

Türkiye’de incelenen dönemler ortalamasına göre kuru baklagiller yurt ii kullanımının %7,7’si tohumluk olarak %92,3’ü ise insan tüketimi iin kullanılmaktadır. Tohumluk kullanım oranı %5,78 ile %11,30 arasında deęişmekte olup 2021/2022 piyasa yılında %9,96 olarak gerekleşmiştir. Kuru fasulyenin tohumluk kullanımı 10 bin 780 ton, nohudun tohumluk kullanımı 68 bin 304 ton, kırmızı mercimek tohumluk kullanımı 36 bin 428 ton ve yeřil mercimek tohumluk kullanımı 6 bin 742 ton olup kuru baklagillerin toplamda tohumluk kullanımı 122 bin 254 tondur (Çizelge 8).

Çizelge 8. Türkiye’de kuru baklagillerin tohumluk kullanımı

Kişi başına kuru baklagil tüketimi 2010-2020 yılları ortalamasına göre Avrupa Birliği (AB)’nde 2,65 kg/yıl, Türkiye’de 14,46 kg/yıl, dünyada ise 7,05 kg/yıl olarak gerçekleşmiştir. İncelenen dönemlerde kişi başına kuru baklagil tüketimi AB’de %10,45 ve dünyada %8,15 artmış, Türkiye’de ise %7,08 azalmıştır (Şekil 2). İncelenen yıllar ortalamasına göre Türkiye’de kişi başına 5,47 kg/yıl nohut, 4,84 kg/yıl kırmızı mercimek, 3,23 kg/yıl kuru fasulye ve 0,56 kg/yıl yeşil mercimek tüketilmiştir (TÜİK, 2023b).

Şekil 2. Kişi başına tüketilen kuru baklagil miktarları (kg/yıl)

Türkiye’de kuru baklagiller ihracat miktarı ve değeri 2021 yılında 650 bin ton ve 608 milyon dolar olarak, ithalat miktarı ve değeri ise 735 bin ton ve 574 milyon dolar olarak gerçekleşmiştir. Türkiye 2021 yılında 86 bin ton kuru baklagil dış ticaret açığı verirken 33,5 milyon ton dış ticaret fazlası vermiştir (Çizelge 9). Türkiye kuru baklagiller dış ticaretinde miktar bakımından dış ticaret açığı vermesine rağmen değer bakımından dış ticaret fazlası vermektedir. Bunun sebebi olarak Türkiye’de üretilen kuru baklagiller yüksek fiyattan ihraç edilirken, ithalat daha düşük fiyattan gerçekleşmektedir. Nitekim yurt içinde tüketimin önemli bir bölümü ithal kuru baklagiller ile karşılanmakta olup yurt içinde üretilen kaliteli kuru baklagiller ihraç edilmektedir.

Çizelge 9. Türkiye’de kuru baklagiller dış ticareti

Gıda için kendine yeterlilik kavramı bir ülkenin gıda ihtiyaçlarını kendi yerli üretiminden karşılayabilme derecesidir (Thomson ve Metz, 1999). Türkiye’de kuru baklagiller üretiminde kendine yeterlilik derecesi 2007/2008 piyasa yılında %107,2 iken 2022/2023 piyasa yılında

%22,2 azalarak %83,4 olarak gerekleşmiştir. İncelenen dönemlerde kendine yeterlilik dereceleri %82,9 ile %107,2 arasında deęişmekle birlikte ortalama %92,1'dir. Ortalama yeterlilik dereceleri kuru fasulyenin %82,7, nohudun %107,3, kırmızı mercimeęin %83,5 ve yeşil mercimeęin %56,6'dır. Türkiye nohut üretiminde kendine yeterli olup kuru fasulye üretiminde özellikle son yıllarda kendine yeterlilięi yükselmiştir. Kırmızı mercimek ve yeşil mercimek üretiminde kendine yeterli deęildir. Özellikle kırmızı mercimek üretiminde yeterlilik derecesi yıllar itibariyle düşüş eğilimindedir (Çizelge 10).

Çizelge 10. Türkiye'de kuru baklagiller üretiminde kendine yeterlilik düzeyleri (%)

Piyasa Yılı	Kuru Fasulye	Nohut	Kırmızı Mercimek	Yeşil Mercimek	Kuru Baklagiller

Sonuç

Türkiye mercimek ve nohut üretiminde dünyada 4. sırada, kuru fasulye üretiminde ise 19. sırada yer almaktadır. Kuru fasulye üretiminde kendine yeterlilik derecesi son yıllarda artmasına karşın henüz istenilen düzeyde deęildir. Nohut üretiminde kendine yeterlilik derecesi yıllar itibariye dalgalı bir seyir izlemekte olup kendine yeterli olduęu söylenebilir. Ancak mercimek üretiminde kendine yeterli deęildir. Tüm kuru baklagiller için deęerlendirildięinde ise

Türkiye'nin kendine yeterli olmadığı belirlenmiştir. Türkiye'de kuru baklagiller açısından kendine yeterliliğin artırılması için aşağıdaki öneriler sıralanabilir.

Kuru baklagiller için kalite standartlarını belirleyerek sertifikalı üretim yapılabilir. Bu sayede Türkiye'nin dünya pazarına rekabet gücü artacaktır. Kuru baklagil üretimi çoğunlukla kuru tarım ile üretilmektedir. Kuru arazileri suya erişirmek, mevcut sulama sistemlerini modernize etmek, depolama olanaklarını iyileştirmek ve kapasitesini artırmak gibi altyapı olanaklarının iyileştirilmesi üreticilerin daha fazla ürün üretmelerini ve ürünlerini korumalarına yardımcı olacaktır. Kuru baklagillerde kaliteli ve verimli yeni çeşitlerin geliştirilmesi için ilgili kurum ve kuruluşlara araştırma ve geliştirme yatırımları yapılabilir. Böylece kaliteli ve verimli çeşitler sayesinde ekstrem geçen yıllarda verimde ve üretimde sert düşüşlerin önüne geçilmiş olacaktır. Tüm bu öneriler ile Türkiye'de kuru baklagil üretiminde kendine yeterliliğin istenilen seviyelere geleceği düşünülmektedir.

ÖZET

Dünyada her geçen gün ekolojik sorunlar artarken, toprak kalitesi de düşmektedir. Her yıl dünyadaki tarım alanları artan nüfusun ihtiyaçları doğrultusunda giderek azalmaktadır. Buna ilaveten küresel iklim değişikliğinin de etkisiyle yıldan yıla daha fazla erozyon, orman yangınları ve toprak kayıpları meydana gelmektedir. Özellikle Türkiye’de mevcut olan tarım alanlarında yapılan bazı yanlış uygulamalar ve aşırı kimyasal kullanımı gibi hatalı alışkanlıklar sonucunda topraktaki organik madde azalmaktadır. Akabinde bitkilere yararlı olan besin maddeleri de azalarak tarımsal üretimde miktar ve kalite düşerken, üreticilerin gelirleri de azalmaktadır. Toprakların bitki besleme ve buna bağlı olarak verimlilik kapasitelerinin azalması karşısında çevre dostu üretim için toprak kalitesini artıran, organik atıkları değerlendiren sürdürülebilir tarım uygulamaları önemli hale gelmiştir. Bu doğrultuda toprak analizlerine bağlı olarak oluşturulacak ve uygulanacak gübreleme programlarında organik gübre olan kompost, vermikompost, mikrobiyolojik gübrelerin yer alması bir tercih değil zorunluluk haline gelmiştir. Kimyasal gübre kullanımı ile toprak organik maddesinin artması mümkün olmayıp, aksine azaldığı bilinen bir gerçektir. Geleneksel tarımın getirdiği olumsuzlukların çözümü organik gübre kullanımına geçiş ile olanaklıdır. Toprakta organik madde azalması, toprağın verimsizleşmesi ve tarımsal kaynaklı gıda krizine kapıların açılması anlamına gelmektedir. Türkiye’de son yapılan akademik çalışmalarda ortaya çıkan acı gerçek, ülke tarım topraklarının %70-80’indeki toprak organik madde miktarının %1’ler seviyesinde olmasıdır. Bu bir kader olmayıp, bilinçli ve akademik temelli çalışmalar ile engellenebilecek ve hatta düzeltilebilecek bir sonuç olmalıdır. Öyleyse gübreleme programlarında mutlaka toprak organik maddesini artırma özelliğine sahip organik ve organo-mineral gübre yer almalıdır. Bu derleme çalışmada toprak organik maddesinin sürdürülebilir tarımsal uygulamalar için önemi üzerinde durulmuştur.

Anahtar Kelimeler: Toprak analizi, organik madde, gübre, toprak verimliliği, sürdürülebilir tarım.

IS SOIL ORGANIC MATTER THE MOST IMPORTANT PARAMETER OF AGRICULTURAL PRACTICES?

ABSTRACT

While ecological problems are increasing day by day in the world, soil quality is also decreasing. Every year, agricultural areas are decreasing in line with the needs of the increasing population in the world. In addition, due to the effect of global climate change, more erosion, forest fires and soil losses occur from year to year. Some wrong practices, excessive use of chemicals etc., especially in agricultural areas in Turkey. Organic matter in the soil decreases as a result of some wrong practices and bad habits such as excessive use of chemicals, especially in agricultural areas in Turkey. Subsequently, the available plant nutrients decrease and the quantity and quality of agricultural production decreases, while the income of producers also decreases. Sustainable agricultural practices that improve soil quality and utilize organic waste for environmentally friendly production have become important in the face of decreasing plant nutrition and therefore productivity capacities of soils. In this regard, the inclusion of organic fertilizers such as compost, vermicompost and microbiological fertilizers in the fertilization programs to be created and applied based on soil analysis has become not a choice but a necessity. It is a known fact that it is not possible to increase soil organic matter with the use of chemical fertilizers, on the contrary, it decreases. The solution to the negativities brought by traditional agriculture is possible by switching to the use of organic fertilizers. The decrease in organic matter in the soil means that the soil becomes poor soil and opens the doors to an agricultural food crisis. The harsh reality revealed in recent academic studies in Turkey is that the amount of soil organic matter in 70-80% of the country's agricultural lands is at the level of 1%. This is not a fate, but should be an outcome that can be prevented and even corrected through conscious and academic-based studies. Therefore, fertilization programs must include organic and organo-mineral fertilizers that have the ability to increase soil organic matter. In this review study, the importance of soil organic matter for sustainable agricultural practices is emphasized.

Keywords: Soil analysis, organic matter, fertilizer, soil productivity, sustainable agriculture.

GİRİŞ

Toprak, tarımın temelini oluşturan; canlılar için besin ve durak yeri olan, canlı ve katı-sıvı-gaz fazlarından oluşan yaşamın temel taşlarından birisidir. Toprak; uygarlıkların gelişmesinde aynı zamanda yaşamın sürekliliğinde önemli rol oynayan, elde edilmesi zor ancak kaybedilmesi kolay olan doğal bir kaynaktır (Bellitürk, 2012). Bir toprağı oluşturan 4 ana öge vardır: Hava (%25), su (%25), mineral madde (%45) ve organik madde (%5) bu öğeleri oluşturmaktadır (Şekil 1). Toprak canlıları (makro ve mikro canlılar, solucanlar vs.) toprağın %5'lik dilimi içindedirler. Ancak yoğun tarımsal uğraşlar neticesinde, organik gübrelerin kullanılmamasından ve diğer yanlış uygulamalardan dolayı bugün sahip olduğumuz tarım topraklarımızın organik madde içerikleri %1'in bile altına gerilemiş, ülkemiz genelin ise %1'den daha düşük organik madde içeren tarım topraklarının oranı %90'lar düzeyinde seyretmektedir (Bellitürk ve Eryüksel, 2018). Toprağın içindeki canlı ve cansız biyolojik varlıkların bütünü ile, bunlardan çeşitli etkinliklerle ortaya çıkan ürünlere "organik madde" ismi verilir (Bellitürk, 2017). Başka bir tanıma göre, toprak organik maddesi (TOM), çeşitli şekillerde toprağa karışmış bitkisel ve hayvansal artıklarla, bunların parçalanma ve ayrışma ürünlerinin çeşitli kimyasal reaksiyonlar sonucunda oluşturduğu kompleks bileşiklerden meydana gelir (Okur, 2021). Şekil 1'den de görüleceği üzere, %5 olması gereken toprak organik maddesi, bugün birçok tarım toprağının analiz sonuçlarına bakıldığında maalesef %1 bile değildir. O nedenle hiçbir kimyasal gübrenin organik madde içermediği, aksine organik gübrelerin içindeki organik maddenin topraklarla buluşması ve toprakların verimliliklerinin artırılması gerekmektedir (Bellitürk ve Goldmann Benardete, 2020).

Şekil 1. Toprağı oluşturan öğeler.

Yıllardır sadece yüksek verim alma uğruna yapılan tarımsal faaliyetler neticesinde toprakların içerisi adeta boşalarak, verimlilik kapasiteleri de düşmüştür. Bugün bu durumu net

olarak yapılan toprak analiz sonuçlarına baktığımızda, özellikle organik maddenin %1'in bile altına düşmüş olması ile görmekteyiz. Tarımla uğraşanların çoğu organik maddedeki bu azalmaya dikkat etmeden, sadece N, P ve K içeren mineral (kimyasal) gübreleri ihtiyaçtan fazla olarak kullanmakta ve hem gübreleme maliyetleri artmakta hem de toprak, yeraltı suları ve hatta üründeki kalıntılar ile çeşitli diğer kirlilik problemlerini oluşturmaktadırlar. Bitkiler bu 3 element ile değil, bunun dışındaki C, H, O, Ca, Mg, S, Fe, Mn, Zn, Cu ve B gibi elementlere de ihtiyaç duymaktadırlar (Şekil 2). Dolayısıyla organik gübrelerin birçoğunda N, P, K dışında diğer yararlı elementler de bulunmakta olup, organik gübre uygulanan toprak ve bitkiler ihtiyaç duyduğu besin maddelerine rahatlıkla sahip olabilmektedirler.

Şekil 2. Bitkilerin ortalama bileşimi.

Bugün, çevresel bozulma, dünyanın karşı karşıya olduğu büyük bir tehdittir ve mineral gübrelerin yaygın olarak kullanımı, fosil yakıtların tükenmesi, karbondioksit (CO₂) oluşumu ve su kaynaklarının kirlenmesi yoluyla çevrenin bozulmasına büyük ölçüde katkıda bulunur. Tarımsal verimliliği olumsuz yönde etkileyen ve toprağın bozulmasına neden olan dengesiz gübre kullanımı nedeniyle toprak verimliliği kaybına yol açar (Büyükfiliz ve ark., 2023).

Mevcut birim alandan daha fazla ürün elde etme ihtiyacı her geçen gün nüfus artışıyla beraber daha da artmaktadır. Bunun sağlanması da yüksek oranda gübre uygulamalarını gerektirmektedir (Fernández-Escobar ve ark., 2004). Toprakların organik maddesi üzerinde olumlu etkiye sahip olan mineral gübreler değil, organik ve kısmen de organo mineral gübrelerdir. Özellikle kompost, vermikompost, biyolojik (mikrobiyal) ve yeşil gübreler son yılların en popüler organik gübreleri arasında gelmektedir.

Bitkisel üretimde vermikompost kullanımının artırılması toprakların sürdürülebilirliğinin sağlanmasına yönelik pek çok eksikliği de tamamlamaktadır. Vermikompost, ısı işlem görmüş

olmasından dolayı hijyen, yavaş salınımlı ve kullanıldığı toprakta sağladığı fiziksel, kimyasal ve biyolojik iyileşmeler sebebiyle son zamanların en gözde organik gübresidir (Bellitürk ve ark., 2013). Organik ürünleri işleyen fabrikaların birçoğunda her yıl önemli miktarlarda atıklar ortaya çıkmaktadır. Bu atıklar hayvansal veya bitkisel kaynaklı olabilmektedir. Organik kökenli bu atıkların tarımsal amaçlı olarak kullanılabilirliğine yönelik yapılan çeşitli araştırmalarda iyi özellikler taşıyan söz konusu atıkların topraklar için organik madde kaynağı olarak kullanılabilmesine yönelik önemli sonuçlar elde edilmiştir (Bellitürk, 2016; Kacar ve ark., 1996; Bellitürk ve ark., 2013).

Sürdürülebilir tarımın oluşturulması ve ileriye dönük tarımsal planlamaların doğru yapılabilmesi için ilk önce toprağın çok iyi tanınması gerekmektedir. Artık toprak verimliliğinin artırılması zorunluluğunun yanı sıra, verimde sürekliliğinin sağlanması ve korunması da ülkemiz için büyük önem taşımaktadır. Bu durum, ancak toprakların mevcut fiziksel, kimyasal ve biyolojik özelliklerinin belirlenmesi ve bu özellikler doğrultusunda yapılacak bilinçli gübreleme çalışmaları ile mümkündür (Bellitürk, 2011).

Bu derleme nitelikli çalışmada, tarımsal faaliyetlerde toprak verimliliğini direkt olarak etkileyen “toprak organik maddesi” ve toprağın diğer özellikleri ile olan ilişkisi gübrelemede dikkat edilecek hususlar da yer alacak şekilde açıklanmaya çalışılmıştır.

TOPRAĞIN FİZİKSEL, ÖZELLİKLERİ İLE TOPRAK ORGANİK MADDESİ ARASINDAKİ İLİŞKİLER

Toprağın fiziksel özellikleri denilince akla gelen özelliklerin başında toprak tekstürü (bünyesi) ve strüktürü (yapısı) gelmektedir. Toprak havası, toprak sıcaklığı, toprak rengi ve toprak suyu da diğer fiziksel özellikler olarak bilinir. Toprak dünyadaki bütün canlıların hem beslendiği ve hem de barındığı yer olmakla beraber, “tarıma elverişli diye adlandırılan yaklaşık 1 cm kalınlığındaki toprak tabakası ortalama olarak 100 ile 1000 yılda oluşur. Bu toprağın üzerinde tarım yapılması mümkün olacak yani yaklaşık 20 cm’lik bir kalınlığa sahip olması için 10 000 yıldan fazla geçmesi gerekir. Bir toprak genel olarak A, E, B, C ve R katmanlarına (horizonlarına) sahip olup, tarımsal üretim ve yetiştiricilik yapılan ve üreticiler tarafından “pulluk katmanı” diğer adıyla “sürüm katmanı” denilen kısım ise “A ve bazen E veya B” horizonlarından oluşur. Bir toprağın yüzeyden itibaren ana materyale kadar olan dikine kesitine “toprak profili”, profil içindeki yatay bölümlerin her birine de “horizon” ismi verilir (Bellitürk, 2017; Bellitürk ve Goldmann Benardete, 2020). Toprak profilinin yapısı Şekil 3’te görülmektedir.

Şekil 3. Toprak profili.

Tarımsal açıdan bitkisel üretim için bir yetiştirme ortamı olan toprak, bitki kökleri için de tutunma aracıdır. Fiziksel bakımdan ise katı zerrelerin arasını bir ağ gibi saran, içerisinde su ve hava dolu gözenekler bulunan kapillar bir sistem olarak kabul edilir. Bu sistemin bir parçası da topraktaki organik madde içeriğidir (Okur, 2021).

Toprak ıslahı çalışmalarında organik gübrelerin mutlaka “gübreleme programlarında” bulunması hem pH düzenleme ve hem de organik maddenin artırılmasına yardımcı olarak toprakların su tutma kapasitelerinin yükseltilmesi açısından oldukça önemlidir (Bellitürk, 2018). Toprakların fiziksel özelliklerini iyileştirme etkisi bulunmayan mineral gübreler, çoğunlukla ithal edilerek ülkemize girip üreticilere satılmaktadır. Ülkemizin tarımsal potansiyeli göz önüne alındığında, organik gübre üretimi açısından oldukça fazla hammadde ve imkanlara sahip olduğumuz açıkça görülmektedir. Organik gübreler bitkilere besin maddesi kaynağı olması yanında, toprağın fiziksel, kimyasal ve biyolojik özellikleri üzerine de önemli etkileri vardır. Vermikompost, organik tarımda kullanılabilirliği tüm dünyada kabul edilen bir organik gübredir.

Azarmi ve ark. (2008), toprağa dekara 1,5 ton vermikompost uygulandığında domates yetiştirilen bir denemesinde toprak fiziksel yapısının olumlu yönde değiştiğini, organik karbon ile N, P, K, Ca, Zn ve Mn miktarlarında artışlar olduğunu belirtmişlerdir.

TOPRAĞIN KİMYASAL ÖZELLİKLERİ İLE TOPRAK ORGANİK MADDESİ ARASINDAKİ İLİŞKİLER

Organik atıklardan elde edilen kompost gibi organik gübreler, toprakların kimyasal özellikleri üzerinde olumlu etkilere sahiptir. Hsieh ve Hsu (1993), çeşitli organik atıkların kompostlanabilme potansiyelini ve bunların C/N oranı, N, P ve K gibi makro ve mikro element içeriklerini araştırmıştır. Arancon ve Edwards (2005) tarafından bildirildiğine göre, az miktarda kullanıldıklarında bile hem toprakların kimyasal özelliklerine olumlu etkiler yapan ve hem de bitkilerin gelişmelerini önemli ölçüde artıran vermikompost gerek çiçekçilikte ve gerekse meyve ve sebze yetiştiriciliğinde etkin bir şekilde kullanılmaktadır.

Organik gübrelerin en önemli faydası, içerdiği yüksek organik madde miktarından ve hümik+fulvik asit oranından dolayı; öncelikle kullanılan kimyasal gübrelerin toprak ve bitkilere yararlılığını artırmasıdır (Büyükliz ve ark., 2023).

Tarım topraklarının yoğun tarımsal uğraşlar neticesinde verimsizleşmesi ile ortaya çıkan en büyük sorunlardan birisi, toprağın kimyasal özelliklerinin başında gelen azalan toprak organik madde içerikleri ile pH değerlerinin düşmesi ile asitleşmesidir. Organik maddece fakir olan topraklara uygulanan kimyasal gübreden yararlanma oranı düşük olmaktadır. Bunu önlemek için, hazırlanacak gübreleme programlarına mutlaka uygun organik gübrelerin (yosun gübresi, mikrobiyal gübreler, solucan gübresi, kompost, hümik asit, yarasa gübresi vs.) ve yeşil gübreleme uygulamasının ilave edilmesi gerekmektedir. Topraklarda organik maddenin artırılması, toprak ıslahının önemli adımlarından birisidir (Bellitürk, 2019).

Sürdürülebilir tarım, toprağı ve çevreyi olumsuz koşullardan korumaya odaklı bir yöntemdir. Toprağı verimli hale getirip küçük alanlardan en yüksek verimin alınması aynı zamanda ekosistemi de olumlu etkileyerek toprağın uzun yıllar kullanılmasına olanak sağlamaktadır. Sebze yetiştiriciliğinde organik gübre kullanılması gerek toprakların kimyasal özelliklerinin iyileştirilmesi ve gerekse çevre sağlığı açısından olduğu kadar sağlıklı beslenme adına da önem taşımaktadır (Bellitürk ve Akgün, 2023).

TOPRAĞIN BİYOLOJİK ÖZELLİKLERİ İLE TOPRAK ORGANİK MADDESİ ARASINDAKİ İLİŞKİLER

Edwards ve Arancon (2004), organik madde, toprak solucanları ve mikroorganizmaların interaksiyonları konusunda çalışmışlardır. Araştırmacılar, organik maddenin parçalanmasını, toprak solucanları tarafından tüketilen organik madde miktarlarının ve toprak solucanlarının besin döngüsünde özellikle karbon ve azot döngüsündeki etkilerini araştırmışlardır.

Vermikompostun tarımda kullanım alanlarına ve önemine dikkat çekmişlerdir. Araştırmacılar, Darwin'in 1881 yılında solucanlar üzerindeki çalışmasından bu yana, solucanların genel olarak agro ekosistemleri ile topraktaki mikroorganizma faaliyetlerini toprak lehine iyileştirdiği konusunda birçok çalışma yapmışlardır.

Organik atıkların solucanlar kullanılarak kompostlanması ile elde edilen ürünün topraklara uygulanması ile başta biyolojik özellikleri olmak üzere yapısı önemli ölçüde düzeltilebilmektedir (Hartenstein ve Mitchell, 1978). Toprakların mikrobiyal yapısı üzerinde kompost ve vermikompost kullanımının oldukça fazla pozitif katkılar sağladığı bilinmektedir. Vermikompost üretimi, organik maddenin biyooksidasyonunu kolaylaştırarak toprak kalitesini ve verimliliğini artırmaktadır (Dominguez ve Edwards, 2010).

Bellitürk (2016)'e göre; organik solucan gübresi tarımsal üretimi artıran ve besin element kayıplarını azaltan yavaş salınım özelliğine sahip olması ve kullanıldığı topraklarda fiziksel, kimyasal, biyolojik ve mikrobiyolojik iyileşmeler sağlaması sebebiyle güvenilir organik bir gübredir.

SONUÇLAR VE ÖNERİLER

Mineral gübre kullanımına bağımlı hale gelen tarım ve peyzaj alanlarında üretim yapan üreticilerin kendi organik gübrelerini yapma imkanları olduğunda, bunu mutlaka hayata gerçekleştirmeleri, organik gübreyi ucuza mal etme anlamında da önemlidir. Hayvansal ve bitkisel kaynaklı organik atıkların mutlak surette geri dönüşümünün özellikle kompost ve/veya vermikompostlama yöntemiyle sağlanması ve tarım-peyzaj alanlarına "organik gübre" olarak kazandırılması ülkemizin gelecek kuşaklara verimli tarım topraklarını, sağlıklı park ve bahçelerini taşıyabilmelerinde oldukça önemlidir. Bu sadece atıklardan organik gübre üretme olarak bilinmemeli, çevreyle dost bir uygulama olarak da görülmelidir.

Sağlıklı bir yaşam tarzının insan yaşamının kalitesini ve uzunluğunu olumlu etkilediği tartışılmaz bir gerçektir. Sağlıklı bir yaşam tarzının elde edilmesinde, beslenmenin rolü büyüktür. Sağlıklı toprakların ve üzerinde yetişecek ürünlerin elde edilebilmesi için, bitkilerin de sağlıklı beslenmeleri gereklidir. Bitkilerin sağlıklı olarak beslenmelerinde organik gübrelerin etkisi çok büyüktür. Tarımsal uygulamalarda gübreleme programları mutlaka organik gübreleri içermelidir. Organik tarım yapılan uygulamalarda zaten sorun yoktur. Ancak geleneksel tarım yapılıyorsa sadece mineral gübre kullanmak yeterli değildir. Sürdürülebilir tarım, ekolojik tarım, biyolojik tarım gözde olma yolunda devam etmektedir. Ancak tarımsal eğitim ve bu tarz

çalışmalardaki akademik deęerlendirmelerin uygulamaya dönmesi ile tarım toprakları üretim hak ettiği deęeri bulacak, gelecek nesillere saęlıklı ürünler ve temiz çevreler bırakılacaktır.

Bunun yanında tarım topraklarında sıklıkla ortaya çıkan azalan organik madde, bozulan pH dengesi, artan kirlenme, verim kayıpları vb. gibi ıslah gerektiren sorunlar da artacak ve üretim maliyetlerine “toprak ıslah maliyetleri” de ilave edilerek tarımdaki kar-zarar dengeleri olumsuz olarak etkilenebilecektir. Organik maddenin azlığı, topraktaki makro ve mikro besin maddelerinin elverişliliğini olumsuz olarak etkilemektedir. Sonuç olarak organik maddenin topraklar için önemi büyük olup, bu durum bitkilerin dengeli beslenmelerinin saęlanması için de elzemdir. Zamanla azalan organik maddenin yeniden topraklara kazandırılması için mutlaka organik gübrelerin de gübreleme programlarında yer almasına önem verilmelidir.

Abstract

Organic food and plants are a splendid driving healthy lifestyle. It gives the higher consumption cost. Therefore, it will be an opportunity for the farmer to grow organic plants such as spinach. This experiment arranged by factorial completely randomized design in pots (2.5 L volume) under controlled conditions aimed to determine the effects of vermicompost (VC), sheep manure (SM) and cow manure (CM) on plant nutrient contents of spinach (*Spinacia oleracea* L.). Only macro elements were evaluated in this study. Five doses (0%, 2%, 4%, 6%, 8%) of VC, SM, CM were incorporated into a uniform soil sample taken from İzmir, and the experiment was completed after 45 days. Organic matter content of CM, SM, and VC was recorded as 71.56%, 25.15%, and 63.10%, respectively. The highest values were obtained from VC concerning N, K, and Mg. On the other hand, P contents reached the highest values at CM. The highest content of Ca was obtained from SM. The results showed that a dose of 4% generally gave remarkable results in plant nutrients. These results indicated that applications of alternative organic fertilizers can improve nutrition status of spinach. As far as we know, this is the first study investigating the positive contribution of the plant to the macro element content by using different organic fertilizer in spinach production.

Keywords: spinach, macro element, vermicompost, sheep manure, cow manure, plant analysis.

Introduction

The world's population is now 8 billion. The world population will be expected to pass 10 billion by 2040. Considering that natural resources used by the fertilizer sector are decreasing gradually, organic fertilizers derived from livestock and plant wastes will be a more important agricultural input in the future. Providing step by step transition to organic fertilizers in spinach growing and even all vegetables and fruit growing will make it possible to protect farmers against price increases of chemical fertilizers in the future due to lack of raw material and to grow healthy products. When considered in terms of their fertility capability, it is seen that agricultural soils contain inadequate amounts of organic matter in Türkiye [1]. Farmers give importance to mineral fertilizers, but they do not give importance to organic fertilizers. Organic fertilizers are one of the main inputs of organic agriculture. First of all, healthy soil is required for a healthy plant [2]. Spinach originated from Central Asia, and it is one of the vegetables widely produced and consumed in almost every region of the world, including our country. In most agricultural production systems, high amounts of nitrogen (N) and phosphorus (P) fertilizers are relied upon to maximize yields, which has directly resulted in numerous environmental problems. Vermicompost is an organic fertilizer whose applicability in organic agriculture is accepted worldwide, and it is also a good soil rehabilitation matter [3,4]. Mineral fertilizers were used extensively in spinach cultivation in Türkiye, but in recent years, it has been reported that tiny amounts of organic fertilizers have been used to spinach growing. Şenlikoğlu examined the effects of different organic materials addition and nitrogenous fertilization on the growth of greenhouse spinach plants (*Spinacia oleracea* L.). He found that mixing soil with an 8% dose of enriched compost increases plant growth [5]. Organic fertilizers, such as farmyard manure, poultry, goat manure, and biofertilizers, can be substituted for inorganic fertilizers in the production of baby spinach [6]. Topcuoğlu and Kütük reported that ammonium nitrate and urea increased the total and physiologically effective oxalic acid content of the spinach more than ammonium sulphate in the first harvest season [7]. Özenç and Şenlikoğlu investigated the effects of compost addition and nitrogen fertilization on the growth of greenhouse spinach plant (*Spinacia oleracea* L.). Their study showed that an 8% dose of enriched compost increases plant growth. They also found that the use of composting products supports fertilization regularly [8]. Zengin has attempted to determine the effects of some nitrogenous fertilizers and barnyard manure on the nitrate accumulation in spinach yield and nitrogen leaching from the soil [9]. Jahanbakhshi and Kheiralipour found that vermicompost

was a better fertilizer than sheep manure due to its more appropriate carbon to nitrogen ratio (C/N), acidity, and salinity [10].

In this research, macro element contents of organic fertilizers such as VC, SM, CM and their effects on the nutrition of spinach which is fertilized chiefly with mineral fertilizers in Türkiye, were analysed and compared with previous studies. In addition, statistical analysis was performed. In this study, it was aimed to determine the effects of VC, SM and CM on the plant nutrient content of spinach (*Spinacia oleracea* L.).

Materials and Methods

Experiment Preparations: The soil samples were collected from 0-30 cm depth. The soil is clay loam texture, neutral (pH: 6.78), slightly salty, low in lime, low in organic matter (1.65%), in N total, in exchangeable Mg low, moderate in available P, moderate in exchangeable K. Spinach is not highly selective in terms of soil requirement. However, the best soils for spinach are clay loams with high organic matter content. The ideal pH value for soil is between 6.0-7.0. Spinach does not like acidic soil [11] (p. 293). Based on this information, the soils used in this experiment were suitable for spinach cultivation (matador variety). In this study, it is very important to choose the soil to be used for the pots. For this reason, it was necessary to use a soil that would not directly affect the research results. Accordingly, the soil used in the experiment had clay loam (CL) texture and care was taken not to adversely affect the test results. Only the low organic matter and low N content of this soil is the general characteristic of many soils in Turkey and is not a negative for the experiment. In this study, three different organic fertilizers (Vermicompost: VC, Cow Manure: CM, and Sheep Manure: SM) in different doses (0%, 2%, 4%, 6%, 8%, volumetrically) were applied to spinach. The experiment was carried out in pots under controlled conditions for 45 days. Factorial (3x5) in a completely randomized pilot trial design with three replications was used in the experiment. For the experiment, 45 plastic pots (2,5 L in volume) were used, and three seeds were sown in each pot. In the experiment setup, pots were fertilized with 150 mg/kg N, 100 mg/kg P, 125 mg/kg at sowing, and then pots were irrigated with distilled water. Growth parameters of the spinach were examined and recorded. Then, N, P, K, Ca, Mg concentrations were investigated. The pot experiment was set up in a greenhouse under controlled temperature and light conditions and continued. Fig 1 explains soil sampling process and preparations of experiment. Fig 2 explains experiment scheme.

Figure 1. Process of preparation for the experiment.

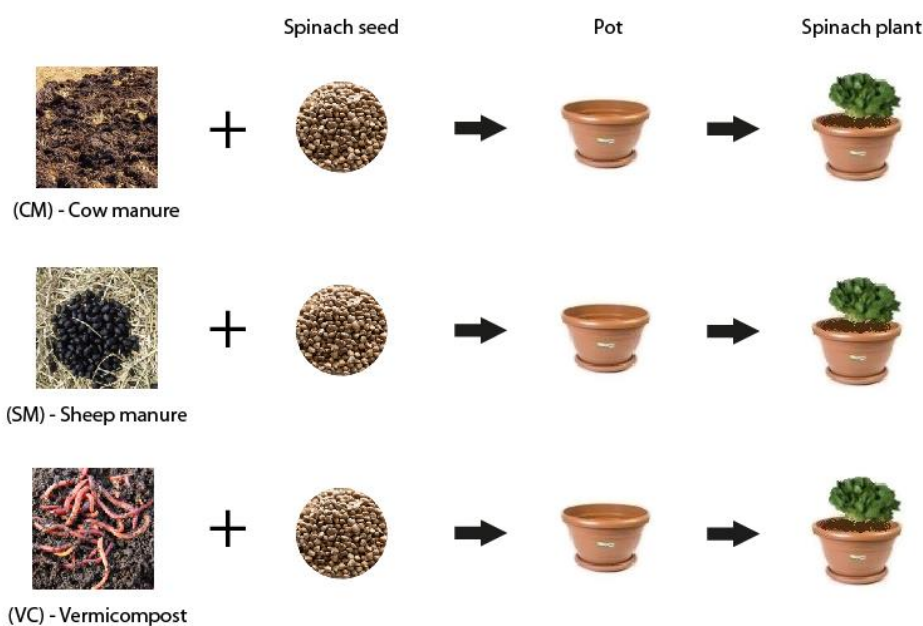

Figure 2. Experiment scheme using cow, sheep and vermicompost manure.

Plant Analysis: Spinach leaves were harvested 45 days after sowing, washed with water until clean, and washed with distilled water at least two times. The leaves were divided into control and four experimental groups and dried under shade for ten days. Then the dried leaves were placed on A4 size envelopes. All samples were put in the oven before analysis for 24 hours at 65°C. The following analysis was performed at dried samples: Total N was measured by the Kjeldahl Method. On the other hand, P, K, Ca and Mg concentrations of spinach samples were determined with ICP-OES (Inductively Coupled Plasma) after wet digestion [12] (pp. 854–855). Effects of CM, CM and VC doses on the growth of spinach are shown in Fig 3.

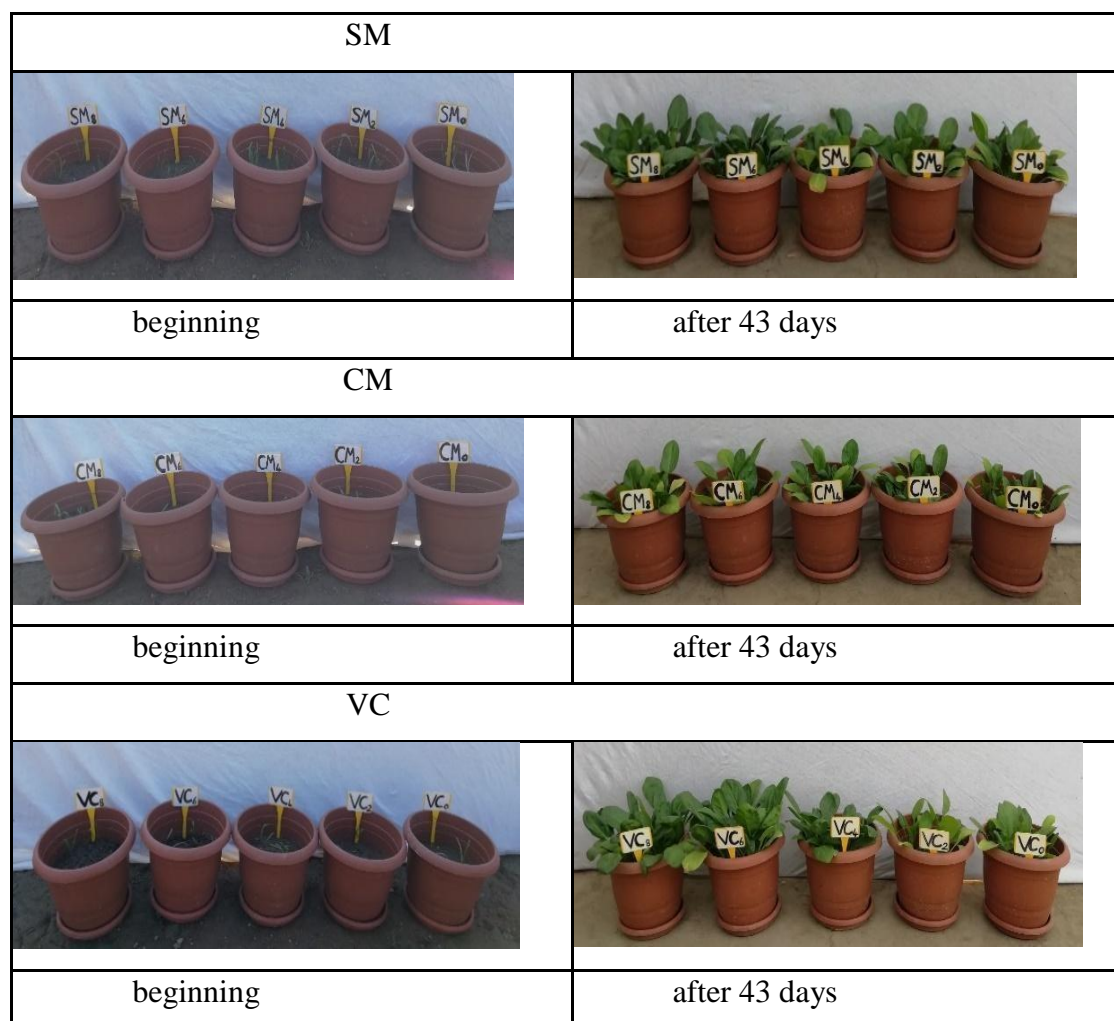

Figure 3. Pots of spinach with treatments of vermicompost, sheep manure, cow manure.

Statistical Data Analysis: Statistical analysis was carried out using JMP 5.0.1. version software. Analysis of variance (ANOVA) was performed, and the significance of the differences between means was tested using Fisher's LSD.

Discussion

Variance analysis results for all elements (N, P, K, Ca and Mg) are given in Table 1. Macro elements concentrations of spinach is presented in Table 2.

Table 1. Results of variance analysis for macro nutrients.

Variation Sources	Elements				
	N	P	K	Ca	Mg
Fertilizer (F)	26.664**	78.580**	6.069*	16.274**	23.164**
Dose (D)	6.422**	0.667ns	6.872**	4.729**	4.656**
F x D	3.888**	3.939**	1.255 ^{ns}	1.792 ^{ns}	7.158**
Significance	ns = not significance, * = significance at the 0.05 level, **= significance at the 0.01 level

The comparison of the effects of 3 different organic fertilizers (CM, SM and VC) on the N, P, K, Ca and Mg contents of the spinach plant is shown in Fig 4.

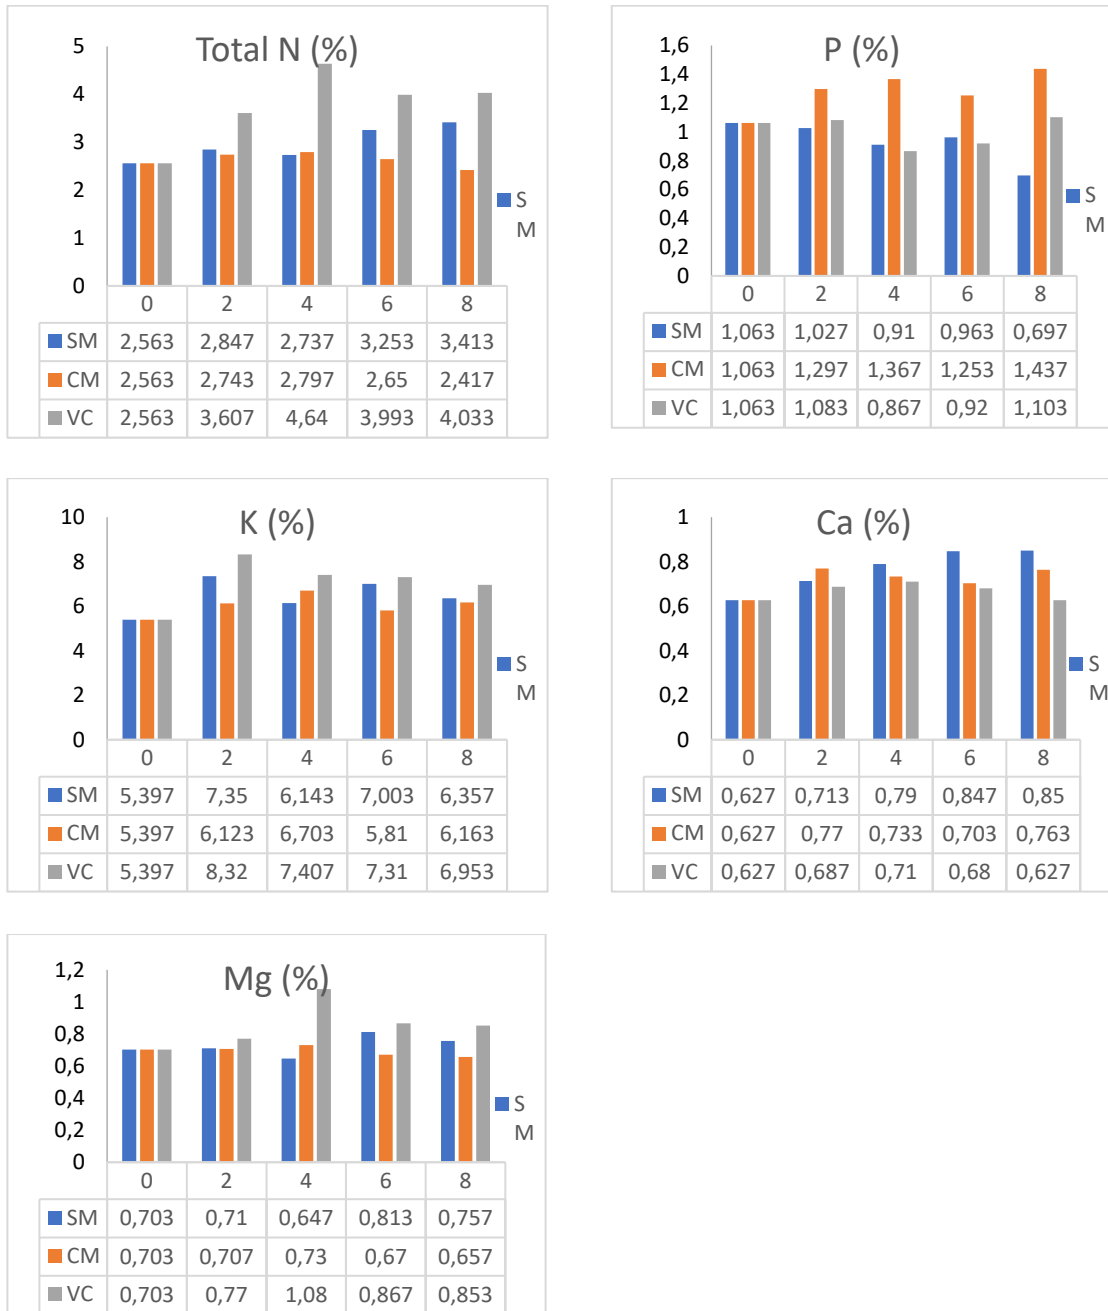

Figure 4. The comparison of the effects of organic fertilizers (CM, SM and VC) on the N, P, K, Ca and Mg contents of the spinach plant.

According to the results of variance analysis, the effect of fertilizers doses and ‘fertilizer x dose’ interactions on the N, P and Mg level were statistically significant at the 1% level ($P < 0.01$). In a study conducted under laboratory conditions in Tekirdağ province, olive pruning wastes were converted as VC with a mixture of farmyard manure using earthworm. It was shown that vermicompost contained sufficient N and rich organic matter [13]. According to this information, VC had a more significant effect on N concentrations in plants when the contained

rich amount of total N. Bellitürk, Hınısli, et al. reported that CM, SM and VC were used to grow curly lettuce. They found that the amount of N in pots with 75 g of the vermicompost was higher than in pots with 25 g of the vermicompost. Therefore, it is similar to this study in terms of the amount of N [1]. Bellitürk and Eryüksel found that the total N content in the onion plant was lowest (5.6%) in the pots treated with 25% VC highest (6.8%) in the pots treated with 75% [14]. Similarly, to this study, the authors stated that total N content increases with increasing VC dose. In many studies has been reported that application of organic vermicompost to soil resulted in increased total N content in the plants. Although VC has been evaluated in several studies, there is still limited information available regarding the influences on plant growth and yield, particularly for greenhouse crops such as spinach [1,15–17]. Bellitürk and Eryüksel reported that the total P content in onion was 4502.4 mg kg⁻¹ at 100% VC dose and 5595.8 mg kg⁻¹ at 75% VC dose [14]. In a study that set out to determine the effect of VC, CM and CM on curly lettuce, Bellitürk, Hınısli, et al. reported that in the P concentration, SM was statistically significant while cow manure was not statistically significant [1]. Bellitürk, Adiloğlu, et al. found that P content was 0.0162% at 0%, while 0.0393 at 7% in pepper [18]. Bellitürk measured P content as 4,70% in CM and VC 0.44% in cow manure+olive pruning waste [19]. Therefore, it seems that the P level could be high in VC, which was obtained from CM by using earthworm. According to the results of variance analysis (Table 1), the effect of fertilizers on K content was statistically significant at the 5% level (P<0.05); the effect of fertilizer doses on potassium content was statistically significant at the 1% level (P<0.01). Bellitürk and Eryüksel found that K value was 77091.8 mg kg⁻¹ at 75% VC rate, 86947,3 mg kg⁻¹ at 25% VC rate and 93357.9 mg kg⁻¹ at 100% VC rate [14]. Bellitürk, Hınısli, et al. reported that K was 4.74% in pots with 25 g of the VC, and the highest K content in curly lettuce was obtained from SM application [1]. Eker stated that the highest Mg, K, and Zn levels were observed in pots fertilized with SM and garbage compost [20]. In another similar study, Azarmi et al. found that the addition of VC at a rate of 1.5 ton da⁻¹ significantly increased contents of soil total organic C, N, P, K, Ca, Zn and Mn [21]. Bellitürk, Hınısli, et al. reported that CM had no impact on the content of Ca. Researchers explained that SM and VC with a dose of 125g had a positive impact on the content of Ca [1]. However, Bellitürk and Eryüksel reported that an inverse proportion between Ca content of onion plant and VC [14]. Çıtak et al. determined that VC showed a significant increase in yield, yield properties, and soil fertility compared to control. They found that VC with a dose of 200 kg was more effective on plant Fe and soil exchangeable Ca concentration. They also found that all treatments showed an increase in pH, E.C., and organic matter values

of soil when compared to control [22]. Bellitürk, Hınısli, et al. demonstrated that the Mg levels were close in all treatments, but it showed fluctuations in CM application [1]. Bellitürk and Eryüksel reported that the content of Mg in onion was decreased, increasing of vermicomposting level [14]. Several studies have indicated an impact of SM, CM and VC on nutrient uptake by plants, and they also noted that better results are obtained by using nutrient-rich fertilizers [1,15,16,23]. Eker stated that different organic fertilizers were studied. The results showed that the most effective results (62%) were obtained at 0%, and the author of this study additionally reported that the best effect on uptake of Mg was recorded at 50% application rate of fertilizer. The addition of VC produced from these different substrates has similarly improved plant growth and yield among a broad spectrum of plant species and cultivars [20]. Demir and Kıran investigated the impact of VC on macro and micronutrients of lettuce under salt stress conditions. Researchers also indicated that the effect of salt stress x VC interaction was statistically significant on N, P, Mg, whereas it was not significant on K and Ca [24]. Kuş studied the effect of different doses of VC on pepper's yield and nutrient content under soilless agricultural systems and reported that P and Mg contents had increased significantly by 2.5% and 5% VC rate. The author also reported that Ca, Fe, and Mn contents were decreased with an increase in the VC rate, whereas K and Cu contents were increased [25]. Çıtak et al. reported that VC with a dose of 200 kg was more effective on Fe content of spinach plant and Ca concentration of soil [22]. Büyükfiliz indicates that Fe, B, and Zn contents were decreased with an increase in the VC rate, while N, P, K, Ca, Mg contents were increased [26].

Conclusion

This study demonstrated that VC, CM and SM had positive effects on the macro element content of the spinach plant. In terms of the N content, VC in this study represented the best contribution of N contents (3.767%) in the spinach plant. When Fig 4 is examined, the highest N (4.64%) and Mg (1.08%) contents in spinach were obtained from 4% application of VC. In terms of the P content, the highest P content was observed at 4% and 8% dose of CM. However, it is concluded that the 4% dose of CM is more suitable economically. In terms of the K content of the plant, the VC was the most effective fertilizer. Fig 4 shows the maximum K content was observed in a 2% dose of vermicompost, 8.32%. Concerning the Ca content of the plant, the SM was most effective when applied at doses 6% and 8%. However, it is concluded that the 4% dose of SM is more suitable economically. Regarding the Mg content of the plant, the use of VC in this study represented the best contribution of Mg contents (0.855%) in the spinach plant (Fig 4). According to research results; the highest content of total N, K, and Mg in spinach was

found in the application of VC; the highest content of P in spinach was obtained in the application of CM, and the highest content of Ca was recorded in the application of SM. The higher values concerning the content of nutrients were generally obtained at a dose of 4%. It was concluded that a dose of 4% is an ideal dose for spinach plants. In addition, this study can serve as a reference source for future studies.

Funding: This work was supported by Research Fund of the Tekirdağ Namık Kemal University. Project number NKUBAP.03.YL.21.284. On the other hand, this study has been prepared from a part of master's thesis titled 'Plant Analysis for the Comparison of the Effects of Vermicompost, Cow Manure and Sheep Manure on the Nutrition Content of Spinach (*Spinacia oleracea* L.),' by author Canan Yalçıntepe (*Supervisor of Master Thesis: Korkmaz Bellitürk*). Vermicompost was donated by Vermis Company.

Conflicts of Interest: The authors declare no competing interest.

KURŞUNUN AKDOĞMUŞ (gundşeyh) KİLİ (agk-2) İLE ADSORPSİYON KİNETİĞİNİN MODELLENMESİ

Dr.Öğr.Üyesi Nilgün ONURSAL (ORCID:0000 0002 2460 6475)
Siirt Üniversitesi Eğitim Fakültesi Fen Bilimleri Eğitimi Bölümü
Email:nilgun.onursal@gmail.com

ÖZET

Kurşun insan sağlığı için gerekmeyen ve oldukça yaygın kullanım alanına sahip bir elementtir. Kurşun-asit akümülatörlerde, kablo kılıfında inşaat amacıyla, radyasyondan korunmada ve alaşımlarda kullanılmaktadır. Toz halinde ise pigment, boya, sır, macun, cam ve fonksiyonel seramiklerde kullanılmaktadır. Toksik bir madde olan kurşuna maruz kalan Özellikle kardiyovasküler, hematopoietik, merkezi ve periferik sinir sistemlerine bağlı rahatsızlıklar yaşamaktadırlar. Kurşunun sulu çözeltilerden giderimi için pek çok yöntem bulunmaktadır. Bunlar arasında en etkili olanlardan biriside adsorpsiyon yöntemidir. Adsorpsiyon ucuz, kolay uygulanabilen etkili bir alternatif yöntemdir. Kil ise adsorplayıcı olarak iyi bir seçenektir. Adsorpsiyon işleminde zamanın kritik bir öneme sahip olduğu bilinmektedir. Bu anlamda kinetik çalışmalar yaygın bir şekilde kullanılmaktadır. Bu çalışmada Kurşun (II) iyonlarının Siirt Akdoğmuş (Gundşeyh) kili (AGK-2) ile adsorpsiyon kinetiği incelendi. Çalışma 318 K sıcaklığında gerçekleştirildi. Deney sonuçları adsorpsiyon kinetiğinde en yaygın olarak kullanılan dört kinetik modele uygulandı. Bu modeller, Yalancı-birinci dereceli kinetik model (Pseudo-First Order kinetic Model-PFO), Yalancı ikinci dereceli kinetik model (Pseudo-Second Order kinetic Model-PSO), Elovich ve Weber-Morris (Parçacık içi difüzyon) modelleridir. Regresyon analizi sonucunda, deneysel verilere en uygun modelin PSO olduğu görülmüştür. Bu modele ait sabitler, $q_e=25.125$ (mgg^{-1}), $k_2=0.0289$ ($\text{gmg}^{-1}.\text{dk}^{-1}$) ve $R^2=1$ olarak hesaplandı. Regresyon katsayısının 1'e eşit çıkması ender olarak görülmektedir. Bu da deneysel verilerin teoriyle bire bir uyduğunu göstermektedir.

Anahtar kelimeler: Kurşun, Adsorpsiyon, Adsorpsiyon Kinetiği, Kil, Yalancı-ikinci dereceli kinetik model

**MODELING THE ADSORPTION KINETICS OF LEAD WITH AKDOGMUS-
(gundseyh) (agk-2) CLAY**

ABSTRACT

Lead is an element that is not required for human health and is widely used. It is used in lead-acid batteries, cable sheathing for construction purposes, radiation protection and alloys. In powder form, it is used in pigment, paint, glaze, paste, glass and functional ceramics. People exposed to lead, a toxic substance, experience disorders related to cardiovascular, hematopoietic, central and peripheral nervous systems. There are many methods for removing lead from aqueous solutions. One of the most effective among these is the adsorption method. Adsorption is a cheap, easy-to-apply and effective alternative method. Clay is a good option as an adsorbent. It is known that time is of critical importance in the adsorption process. In this sense, kinetic studies are widely used. In this study, the adsorption kinetics of Lead (II) ions with Siirt Akdoğmuş (Gundseyh) clay (AGK-2) was examined. The study was carried out at a temperature of 318 K. The experimental results were applied to the four most commonly used kinetic models in adsorption kinetics. These models are Pseudo-First Order kinetic Model (PFO), Pseudo-Second Order kinetic Model (PSO), Elovich and Weber-Morris (Intraparticle diffusion) models. As a result of the regression analysis, it was seen that PSO was the model that best suited the experimental data. The constants of this model were calculated as $q_e = 25.125$ (mgg^{-1}), $k_2 = 0.0289$ ($\text{gmg}^{-1} \cdot \text{dk}^{-1}$) and $R^2 = 1$. It is rare for the regression coefficient to be equal to 1. This shows that the experimental data exactly agree with the theory.

GİRİŞ

Son dönemlerde su kirliliği küresel sorun haline gelmiştir. Buna bağlı olarak ağır metal kirliliği de en ciddi sorunlar arasında kabul edilmektedir (Canpolat, Altunkaynak ve Yavuz 2022). Artan nüfus, küresel iklim değişikliği ve endüstriyel ürünlerin artarak üretimi, önemli ölçüde su kaynaklarının kontrolsüz kullanılmasına buna bağlı olarak ağır metal iyonları, organik kirleticiler, petrol ve türevlerinin kirlenmesine neden olmaktadır (Neskoromnaya, ve diğerleri 2022). Birçok yaşam biçimi üzerinde zararlı etkiye sahip olan ağır metallerin giderimi, bilim insanları açısından özel bir önem arz etmektedir (Onursal, Dal, ve diğerleri 2020). Bunlardan Bakır, kurşun, cıva, nikel, krom ve çinko olmak üzere genellikle çeşitli üretim süreçlerinden geçerken atık su deşarjı yoluyla su sistemlerine girerek doğaya ve canlılara özellikle de insanlara zarar vermektedirler (M. C. Dal, N. Onursal, ve diğerleri 2021). Çünkü bu metaller biyolojik olarak parçalanmazlar. Bu nedenle canlı dokularda özellikle de insan vücudunda birikme eğilimindedirler. Böylelikle çeşitli hastalıklara ve merkezi sinir sistemi hasarı gibi önemli fizyolojik bozukluklar meydana getirebilirler (Alghamdi, ve diğerleri 2020). Normalde su da çok düşük konsantrasyonlarda dahi bulunmayan zararlı ağır metallerden birisi de kurşundur. Kurşunun atom numarası 82 ve atom ağırlığı $207,2 \text{ g mol}^{-1}$ dir. Kurşun doğada çok nadir bulunan fakat geniş bir coğrafyaya sahip olan ağır metaldir. Atık sularda en yaygın olarak kurşun kirliliğine neden olan faktörler, petrol rafinerileri, metal endüstrileri, boya üretim endüstrileri, pil fabrikaları, akümülatörler ve patlayıcı endüstrileri olarak sayılabilir (Ekmekyapar Torun ve Kısacıkoglu 2023). Bunun dışında Kurşun, kâğıt yapımında, kurşun-asit pillerin üretiminde, tekstilde, silah yapımında ve birçok malzeme üretiminde de kullanılmaktadır (Onursal, Altunkaynak, ve diğerleri 2023), ((Onursal, Kul ve Yavuz,2019). Ayrıca kablo kılıfında inşaat amacıyla, radyasyondan korunmada ve alaşımlarda kullanılmaktadır. Toz halinde ise pigment, boya, sır, macun, cam ve fonksiyonel seramiklerde kullanılmaktadır (Abdulla 2020).

Kurşun, insan sağlığı açısından gerekli olmayan bir element olup düşük erime noktasına sahip ve oldukça yumuşaktır. İnsanlarda kurşuna maruz kalma durumları söz konusudur. Özellikle kurşun ile lehimlenmiş kutularda saklanan yiyecekler ve kurşun ile sırlanmış çömlükler de dahil olmak üzere temel olarak yiyecek ve içecekler yoluyla oluşmaktadır. Yapılan çalışmalara göre sanayileşmiş ülkelerde mevcut günlük alımlar 8-282 μg aralığındadır. Ortalama günlük alım ise 100 μg 'dan daha az miktardadır (Abdulla 2020). Toksik özelliğe sahip olan kurşun, vücuttaki birçok organ sistemini olumsuz etkilemektedir. Kardiyovasküler, hematopoietik ve özellikle merkezi ve periferik sinir sistemleri sıklıkla etkilenmektedir. Ayrıca böbrekleri, karaciğeri ve

üreme sistemini, kemikteki mineral metabolizmasını etkilediği bulunmuştur. Meslekleri gereği kurşuna maruz kalan kişilerde ise anemi ve kan basıncında artış gözlenir. Dahası bebekler ve çocuklar kurşun toksisitesine karşı daha savunmasızdırlar. Bunlar kurşuna maruz kaldıkları zaman, (Beyin hastalığı, hasarı yâda arızası anlamına gelen) ensefalopati sıklıkla görülmektedir. İnsanlarda kurşuna maruz kalmayla ilgili sorunlar, kurşunlu benzinin ortadan kaldırılması ve daha iyi çevresel ve mesleki izlemeler sayesinde, son yıllarda daha ciddi ele alınmaya başlanmıştır (Abdulla 2020). Kurşunun çözüldüğüden uzaklaştırılmasına yönelik çokça yöntem bulunmaktadır. Bunlar arasında, kimyasal çökeltme, elektroliz, biyoteknoloji, elektrodiyaliz ve adsorpsiyon sayılabilir. Bunlar arasında adsorpsiyon yöntemi, düşük maliyet, basit işletme ve geniş hammadde kaynağı avantajlarından dolayı en yaygın kullanılanıdır. (Li, ve diğerleri 2023 15(10), 1857). Ağır metallere kirlenmiş alanlar, iyileştirilmesi en zor alanlardan biri olarak kabul edilir. Bu nedenle bu konuda araştırmalar hızla devam etmektedir (Usman, ve diğerleri 2020). Bu çalışmanın ana temasını kirlenmiş alanların ağır metalin giderimi oluşturmaktadır.

Ağır Metaller

Ağır metaller, yer kabuğunda doğal olarak bulunmaktadır. Periyodik tabloda önemli yer tutan ağır metaller yüksek özkütle ve atom kütlesine sahiptirler. Bu metalik olan elementler, oldukça düşük maruz kalma seviyelerinde dahi çoklu organ hasarına neden oldukları bilinen, toksik maddeler olarak belirtilmektedirler. Uluslararası Kanser Araştırma Ajansı ve ABD Çevre Koruma Ajansı'na göre (the U.S. Environmental Protection Agency (EPA), and the International Agency for Research on Cancer (IARC) insanlar için kanserojen (bilinen veya olma ihtimali olan) olarak sınıflandırılabilir (Tchounwou, ve diğerleri 2012; 101).

Kil

Doğal kil mineralleri, geniş yüzey alanları, değişim kapasiteleri, büyük katalitik destekleri ve düşük maliyetleri nedeniyle en çok tercih edilen doğası gereği renksiz bir malzeme sınıfıdır (Sdiri , ve diğerleri 2016). Kayaç anlamı taşıyan kilin, boyutunun birkaç nanometreden mikrometreye kadar değiştiği belirtilmiştir. (Wang ve Wang 2022). Bazı kaynaklara göre ise, tanecik boyutu 4 µm den daha küçük olan taneciklere kil denmektedir (Aird 2019) Kimya ve mineraloji açısından oldukça önemli olan kil çok çeşitli şekillerde kullanılmışlardır. Eski dönemlerde çamaşır ağartıcı olarak kullanılmış olan kil bugün hala seramik yapımında, ilaç sanayinde ve resim ile boya malzemesinde kullanılmaktadır (Onursal, Dal, ve diğerleri 2020)

Adsorpsiyon

Adsorpsiyon, farklı fazlarda bulunan sıvı ya da gaz moleküllerinin katı ya da sıvı fazdaki maddelerin yüzeyine tutunması işlevidir (M. C. Dal, N. Onursal, ve diğçerleri 2021). Adsorpsiyon kinetiđi konusunda yapılan çalıřmalardan en çok kullanılanlar, Lagergren (Yalancı Birinci Dereceden Hız Denklemi-PFO), Ho ve McKay'ın (İkinci Dereceden Hız Denklemi-PSO), Parçacık İçi Difüzyon Modeli olan (Weber-Morris difüzyon modeli) ve Elovich kinetik modelleridir. Bunlara ait denklemler ise ařađıdaki řekilde verilebilir.

Tablo 1. Adsorpsiyon Kinetik Modelleri

Kinetik Modeller	Denklem	Açıklamalar	Kaynak
Lagergren (PFO)	$\log(q_e - q_t) = \log q_e - k_1 t$	Yalancı birinci dereceden kinetik model, adsorbanların sorpsiyon bölgelerinin doluluk oranı ile boş alanların sayısı arasındaki ilişkiyi açıklar. Burada k_1 , adsorpsiyonun birinci dereceden hız sabitidir; q_e ise, dengede adsorbe edilen madde miktarı ve q_t , t Süre sonunda adsorbe edilen madde miktarını ifade etmektedir	(Edet ve Ifelebuegu 2020) (Onursal, 2022)
Ho-MacKay (PSO)	$\frac{t}{q_t} = \frac{1}{k_2 q_e^2} + \left(\frac{1}{q_e}\right) t$	Bu model geliştirilen kinetik modeldir österilen ifade adsorpsiyon kapasitesinin uanla nasıl değiştiğini göstermektedir. urada q_t ve q_e sırasıyla dengede ve t uanında (dakika) adsorbe edilen madde iktarlarıdır. ve k_2 , yalancı ikinci dereceden z sabitidir (g/mg/dak).	(Dal ve Onursal, 2023)
Elovich	$q_t = \frac{1}{\beta} (\ln \alpha \beta) + \frac{1}{\beta} \ln t$	Bu model katı yüzeydeki adsorpsiyon süreci hakkında bilgi verir. Bu model aynı zamanda Roginsky ve Zeldovich tarafından geliştirilen model olarak da literatürde yerini almış ve denklem olarak formüle edilmiştir. Burada α , başlangıçtaki adsorpsiyon hızıdır (mg/g/dak) ve β , yüzey kaplamasının boyutu ve kemisorpsiyon için aktivasyon enerjisi (g/mg) ile ilgilidir.	(Buldağ ve Yavuz 2023)
Weber-Morris Kinetik Modeli	$q_t = k_{WM} \sqrt{t} + C$	Partikül içi difüzyon olayını incelemek amacıyla WeberMorris modeli tercih edilmiştir. Bu modelde sınır tabaka direnci, çözelti adsorpsiyonun da ki parametrelerden denge, hız ve bunlara bağlı olarak temas süresine etki etmektedir. Burada q_t dengede ve t zamanında (dakika) adsorbe edilen madde miktarlarıdır. k_{WM} ise, IPD hız sabitidir (mg/(g min ^{1/2}), C denklem sabitidir (mg/g).	(M. C. Dal, N. Onursal, ve diğerleri 2021)

MATERYAL VE METOT

Adsorplayıcının Hazırlanması

Bu çalışmada, adsorplayıcı olarak kullanılan kil (AGK-2), Siirt ili Akdoğmuş (Gundşeyh) köyünden yaklaşık 1,5- 2 km mesafedeki bölgeden temin edilmiştir. Kil 15 gün boyunca kurutulmaya bırakılmıştır. Öğütücüde öğütüldükten sonra toz halindeki kil 120 µm'nin altındaki elek ile elenerek hazır hale getirilmiştir.

Metal İyon Çözeltisinin Hazırlanması

Çalışmada kullanılmak üzere stok çözelti olarak 1000 (mgL⁻¹) derişime sahip Pb²⁺ iyon çözeltisi hazırlanmıştır. Merck marka Pb (II) nitrat [Pb (NO₃)₂] ile distile su kullanılarak değişik konsantrasyonlara sahip Pb²⁺ çözeltileri hazırlanmıştır.

Kinetik Deney Çalışma Usulü

Çalışma Memmert marka WNB 14 model ısıtıcılı çalkalamalı su banyosunda 45 °C (318 K) sıcaklıkta gerçekleştirilmiştir. Ön deneylerde 5 saatte geldiği görüldüğü için, esas deneyde kinetik çalışma 5 saatte sona erdirilmiştir.

BULGULAR

XRF Analizi

Kilin karakterizasyonu yapılmış olup, kilin kimyasal bileşimi, XRF analizi verilerine göre; SiO₂ değeri %39,2, Al₂O₃ değeri %10,5 ve CaO değeri ise 13,9 olarak ölçülmüştür. Burada ikinci sıradaki değerin, CaO' dan büyük olması beklenen değerdir. Ancak CAO nun büyük olması kildeki kalsit miktarının fazla olduğu anlamına gelmektedir (Onursal, Siirt Akdoğmuş-2(Gundşeyh-2) Kili ile Cu (I) Adsorpsiyonunda İzoterm Modellerinin Karşılaştırılması 2023).

XRD Analizi

Cu-X ışın tüplü Panalytical X'Pert Powder XRD analiz cihazı ile yapılmış olup, tüm kayaç analizi verilerine göre mixed tipli kil olduğu anlaşılmıştır. (Onursal, Siirt Akdoğmuş-2(Gundşeyh-2) Kili ile Cu (I) Adsorpsiyonunda İzoterm Modellerinin Karşılaştırılması 2023).

Adsorpsiyon Deneyi

Adsorpsiyon deneyi tek grupta, kinetik olarak yapıldı. Deneyde 1'er g lık illerin üzerine ağır metal çözeltileri, 25 ml olacak şekilde bırakılmıştır. Isıtıcı çalkalayıcıda uygun zaman dilimlerinde çalkalandıktan sonra katı ve sıvı faza ayrılması için 20'şer dakika santrifüj edilmiştir. Akabinde kalan kil ile çözelti ayrıştırıldıktan sonra AAS cihazında analiz edilmiştir. Adsorplanan miktarlar ise aşağıdaki bağıntı kullanılarak hesaplanmıştır.

$$q = \frac{(C_i - C_e) \cdot V}{m}$$

Bağıntıdaki C_i ile C_e (mgL^{-1}) başlangıç ve denge konsantrasyonlarını ifade etmektedirler. V (L) metalin çözelti hacmini m (g) ise alınan kil miktarını göstermektedir. Dengeye ulaşım süresini belirlemek için 15 ile 360 dakika saatleri arasında çalkalama işlemi yapılmıştır. Elde edilen veriler AAS ile ölçülmüş olup, elde edilen veriler ışığında Pb^{2+} çözeltilisinin doyumluğa ulaştığı süre belirlenmiştir. Yapılan deneysel çalışmalar, yalancı-birinci dereceli kinetik model, yalancı-ikinci dereceli kinetik model, Elovich ve Weber-Morris kinetik modellerine uygulandı. Oluşturulan grafiklerden elde edilen veriler regresyon analizine uygulanarak en küçük kareler yöntemi kullanılmıştır. Sonuçlar tablo 2' de verilmiştir.

SONUÇ VE TARTIŞMA

Kurşun hem üretimi hem de tüketimi esnasında çevreyi çok kirleten ve en zararlı ağır metaller arasında başı çeken bir elementtir. Kurşunun kirletici ortamlardan giderilmesi için adsorpsiyon, ucuz ve etkili olması nedeniyle iyi bir alternatiftir. Adsorpsiyon kinetiği bu konuda yapılan çalışmaların bilimsel izdüşümüdür.

Bu çalışmada; Siirt ili Akdoğmuş (Gundşeyh) köyünden alınan kil, adsorplayıcı olarak kullanıldı. 318 K sıcaklığında gerçekleştirilen adsorpsiyon deneyinde Pb (II)'nin kinetik davranışı incelendi. Deneyden elde edilen veriler, en yaygın olarak kullanılan dört kinetik modele (yalancı-birinci dereceli kinetik model, yalancı ikinci-dereceli kinetik model, Weber-Morris ve Elovich modeli) uygulandı. En küçük kareler yönteminin regresyon yöntemi olarak

kullanıldığı çalışmada yalancı-ikinci dereceli kinetik modelin deneysel verilere en çok uyumlu model olduğu ($R^2=1$) görüldü. q_e değeri 25.125 mgg^{-1} olarak ve k_2 değeri 0.289 olarak bulundu. Sonuç olarak Siirt AGK-2 kilinin orta derecede bir kapasiteye sahip olduğu ve yalancı-ikinci dereceli kinetik modele uyduğu için Pb (II) ile kimyasal adsorpsiyon yaptığı değerlendirilmektedir.

**A CASE REPORT: PULMONARY ARTERY DISSECTION IN A YOUNG PATIENT
WITH PULMONARY HYPERTENSION**

Hüseyin ŞAHİN*

Namik Kemal University Faculty of Medicine Department of Emergency Medicine
Email:drhuseyinsahin@hotmail.com

Sercan BIÇAKCI

Namik Kemal University Faculty of Medicine Department of Emergency Medicine

Introduction

Pulmonary artery dissection is a scarce and fatal condition. It is usually associated with pulmonary artery aneurysm due to pulmonary hypertension. Most diagnoses are made at autopsy because of the high mortality rate. The aim is to raise awareness of this life-threatening condition, alongside other emerging pathologies associated with chest pain and back pain.

Figure 1: Enlarged Pulmonary Artery

Case:

A 37-year-old woman suffering from a "cold" and back pain for 2 days duration was admitted to the emergency department. Her medical history includes pulmonary arterial hypertension for 8 years. She and her husband stated they'd had similar symptoms due to a 'cold'. She had a sore throat, chest pain, and back pain. Physical examination revealed decreased lung sounds in the left base, ecchymosis due to cupping therapy on her back (for her cold), and normal oropharynx. Her blood pressure was 85/50 mmHg, which responded well to normal saline infusion. Heart

rate was 101/min and oxygen saturation was 92%. The patient immediately underwent PA chest radiography (figure 1). The ECG showed T wave inversions in leads v1-v4, D3, and aVF (figure 2).

Figure 2: EKG

Figure 3: Pulmonary Artery Dissection

Enlarged right pulmonary artery

Laboratory results showed that cardiac troponins were within normal limits and CRP was 76. Arterial blood gas was consistent with respiratory alkalosis (pH:7.5; pO₂:52, pCO₂:25). A CT angiography of the pulmonary artery was performed for further evaluation. The CT scan showed an enlarged main pulmonary artery with a diameter of 100 mm and a dissection site of 17 mm in length (figure 3,4,5). Emergency cardiovascular surgery and cardiology consultations were arranged. Unfortunately, the patient suffered a sudden cardiac arrest while under observation in the emergency department and died.

Figure 4: Pulmonary Artery Dissection

Enlarged pulmonary artery and dissection site

Conclusion

A review of the literature shows that only a few dozen patients with pulmonary artery dissection have survived since it was first described in 1842. This case reminds us that we should consider pulmonary artery pathology alongside other life-threatening diagnoses (acute coronary symptoms, aortic dissection, etc.) when evaluating a patient with chest or back pain. Also, considering that our patient waited for 2 long days before coming to the emergency department, it would be appropriate to work on raising awareness among these high-risk patients with pulmonary hypertension disease. Early surgical intervention can be life-saving for these patients.

ABSTRACT

Obsessive-compulsive disorder (OCD) is a common, chronic condition characterized by unwanted and distressing thoughts (obsessions) and repetitive behaviors (compulsions). It is an inherited and multifactorial disease contributed by both common and rare features. OCD is ranked by the World Health Organization as one of the ten disorders that most severely impair life quality. Even though it's a routine condition with identical symptom dimensions; each patients symptoms, level of insight, level of comorbidity and genetic history must be evaluated individually. Cognitive behavioral therapy along with selective serotonin reuptake studies (SSRIs), are recommended treatments for OCD. In this study, the genetic background of OCD have been summarized, and recent studies have been highlighted. It focused on the genes such as dopamine receptor D2 (DRD2-TaqIA), catechol-O methyltransferase (COMT), dopamine receptor D3 (DRD3), monoamine oxidase (MAO), dopamine receptor D4 (DRD4), serotonin 5-hidroksitriptamin (5HT2A), 5-HTT (SLC6A4). It also focused on several promising areas of research that could help understand more about the genetic roots and pathophysiology of OCD. In essence, this review aims to provide an overview of OCD, encompassing the latest developments in genetic research, and an outlook on the fields potential future directions.

INTRODUCTION

The increased incidence of Obsessive Compulsive Disorder (OCD), or Obsessive Compulsive Neurosis as it was once known, is a common pigment and formation that can be observed across a wide social spectrum and across cultures. The origin of 'obsession'; It was based on the Latin word "obsidere" meaning to worry or not to give peace. In English, what happened in the seventh century began to be used to mean 'unchanging thoughts'. The use of psychoanalysis literature began when Freud talked about "obsessive neurosis" in 1894. Freud identified the internal thoughts that arise from the obsessional neurotic mind and the elements that are replaced in order to prevent them. Later, new definitions were made in the psychology and psychiatry literature and the name "obsessive compulsive disorder (OCD)" began to be used more frequently instead of obsessional neurosis. Obsessions; Feelings and thoughts that come to every individual repetitively, that disturb him/her and that he cannot get out of his mind despite all his efforts, are imaginary images that could come true. Obsessions, which often seem meaningless to the individual, can appear on various themes. The most common details are obsessions; They can be listed as contamination obsessions, aggression obsessions, obsessions related to order and symmetry, and sexual obsessions. Compulsions, on the other hand, may be used to lessen the anxiety and distress brought on by these thoughts. These rituals, which can be very damaging to one's functioning, can be either private and personal or they can involve others. They serve as a counterbalance to the ego-dystonic feelings caused by the obsessional thoughts. (1) Compulsion compulsions can be listed as cleaning compulsions, control compulsions, mental compulsions, and symmetrical compulsions. OCD affects 3.3 million and 1 million children and adolescents in the United States. The disorder first appears in childhood, adolescence, and early adulthood. Among the ten most disabling disorders affecting people, OCD is ranked by the World Health Organization (WHO) as number 36.(2) It has been announced that many famous people have OCD. Leonardo Dicaprio, David Beckham, Megan Fox, Frank Sinatra, Donald Trump are some of these names. Compared to the general population, OCD patients have a significantly higher risk of dying from natural or unnatural causes (mortality risk ratios = 1.68 and 2.61, respectively; (3) Similarly, another review found that a significant percentage of OCD patients had suicidal ideation and that the mean lifetime rate of suicide attempts was 14.2%. (4) Suicide deaths have been the subject of two sizable population-based Swedish studies with long-term follow-ups. (5)

Although the cause is not fully understood, research has shown that biological and environmental factors may be associated with OCD. Some environmental stressors can trigger

OCD. Certain environmental factors can worsen this condition in a person. These; It could be abuse, life changes, illness, death of a loved one, changes or problems with work or school, and relationship concerns. Although it is not due to chance that individuals with OCD also have various tics, scientific findings have been demonstrated as evidence. Obsessive Compulsive Disorder (OCD) is a disorder that needs to be treated. Before treatment, it is necessary to determine whether the current situation is caused by environmental factors or biological genetic factors. The brain is a complex structure. There are billions of nerve cells called neurons that are needed for the normal functioning of the body. Neurons communicate through electrical signals. Chemicals called neurotransmitters help transmit these signals from neuron to neuron. Research has identified a link between decreased levels of the neurotransmitter called serotonin and the development of OCD. There is also evidence that serotonin imbalance is passed from parent to child. This is an indication that obsessive-compulsive disorder (OCD) may be genetic. Additionally, certain areas of the brain are affected by serotonin imbalance, leading to OCD. This problem appears to be related to brain pathways that are connected to areas of the brain involved in common sense and planning, and areas that filter messages involving bodily movements. The effectiveness of serotonin reuptake inhibitors on obsessive-compulsive symptoms and the fact that mCPP (methyl chloro phenyl piperazine) causes obsessive-compulsive symptoms are considered indicators that there may be dysfunction in serotonergic pathways.

Pharmacological, psychotherapy, and surgical (DBS) options are available for the treatment of OCD. Strong evidence supports the use of cognitive behavioral therapy, such as exposure and response prevention therapy, in conjunction with selective serotonin reuptake inhibitors to treat OCD symptoms (6). Although meta-analyses have shown that higher doses of SSRIs are marginally more effective than lower doses,(7) approximately 60% of patients with OCD do not have satisfactory outcomes with SSRIs.10 On the contrary, numerous patients have experienced unpleasant adverse effects, including difficulty in urination, decreased blood pressure, dry mouth, drowsiness, nausea, headache, and dizziness.(8) Clomipramine or atypical antipsychotic medications, primarily risperidone and aripiprazole, are second-line pharmacological options. (9) But not every OCD sufferer responds to these treatments in a meaningful way. (10) Therefore, a more effective and safer treatment remains an unmet medical need for OCD. Given the severity and prevalence of OCD, further research into the underlying mechanisms is required to enhance treatment outcomes, facilitate early detection, and comprehend the etiology of OCD.

MOLECULAR MECHANISMS

The review highlights the role of neurotransmitter systems, such as glutamate, dopamine, and serotonin, in the development of OCD. These neurotransmitter systems are thought to be involved in the cortico-striato-thalamo-cortical (CSTC) circuits that underlie OCD. The serotonergic system, in particular, has received a lot of attention since it was discovered that OCD responds selectively to serotonin reuptake inhibitors (SRIs). There is discussion of a number of genes connected to neurotransmitter systems that are believed to play a role in the onset of OCD. These genes include DRD2-TaqIA, DRD3, and 5HT2A receptor genes. When new groups of OCD patients with tics were formed, a study discovered an increase in the frequency of homozygosity in the A2 allele of TaqIA at the DRD2 locus. There is also discussion of the DRD4 gene, which has been recognized as a possible candidate gene for OCD because of a 48-base pair (bp) polymorphism in its third exon. According to a study, there is a substantial difference in allele 2 between OCD patients and controls when it comes to DRD4 gene variations and OCD. Serotonin transporter (5-HTT) gene (SLC6A4) is also noted; this gene is being investigated to see how OCD and the serotonergic system are related.

DRD2-TaqIA, DRD3, and 5HT2A receptor genes

Nicolini et al. examined the polymorphism of the dopamine receptor D2 (DRD2-TaqIA), DRD3, and serotonin 5-hidroksitriptamin (5HT2A) receptor genes in 67 OCD patients and discovered no discernible differences in these genes. Nevertheless, they discovered a rise in the frequency of homozygosity in the A2 allele of TaqIA at the DRD2 locus when new groups were created with OCD patients who exhibited tics. This lends credence to the theory that tics and OCD are related. It also appears to explain why risperidone and atypical antipsychotic medications, which have strong affinities for the D2, D3, and D4 dopamine receptors, as well as serotonin 5HT2 and 5HT7 receptor antagonists added to the treatment, are beneficial in OCD cases with tics rather than SSRIs alone (11). In addition, the use of cocaine in OCD patients blocks presynaptic dopamine uptake and aggravates the symptoms of the disease. Again, in cases of cocaine intoxication, it causes obsessive-compulsive symptoms in those who have a family history of OCD but do not have OCD themselves. These findings support the hypothesis that the 5-HT and dopamine systems may be involved in some OCD subtypes (12)

MAO (monoamine oxidase)

Monoamine oxidase A (MAOA) is a mitochondrial enzyme involved in the catabolism of catecholamine neurotransmitters, such as dopamine, serotonin, and norepinephrine (Buckholtz and Meyer-Lindenberg, 2008). Taylor (13) carried out an extensive meta-analysis of studies on

the genetic associations with OCD. 230 polymorphisms in all were found across 113 genetic association studies. Male OCD was found to be associated with COMT and MAO-A polymorphisms in the primary meta-analysis.

Catechol-O-methyltransferase (COMT)

Catechol-O-methyltransferase (COMT) catalyses methyl conjugation and involved in the inactivation of certain catecholamines (norepinephrine, epinephrine, and dopamine). Given the relative dearth of dopamine transporters in the prefrontal cortex, the catechol-O-methyltransferase (COMT) enzyme is especially important in the regulation of prefrontal dopamine. The most extensively researched COMT polymorphism is a single-nucleotide polymorphism (SNP) that causes a valine-to-methionine substitution at codon 158 (val158met or rs4680). This polymorphism produces the met(158) and val(158) alleles, which are the low-activity thermolabile and high-activity thermostable forms of the enzyme, respectively (14). Velocardiofacial syndrome, which is brought on by a deletion in the 22q11 region, which contains the COMT region, raises the risk of numerous psychiatric conditions, including OCD (14). These disorders were included as broader phenotypes in the analyses because family studies have demonstrated familial aggregation between OCD and various psychiatric disorders (e.g., tic disorders, body dysmorphic disorder, skin picking, trichotillomania, and anxiety disorders) [17-22]. OCD patients have been the subjects of gene studies on the enzymes MAO (monoamine oxidase) and COMT (catechol-O-methyltransferase). Contradictory outcomes have been observed. In female OCD patients, Camarena et al. found high rates of low-activity allele frequency of this enzyme in the MAO-A gene (which is located on the X chromosome). (15)

This circumstance may be seen as proof that certain forms of OCD are associated with aberrant neuronal transmission and enzyme deficiencies (15). In a different study, the COMT enzyme and its low activity allele in male OCD patients were found to be positively correlated. This could be explained by the fact that OCD is associated with low MAO activity in certain gender-related subgroups. (16)

DRD4

Dopamine is a neurotransmitter that is involved in reward-motivated behavior and movement. The dopamine receptor D4 gene (DRD4) codes for a protein that is involved in the transmission of dopamine. In one study, probands' clinical evaluation and family history were gathered through the use of the Yale-Brown Obsessive-Compulsive Scale (Y-BOCS) in Spanish. All subjects had their tic presence or absence clinically assessed using the DSM-IV criteria for

chronic motor or vocal tic disorder. A standard procedure was used to extract DNA from leukocytes in peripheral blood. 61 OCD patients had their genotypes for the 48 bp repeat region of the DRD4 gene determined by means of primers and PCR amplification conditions. The clinical status was not known to the genotype analysis team. The findings demonstrated that the probands with tics had more copies of the seven-repeat allele of the DRD4 gene than the probands without tics. According to the study, the DRD4 gene's seven-repeat allele may contribute to the phenotypic variation of tics in people with OCD. Stated differently, there may be a greater frequency of the seven-repeat variant of the DRD4 gene in people with OCD who also exhibit tics. (23)

The relationship between obsessive-compulsive disorder and the dopamine receptor D4 (DRD4) gene is issued in another study. According to the study, the DRD4 gene's 2 allele or a nearby genetic variation may be able to prevent OCD symptoms. Other disorders like Tourette's syndrome, attention deficit hyperactivity disorder, pathological gambling, and substance abuse have also been linked to the DRD4 gene. offers fresh perspectives on the genetic foundation of OCD and the possible role of dopamine in the pathophysiology of this anxiety disorder. According to the study, a 48-base pair (bp) polymorphism in the dopamine receptor type 4 (DRD4) gene's third exon has been identified as a potential OCD candidate gene. Through the use of two distinct methodologies, including case-control and transmission-disequilibrium test (TDT) analyses, the study has discovered a correlation between DRD4 gene variants and OCD. Using the TDT method, the study has demonstrated that there is no transmission for allele 2 of the DRD4 48 bp repeat polymorphism in OCD trios. Additionally, it was discovered that OCD patients lacked allele 2 significantly in comparison to controls, which lends more credence to the theory that this variant may be linked to a lower risk of developing OCD. (24)

The serotonin (or 5-hydroxytryptamine) transporter (5- HTT) gene (SLC6A4)

A study is attempting to elucidate the connection between OCD and the serotonin transporter (5-HTT) gene (SLC6A4). This was a double-blind, randomized trial designed to look into the benefits of rTMS augmentation over SSRIs for treating OCD and how SLC6A4 functions in this process. In addition to receiving SSRIs, a total of 57 patients were enrolled and randomly assigned to either the active or sham rTMS group. In comparison to the sham group, the study indicated that OCD symptoms, anxiety, and depression were significantly improved by rTMS augmentation of SSRIs. Furthermore, compared to patients with the L allele, those with the S/S genotype of SLC6A4 demonstrated a higher degree of improvement in OCD symptoms with active rTMS. In summary, OCD has been linked to the serotonin transporter gene (SLC6A4).

In particular, the promoter region of the SLC6A4 gene has a long (L)/short (S) variant due to a functional polymorphism (5-HTTLPR). Reduced transcriptional activity and worse outcomes from antidepressant pharmacological and non-pharmacological treatments are linked to the S allele of this polymorphism. Although 5-HTTLPR polymorphism and OCD have been linked by meta-analyses, there hasn't been any research on the connection between 5-HTTLPR polymorphism—more especially, SLC6A4 polymorphism—and the way OCD patients react to rTMS. (25)

5-HT2A

The effects of targeting the 5-HT1A, 5-HT2A, and 5-HT2C receptors on repetitive behaviors are the subject of a recent review. It suggests that it is possible to reduce repetitive grooming behavior by using DOI to increase 5-HT2A receptor activity. (26)

5-HT2A receptors may be involved in the pathophysiology of obsessive-compulsive disorder (OCD), according to another study. In both OCD patients and animals, long-term use of selective serotonin reuptake inhibitors (SSRIs), which are frequently used to treat OCD, has been demonstrated to cause desensitization or downregulation of 5-HT2A receptors. Nevertheless, research on the function of 5-HT2A receptors in OCD has produced conflicting results, and the exact mechanism of action of SSRIs is still unknown. Strong 5-HT2A agonism in certain compounds has been proposed by some authors as a potential treatment for OCD. (27)

CONCLUSIONS

In summary, the present review of research on obsessive-compulsive disorder identifies areas that require more investigation as well as the advancements made in our understanding of this intricate condition. While genetic research has provided valuable insights into the disorder, much remains unknown about the molecular mechanisms that underlie the interaction between genetic and environmental risk factors. As such, future research should focus on developing a more comprehensive understanding of the biological basis of OCD. In addition to genetic research, it is also important to explore the role of hormones in OCD. More research is required to investigate the potential that hormonal imbalances have a role in the development of OCD. Additionally, since this will paint a fuller picture of the condition and its underlying causes, future research on OCD should consider both hereditary and environmental variables. While current treatments for OCD are often effective, they can also have significant side effects and may not be suitable for all patients. As such, it is important to develop new, more targeted

treatments for OCD that can be tailored to individual patients' needs. Emerging technologies, such as deep brain stimulation and transcranial magnetic stimulation, show promise in this regard and should be further explored. In conclusion, this review emphasizes the necessity of more OCD research as well as the significance of creating more individualized and efficient therapies for this complicated illness. We can make a positive difference in the lives of OCD sufferers by advancing our understanding of the underlying causes of the disorder and creating novel treatments that are individualized for each patient.

Özet

Çalışmanın amacı, elit seviyede boks branşı ile ilgilenen aktif sporcuların sporda mükemmel performanslarının farklı değişkenler arasındaki ilişkiyi ortaya çıkarmaktır. Çalışmaya 75' i kadın ve 169' u erkek olmak üzere toplam 244 kişi katılmıştır. Araştırmada veri toplama aracı olarak Kişisel Bilgi Formu ve Sporda Mükemmel Performans Ölçeği" kullanılmıştır. Veriler analizinde tanımlayıcı istatistik, güvenilirlik analizi, ikili değişkenler için bağımsız örneklem t testi, ikiden fazla değişkenler için Anova testi yapılmıştır. Araştırma sonucunda cinsiyet, milli sporcu olma, eğitim düzeyi, yaş, spor yaşı, kaç yıl boks branşını yapma durumuna göre ölçek ortalama puanı açısından istatistiksel olarak anlamlı bir farklılık görülmemektedir.

Anahtar Kelimeler: Boks, spor, mükemmel performans

**EXAMINATION OF ELITE BOXERS' EXCELLENT PERFORMANCE IN SPORT
IN TERMS OF DIFFERENT VARIABLES**

Abstract

The aim of the study is to reveal the relationship between different variables and excellent performance in sport of active athletes who are interested in boxing at elite level. A total of 385 people, 75 women and 169 men, participated in the study. Personal Information Form and Excellent Performance in Sport Scale" were used as data collection tools in the study. Descriptive statistics, reliability analysis, independent sample t test for binary variables and Anova test for more than two variables were used in data analysis. As a result of the research, there is no statistically significant difference in terms of scale mean score according to gender, being a national athlete, education level, age, sport age, and number of years of boxing.

Keywords: Boxing, sport, excellent performance

Giriş

Sağlıklı bir toplum olmakta, evren ile bütünleşmekte, ilerlemekte, toplumsal adaletli, aydınlık çevreli bir toplum olmakta sporun yeri ve önemi yadsınamaz (Yazıcı, 2014). İnsanların fiziksel ve ruhsal gelişimine katkı sağlayan spor sosyal açıdan ele alındığında organizasyonlar dâhilinde kültürlerin kaynaşmasına, sorumluluk alabilen, takım çalışmasına yatkın ve etik değerlere sahip sağlıklı bireylerin yetiştirilmesine katkı sağladığı da görülmektedir (Tiryaki & Yetim, 2017). Sporda rekabet ortamının olması ve kazanmanın her zaman ön planda yer alması sporcuların fiziksel ve psikolojik güçlerinin de geliştirilmesi gerekmektedir (Yazıcı vd., 2018). Spor ve fiziksel aktivite bağlamına uygulanan insan davranışı çalışması olarak spor psikolojisi, (Turkay & Demir, 2021) sporun içerisinde yer alan bireylerin psikolojik özelliklerinin değerlendirilerek gerek takım sporlarında gerekse bireysel sporlarda performanslarının en tepeye nasıl çıkarılabileceği ile ilgilenir (Azboy vd., 2012). Spor psikolojisinin yönelimlerinden biri olan bilişsel-davranışçı yaklaşımı; sporcunun bilişsel ve davranışsal yönüne vurgu yaparak bir sporcunun ne düşündüğüne; kendisini ne kadar güvende, rahat veyahut stresli hissettiğine ve bunların performansını nasıl etkilediğine odaklanır (Biddle & Mutrie, 2006).

Alan yazında performans ile ilgili birçok tanıma rastlanmaktadır (Savaş, 2005). Performansa farklı bir açıdan bakacak olursak çalışan kişi verilen vazifeyi ne oranda yaptığı ve yapılaş şekliyle hedeflere ulaşma noktasında ortaya çıkan orandır (Doğan, 2004). Bu tanımlamadan hareketle, değerlendirme için performansın bileşenlerini, belirleyen ve etkileyen tüm faktörleri göz önünde bulundurmak gereğini de beraberinde getirmektedir.

Sportif performansın karmaşık yapısının sebebi, sonucu etkileyen faktörlerin sayısının çokluğu ve çeşitliliğidir. Bu faktörler, performansı olumlu ve olumsuz etkileyebilirler ve oluşum kaynaklarına göre içsel ve dışsal faktörler olarak ikiye ayrılırlar. İçsel faktörler; genel anlamda insanda mevcut olan, kısmen kalıtsal gelen, zaman içinde küçük değişikliklerle farklılaşabilen ve dışarıdan üzerine etki imkânı çok sınırlı olan veya hiç etki yapılamayan etkenlerdir. Yaş, cinsiyet, anatomik yapı, genetik, zekâ, lokomotor sistemin durumu, psikolojik denge, otonom sinir sistemi, salgı bezlerinin fonksiyonları, metabolizma, enerji kullanım mekanizmaları, organ sistemlerinin durumu, allerji, nöromusküler ileti hızı, kardiyovasküler yapı özellikle içsel faktörlerin en başlıcalarıdır. Bu listeyi uzatmak ve detaylandırmak çok mümkündür.

İçsel faktörleri objektifleştirmek oldukça zor olduğundan performans üzerine etkilerini hesaplayabilmek ve yapılabilecek değişiklikleri tümüyle öngörebilmek neredeyse imkansızdır. Dışsal faktörler; ise adından da anlaşılacağı gibi insanın vücudundan ve yapısından kaynaklanmayan dışarıdan gelen ve bu nedenle de dolaylı yolla sportif performansı fiziksel

veya psişik bileşen üzerinden etkileyen faktörlerdir. Dışsal faktörler üzerine olan etkimiz, içsel olanlara göre çok daha fazladır. Birçoğunu uygun şartlar ve müdahaleler ile değiştirmek ve geliştirmek mümkündür (Bayraktar & Kurtoğlu, 2004).

Fiziksel aktivitenin dayanıklılığı artırma da sporcunun performansı açısından çok önemlidir. Bunun yanında zihinsel olarak da eğitilmeli ve dayanıklılık performansına katkı sağlamalıdır. Özellikle sporcular spor performanslarını fizyolojik, biyomekanik ve psikolojik verimliliği artırılması yönünde yapılacak aktivitelerin sıralanması tanımlanmış olması gerekmektedir. Optimum ve üstün bir sonuca ulaşmak için performans her ikisinin de gelişimine bağlıdır. Sporcunun psikolojik ve fizyolojik yetenekleri ve amaca göre belli bir seviyeye yükseltilmesi gerekmektedir (Konter, 2003).

Yarayan ve İlhan'a (2018) günümüz sporunda kazanmakla kaybetmek arasındaki çizgiyi inceleyerek performans yoğunluğunu artırarak sporcular üzerinde büyük bir baskı oluşturduğunu dile getirmişlerdir. Hazırlıksız yakalanan sporcu ve antrenörler ise birçok baskıya maruz kalıp bu durumla başa çıkmak için arayış içine girmişlerdir. Bu nedenle kişilerin psikolojik farkındalıkları arttıkça son yıllarda yapılan psikolojik çalışmalara verilen önemde artmıştır. Bu hem bireysel hem de takım sporları için geçerlidir. Sporcuların hazırlık süreçlerinde zihinsel eğitim kavramlarının verilmesi ve öğretilmesi, zihinsel dayanıklılığın bireylerin içsel ve dışsal, zihinsel ve fiziksel davranışlar ve deneyimler edinmektedir (Unestahl, 1982).

Bireysel dövüş sporlarından biri olan boks, yüksek düzeyde fiziksel ve zihinsel yetenek gerektiren, mevcut yapısı ve uygulaması gereği performansı, vücut temasının ve dövüşün en çok yaşandığı yer yoğun bir şekilde yapılmaktadır (Quinna, 1994). Boks sporu savunma ve hücum yapma, tempoyu artırma gibi maç sırasında temponun düşürülmesi gerekli stratejiler içermektedir. Bu nedenle zihinsel antrenman uygulamaları beden eğitiminin yanı sıra spor da yapılması gereken maçlara hazırlanmalıdırlar (Luthans, 2002).

Boks sporu bireyin kendisini savunma ve atak gibi yeteneklerini ön planda olduğu, galip gelebilmek için vurulan yumruğun alınan net puandan daha fazlası olmasını gerektiren, teknik ve taktik özelliklerin müsabaka sonucunu etkilediği olimpik bir spor branşıdır. Boks sporu karakteristik özelliklerinin yanı sıra temasa dayalı, güç, hız, çeviklik ve spora özgü becerilerin bir kombinasyonunu gerektirdiği bir spor dalı olarak görülmektedir (Ağgön vd., 2020). Her branşta olduğu gibi öncelikli olarak yapılan branşa özgü yetenek ön plana çıkmakla birlikte bu yeteneğin kuvvet, zekâ ve beceri ile bütünleştirilmesi boksta elde edilecek yüksek performansın öncelikli etkenidir. Bununla birlikte, yaratıcılık, kurallarına uygun beslenme, bilimsel çalışma,

anında karar verme, inanç, kötü alışkanlıklardan uzak durma, kurallara uyma, yenme hırsı, mücadele, dayanıklılık, kuvvette devamlılık, hızlılık, kendine güven, düzenli yaşam, ruhsal üstünlük, deneyim kazanma, esneklik, belirli bir hedefe yönelme gibi özellikler boksta başarıyı pekiştirecek önemli faktörler olarak karşımıza çıkmaktadır (Zorba vd., 1999).

Herkes için spor anlayışının temelinde de yatan spor yapan bireylerin mükemmelliğe ulaşma çabası içerisinde ulaşılabilen hedefin kendilerinin en iyi yapabildiğine ulaşmasıdır. Bu bağlamda mükemmeliyetçilik, kişinin davranışını aşırı derecede değerlendirilmesine yönelik eğilimlerinin yanı sıra kusursuz bir performans sergilemek için yüksek standartlar belirlemek ve çabalamak ile karakterize edilen kişilik özelliği olarak görülürken (Flett & Hewitt, 2002), Burns ise mükemmeliyetçiliği; kişinin kendisine koyduğu standartların ulaşılabilecek olanın ve mantığın ötesinde olması, zorla ve aralıksız olarak imkânsız hedefler için çabalaması ve kişinin kendi değerlerini belirlerken bunu yalnızca verimli ve başarılı olma üzerinden yapması olarak tanımlamaktadır (Burns, 1980). Mükemmeliyetçilik sosyal psikoloji ve klinik dallarında sıklıkla yapılan bir başlık olarak araştırmacıların 1970'den beri ilgisini çekmiştir. Mükemmeliyetçilik geleneksel olarak, normalin dışında standartlar koymak ve buna ulaşmak için aşırı derece de çaba göstermektir (Slade vd.,1998).

Sportaki mükemmeliyetçilik ise 1990 yılından beri çalışılmaya başlanılmıştır. Çoğu spor psikoloğu mükemmeliyetçiliğin büyük yarışlarda olumlu bir rol oynadığını kabul etmiştir. Hardy ve ark kendi alanlarında en iyi olan sporcuların mükemmeliyetçi olduğunu ve bu özelliklerin kendilerini geliştirme noktasında olumlu yönde olduğunu ve bu özelliklerinin performanslarını artırdığını söylemişlerdir (Hardy, 1996).

Yöntem

Bu araştırma genel tarama modeli kullanılarak tasarlanmış ve planlanmıştır. Tarama modelleri geçmişte ya da halen var olan bir durumu var olduğu şekli ile betimlemeyi amaç edinen araştırmalar için uygun bir modeldir. Betimsel tarama modelleri kendi içinde iki bölüme ayrılmaktadır. Bu bölümler; genel tarama ve örnek olay taramalarıdır. İlişkisel tarama modeli genel tarama yöntemi içine giren bir yöntemdir.

Genel tarama modelleri; çok sayıda elemandan oluşan bir evrende, evren hakkındaki genel yargıya varmak amacı ile evrenin tümü ya da ondan alınacak bir grup örnek ya da örneklem üzerinde yapılan tarama düzenlemeleridir (Karasar, 2006).

Araştırma 17.01.2022 tarihinde Ardahan Üniversitesi E-67796128-000-2200017488 sayılı, Etik Kurulu Kararında gerekli izinler alınarak yapılmıştır.

Evren/Örneklem

Araştırmanın örneklem seçiminde gelişigüzel örnekleme yöntemi kullanılmıştır. Araştırmacının saptanan örneklem büyüklüğüne göre herhangi bir şekilde evrenin bir parçasını seçmesidir. Herhangi bir okula gidip saptanacak sayıda (100 öğrenci gibi) rastlanan öğrenciyi olasılıklı olmadan örnekleme alma gelişigüzel örneklemedir (Dawson & Trapp, 2001).

Çalışmanın evrenini 2022-2023 yılında boks branşında yarışlara katılan sporcular oluşturmaktadır. Araştırmanın örnekleme ise; gelişigüzel 75 kadın, 169 erkek olmak üzere toplam 244 sporcu oluşturmaktadır. Çalışmaya gönüllü katılan her bir sporcuya demografik bilgi toplama formu verilerek, sporcular çalışma içeriği hakkında bilgilendirilmiştir.

Veri Toplama Araçları

Bu çalışmada kişisel bilgi formu ve “Sporda Mükemmel Performans Ölçeği (PPS-S)” uygulanmıştır. Araştırma kullanılan kişisel bilgi formu ve ölçeklere ilişkin bilgiler aşağıda açıklanmıştır.

Kişisel bilgi formu

Kişisel bilgi formu 6 maddeden oluşmaktadır ve katılımcıların cinsiyet, yaş, eğitim durumu, spor yaşı, milli sporcu ve kaç yıldır boks branşı ile uğraşıyorsunuz değişkenleri gibi bilgileri toplamak amacıyla hazırlanmıştır.

Sporda Mükemmel Performans Ölçeği (PPS-S)

Çalışmada Hewitt ve Flett'in (1991) mükemmeliyetçiliğin boyutları ile ilgili ortaya konulan modelden esinlenerek Hill, Appleton ve Mallinson (2016) tarafından geliştirilen bir ölçektir. Çocuk ve yetişkin sporcular için geçerlik ve güvenilirliğinin incelenmesi ise Esentaş vd., 2020 yılında yapılmıştır. Ölçek kendine yönelik performans mükemmeliyetçiliği (SOPP), sosyal olarak belirlenmiş performans mükemmeliyetçiliği (SPPP) ve diğerlerine yönelik performans mükemmeliyetçiliği (OOPP) olmak üzere 3 alt boyuttan oluşmaktadır. Ölçeğin derecelendirilmesinde (1) kesinlikle katılmıyorum (2) katılmıyorum, (3) kısmen katılmıyorum, (4) kararsızım, (5) kısmen katılıyorum, (6) katılıyorum, (7) kesinlikle katılıyorum olmak üzere 7'li Likert tipi bir derecelendirme sistemi kullanılmıştır.

Verilerin Analizi

Araştırmada elde edilen verilerin analizi SPSS 21 paket programında yapılmıştır. Veriler analiz edilirken tanımlayıcı istatistik, güvenilirlik analizi, ikili değişkenler için bağımsız örneklem t testi, ikiden fazla değişkenler için Anova testi yapılmıştır. Tüm istatistiksel işlemler için güven aralığı 0.05 kabul edilmiştir.

Bulgular

Tablo 1. Örneklem grubuna ilişkin demografik dağılımı

Değişkenler	n	min.	mak.	x	s.s.
Lise	244	1,00	4,00	2,59	,93
Yaş	244	15,00	18,00	16,47	1,02
Cinsiyet	244	1,00	2,00	1,69	,46
Spor_deneyim_süresi	244	1,00	3,00	2,12	,87
Milli_sporcu	244	1,00	2,00	1,80	,39
Kaç yıldır boks yapıyorsunuz	244	1,00	3,00	2,03	,86
Ölçek_ort	244	1,00	7,00	2,89	1,16

Tablo 1’de araştırmada katılımcı grubuna ait demografik dağılım görülmektedir.

Tablo 2. Katılımcılardan elde edilen betimsel istatistikler

Değişkenler	n	%	
Eğitim Düzeyi	Lise 1	34	13,9
	Lise 2	73	29,9
	Lise 3	94	38,5
	Lise 4	43	17,6
	Toplam	244	100,0
Yaş	15	55	22,5
	16	62	25,4
	17	84	34,4
	18	43	17,6
	Toplam	244	100,0
Cinsiyet	Kadın	75	30,7
	Erkek	169	69,3
	Toplam	244	100,0
Spor Deneyimi	1 ve 2 yıl	79	32,4
	3 ve 4 yıl	55	22,5
	5 yıl ve üstü	110	45,1
	Toplam	244	100,0
Milli Sporcu	Evet	48	19,7
	Hayır	196	80,3
	Total	244	100,0
Boks deneyimi	0-2 yıl	86	35,2
	3-4 yıl	64	26,2
	5 yıl ve üzeri	94	38,5
	Toplam	244	100,0

Tablo 2'deki veriler incelendiğinde 75 (%30,7) kadın, 169 (%69,3) erkek olmak üzere toplam 244 kişi katıldığı görülmektedir. Katılımcıların eğitim düzeyleri incelendiğinde ise 34'ünün (%13,9) lise 1. sınıf, 73'ünün (%29,9) lise 2. sınıf, 94'ünün (%38,5) lise 3.sınıf ve 43'ünün (%17,6) lise 4. sınıf düzeyinde olduğu görülmektedir. Katılımcıların yaş değişkeni incelendiğinde ise 55'inin (%22,5) 15 yaşında, 62'sinin (%25,4) 16 yaşında, 84'ünün (%34,4) 17 yaşında ve 43'ünün (%17,6) 18 yaşında olduğu tespit edilmiştir. Spor deneyimi durumuna göre incelendiğinde ise katılımcıların 79'unun (%32,4) 1-2 yıl, 55'inin (%22,5) 3- 4 yıl ve 110'unun (%45,1) 5 yıl ve üstü olduğu görülmüştür. Milli sporcu olup olmadığı durumuna bakıldığında katılımcıların 48'inin (%19,7) evet ve 196'sının (%80,3) hayır olduğu tespit edilmiştir. Katılımcıların boks deneyimi değişkeni incelendiğinde ise; 86'sının (%35,2) 0-2 yıl, 64'ünün (%26,2) 3-4 yıl ve 94'ünün (%38,5) 5 yıl ve üzeri olduğu görülmektedir.

Tablo 3. Cinsiyet Değişkenine Göre Sporda Mükemmel Performans Ölçeği Puanlarının Dağılımı

	Cinsiyet	n	x	s.s.	t	p
Ölçek_ort	Kadın	75	2,8800	1,09889	-,127	,899
	Erkek	168	2,9006	1,19903		

Tablo 3'de cinsiyet değişkeni ile ölçek ortalama puanı ($t=-127;p>0.05$), açısından anlamlı bir farklılık görülmemektedir.

Tablo 4. Milli Sporcu Olma Değişkenine Göre Sporda Mükemmel Performans Ölçeği Puanlarının Dağılımı

Sonuç ve Tartışma

Araştırmamızda elit boksörlerin sporda mükemmel performanslarının farklı değişkenler açısından incelenmesi amacıyla yapılmıştır.

Araştırmada katılımcıların sporda mükemmel performans düzeyleri ile cinsiyetleri arasındaki farklılık değerlendirildiğinde kadın ve erkek boksörler arasında istatistiksel olarak anlamlı farklılık olmadığı belirlenmiştir. Alan yazın incelendiğinde araştırmamızla aynı doğrultuda

olmayan çalışmalara rastlanılmıştır. Abdioğlu vd., (2022) ve erkek tenisçilerin performans mükemmeliyetçiliğinin, kız tenisçilerin performans mükemmeliyetçiliğinden daha yüksek olduğu belirlenmiştir. Yine Gönülateş ve İmamoğlu (2019) araştırmasında erkeklerin kadınlardan daha yüksek mükemmeliyetçilik puanlarına sahip olduğu bildirilmiştir. Bu bulgular araştırmamızla paralellik göstermemektedir. Bu durum profesyonel sporcular için genellikle kendilerini mükemmeliyetçi olarak tanımlamalarından (Hill vd., 2016) kaynaklandığı düşünülmektedir. Yine Kangotan (2020) de yapmış olduğu çalışmada sporcuların cinsiyetlerine göre spora ait mükemmeliyetçilikleri arasında istatistiksel olarak anlamlı farklılık olmadığını ortaya çıkarmıştır. Bu bulgu araştırmamız ile aynı doğrultudadır.

Araştırmada sporda mükemmel performans düzeyleri ile spor yaşı arasındaki farklılık değerlendirildiğinde ölçek ortalama puanı açısından istatistiksel olarak anlamlı farklılık olmadığı belirlenmiştir. Özen (2019) yılında yapmış olduğu araştırmada Taekwondocuların spor yaşlarına göre anlamlı fark bulmuştur. Bu çalışma araştırmamızla paralellik göstermemektedir. İlgili literatür incelendiğinde sporda mükemmel performans üzerine çalışmalar yetersiz olduğu görülmüştür. Sonuç olarak araştırmada cinsiyet, milli sporcu olma, eğitim düzeyi, yaş, spor yaşı, kaç yıl boks branşını yapma durumuna göre ölçek ortalama puanı açısından istatistiksel olarak anlamlı bir farklılık görülmemektedir.

Öneriler

1. Araştırmanın örneklem grubunu sadece Boks branşındaki elit düzeydeki sporcuların oluşturması bir sınırlılık meydana getirdiği için diğer branşlarla ilgilenen elit sporcular üzerinde de uygulanabilir.
2. Çalışma başka ölçeklerle kullanılarak genişletilebilir. (Örn. stres, kaygı düzeyi, atılganlık vb.... gibi)
3. Araştırma sonuçlarımız benzer bilimsel çalışmaların yürütülmesinde kullanılabilir.
4. Elit düzeyde sporda konusunda literatürde çok fazla araştırma bulunmamaktadır. Bu kavramın farklı değişkenlerle ilişkisi üzerine araştırmalar yapılabilir.

ABSTRACT

The study investigated constraints to Adoption of Export Standard Practices (ESP) among Coffee-based farmers in Kogi State, Nigeria. Multistage random sampling was used to select 227 coffee-based farmers. Data was collected using validated interview schedule while frequency count and percentages, weighted mean score and binary logistic regression were used for data analysis. The results reveal that mean age was 43.74 years while majority were male (84.1%), married (86.8%) with mean household size of 8.52 persons and mean farm size of 5.8ha. The highly severe constraints faced by the farmers were inadequate training on coffee processing (WA = 3.34), inadequate training on capacity building (WA =3.19), availability and acquisition of adequate land (WA = 2.92), availability of improved seeds/seedlings (WA = 2.89). The extent of adoption of ESP among the coffee-based farmers was very low (7.9%). the effect of awareness of export standard practices was (M=2.59). The binary logistic regression model was able to explain about 42.1% variation in the level of adoption of export standard practices in coffee production and processing among farmers (R = 0.421). Also the model classified correctly 69.27% cases, while the remaining 30.73% was not predicted by the model at both 0.05 and 0.01 levels of significance.

Keywords: Coffee production technology, Constraints to ESP, Coffee-based farmer, Export standard practices.

INTRODUCTION

Coffee beans are one of the most widely traded commodities in the world and thus play a vital role in the balance of trade between developed and developing countries (Adeleke, *et al.*, 2018). There are more than 100 different plant varieties of the *Coffea* genus in the world. Despite this great diversity, only two varieties *Coffea canephora* (Robusta coffee) and *Coffea Arabica* (Arabica coffee) with significant economic importance in the world coffee market are being cultivated in Nigeria (Alli, *et al.*, 2021; Akinpelu & Oluyole, 2020; Pigozzi *et al.*, 2018).

In Nigeria, Coffee growing states are Oyo, Ogun, Ondo, Ekiti, Kwara, Kogi, Edo, Delta, Abia, Cross River, Akwa Ibom, Taraba, Bauchi, and Jos (Adepoju & Obayelu, 2017). Of these states, Kogi State is known as the major producer of coffee; especially the Robusta which accounts for 90% of coffee export (Akinpelu, *et al.*, 2020; Idrisu, *et al.*, 2012). Reports indicated that coffee production quantity in Nigeria was 2040 tons in 2009 and gradually depreciated to 1829 tons in 2018 (FAOSTAT, 2019). The reduction in the international market price of coffee beans may be attributed to its decreased production (Alli, *et al.*, 2021). However, the production of coffee is profitable for a sustainable economy and serves as the major source of income for the majority of farming households in Kabba areas of Kogi State (Aderolu, *et al.*, 2014; Mohammed, *et al.*, 2013).

To improve upon the export performance and to ensure continuous growth in the major strongholds of the subsector (quality, price, and exports), the Cocoa Research Institute of Nigeria (CRIN) has recommended Export Standard Practices (ESP) in line with the International Coffee Organization (ICO, 2018), Coffee Exporter's Guide for coffee processing to meet up with international export standard practices and improve the profitability of farmers. According to the Cocoa Research Institute of Nigeria, (CRIN, 2004), the ESP of coffee production are:

Regular harvesting of ripe berries fortnightly and weekly at peak periods;

The berries are sorted out after harvesting and either of the processing technique is carried out (Dry and/or Wet processing);

Fermentation must be covered and protected from rain and/or cold;

Turning of beans once daily during fermentation;

Drying of beans on a raised slab;

The thick layer of drying beans should be between 3 to 5 cm;

Regular turning during drying;

Dried beans should be packed into clean jute bags;

The bagged beans should be stored off the ground and away from walls;

The storage house should be well ventilated; and

Store beans away from strong odours e.g. smoke

Thus, strictly adhere to these practices might improve standard of coffee production processed locally and acceptable internationally and on the long run fetch the farmer good money that may affect his livelihood positively.

However, there has been a decline in coffee production in recent years mainly due to a decline in prices, non-compliance to post-harvest processing and some constraints faced by coffee farmers in coffee production that could guarantee improved sales. Consequently, farmers are faced with poor prices, low income, low profits, and increased poverty. Idrisu, *et al.*, (2012), reported that some problems arise from several factors related to the quantity and quality of the product, these factors include poor information on appropriate husbandry practices, good agricultural/management practices, quality of the product, processing, pricing, marketing problem. Previous studies reported by (Sanusi, *et al.*, 2004) have established that low profit from coffee is a major reason for the declining participation in coffee production by farmers in Nigeria. According to Osorio, (2005), the decline in coffee prices contributes to increased poverty and makes it more difficult to reach the Millennium Development Goals. In many developing countries, including Nigeria, low pricing of coffee has led to the abandonment of coffee farming for readily marketable crops.

Due to decline and constraints faced by coffee farmers and coffee production, therefore, there is a need to investigate constraints to farmers' adoption of ESP among coffee-based farmers' and possible solution in the study area, doing this might give room for an increase in the farmers' adoption of ESP for coffee production, processing, and marketing of coffee to add value to their productivity. According to Laven & Boosma, (2012), the constraints to adoption of improved export standard practices (ESP) is a platform for the increased price of coffee, and farmers' profits, through higher yields, good quality, and internationally accepted coffee for export. According to the Nation, Iyama, (2020), various measures must be undertaken to boost coffee production. Among these, is working with coffee farmers and others in the industry to meet the country's goals through improved technologies of coffee seedlings. Abdul-karim, *et al.* (2019) reported that, it is alarming and quite incredible to see many rural youths opting out of farming in search of non-existent white-collar jobs in the cities, leading to unprecedented level of rural-urban migration. All these constraints are affecting production, processing and adoption of technologies in coffee production. However, there is need to find lasting solution

to all these constraints in order to boost coffee production, processing and adoption of its technologies. The study a constraint to adoption of export standard practices among coffee-based farmer in Kogi State was investigated among the coffee-based farmers in the study area is a step thus expedient. This study provided answered to the following research questions; what are the coffee farmers' socio-economic characteristics? What are the farmers' adoption levels of ESP? what are the constraints to adoption of ESP among the coffee farmers?

The general objective of the study is to investigate the constraints to adoption of export standard practices (ESP) among coffee-based farmers in Kogi State, Nigeria. The specific objectives were to: identify the farmers' sources of information on ESP of coffee production; determine the coffee farmers' adoption level of ESP; and Identify the constraints to farmers' adoption of ESP in the study area. the hypotheses that powered this study were: There is no significant relationship between some selected socio-economic characteristics of coffee-based farmers and the adoption of ESP, There is no significant relationship between the farmers' knowledge level of ESP and the adoption of ESP, There is no significant relationship between the farmers' adoption level of ESP and their perceived effect on productivity.

Significance of the Study

The decline in agricultural production has been attributed to some factors, one of which has been the inappropriate and ineffective dissemination of technologies (Aremu, *et al.*, 2015). However, this study, therefore, evaluated the key elements upon the constraints which make farmers not to the adopt export standard practices (ESP) to processed coffee profitably in Nigeria, to improve the quality and quantity of the product and to be an internationally accepted export product. Thus, if the solution is provided to the constraints the faced by coffee farmers and the farmers were able to strictly adhere to it, it make adoption of the export standard practices of coffee significant to producers and exporters.

Constraints to coffee production processing and adoption of agricultural technologies

According to statistics from Raw Material Research and Development Council (RMRDC), between 2010 and 2015, about an N1.5billion worth of coffee products were imported into the country. Several factors have been attributed to the country's dwindling production level, the majority of which have forced farmers to abandon coffee farms for other crops to make ends meet. According to analysts, most of the coffee plots are also old and farmers have suspended major activities on their farms. To revamp the sector, the President of the Federation of Agricultural Commodities Association of Nigeria (FACAN), Victor Iyama, urged the government to support massive coffee production and productivity improvement efforts

throughout the whole coffee growing destinations. As it has potential for coffee production, he said the nation has set a goal of increasing coffee export to support its economic development. Farm-gate prices received in most of the sub-region in the last five to ten years have mostly been below a breakeven point. The low farm-gate realizations have reduced farmers' disposable income and therefore discouraged investment in production and processing. Some of the main causal factors for low farm-gate earnings include world coffee prices, high costs of production, high deductions, diseconomies of scale either due to the disintegration of farmer organizations or sub-division of land, and high marketing costs. Taking the high cost of production as an example, it was noted that in Kenya, it is estimated that production costs increased two and a half times for the small-holder sector, while it tripled for estates between 1987/88 and 1997/98 (CRF, 1999). The respective cost of production values for 2002 was US\$ 56 – 49, for smallholders and US\$ 106 for commercial estates, per 50kg of clean coffee produced (Agro Consortium, 2002). Another example where the sub-region's performance is uncompetitive concerned statutory deduction, levies, and cost of processing where Kenya's deductions for 2001/02 were just below US\$ 0.60 per kg of clean coffee compared to other high quality, high-cost producers like Colombia, with costs estimated at US\$ 0.30 and Costa Rica at US\$ 0.39 per kg of clean coffee, local deductions and levies are exorbitant. However, the following listed are constraints to coffee production and processing;

Limited Availability of and Access to Appropriate Technology: inadequate of appropriate technologies is major impedance to the sustainable production of high-quality coffee. It reduces the system's competitiveness and is the result of lag or sluggishness in research response to current farmer's needs, inefficient extension systems, low farmer capacity to access and use improved technology, and non-innovative and non-proactive research systems. Inefficient Extension Service Ineffective and inadequate extension service in most countries of the sub-region is a major cause of declining coffee production and quality.

Low Farmer Capacity to Access and Use of Technology: Farmers in the sub-region are often beset by myriads of constraints limiting their capacity to access and use technology even if it is appropriate. These include, among others, risks and uncertainties in the coffee business, poor technology packaging which is often inappropriate and expensive, lack of affordable cost-saving and appropriate technologies inadequate financial resources given that the majority of smallholders have no access to affordable credit, poor extension and extension coverage and poor farmer perception of new technologies due to limitations related to farmer literacy, exposure traditions, attitudes, and social obligations.

Non-innovative, Non-Proactive Research Systems: Non-innovative, non-proactive research systems were identified as a cause of limited availability of and access to appropriate technology. This is often reflected in form of inadequate participation of stakeholders in research priority setting, leading to the formulation of poor research programmes hence resulting in the development of technologies that are often not well adapted to the primary concerns of the farmers.

Poor rewarding system and recognition for scientists: this is probably the single most important contributor to non-innovative and non-proactive research in the sub-region, the weak link between researchers and end users, poor strategic partnerships, inadequate and obsolete research facilities, poor access to research information, and poor strategic planning. Processing Practices The major causes of poor processing practices in the sub-region include inadequate incentives for quality coffee, poor crop husbandry, and harvesting practices, prevailing low coffee prices and unpredictable fluctuations, lack of objective grading mechanisms, inability to enforce code of good factory practices, inappropriate and dilapidated processing facilities, poor extension service, high cost of establishment and maintenance of processing facility, lack of innovative processing systems and high cost of processing.

Inadequate Price Incentives for High-Quality Coffee: This is among the most serious constraint to improved coffee processing practices among smallholders in all the countries of the sub-region. Although high-quality coffees attract premium prices, the prevailing differentials are too low to compensate for the increased associated with the production and processing of high-quality coffee. Furthermore, these differential payments are often obscured by other factors including high operating costs, deductions along the value chain, high processing costs, and lack of an objective and simple system for grading cherry at the delivery point.

Poor Coffee Harvesting Practices: Non-selective picking is a common practice on smallholder farms in D. R. Congo, Uganda, Ethiopia, and Madagascar and on some estates in Kenya, and Robusta coffee in Uganda and Madagascar. This practice is a contributor to poor-quality coffee regardless of whether it is a wet or dry process. In addition, sorting and grading coffee berries before further processing is a practice that is long forgotten among most smallholders because of low net earnings, high cost of labour, and lack of incentives for high-quality coffees.

Lack of Innovative and Dynamic Extension Approach: This is a result of low morale, poor attitudes, and aptitude of extension agents, the major causes being poor remuneration and

working conditions, lack of frequent in-service training, and poor linkage with research. Lack of logistical support is cited by most countries in the sub-region as among the major causes of ineffective extension. The lack of farmer participatory approach is another cause of non-innovative extension approaches and is a result of a lack of proper training in a participatory approach and the inadequate number of extension staff in coffee processing.

High Cost of Establishment and Maintenance of Processing Facilities: Limited use of locally available and inexpensive materials in coffee processing facilities increases the cost of establishment whereas lack of locally fabricated maintenance parts increases the cost of maintenance of processing factories.

Inefficient processing chains: Inefficient management of processing facilities is another cause of poor processing. Reasons for mismanagement along the processing chain vary from country to country and include a lack of skilled and trained manpower in coffee processing and factory management, inefficient and ineffective extension services, and limited participation by farmers in decision-making processes concerning coffee processing.

Lack of skilled and well-trained manpower: is a fairly high priority constraint in most countries of the sub-region. And is the result of inadequate training programs and training facilities, high cost of training in the few available institutions, lack of interest by the youth in factory management, poor sourcing and recruitment of coffee processing staff, and low investment in training of factory technicians.

The lack of interest by young people in coffee processing is probably due to poor remuneration and lack of social welfare incentives, drudgery associated with the working environment, and negative attitudes of youth.

Inappropriate and or Dilapidated Processing Facilities: This is a major constraint to improved coffee processing in all countries except Ethiopia and Kenya. The causes of the problem include inefficient management of processing facilities, lack of more innovative and cost-effective processing systems, lack of capital, and archaic legislation hindering private sector investment in more innovative processing systems, e.g., privately owned hand pulpers or mobile pulping units.

Lack of Codes of Good Factory Practices: This would include for example a list of precautions to be observed from picking, grading, pulping, fermenting, washing, and drying, in addition to factory maintenance and factory hygiene. The lack of such a code in many societies and farmer's organizations is a reflection of apathy among most growers given the present sorry

state of the coffee industry, i.e. low coffee prices and widespread poor husbandry practices and mismanagement and laxity within the factories.

The constraints faced by the farmers in order of severity according to Awodunmila *et al* (2020) are, Low market price for processed coffee, lack of government support in form of loans and financial assistance, inadequate processing machine, and inadequate labour were ranked order of their severity respectively. poor access to credit is a serious issue for farmers, this usually come as a result of high and stringent measures adopted in granting the loan to farmers such as high-interest rates, high collateral demand, etc. all these were the constraint considered by coffee farmers' before technology or innovation could be adopted.

Eghe *et al.*, (2008) reported that poor marketing and pricing were the highest constraints to field maintenance of coffee in Taraba State. This means farmers find it difficult to market their coffee beans. It could have serious implications on their income. This situation corroborates the finding of Sanusi *et al.*, (2004), those most coffee producers in Nigeria experience low sales and sometimes no market for their products after processing. Inadequate market information was also high, which could be an indication of poor knowledge about the information on the coffee commodity market among growers. Lack of farm inputs and high labour costs were high respectively. It means that inputs and cost of labour are among the very serious constraints of coffee production. Another variable, weak extension services was another constraint to coffee. These findings confirm that there is a gap between extension workers and coffee farmers. There is a need for information providers to always relate with coffee growers to reduce any form of problems militating against coffee production

Farmers' decisions about whether and how to adopt new technology are conditioned by the dynamic interaction between the characteristics of the technology itself and the array of conditions and circumstances. The characteristics of innovation are:

Relative advantage is the degree to which innovation is perceived as better than the idea it supersedes. The degree of relative advantage may be measured in economic terms., **Compatibility** is the degree to which an innovation is perceived as being consistent with the existing values, past experiences, and needs of potential adopters.

Observability is the degree to which the results of an innovation are visible to others. The easier it is for individuals to see the result of innovation, the more likely they are to adopt it. Such visibility stimulates peer discussion of a new idea, as friends and neighbours of an adopter ask him or her for innovation evaluation information about it.

Trial-ability or a degree to which a potential adopter can try something out on a small scale first before adopting it completely is a major determinant of technology adoption. (Singh, 2007). In studying determinants of adopting Imazapyr Resistant maize (IRM) technology in Western Kenya (Mignouna, *et al*, 2011), stated that the character of the technology plays a critical role in the adoption decision process. They argued that farmers who perceive the technology find it a positive investment. Farmers' perception of the performance of the technologies significantly influences their decision to adopt them.

Farmers with large farm sizes are likely to adopt a new technology as they can afford to devote part of their land to try new technology unlike those with less term size (Uaiene, *et al.*, 2009). In addition, lumpy technologies such as mechanized equipment or animal traction require economies of size to ensure profitability. Some studies have shown a negative influence of farm size on the adoption of new agricultural technology. Small farm size may provide an incentive to adopt a technology, especially in the case of an input-intensive innovation such as a labor-intensive or land-saving technology. Farmers with small land may adopt land-saving technologies such as greenhouse technology, Zero grazing among others as an alternative to increased agricultural production (Yaron, *et al.*, 1992; Harper, *et al.*, 1990).

CONCEPT OF COFFEE PRODUCTION AND / OR PROCESSING

According to Shahbandeh, (2021), Global coffee production reached 163.7 million 60-kilogram bags as of 2019/2020, decreasing from 172.5 million 60-kilogram bags in 2018/2019. The majority of the world's coffee is produced in South America, specifically Brazil. Also, the leading coffee producer in the world in 2018, Brazil produced 61.7 million 60-kilogram bags of coffee. Vietnam is the second leading producer of coffee, with 29.5 million 60-kilogram bags of coffee in that year. However, Vietnam exports a higher volume of coffee than Brazil, at 3.3 million 60-kilogram bags as of January 2019, Shahbandeh, (2021).

Coffee Processing

According to coffeeresearch.org, (2006), Irrespective of the harvesting method, green coffee beans and overripe coffee cherries inevitably end up mixed with the perfectly ripe cherries and must be separated during coffee processing. An overripe coffee cherry, undeveloped coffee cherries, sticks and leaves float in water.

Coffee Processing Equipment

The first stage of coffee pulping is used to remove the green coffee cherries from the ripe cherries. In the coffee pulping machinery, the internal pressure is monitored to push the coffee against a screen with holes only large enough for a coffee bean (not cherry) to pass through. Since the ripe cherries are soft, they break and the coffee seed is released through the screen.

Pulping Coffee

The green cherries are hard and cannot be pulped. Instead of passing through the screen, the green coffee beans pass to the end of the barrel system and are separated from the ripe coffee beans. The pressure inside the barrel controls how many cherries will be pulped. A very high pressure will cause all of the cherries including the green beans to be pulped. It is necessary to continuously monitor the pressure so that about 3% of ripe cherries are not pulped and are removed with the green cherries. This margin of error ensures that no green cherries are mistakenly pulped. The pulp and coffee beans are then separated by centrifugal force and a barrel screen system.

Coffee Fermentation

The coffee beans covered in the slippery mucilage can be sent to the patios to dry as pulped natural coffees or can be sent to coffee fermentation tanks. The coffee fermentation tanks are used to remove the mucilage before drying. The pulped coffee beans are put into cement tanks with water and are allowed to ferment for 16-36 hours. On the way to the fermentation tanks, another density separation can occur. The highest quality coffees are the densest and should be separated and fermented in a different tank.

The coffee fermentation time depends on a number of factors including the amount of coffee fermenting, water temperature, and humidity. The mucilage is made up of pectin materials including protopectin (33%), reducing sugars including glucose and fructose (30%), non-reducing sugars such as sucrose (20%), and cellulose and ash (17%). Protopectin is not water soluble and will hydrolyze to pectinic acid in the fermentation tanks. Hydrolysis of the protopectin and degradation of the pectin by enzymes is the process that occurs to remove the mucilage during fermentation. Currently, the best way of determining the end of coffee fermentation is to feel the coffee beans to determine if they are still encased in mucilage. If the coffee beans are fermented for 36-72 hours, stinker beans develop. Lactic, acetic, and propionic acids are produced in this process and are believed to prevent the traditional fermentation taste by inhibiting mold growth that regularly occurs during drying on a patio in humid conditions.

Coffee Drying

From the coffee fermentation tanks, the beans are moved to drying patios and dried to 11-12% moisture content. See coffee drying section for more details. A small portion of the lot is hulled and milled by a mini-huller. Three hundred grams of coffee is classified for defects (100 grams is often used), and the percentage of each screen size is determined. Then, 200-300 grams of coffee is roasted in a sample roaster and cupped to determine coffee quality. Ideally no lots will be mixed until the coffee has been classified and cupped. The coffee remains in pergamino until shipment time to help protect the flavor and aroma of the coffee.

Roger, 2003 hence developed the adopters' categories to measure the innovativeness of farmers over the average time of adoption.

Innovators: They constitute 2.5% of the social system population and are willing to take risks, have the highest social status, have financial liquidity, are social, and have the closest contact to scientific sources and interaction with other innovators. Their risk tolerance allows them to adopt technologies that may ultimately fail. Financial resources help absorb these failures.

Early adopters: 13.5% of the social system population are these individuals with the highest degree of opinion leadership among the adopter categories. Early adopters have a higher social status, financial liquidity, and advanced education and are more socially forward than late adopters. They are more discreet in adoption choices than innovators. They use the judicious choice of adoption to help them maintain a central communication position.

Early Majority: They constitute 34% of the social system population and tend to adopt an innovation after a varying degree of time that is significantly longer than the innovators and early adopters. The early Majority have above-average social status, and contact with early adopters and seldom hold positions of opinion leadership in a system.

Late Majority: They adopt an innovation after the average participant. These individuals approach an innovation with a high degree of scepticism after the majority of society has adopted the innovation. They comprise 34% who are typically sceptical about an innovation, have below-average social status, and little financial liquidity, are in contact with others in the late majority and early majority, and have little opinion leadership.

Laggards: They are the last to adopt an innovation. Unlike some of the previous categories, individuals in this category usually constitute 16% of the social system population who show little to no opinion leadership. These individuals are typically aversive in nature to extension agents. Laggards typically are the oldest among adopters who focus more on "traditions", lowest social status, lowest financial liquidity, and usually have contact with only family and close friends.

METHODOLOGY

This study was conducted in Kogi State, Nigeria. Kogi is a state in the Middle-Belt of Nigeria. The population for the study comprised 631 registered coffee-based farmers in Kogi State, Nigeria. These comprised (i.e. the addition of registered population of coffee-based farmers; 219, 165, 172, and 75 which makes up 631) registered coffee-based farmers in the study area. Multistage sampling procedure was used to select coffee-based farmers. The first stage involved a purposive selection of four Local Government Areas (4-LGAs) with the highest, medium and lower production of coffee in recent times. The primary data were collected through field surveys. Respondents were interviewed through the use of a questionnaire while a few respondents filled the well-structured questionnaire. The interview schedule with the questionnaire was designed to obtain information relevant to the objectives of the study. This study considered two paramount sets of variables which are independent and dependent. Constraints faced by the farmers in the adoption of ESP among coffee-based farmers were measured by asking the respondents to indicate the challenges they face towards the adoption of standard practices and it was ranked using a 3-point Likert-type scale such as Highly Severe constraint (HSC-3), Severe Constraint (SC-2), Not Severe constraint (NSC-1). This was added to obtain 6 and was divided by 3 to obtain the mean point of 2; any constraint below 2 points was regarded as not severe. Both descriptive and inferential statistics were used for data analysis. Descriptive statistics including the frequencies, percentages, and means were used to summarize the adoption of export standard practices (ESP). The Statistical Package for Social Science (SPSS) software was used to analyze the objectives.

RESULTS AND DISCUSSION

Table 1: Distribution of respondents by socio-economic characteristics (n=227)

Socio-economic Characteristics	Frequency	Percentage	Mean	Standard Deviation
Age (Years)				
<30	8	3.5		
30 – 49 years	97	42.7	43.74	8.61
50 – 59 years	87	38.3		
60 years and above	35	15.4		
Sex				
Male	191	84.1		
Female	36	15.9		
Marital status				
Single	17	7.5		
Married	197	86.8		
Divorced	9	4.0		
Widowed/widower	4	1.8		
Level of education				
No formal education	41	18.1		
Primary education	53	23.3		
Secondary education	104	45.8		
Tertiary education	29	12.8		
Household Size				
<5	59	26.0		
5-10	103	45.4	8.52 person	2.11
11 persons and above	65	28.6		
Experience in cultivating coffee				
<10	19	8.4		
10 – 19 years	27	11.9		
20 – 29 years	87	38.3	21.51	5.69

5 ha and Above	137	60.4		

Source: Computed from Field Survey, 2021.

Age

Results in Table 1 show that the mean age of the respondents was approximately 44 years, hence, the farmers were still in their economically productive ages and can therefore withstand the rigour associated with coffee farming. However, out of 227 respondents coffee-based farmers, 42.7% were between 30 and 39 years, 38.3% were found between 50 and 59 years, and 15.4% were 60 years and above. These findings imply that the cultivation of coffee in the study area was dominated by the youth farmers who were in their productive ages. This finding is incongruent with that of Kelemen, (2014), who opined that learning reduces with an increase in age. Thus, the adoption of farming-related practices has been documented to be influenced by age (Serebrennikov, *et al.*, 2020, Wauters & Mathijs, 2014 Liu, *et al.*, 2018). This study is also supported by Guangchen Guo, *et al.*, (2015) who concluded that young farmers appear to utilize new technologies in agricultural production more than the elderly ones, and input and experience of the older farmers do not have enough to compensate for the adverse effect of their age.

Sex

The result in Table 1 also shows that the majority (84.1%) of the respondents were male while females constituted 15.9% of the coffee farmers in the study area. The reason for this may not be far-fetched as women are less likely to allocate farmland for tree crop production in many parts of Nigeria due to cultural implications of land ownership (Chigbu, 2020). Culturally and traditionally, women's access to farmland is limited as they are not mostly allowed to access farmland for plantation farming. This is because this type of farming is assumed to be synonymous with permanent ownership of farmland. Able women should be encouraged to go into coffee production since technologies are available to reduce the drudgery in land preparation, application of input, and pest and disease control among others. Women must be seen as part of the nation's agricultural development process.

Marital Status

It was also observed from the results that the majority (86.8%) of the respondents were married while 7.5% of the respondents were single, 4.0% were divorced and 1.8% was widowed. According to Ebewore, *et al.*, (2013), marital status is a crucial factor in shaping social rural participation and acceptance. This implies that marital status is a measure of commitment as opined by Aderolu, *et al.*, (2014) and according to the same study 100% of the Coffee farmers in Kogi State were married. Similarly, Akinpelu, *et al.*, (2020) findings on the marital status of coffee farmers in Kogi State reported that over 60% of the farmers were married and marital

status was a significant variable in their involvement in coffee production. These findings, therefore, conform to the existing literature that the majority of farmers who cultivate Coffee in Kogi State are married with accessibility to family labour and commitment to the production of the crop. This would have significant contributions to the adoption of export standard practices by increasing the number of farmland available for coffee production.

Level of Education

Results in Table 1 further show that less than average (45.8%) of the respondents had secondary education, 12.8% had tertiary education, 23.3% had primary education, and 18.1% had no formal education. This means that most of the coffee farmers were educated and very few were without formal education. This implies that the level of education is adequate to promote awareness and adoption of ESP that may enhance their means of livelihood, particularly in coffee production. This is because education has been researched to be a significant determinant of the adoption of farming practices as corroborated by Akinpelu, *et al.*, (2020), Adinoyi & Atanda, (2016), and Mohammed, *et al.*, (2013) in their various studies on adoption. Thus, the farmers who completed minimum education of secondary level are most likely to adopt modern varieties and experience the yield-augmenting effects of education. This indicates that attaining a minimum threshold level of education helps farmers in ways of improving their skills and capabilities to collect and analyse information and execute that on the field. It creates a conducive environment for modern technology adoption and thereby augments productivity (Paltasingh & Goyari, 2018).

Household Size

The numbers of members of a household are those that eat from the same pot and sleep under the same roof at a particular period. In this study, it was found that on average, about 9 persons represented members of the Coffee farmers' households and about 45.4% had between 5 and 10 household members while 28.6% had between 11 persons and above as their household size. The findings show that Coffee farmers in the study area had moderately high household members and the implication of this is that they may have enough members of their family being used as family labour provided their interest in farming is aroused through better yield, the use of technology, and better profit. The finding is in line with the findings of Agwu, *et al.*, (2019), who reported that 50% of farmers in Kogi State had between 5 and 10 household size. Akinpelu, *et al.*, (2020), reported that in the same state, 52.0% and 24.0% of Coffee farmers had between 5-10 and 11 and above as members of their household, respectively.

Years of Experience in cultivating Coffee

Results in Table 1 show that 41.4% of the respondents had between 20 and 29 years of experience and 38.3 % had experience between 30 years and above in coffee production. The average years of experience of the respondents in coffee production were 21.5 years. This means that the experience of the farmers may come to play in the awareness and adoption of practices that will ensure that the crops, being export crops are internationally recognized and accepted, provided the information of the export standard practices is sought by the farmers. This study contradicts the findings of Agwu, *et al.*, (2019), who reported that in Kogi State the average farming experience recorded by Coffee farmers was 19 years, while Akinpelu, *et al.*, (2020), asserted that Coffee farmers in the State had on average, 29 years of farming experience and Mohammad, *et al.*, (2013), affirmed that about 78% of the Coffee farmers in the state had over 30 years of farming experience in coffee production. Reason been that most of the coffee-based farmers were aged farmer, they had the experience but the experience is arcade one.

Size of farmland (Hectare)

The result from the table shows that the majority (60.4%) of the respondents had 5 hectares and above, 35.7% had between 2.5 and 5 hectares while 4.0% of the farmers cultivated less than 2.5 hectares of available farmland. The average farm size cultivated by the farmers in the study area was 5.8 hectares. In Africa, due to the land tenure system, farmland ranging from 1–5 hectares is classified as small scale while between 5 hectares and above are classified as medium scale according to Lowder & Raney, (2016). This implies that most of the farmers in the study area operate medium-scale farming with an average farm size of 5.8 hectares. This finding conforms to the opinion of Akinpelu, *et al.*, (2020) whose results showed that farmers cultivated about 5 hectares of farmland for Coffee production but not support of Aderolu, *et al.*, (2014) who posited that the average farm size dedicated to Coffee production in Kogi State was approximately 6.1 hectares. Because the farmers were small-scale farmers, low income, and there is no support in terms of loan to expand the farm land.

Table 2: Distribution of respondents based on their Socioeconomic characteristics (Cont'd) (n=227)

Types of coffee cultivated

The result in Table 2 shows that the respondents (90.0%) of the Coffee farmers in Kogi State cultivated Robusta variety of the coffee crop while only 10.1% cultivated Arabica type. The findings show that the most common type of Coffee cultivated in the study area was the Robusta type. This finding is buttressed by Aderolu, *et al.*, (2014), who concluded that 100% of farmers in the Kabba Local Government Area of Kogi State cultivated Coffee Robusta; Alli, *et al.*, (2021), revealed that although two types of Coffee are cultivated in Nigeria Coffee Robusta was the commonest among cultivated variety suitable for the soil and other climatic conditions in Nigeria.

Mode of farmland Acquisition

On the mode of farmland acquisition, the result shows that most (48.0%) of the respondents acquired their farmland through inheritance, 34.8% acquired their farmland by outright purchase while 9.7% and 7.5% of the farmers respectively acquired their farmland through rent, and gift. This means that a little less than half of the respondents' utilized inherited farmland from their family members for Coffee production. Usually, the land is a critical factor in the production of economic tree crops in Nigeria due to undue pressure on land as a result of the land tenure system. Therefore, the easiest way of securing land for such permanent crops is through inheritance because land ownership is in the hands of the individual and community as an entity, hence, individuals and communities control the ownership of land. In a situation where a farmer has enough money to purchase, it is always difficult to acquire a large expanse of farmland due to the communal and family influence that usually generates a crisis for the buyers. This finding is in tandem with the studies of Aderolu, *et al.*, (2014), and Mohammed, *et al.*, (2013), who reported that 90.0% and 87.0% of the coffee farmers in Kogi State acquired their farmland by inheritance while only 10.0% and 8.0% were reported by the authors as those that purchased their farmland. This simply infers that land by inheritance is the viable mode of land acquisition for plantation farming like Coffee production.

Types of labour used

The result in Table 2 shows that most (82.2%) of the Coffee farmers used hired labour for Coffee production, 11.0% indicated the use of family labour while 38.8% of the farmers used both family and hired labour. This means that hired labour is the most common type of labour engaged in the study area. The use of family labour for farming has been affected by the rapid migration of youth out of rural areas to urban areas due to poor condition of basic amenities that

could make them stay (Ajaero & Onokala, 2013). This has been a major setback to farming in Nigeria as farming primarily takes place in rural areas due to less pressure on land for building Construction and other industrial uses (Yusuf, 2018).

Average annual income from Coffee

The results in Table 2 show that on average farmers earned ₦795, 500.14k from the sales of Coffee annually. This means that every month, a farmer earns ₦66, 291.00 as an income from the sales of Coffee. This indicates that Coffee farmers in Nigeria earn far more than the monthly minimum wage of ₦30, 000.00 per month and ₦360, 000.00 per annum stipulated by the government. This implies that Coffee production may be profitable just like every other tree crop in Nigeria. Though, the Cost of inputs and other factors of production may grossly affect the farmers' income under adequate cost and returns analysis of coffee production. Even with this, it could be observed from the above analysis that coffee farming enterprise is profitable. This conforms to the finding of Mohammad, *et al.* (2013), who stated that the profitability index of the coffee farmers was 0.29; an indication that coffee farmers earn 0.29 on every naira invested into production and this low level of profit was attributed to the high cost of labour. This is because the study submitted that the cost of labour takes about 95.16% share of the total variable cost. This may be attributed to the scarcity of family labour in rural areas where farming takes place; hence, farmers have no choice but to depend on hired labour.

Other occupation

The result of the findings shows that coffee farmers did not just depend on coffee production as the only means of livelihood but engaged in other forms of enterprises such as crop and animal rearing, artisanship, trading, and civil and public services to complement the income from coffee. Specifically, the findings show that 85.9% of the farmers engaged in the production of food crops, 29.5% engaged in artisanship, 31.3% were found to have indicated their involvement in trading and 25.6% of the farmers were public servants. The findings also revealed that Coffee farmers had a high degree of income diversification through agro-forestry. This may be of great benefit as income from agro-forestry may be useful in keeping the family going before the maturation of Coffee trees. The concept of agro-forestry is a strategy to combine food crops with cash crops in a rotational arrangement (Allen, 2001). This is based on the assertion of Feintrenie, *et al.*, (2010), on the significance of agro-forestry as a strategy to alleviate poverty. This implies that coffee production takes a longer period to attain gestation and farmers solely depend on them for survival and may suffer before this period. Also, the

establishment of coffee production requires huge investment, and getting income from other sources may be of great help in securing such an investment in coffee production.

Income from other sources

The result further shows that a reasonable amount of income was obtained by the farmers from other sources. It was revealed that on average, farmers earned ₦507, 590.44k from other sources.

This will serve as a great source of investment for the maintenance of the coffee plant which takes almost 3 – 4 years for the newly established plantation. Most (33.5%) of the farmers earned less than ₦500, 000.00 as their annual income from other sources apart from Coffee production while only 5.7% earned ₦900, 000 and above. For instance, in every other tree crop farming in Nigeria, farmers are involved in other economic enterprises that would sustain them during the growing period and off-season.

Contact an extension agent

The finding reveals that contact with extension agents was very poor as very few (26.9%) of the farmers indicated that they had contact with extension agents. This indicates that extension visit to coffee farmers in the study area was poor. The implication of this is that coffee farmers may be poorly updated concerning new technologies that are useful for optimal production including information on the ESP that may promote and encourage the production of high-quality coffee beans that would be internationally recognized and accepted by the international communities. The finding supports the study of Aderolu, *et al.* (2014), who submitted that only 15.0% of Coffee farmers received information from extension agents in Kogi State. The significance of extension contact was emphasized by the study of Ntshangase, *et al.*, (2018), where extension contacts made huge contributions to the adoption of zero tillage among farmers in Zashuke, KwaZulu-Natal Province in South Africa.

Access to credit

Access to credit is also another critical factor of production in farming. Based on the findings of this study, it was observed that less than the average (42.3%) of the farmers had access to credit in form of either loans or grants. This shows that farmers may be unable to manage large hectares of farmland if they are to depend on their finance without assistance from external sources such as the government, NGOs, and other stakeholders in agriculture. Similarly, Ntshangase, *et al.*, (2018), indicated that only about 10% of farmers in South Africa could access credit for farming while Ajah, (2017), posited that farmers in Nigeria only access credit through their self-built efforts such as cooperative society and other forms of self-help

mechanism as government pays less attention toward improving agricultural productivity in terms of credit and grants to farmers.

Awareness of Export Standard Practices (ESP) among coffee-based farmers

The results in Table 2 show that very few (5.3%) of the respondents indicated their awareness of ESP among farmers. This is an indication that awareness of ESP among Coffee farmers was low despite the introduction of these practices by CRIN to increase farmers' profitability in coffee production following the guideline of the International Coffee Organization (ICO, 2018). This finding implies that coffee farmers may still be using the old techniques for coffee production. The low awareness of the ESP among coffee-based farmers and processing may be attributed to the poor extension contact earlier recorded. This may harm the quality of Coffee beans and farmers' profit in the study area.

Table 3: Distribution of respondents according to Adoption level of Export Standard Practices (ESP) by coffee-based farmers

	NA	A	I	E	T	UR	SU

Source: Computed from Field Survey, 2021. NA= Not Aware, A= Aware, I= Interest, E= Evaluation, T= Trial, UR= Used but Rejected, SU= Still Using

Results in Table 3 show that 8.4% of the respondents adopted the use of regular harvesting of ripe berries fortnightly and weekly at peak periods while 2.64% discontinued its usage. Furthermore, 91.6% were not aware of the regular harvesting of ripe berries fortnightly and weekly at peak periods, 8.4% were at the awareness stage, 8.4% were interested in the technology while 8.4% and 8.4% of the respondents were at the evaluation and trial stages of the adoption of ESP. The implication of this finding is that majority of the respondents were not aware of this technology as a result of poor extension and other channels of communication contact in the study area. The low number that adopted must have seen the positive effect of carrying out this practice as a way of improving the quality of the product for the international market and they must have made the deliberate effort or unconsciously adopted such practice without knowing the implications on the ESP quality among Coffee-based farmers.

The result in Table 3 reveals that 7.9% of the respondents adopted the sorting out of berries after harvesting while 92.1% indicated their non-awareness of this technology as one of the practices to improve the acceptability of the product in the international market. Interestingly, each 7.9% of the respondents were aware, interested, evaluated, and tried the technology without any recorded discontinuance of the technology in the study area.

The result in Table 3 shows that the majority (100.0%) of the respondents adopted the technology of fermentation covered and protected from rain or cold. This means that the majority (100.0%) of the coffee farmers were aware, interested, evaluated, and tried the technology before totally adopted without any record of discontinuance in the study area. Because the adoption process, awareness, interest, evaluation, trial, and adoption (AIETA) were familiar to the farmers' and they were comfortable with it. This finding implies that fermentation is gaining popularity among farmers probably because they were already evaluated the practice. This agrees with the findings of Edeoghon, (2008), who stressed that farmers are usually more involved in practices that they are more familiar with than any other practices.

The result in Table 3 reveals that the majority (100.0%) of the respondents indicated their non-awareness of the turning of beans once daily during fermentation. This finding implies that the respondents failed to recognize the importance of turning the beans daily for even dryness and quality of the Coffee beans. This may be responsible for the poor quality of Coffee beans usually recorded in Nigeria by the international markets (Aderolu, *et al.*, 2014). There was no adoption at all as a result of the low knowledge they have about the significance of fermentation to the quality of agricultural produce. This is in line with the assertion of Nutley, *et al.*, (2002), who identified knowledge as the first and critical stage in the innovation decision-making process.

The result in Table 3 shows that 12.3% of the respondents adopted drying of beans on a raised slab, 87.7% were never aware of drying of beans on a raised slab but only 12.3% continued the usage of this practice. The significance of this practice may need to be re-integrated into the agricultural extension programme for better adoption as this seems to encourage fast and better drying of Coffee beans for quality assurance purposes. The poor adoption and continuous usage are an indication that respondents had poor knowledge of the importance of this practice as part of the export standard practices that could enhance the quality of Coffee beans.

The result of the findings in Table 3 shows that the majority (100.0%) of the respondents were not aware of the thickness of drying materials between 3 and 5cm and none of them was found to be using it at the time of data collection for this study. This shows that respondents never

consider this practice as a measure to improve the quality of Coffee beans. The results in Table 12 reveal that 11.5% of the respondents adopted regular turning during the drying of coffee beans while 88.5% were completely not aware of this practice in the study area. However, 11.5% of the respondents were at the stages of awareness, interest, evaluation, and trial of this technology and never discontinued the usage.

It was reported in Table 3 that only 2.2% of the respondents adopted the package of dried coffee beans into clean jute bags while 97.8% were not aware of this export standard practice in the study area. Moreover, 2.2% were at the stages of awareness, interest, evaluation, and trial of this technology. This finding implies that the respondents failed to adopt and recognize the importance of packaging dried coffee beans in clean jute bags. Doing so will improve the quality of the product and increase the market value.

The results in Table 3 indicate that very few (14.1%) of the respondents adopted the storage of bagged beans off the ground and away from walls while the majority (85.9%) of the farmers were not aware of the practice in the study area. Hence, 14.1% of the respondents were each at the stages of awareness, interest, evaluation, and trial of this technology without discontinuance. On the storage in a well-ventilated house, it shows that 100.0% of the respondents were never aware of this practice probably because of poor extension contact in the study area. This finding implies that the farmers were not even ready to continue this technology since all of them were not aware.

The result in table 3 reveals that only 6.6% of the respondents adopted the storage of beans away from strong odour in the study area while the majority (93.4%) of the farmers were not aware of this practice. This finding implies that the coffee beans being produced in the study area may be substandard and not meeting up with the quality of beans required to be sold in the international market.

Figure 1: in parentheses represented percentages.

Level of adoption

Source: Computed from Field Survey, 2021.

On the overall level of adoption, results in Figure 1 show that 65.6% of the respondents recorded a low level of adoption while 30.4% and only 4.0% had moderate and high levels of adoption. The low level of adoption of the Export Standard Practices recorded by the farmers may be attributed to their low knowledge level and high knowledge gap about the export standard practices as knowledge proxy by awareness is a first and indispensable stage in the adoption process (Nutley, *et al.*, 2002).

The low adoption level of the practices among coffee farmers might have been attributed to inadequate interactions of coffee-based farmers with the extension agents and other stakeholders in the Coffee industry and among themselves on the best way to solve their problems as extension contact was poor based on the findings of this study. Adoption would only take place with input support, information and monitoring, otherwise, the rate of rejection may be high based on the findings of Ukaejiofo, *et al.*, (2013).

Distribution of respondents according to their constraints to adoption of ESP among coffee-based farmers

Table 4: Constraints to adoption of ESP and level of severeness

Constraints	Yes	Percent	No	Percent	Not severe	sometimes severe	Severe	Highly severe	WT	WA
Availability of improved seeds/seedlings	208	91.6	19	8.4	17	78	45	87	656	2.89
Availability and acquisition of adequate land for coffee production	109	48	118	52	17	80	35	95	662	2.92
Low cost of farm input for the adoption of ESP	172	75.8	55	24.2	29	108	3	87	602	2.65
Inadequate financial support for ESP	153	67.4	74	32.6	25	80	41	81	632	2.78
The old age of coffee farm	151	66.5	76	33.5	2	121	38	66	622	2.74
Inadequate visits of extension agents or worker	206	90.7	21	9.3	4	143	59	21	551	2.43
Inadequate sensitization of farmers on coffee ESP	10	4.4	217	95.6	27	122	14	64	569	2.51
Inadequate training in coffee processing	199	87.7	28	12.3	3	51	38	135	759	3.34

Inadequate storage facilities for coffee ESP	113	49.8	114	50.2	25	69	41	92	654	2.88
Poor dissemination of current information on coffee ESP	227	100	0	0	24	78	17	108	663	2.92

Source: Field Survey, 2021 *Mean >2.5 = Highly Severe Constraints

Results in Table 4 show that inadequate training on coffee processing (WA = 3.34), inadequate training on capacity building (WA = 3.19), availability and acquisition of adequate land (WA = 2.92), availability of improved seeds/seedlings (WA = 2.89), inadequate financial supports (WA = 2.78) were the identified constraints to adoption of ESP among farmers. However, inadequate training on coffee processing (135), inadequate training and capacity building (127), poor dissemination of current information on coffee (108), availability and acquisition of adequate land (95), and inadequate storage facilities (92) were found to very serious constraints among the identified major constraints. Furthermore, the Low cost of farm input for the adoption of ESP (29), Inadequate sensitization of farmers (27), Inadequate financial support (25), Inadequate capacity building (25), and Inadequate storage facilities (25) were also found not to be serious constraints to adoption of export standard practices in the study area.

The identified constraints are very critical to the adoption of ESP as they determine the quantity and quality of the products that would be produced by the farmers. For example, the inability to access farmland will limit the expansion of farmland, and poor access to finance and

information could also hinder the scaling up of farms, thereby reducing the expected yield (Uiaene, *et al.*, 2009, Genius, *et al.*, 2010). Inadequate information may be misleading and farmers have a high tendency of misinterpreting information to suit their local practice. Similarly, Mohammed and Temu, (2008), posited that access to credit is an important stimulus to the adoption of technologies. Also, Uaiene, *et al.*, (2009), stressed the significance of farm size which could be proxy by the access to land in the adoption of technology in agriculture while studies like the ones conducted by Uematsu, *et al.*, (2010), Mishra, *et al.*, (2005); Mishra, *et al.*, (2009), Rahm & Roberts, *et al.*, (2004), confirmed the importance of current information dissemination to the adoption of technologies among farmers.

Results of Hypotheses Testing

H₀₁: There is no significant relationship between some selected socio-economic characteristics of coffee-based farmers and the adoption of ESP.

The binary logistic regression model showing the relationship between socio-economic characteristics and level of adoption

Table 5: Determinants of level of adoption of ESP

	Coeff (B)	Wald	Odd Ratio	Decision
Age (years)	0.691	0.912	1.996	NS
Sex	0.048	1.732	1.049	NS
Level of education	1.813	3.916*	6.129	S
Household Size	0.196	1.073	1.217	NS
Experience (years) in cultivating coffee	1.611	2.881*	5.008	S
Size of land (ha) for coffee production	0.519	1.534	1.680	NS
Mode of farmland acquisition	0.092	0.729	1.096	NS
Type of labour used	2.619	4.133**	13.722	S
Income (Naira) from other occupations	3.261	5.125**	26.076	S
Contact an extension agent	2.103	3.019*	5.108	S
Access to farm credit	2.172	3.162*	8.776	S
Awareness of ESP in coffee	2.719	4.129**	15.165	S
Constant	4.419	15.772**	83.013	S

Source: Field Survey, 2021 Nakerkalke R – Square = 0.421, log-likelihood = 0.8151, Overall

percentage prediction = 69.27 *Significant at 0.05, **Significant at 0.01

Results in Table 5 show that the binary logistic regression model was able to explain about 42.1% variation in the level of adoption of export standard practices in Coffee production and

processing among farmers ($R = 0.421$). Also, the model classified correctly 69.27% of cases while the remaining 30.73% were not predicted by the model. Hence, the findings revealed that level of education (Odd ratio = 6.129), experience in coffee cultivation (Odd ratio = 5.008), labour used (Odd ratio = 13.722), income from other sources (Odd ratio = 26.07), access to credit (Odd ratio = 8.77) and awareness of ESP (Odd ratio = 15.16) were the significant variables that influenced the adoption of ESP among coffee-based farmers in the study area at both 0.05 and 0.01 levels of significance. The odd ratio of 6.129 for the level of education implies that being educated increases the odd of adopting ESP by 6 times; meaning that educated farmers are more likely to adopt ESP 6 times more than non-educated farmers. This is in consonant with the studies of Mignouna, *et al.*, (2011); Lavison, (2013); Namara, *et al.*, (2003), and Okunlola, *et al.*, (2011), who opined that level of education was a positive determinant of adoption in their various findings.

Furthermore, experience in the cultivation of Coffee with an odd ratio of 5.008 is an indication that farmers with high experience have the likelihood of adopting ESP five times more than those with low experience proxy by the number of years cultivating and processing Coffee. Also, the type of labour used was significant at $P < 0.01$ while income from other sources with an odd ratio of 26.076 signifies that farmers who have other sources of income would be 26 times better in the adoption of ESP than those without other income sources while contact with extension (Odd ratio = 5.108) and access to credit (Odd ratio = 8.77), as well as awareness of ESP (Odd ratio = 15.16), imply that farmers who have contact with extension agents have the chance of adopting ESP five times faster than those without extension contact and those that had awareness of ESP would be 15 times probably adopt than those who have never heard about it. The findings conform to the studies of Akudugu, *et al.*, (2012), and Genius, *et al.*, (2010), who affirmed the significance of extension contact to the adoption of technology, and Mohammed & Temu, (2008), who submitted that access to credit a significant determinant of technology adoption among the farmers.

H₀₂: There is no significant relationship between the farmers' knowledge of ESP and the adoption of ESP among coffee-based farmers.

Linear Regression analysis showing the influence of knowledge on the adoption of ESP among Coffee-based farmers

Table 6: Influence of Knowledge on the adoption of ESP

	Co-eff	Std. Err.	T – ratio	Decision
Knowledge	1.518	0.162	9.370**	S

Source: Field Survey, 2021 R = 0.612; R – Square = 0.375**Significant at 0.01

Evidence in Table 6 shows that knowledge of export standard practices ($t = 9.370$) was positive and significantly influenced the adoption of ESP at $P < 0.01$ and the R – the square value of 0.375 implies that a unit change in knowledge would bring about 37.5% variation in the adoption of the practices by the farmers. This implies that increasing the knowledge level by one unit will increase adoption by about 37.5%. This means that knowledge is an important stage in the adoption of ESP. Therefore, for adoption to be increased, knowledge of such technology should be the entry point. This finding is in agreement with the study of Nutley, *et al.*, (2002), who stated that knowledge is an important component of adoption. It reinforces adoption and ensures that the target audience in any adoption process is well informed about the innovation characteristics such as relative advantage, compatibility, cost, trial-ability, and complexity among others.

Therefore, the study was conducted to investigate the adoption of Export Standard Practices (ESP) among coffee-based farmers in Kogi State, Nigeria where the specific objectives were to: describe the socio-economic characteristics of coffee farmers; identify the farmers’ sources of information on ESP among coffee-based farmers; determine farmers’ knowledge level of ESP among coffee-based farmers; determine adoption level of the farmers’ adoption of ESP among coffee farmers; examine the perceived effect of the adoption of ESP on farmers’ productivity and identify the constraints of farmers to the adoption of ESP among coffee-based in the study area.

A three-stage sampling procedure was used to select 16 communities in 4 Local Government Areas of the State where the concentration of coffee farmers is high. A total of 631 registered coffee farmers were found in the selected LGAs and communities. The Research Advisors Table (2006) sample size formula and Table with 95% confidence and 5.0% Margin of Error were applied to obtain the statistically represented sample size of 227 coffee farmers. Data were collected with the use of a structured questionnaire and interview schedule. However, 227 copies of the questionnaire taken to the field were adequately filled and returned for analysis. This represented a 100% response rate. Thus, 227 respondents were used for this study. Data

collected were described with descriptive statistics such as frequency, percentages, mean, weighted mean discrepancy scores, and charts while binary logistic regression and simple linear regression were used to make inferences from the findings through the stated hypotheses.

Conclusion

Based on the research findings, coffee farmers in the study area embraced and adopted the ESP to their processing of coffee though the adoption level was very low, possibly due to low awareness, low knowledge level of the ESP as established in the study.

- The findings showed that farmers who produce and process Coffee in Kogi State are still in their active age and they could still learn very fast if the opportunity is presented before them to increase productivity and ensure that Nigerian Coffee beans are among the best in the world if they follow the export standard practices in the production and processing of Coffee beans.
- Males dominated the enterprise and most of them had between primary and secondary education which could make the adoption of technologies easier.
- Robusta type of Coffee was popularly cultivated but most of the farmers operate at a medium scale level with about 5 hectares of farmland obtained mostly through inheritance because of their low income.
- Level of education, experience in coffee cultivation, labour used, income from other sources, access to credit, and awareness of ESP were the significant determinants of the adoption of ESP among coffee-based farmers in the study area.
- Even with the limited size of farmland, they make approximately ₦66, 291.00 as monthly income from Coffee production and about ₦507, 590.44 annually from other economic activities.
- Though, the major information sources are intra-personal such as fellow farmers and Coffee Farmers' Association.
- Also, information sources like the Cocoa Research Institute of Nigeria (CRIN), fellow farmers, and radio could be used to increase the adoption of ESP among Coffee farmers in the study area.
- However, very few of these farmers had high knowledge of the parameters used to determine export standard practices in Coffee production and
- The adoption of these practices was very low; hence it leads to reasons for the poor quality of Nigerian Coffee local and international markets.

- The identified constraints are very critical to the adoption of ESP as they determine the quantity and quality of the products that would be produced by the farmers.

Recommendations

Based on the findings of this study, the following recommendations were put forward:

1. There should be sensitization either on the radio, television and other means to inform the coffee farmers on ESP on coffee.
2. Educating and training of coffee farmers on ESP to boost their knowledge on post-harvest processing techniques on coffee.
3. Educate the coffee farmers on the importance and significant of adopting the ESP compared to the previous techniques on coffee processing.
4. There should be solution to major constraints faced by coffee farmers in coffee production and processing. Extension agents could arrange programmes for coffee farmers inform of training.
5. Stakeholders (such as farmers, processors, input dealers, Nigeria export promotion council (NEPC), standard organization of Nigeria (SON), extension agents, CRIN and the likes) in agriculture must work hard to ensure that the adoption of best practices especially in crops like coffee with international relevance standard is disseminated to the farmers to make Nigeria a home for producing high-quality coffee crops in the world. This will serve as a way of restoring Nigeria's glory in agriculture.
6. CRIN assisted by extension agent or researchers should do regular teaching like workshops and seminars on adoption of ESP.
7. Coffee farmers on their own should make effort to visit CRIN for information on ESP and not rely only on other farmers' information.
8. Young aged able body coffee farmers should be sensitized, motivated, encouraged, trained, and financed on ESP and good quality coffee production to sustain its production in the study areas and Nigeria as a whole by governments.
9. Women who are critical stakeholders (coffee farmers) in agriculture should be encouraged by the government and community leaders to own plantation farming as their contributions to arable crops are recognized worldwide. Able women should be encouraged to go into coffee production since technologies are available to reduce the drudgery in land preparation, application of input, and pest and disease control among others. Women must be seen as part of the nation's agricultural development process.

10. Efforts must be made by the authority of the Cocoa Research Institute of Nigeria (CRIN) to ensure that Export Standard Practices in Coffee knowledge are disseminated to the farmers to increase the adoption of the practices and ensure that farmers' economic environment is favourable in terms of income from such crops.
11. Stakeholders in the agricultural sector should take the advantage of the use of social media to contact farmers, especially Coffee farmers with relevant information that could improve the quantity and quality of agricultural products in Nigeria.
12. Awareness creation through mass media, symposiums, seminars, workshops, conferences, fliers, and pamphlets among others should be carried out to sensitize and enlighten the coffee farmers on ESP practices in post-harvest processing on coffee production.
13. Coffee farmers and any interested members of the public who had desired coffee production should be encouraged to carry out soil testing before planting on such soil and the type of coffee variety to be planted.

Contributions to the body of knowledge based on empirical findings

The study will contribute to the body of knowledge in agricultural extension and rural developments as follows:

1. The study documented that socio-economics like sex, age, marital status, level of education, household size, farm size, farmers' experience etc.in the study area.
2. The study provided quantitative data on source of information on ESP in the study area.
3. The study ascertained knowledge level of the coffee farmers on ESP in the study area.
4. The study provided quantitative data on adoption level of coffee processors in the study area.
5. The study documented the perceived effect of the adoption of ESP on farmers' productivity in the study area.

Abstract

Trends towards healthy and environmentally friendly diets have increased interest in more affordable and nutritious plant proteins as an alternative to animal protein sources. Plant protein sources such as legumes and pulses allow the manufacturing of products similar to animal proteins, thanks to their functional properties such as water and fat holding capacities, solubility, foaming capacity, stability, emulsifying, and gelling. In addition, plant proteins are sustainable, affordable, low in allergens, and high in nutrients. Legume and pulse proteins are characterized by globulins and albumin, which are soluble in salt solutions. Boiling these legumes or pulses is one of the traditional methods of food preparation. Cooking or canning of the legumes or pulses leads to the production of a solution called aquafaba. This aquafaba is obtained from the boiling water of many legumes or pulses such as beans, peas, green lentils, and chickpeas, and can be used as a plant-based rheological additive in food formulations. Aquafaba contains water (92-95%), carbohydrates, low molecular weight proteins (0.95-1.5% w/v; ≤ 24 kDa), saponins, and Maillard reaction products. Aquafaba has different functional properties such as thickening, emulsifying and foaming. The composition of Aquafaba varies depending on several factors, such as pre-soaking of the legume or pulse, legume-to-water ratio, extraction conditions (temperature, pH, time, and pressure), the type and genotype of legume or pulse, as well as the cell wall composition and the structure of legume or pulse. Due to its plant origin and versatile functionality, aquafaba can be used as an egg substitute in the food industry. This study aims to examine the methods used to obtain aquafaba, the end product characteristics, and the possibilities of its use.

Keywords: Aquafaba, food waste, functional properties, legume, pulse

Introduction

In recent years, there has been a growing interest in plant-based proteins as potential candidates to replace animal-based proteins (Sharif et al., 2017). This interest stems from a modern consumer perspective and the increasing awareness of sustainability and healthy living observed in the food industry (Sharif et al., 2017). The production of peas and legumes has increased in the last 15 years, reaching levels such as 12.7 million tons of chickpea production worldwide in 2016 (FAO, 2016). The functional properties of peas and legumes, especially when compared to proteins from animal and milk sources, have been a significant factor in their increased production (Sharif et al., 2017). Functional properties include fat binding, water holding capacity, solubility, as well as gelation, foaming, and emulsifying properties, making pea and legume proteins an alternative source in various food applications, such as salad dressings and imitation chicken nuggets (Sharima-Abdullah et al., 2018). Additionally, nutritional benefits such as low allergenicity, coupled with sustainable production, low cost, and high production volumes, support the industrial use of pea and legume proteins (Gumus, Decker, & McClements, 2017; Papalamprou, Doxastakis, & Kiosseoglou, 2010; Sánchez-Vioque et al., 1998).

Due to changing and evolving consumer needs, it has been observed that technology experts and scientists have long been working on developing plant-based egg substitutes (Mustafa and Reaney, 2020). The reasons behind the quest for egg substitutes can be listed as the increasing number of allergenic factors, the adoption of vegan and vegetarian diets, environmental sustainability, the growing interest in healthy eating, and the expectation of price reductions (Erem et al., 2021). The functional properties of wastewater from the cooking process of chickpeas were discovered a few years ago as a result of the search for a vegan egg alternative to make meringues. The wastewater was named aquafaba based on the Latin origin of water (aqua) and beans (faba), and it is defined as both the liquid from canned chickpeas and the boiling water from chickpea preparations (The Official Aquafaba Website, 2016). In addition to the discovered foaming abilities, the wastewater also exhibits emulsifying properties (The Official Aquafaba Website, 2016). Based on the foaming and emulsifying properties of this plant-based liquid, there is a growing interest in evaluating the capacity of aquafaba as an egg replacement.

Aquafaba History

The term "aquafaba" was coined by the French musician Joël Roessel and was initially used in an attempt to replace egg whites as a foaming agent in a "floating island" recipe (Révolution

végétales, 2014). Roessel mentioned that the stability of aquafaba foam was improved by adding cornstarch and guar gum. He also observed the foamability of red kidney bean and palm heart cooking water (Révolution végétales, 2014). This development has served as a guiding light for food businesses and manufacturers in creating vegan recipes.

Recorded numbers of studies related to Aquafaba by country are given in Figure 1. The countries with the highest number of publications on Aquafaba are Canada (14), Turkey (12), China (11) and South Korea (11).

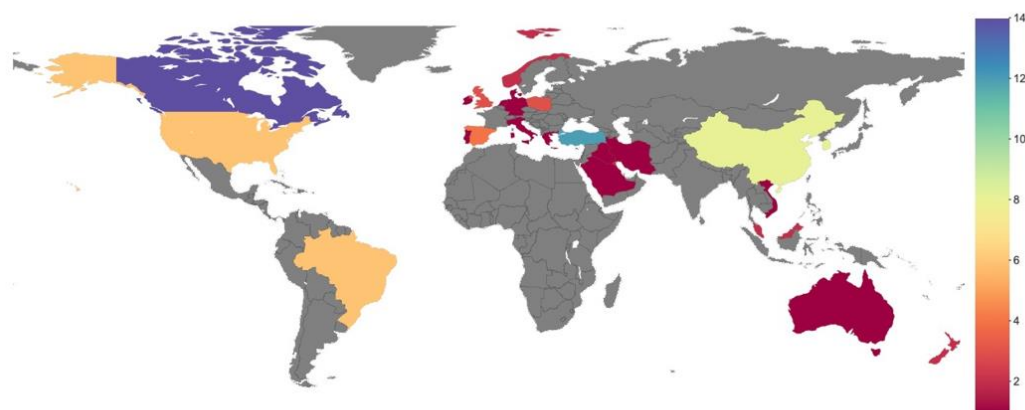

Figure 1. The recorded numbers of studies related to Aquafaba by country

Preparation of Aquafaba

The primary cooking method for legumes involves boiling them after they have been soaked in water, causing them to absorb water and increase in volume, as shown in Figure 2. Chickpeas can be cooked in water and consumed directly or packaged for sale. The water remaining after cooking is referred to as "aquafaba." Commercially produced aquafaba is obtained by drying this water under suitable processing conditions and delivered to suppliers. During the process of cooking chickpeas and preparing them for consumption, the addition of mineral salts to the soaking and/or cooking water can be applied to shorten the cooking time. When comparing the nutritional values of raw and cooked chickpeas, a decrease in the quantity of valuable nutritional compounds in cooked chickpeas has been observed (Shim et al., 2018; Xu and Chang, 2009). This is because legumes contain many water-soluble components such as proteins (albumins, etc.), carbohydrates (sugar, fiber), phenolic compounds, and saponins (Klupšaitė and Juodeikienė, 2015). These components that pass into the water make the cooking water of chickpeas valuable.

Figure 2. The preparation of the aquafaba (He et al., 2021)

The Composition and Functional Properties of Aquafaba

Aquafaba is a mixture of water, proteins, and carbohydrates that varies depending on the legume. This liquid, which is typically thrown away as food waste, contains saponins and phenolic compounds. Studies have shown that aquafaba is a useful component that can be incorporated into a variety of formulations due to its desired functional qualities such as foaming, emulsifying, and gelling (Damian et al., 2018; Shim et al., 2018; Raikos et al., 2020). The factors effecting the aquafaba composition and functional properties are given in Figure 3. Raikos et al. (2020) reported the energy ($72.00 \pm 1.00\text{kJ}/100\text{g}$), moisture ($94.97 \pm 0.03\text{g}/100\text{g}$), ash ($0.44 \pm 0.00\text{g}/100\text{g}$), protein ($1.27 \pm 0.02 \text{g}/100\text{g}$), fat ($<0.1\text{g}/100\text{g}$), available carbohydrates ($2.64 \pm 0.04\text{g}/100\text{g}$), total sugars ($0.64 \pm 0.10\text{g}/100\text{g}$), dietary fibre ($0.69 \pm 0.03\text{g}/100\text{g}$), sodium ($17.00 \pm 0.00 \text{mg}/100\text{g}$), tocopherols ($0.11 \pm 0.01 \mu\text{g}/\text{mL}$), and total phenols ($6.50 \pm 0.00 \text{mg GAE}/\text{g}$) contents of aquafaba from commercial canned chickpeas. After analyzing the aquafaba from ten commercial canned chickpea products, Shim et al. (2018) found that the protein and dry matter contents varied from 1.21 to 1.72 g/100 g and 4.9 to 6.4 g/100 g, respectively. Buhl et al. (2019) also determined the energy ($494\text{kJ}/100\text{g}$), fat ($2.2/100\text{g}$), carbohydrates ($15\text{g}/100\text{g}$), protein ($6.3\text{g}/100\text{g}$), and salt ($0.65\text{g}/100\text{g}$) contents of aquafaba from commercial canned chickpeas. Upon reviewing research on aquafaba, it becomes evident that there are studies investigating the characteristics of the aquafaba from canned chickpeas, as well as studies focused on the preparation and properties of aquafaba itself. Table 1 provides information on the composition of aquafaba and the the preparation conditions from studies specifically focused on aquafaba production . When Table 1 is analyzed, aquafaba composition is

significantly affected by pulse variety and aquafaba production conditions (such as pulse: water ratio, temperature, time, etc.).

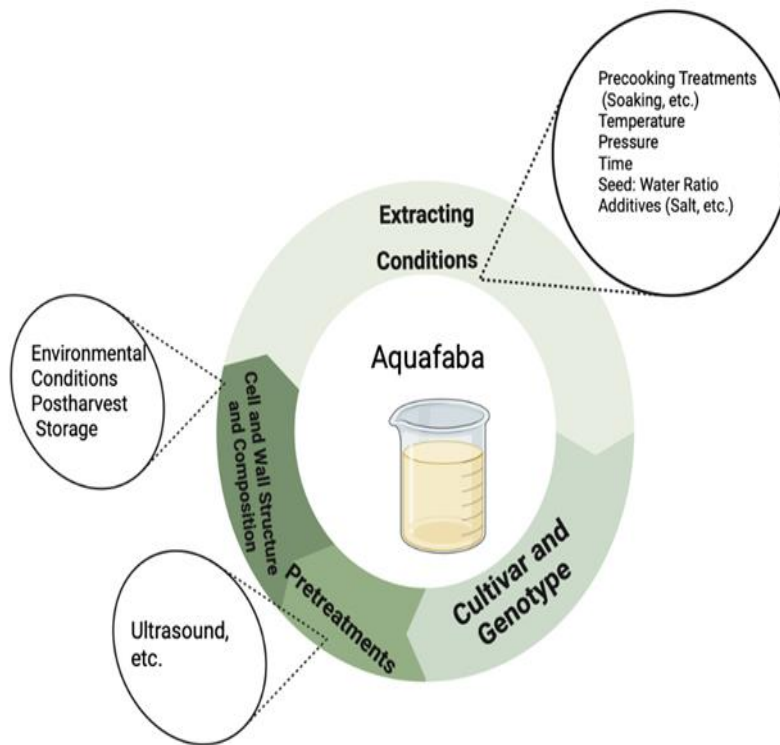

Figure 3. The factors effecting the aquafaba composition and functional properties

The functional properties (foaming, emulsification and gelling properties) of aquafaba are influenced by its physical characteristics, encompassing factors such as pH, density, viscosity, as well as water- and oil-absorption capacities (He et al., 2021). The foam capacity of aquafabas produced from yellow soybean, green lentil, split yellow pea, haricot bean, and chickpea were reported as 65% (Serventi et al., 2018), 93%, 97%, 39%, and 58% (Stantial et al., 2018; Damian et al., 2018), respectively. Emulsion stabilities of aquafaba produced from chickpea were reported as follows: 60–80% (Mustafa et al., 2018), 19–21.5 min (Buhl et al., 2019), 71.9–77.1% (He et al., 2019), and 8 mL (2:3 pulse:water, 60 min cooking, Alsalman et al., 2020). Emulsion capacity of yellow soybean, green lentil, split yellow pea, haricot bean, and chickpea were reported as 49.3% (Serventi et al., 2018), 49.0%, 52.7%, 46.3%, and 54.2% (Stantial et al., 2018; Damian et al., 2018), respectively. Mustafa et al. (2018) reported that aquafaba from chickpea generates foam that exhibits similar density (1.01 ± 0.01 g/mL), foam volume (98.00 ± 2.00 mL) and stability ($296.97 \pm 6.06\%$) when compared to both fresh egg white and commercial egg white liquid. Buhl et al. (2019) noted that the foam capacity (95–105%) of aquafaba from canned chickpea is lower than that of egg white, but its foam stability is

comparable to that of egg white. Stantial et al (2018) and Damian et al. (2018) reported that the foam capacity of aquafaba (58%) is notably lower than that of egg white.

(2018)
Whole		4.69 ±	-	0.54 ± 0.03 (low	1.51 ± 0.01	2.09 ± 0.02	0.48 ± 0.00	12 ± 1	-	-	

combining egg whites or whole eggs, sugar, and flour to create a foam form. Aquafaba has been added as a substance that replaces egg whites in this application, foaming and enhancing the texture (Mustafa et al., 2018). Additionally, in the study conducted by Mustafa et al. (2018), an aquafaba sponge cake with similar color, appearance, and texture to a sponge cake made with egg whites was obtained. However, it is observed that the cake prepared with aquafaba showed a distinct collapsed center and large spaced voids, making aquafaba sponge cakes less elastic and cohesive than egg white cakes.

In a study conducted by Raikos et al. (2020), the researchers investigated the viability of utilizing aquafaba extracted from commercially canned chickpeas as an egg substitute in the creation of a vegan mayonnaise formula. The findings indicated that aquafaba demonstrated effective emulsion-forming capabilities, maintaining stability throughout a 21-day period of cold storage.

Aslan and Ertaş (2020) found that aquafaba can be used to replace half of the egg in a cake recipe, but a cake made with 100% aquafaba exhibited high hardness values and low color, odor, and pore structure scores.

Meringue is typically made with whipped egg whites and sugar. However, aquafaba can be used as a foaming and gelling agent in meringue. Stantiall et al. (2018) demonstrated that meringues made with aquafaba and cooking water from split yellow peas have a flavor and overall quality comparable to traditional egg white meringue. While the color parameters and sensory scores of meringues made with egg whites or aquafaba are similar, aquafaba meringue exhibits lower hardness and lower consistency. The texture and color of aquafaba meringue have been improved when aquafaba is pre-processed with ultrasound (Meurer et al., 2020). However, the poor gelling ability of bean aquafaba results in a flat structure, and the cooking water of whole green lentils contains an unpleasant taste due to saponins and phenols, limiting the use of aquafaba (Stantiall et al., 2018).

Cream mousse is made by whipping egg whites, whipped cream, and sugar. Aquafaba, due to its foaming and emulsifying properties, serves the function of egg whites. Cream mousse made with chickpea aquafaba and cooking water from split yellow peas have received high scores in terms of flavor, color, and shine (Damian et al., 2018). No flaws related to aroma have been detected. However, in aquafaba cream puffs, lower perceived sweetness and smoothness have been observed, stemming from the mineral and saponin content.

Aquafaba can also be used to enhance the texture of gluten-free baked goods due to its gelatinizing properties and water-holding capacity. Serventi et al. (2018) increased water

absorption in gluten-free crackers by adding soy cooking water, resulting in a product with stronger yellow color. Soy cooking water increases the softness and moisture content of the product.

Mayonnaise is made from a mixture of edible vegetable oil, egg yolk, acetic or citric acid, spices, salt, and natural sweeteners. Aquafaba has been investigated as a substitute for egg yolk due to its stabilization and emulsification properties. Aquafaba mayonnaise has a significantly deeper appearance and higher color density compared to egg-based mayonnaise (Lafarga et al., 2019). There is no difference in taste and texture scores between mayonnaises made with aquafaba or egg, but the overall acceptance score for aquafaba mayonnaise is lower than the control group.

Aquafaba serves as an ideal alternative for egg and foaming agents for vegans and individuals with egg allergies. With these properties, it has become an indispensable component of many innovative and healthy recipes in the food industry.

Conclusion and Recommendations

The process of canning or cooking pulse/ legume in water results in a solution that, when extracted from the seeds, serves as a plant-based additive for food formulations. This solution, known as "aquafaba," has gained widespread attention as a novel clean label additive derived from pulses. Aquafaba is composed of mainly water (92–95%) and dry matter (5–8%, carbohydrates, low molecular weight proteins, saponins, etc). Its functional attributes, including foaming, emulsification, and gelling properties, are notable. These properties are contingent on various factors such as pulse genotype, composition, and processing conditions. It is notably favored by content creators who specialize in sharing vegetarian and vegan recipes. Recent studies have revealed beneficial impacts of aquafaba on the physiochemical characteristics of various food items, including confections, egg/gluten-free bakery products, and mayonnaise. A review of the literature on aquafaba indicates the need for increased research in this field. Further investigation is required to address existing gaps and gain a deeper understanding. These studies are expected to provide a significant foundation for evaluating the industrial potential of aquafaba and contributing to its more effective utilization in food production.

ÖZET

Bu çalışmanın amacı, inovasyon ile ekonomik büyüme arasındaki ilişkiyi uygulamalı olarak test etmektir. Çalışmada BRICS-T ülkeleri (Brezilya, Rusya, Hindistan, Çin, Güney Afrika ve Türkiye) için 1992-2021 dönemi verileri kullanılarak panel veri analizi gerçekleştirilmiştir. Çalışmadaki model, ölçeye göre sabit getirili modelden geliştirilen Romer (1986) modeli ele alınarak oluşturulmuştur. Bu çerçevede çalışmamızda ekonomik büyüme için kişi başına düşen gelir, inovasyon için patent sayıları, sermaye için gayri safi sabit sermaye oluşumunun GSYH içindeki payı (%), istihdam için 15 yaş üstü çalışan nüfusun toplam nüfus içindeki payı (%) verileri kullanılmıştır. Bu değişkenler arasındaki ilişkiler Dumitrescu ve Hurlin (2012) panel nedensellik analizi kullanılarak gerçekleştirilmiştir. Gerçekleştirilen analizler neticesinde hem ekonomik büyümeden inovasyon değişkenine hem de inovasyon değişkeninden ekonomik büyümeye doğru nedensellik ilişkisi tespit edilmiştir ve ekonomik büyüme ile inovasyon arasında çift yönlü nedensellik ilişkisi olduğu ifade edilmektedir. Ekonomik büyüme ile sermaye arasında ve ekonomik büyüme ile istidam arasında da çift yönlü nedensellik ilişkisi tespit edilmiştir.

AnahtarKelimeler: İnovasyon, ekonomik büyüme, patent

ABSTRACT

The aim of this study is to practically test the relationship between innovation and economic growth. In the study, panel data analysis was carried out using 1992-2021 period data for BRICS-T countries (Brazil, Russia, India, China, South Africa and Turkey). The model in the study was created by considering the Romer (1986) model, which was developed from the constant returns to scale model. In this context, in our study, per capita income data were used for economic growth, patent numbers for innovation, share of gross fixed capital formation in GDP for capital (%), and share of the working population over the age of 15 in the total population (%) for employment. The relationships between these variables were carried out using Dumitrescu and Hurlin (2012) panel causality analysis. As a result of the analyses, a causal relationship was determined both from economic growth to the innovation variable and from the innovation variable to economic growth, and it is stated that there is a bidirectional causal relationship between economic growth and innovation. A bidirectional causality relationship has been determined between economic growth and capital and between economic growth and employment.

Keywords: Innovation, economic growth, patent

Giriş

İnovasyon, işletme içi uygulamalarda, işyeri organizasyonunda ya da dış ilişkilerde yeni ya da önemli ölçüde geliştirilmiş bir ürün/hizmet ya da yeni bir süreç, yeni bir pazarlama yönteminin ya da yeni bir organizasyonel yöntemin gerçekleştirilmesidir (OECD, 2005). İnovasyon ölçütü olarak genellikle Ar-Ge ve patent verilerinin kullanıldığı görülmektedir. Bu amaçla Ar-Ge harcamaları daha spesifik şekilde Ar-Ge harcamalarının GSYİH'ye (Gayri Safi Yurtiçi Hasıla) oranı şeklinde kullanılmaktadır ve patent istatistikleri kullanılmaktadır (Wang, 2013: 1). İnovasyon neticesinde elde edilen buluşlar patent ile tescillenmekte olup, bunun da farklı alanlarda kullanılmaya başlandığını görürüz. Böylece, her bir inovasyon sonraki inovasyonun alt basamağını oluşturmaktadır. İnovasyon bu haliyle hiç durmayan ve sürekli kendini besleyen bir sistem haline dönüşmektedir (Hall, 2002: 3). Ekonomi metodolojisi bakımından inovasyon kavramı büyüme ve üretim faktörlerine odaklanmaktadır (Demir, 2009: 4). Ülkeler ekonomik büyümelerini devam ettirmek ve rekabete karşı güçlerini arttırabilmek için inovasyon geliştirmek ve inovasyonu yeni ticari başarıya dönüştürmek durumundadırlar (Tüylüoğlu ve Saraç, 2012: 40).

Bu bağlamda çalışmanın amacı inovasyon ve ekonomik büyüme arasındaki ilişkiyi BRICS-T ülkeleri için ele almaktır. Çalışmanın giriş bölümünü takiben ikinci bölümde BRICS-T ülkeleri ve ekonomik yapısı yer almaktadır. Üçüncü bölümde literatür yer alırken, dördüncü bölümde veri seti, yöntem ve bulgular sunulmuştur. Çalışmanın son kısmında ise sonuçlar bölümünde yer verilmiştir.

BRICS-T Ülkeleri ve Ekonomik Yapısı

Dünya Bankası'ndan elde edilen veriler ışığında BRICS-T ülkelerinin kişi başına düşen milli geliri (US \$) Şekil 1'de verilmiştir. Şekil 1'de görüleceği gibi, 1990-2022 döneminde Çin ekonomisinde kişi başına düşen milli gelir yıllar itibariyle giderek artmıştır.

Şekil 1. BRICS-T Ülkelerinde Kişi Başına Düşen Milli Gelir (1990-2022) (Dünya Bankası)

Çalışmada inovasyon göstergesi olarak patent sayısı ele alınmıştır. Şekil 2'de Dünya Bankasından elde edilen patent sayıları verilerine göre; 2021 yılında BRICS-T ülkeleri içerisinde en fazla patent sayısına sahip olan ülkenin Çin olduğu görülmektedir. 2021 yılında BRICS-T ülkeleri içinde Çin'i takiben en çok patent başvurusunda bulunan ülkeler sırasıyla Hindistan, Rusya, Türkiye, Brezilya ve Güney Afrika olduğu gözlemlenmiştir.

Şekil 2. BRICS-T Ülkelerinde Patent Sayıları (2021 Yılı) (Dünya Bankası)

Literatür İnovasyon ve ekonomik büyüme arasındaki ilişkiyi ortaya koyabilmek için konuya ilişkin literatürün incelenmesi oldukça önemlidir. Bu bölümde konuya ilişkin literatürden örnekler kronolojik şekilde sıralanarak Çizelge 1’de sunulmuştur.

Çizelge 1.

Çalışma	Yılı	Ülke/Ülke Grubu	Bulgular
Lichtenberg (1993)	1964-1989	74 ülke	Özel sektör tarafından yapılan Ar-Ge harcamaları ve ekonomik büyüme arasında pozitif ve anlamlı bir ilişki olduğu saptanmıştır.
Goel ve Gam (1994)	1960-1980	52 Ülke	Ar-Ge faaliyetleri ekonomik büyümeyi olumlu etkilemektedir.
Freire-Serén (1999)	1965-1990	21 OECD	Ar-Ge harcamaları ile ekonomik büyüme arasında çok güçlü bir ekonomik ilişki olduğu saptanmıştır.
Crosby (2000)	1901-1997	Avustralya	Patent başvuruları ile ekonomik büyüme arasında pozitif ilişki vardır.
Bassanini ve Scarpetta (2001)	1971-1998	21 OECD	Ar-Ge harcamalarının ekonomik büyüme üzerindeki etkisi pozitifdir. Ar-Ge harcamalarındaki %1’lik artışın ekonomik büyümeyi %0,4 oranında artırdığını tespit etmiştir.
Sylwester (2001)	1981-1996	16 OECD Ülkesi	Ar-Ge ile ekonomik büyüme arasında bir ilişki olmadığı sonucuna ulaşmıştır.
Ülkü (2004)	1981-1997	30 Ülke (20 OECD, 10 OECD Üyesi Olmayan)	Ar-Ge harcamaları ve patent sayısı ile GSYH arasında istatistiksel açıdan anlamlı pozitif ilişki olduğu sonucuna ulaşılmıştır
Yanyun ve Mingquian (2004)	1994-2003	8 Asya Ülkesi	Ar-Ge harcamalarının ekonomik büyüme üzerinde pozitif yönde etkisi olduğu sonucuna ulaşılmıştır.
Yang (2006)	1951-2001	Tayvan	Patent sayısı ile ekonomik büyüme arasında pozitif bir ilişki olduğu tespit edilmiştir.
Falk (2007)	1970-2004	15 OECD Ülkesi	AR-GE harcamaları, teknolojiye yönelik yatırımlar ve kişi başı milli gelir arasındaki ilişkiyi inceleyerek değişkenler arasında pozitif yönlü ilişki tespit etmiştir.
Sinha (2008)	1963-2005	Japonya ve Güney Kore	Japonya için reel GSYH ile patent sayısının uzun dönemde birlikte hareket ettiği tespit edilmiştir ve Granger nedensellik analizine

			göre aralarında çift yönlü nedensellik ilişkisi bulunmuştur. Ancak Güney Kore için eşbütünleşik ve nedensellik ilişkisi tespit edilememiştir.
Altın ve Kaya (2009)	1990-2005	Türkiye	Ar-Ge harcamaları uzun dönemde ekonomik büyümeyi arttırmaktadır.
Saraç (2009)	1983-2004	10 OECD ülkesi	Ar-Ge harcamalarının ekonomik büyümeyi pozitif yönde etkilediği sonucuna ulaşılmıştır.
Alene (2010)	1970-2004	52 Afrika ülkesi	Ar-Ge harcamalarının büyüme üzerinde pozitif ve anlamlı bir etkisi olduğu sonucuna ulaşılmıştır.
Genç ve Atasoy (2010)	1997-2008	34 Ülke	Ar-Ge harcamalarından ekonomik büyümeye doğru tek yönlü bir nedensellik ilişkisi tespit etmiştir.
Josheski ve Koteski (2011)	1963-1993	G7 Ülkeleri	Patent ve ekonomik büyüme arasında uzun dönemde pozitif ilişki bulunmuştur.
Güloğlu ve Tekin (2012)	1991-2007	13 OECD ülkesi	Ar-Ge harcamalarının, inovasyonun Granger nedeni olduğu sonucuna ulaşılmıştır.
Gülmez ve Yardımcıoğlu (2012)	1990-2010	21 OECD Ülkesi	Ar-Ge harcamalarındaki %1'lik bir artış ekonomik büyüme üzerinde uzun dönemde yaklaşık olarak %0,77'lik bir artış meydana getirdiği tespit edilmiştir. Ar-Ge harcamaları ile büyüme arasında uzun dönemli ve anlamlı bir ilişki tespit edilmiştir.
Galindo ve Mendez (2014)	2002-2007	13 Gelişmiş Ülke	İnovasyonun artmasının ekonomik büyümeyi teşvik edeceğini göstermektedir.
Gülmez ve Akpolat (2014)	2000-2010	Türkiye ve 15 AB ülkesi	Ar-Ge harcamaları ve patent sayılarının ekonomik büyüme üzerinde etkisi olduğu tespit edilmiştir. Ar-Ge harcamalarının etkisinin patent sayısına göre 4 kat daha fazla olduğu sonucu elde edilmiştir.
Pece vd. (2015)	2000-2013	Polonya, Çek Cumhuriyeti, Macaristan	Ekonomik büyüme ve inovasyon arasında pozitif bir ilişkinin var olduğu saptanmıştır.
Işık (2017)	1995-2015	G20 Ülkeleri	Ekonomik büyüme ile inovasyon panel verilerinin eş bütünleşik olduğu kabul edilmiştir. İnovasyon ve ekonomik büyüme

			arasında uzun dönemde pozitif ve anlamlı ilişki tespit edilmiştir.
Akar ve Ay (2018)	1990-2014	52 Ülke	İnovasyonun ekonomik büyüme üzerinde pozitif bir etkisi tespit edilmiştir.
Yıldırım ve Kantarcı (2018)	1998-2013	Gelişmekte olan ülkeler	Ar-Ge harcamalarının ekonomik büyüme üzerinde istatistiksel olarak anlamlı bir etkiye sahip olmadığı bulunmuştur.
Duman ve Aydın (2018)	1998-2015	Türkiye	Ar-Ge harcamalarındaki artış GSYH üzerinde olumlu artışlara yol açarken, azalmalar da GSYH’de azalışa sebep olduğu tespit edilmiştir. Ar-Ge harcamalarının GSYİH’nin nedeni olduğu görülmüştür.
Kethudaoğlu ve Bayraktutan (2019)	1996-2015	29 Ülke	Ar-Ge harcamaları ekonomik büyümeyi pozitif etkilemektedir.
Cütçü ve Bozan (2019)	1981-2016	G-7 Ülkeleri	İnovasyon ile ekonomik büyüme arasında uzun dönemli ilişki vardır. Ekonomik büyüme ile Ar-Ge arasında negatif yönlü ilişki tespit edilmiştir. Ekonomik büyümeden patent başvurularına doğru tek yönlü nedensellik ilişkisine ulaşılmıştır.
Dereli ve Salğar (2019)	1990-2015	Türkiye	Ar-Ge harcamaları ve büyüme arasında uzun dönemli bir ilişkinin olduğu tespit edilmiştir. Değişkenler arasında çift yönlü bir nedensellik ilişkisi bulunmuştur.
Moustapha ve Yu (2020)	2000-2016	35 OECD Ülkesi	İnovasyon ve ekonomik büyüme arasında pozitif ilişki vardır.
Wusiman ve Ndzembanteh (2020)	1988-2013	Malezya ve Türkiye	İnovasyonun ekonomik büyümeye etkisi pozitifdir. Malezya’da inovasyondan ekonomik büyümeye doğru tek yönlü nedensellik ilişkisi tespit edilmiştir.
Bakari (2021)	1990-2020	Romanya	Patentlerin ekonomik büyüme üzerinde pozitif etkisi bulunmuştur.

Veri seti, Yöntem ve Bulgular

Çalışmada 1992-2021 döneminde BRICS-T Ülkeleri (Brezilya, Rusya, Hindistan, Çin, Güney Afrika ve Türkiye) için ekonomik büyüme ile inovasyon arasındaki ilişki araştırılmıştır. Çalışmada 6 ülke (N=6) ve 30 yıl (T=30) verileri yer almaktadır. Çalışmadaki model, ölçüğe

göre sabit getirili modelden geliştirilen Romer (1986) modeli ele alınarak oluşturulmuştur. Çalışmada bağımlı değişken olarak ekonomik büyüme değişkeni kullanılmıştır. Açıklayıcı değişken olarak inovasyonu temsilen patent değişkeni kullanılmıştır ve kontrol değişkenleri ise istihdam oranı ile sermaye değişkenidir. Çizelge 2’de çalışmada yer alan değişkenlere ilişkin açıklamalar ve veri kaynağı yer almaktadır.

Çizelge 2. Değişkenler ve Veri Kaynakları

Değişkenler	Değişkenlerin açıklaması	Değişkenlerin Kısaltması	Elde Edilen Kaynak	Zaman Aralığı
Ekonomik büyüme	Kişi başına reel GSYH (constant 2015 US\$)*	GDP	Dünya Bankası	1992-2021
İnovasyon	Yurt içi yerleşikler tarafından patent sayıları*	İNO	Dünya Bankası	1992-2021
Sermaye	Gayri safi sabit sermaye oluşumunun içindeki payı (%)	CAP	Dünya Bankası	1992-2021
İstihdam	15 yaş üstü çalışan nüfusun toplam nüfus içindeki payı (%)	EMP	Dünya Bankası	1992-2021

*Doğal logaritması alınmış seriler kullanılmıştır

Çalışmada 1992-2021 döneminde BRICS-T Ülkelerinde (Brezilya, Rusya, Hindistan, Çin, Güney Afrika ve Türkiye) değişkenlere ilişkin tanımlayıcı istatistiki bilgileri içeren gözlem sayısı, ortalama, standart sapma, minimum ve maksimum değerler Çizelge 3’te sunulmuştur. Çizelge 4’te ekonomik büyüme ile inovasyon ve sermaye değişkeni arasında korelasyon katsayısı pozitif ve güçlü çıkmıştır. Ayrıca, istihdam değişkeni ile hem inovasyon hem de sermaye arasındaki korelasyon düşük çıkmıştır.

Çizelge 3. Tanımlayıcı İstatistikler

Değişken Adı	Gözlem Sayısı	Ortalama	Standart Sapma	Minimum	Maksimum
GDP	180	27.68	1.00	25.91	30.39
İNO	180	8.71	2.05	4.92	14.17
CAP	180	24.66	8.17	13.09	44.51
EMP	180	37.82	12.78	13.28	73.04

Çizelge 4. Korelasyon Testi Sonuçları

Değişkenler	GDP	İNO	CAP	EMP
GDP	1.0000			
İNO	0.8987	1.0000		
CAP	0.7455	0.6672	1.0000	
EMP	0.5073	0.3536	0.4129	1.0000

Yatay Kesit Bağımlılığı durumunda En Küçük Kareler Yöntemine (OLS, Ordinary Least Square) dayalı tahminler etkin olmamakta, tutarsız ve yanlı sonuçlar elde edilmektedir. Bu sebeple panel analizlerine başlarken birimler arasındaki bağımlılığın incelenmesi önem arz etmektedir (Tarı vd., 2019). Breusch ve Pagan LM testinde birimler arası korelasyonun olup olmadığı tespit edilebilmektedir ve her bir birim için kurulan eşbütünlüşme ya da hata düzeltme modelinin kalıntıları arasında korelasyon olup olmadığı sınanmaktadır. Breusch ve Pagan LM testinde temel hipotez ve LM test istatistikleri Denklem 2'deki gibi hesaplanmaktadır. Breusch ve Pagan LM test istatistiği $N(N-1)/2$ serbestlik derecesi ile χ^2 dağılmaktadır (Yerdelen Tatoğlu, 2020: 238).

Çizelge 5 incelendiğinde olasılık değeri kritik değer olan 0.05'ten küçük olduğu tespit edilmiştir. Bu sonuç temel hipotezin reddedildiğini göstermektedir ve birimler arasında yatay kesit bağımlılığı olduğu bulgusuna ulaşılmaktadır.

Çizelge 5. Pesaran CD Testi Sonuçları

İstatistik	Olasılık Değeri
2.321	0.0203

Çalışmada $T > N$ koşulunu barındıran ve panel veri setinin yapısına uygun olan serilerin durağanlığı ikinci nesil birim kök testlerinden olan Im-Pesaran-Shin (CIPS) ile tespit edilmiştir. Burada, temel hipotez H_0 : "Seri durağan değildir" şeklindedir. CIPS testi istatistik mutlak değeri %10, %5 ve %1 önem düzeyindeki değerlerden daha yüksek olduğunda seri durağandır, şeklinde yorumlanmaktadır. Çalışmada yer alan değişkenlerin CIPS birim kök testi sonuçlarına göre ekonomik büyüme değişkeninin düzeyde durağan $I(0)$ olduğu belirlenmiştir. İnovasyon, sermaye ve istihdam değişkenlerinin ise düzeyde durağan olmadıkları birinci farkları alındığında $I(1)$ 'de durağan hale geldikleri belirlenmiştir. (Çizelge 6)

Çizelge 6. CIPS Birim Kök Testi

Test	I(0)	I(1)
GDP	-2.637**	-3.840**
İNO	-2.329	-4.529**
CAP	-1.937	-5.072**
EMP	-1.800	-5.218**

Not: ** %5 anlamlılık düzeyini göstermektedir. %5 düzeyinde kritik değer -2.33'tür.

Eğim katsayılarının homojen ya da heterojen olduğunu tespit etmek için Pesaran ve Yamagata (2008) tarafından geliştirilen delta testi kullanılabilir. Delta test istatistiklerini şu şekilde gösterebiliriz (Pesaran ve Yamagata, 2008: 56):

$$\tilde{\Delta} = \sqrt{N} \frac{N^{-1}\tilde{S} - k}{\sqrt{2k}}$$
$$\tilde{\Delta}_{adj} = \sqrt{N} \frac{N^{-1}\tilde{S} - k}{\sqrt{Var(t, k)}}$$

Delta ve Δ_{adj} test sonuçlarına Çizelge 7’de yer almaktadır. Elde edilen bulgulara göre her iki test istatistiğinde de olasılık değeri 0.05’ten küçük olduğundan temel hipotez reddedilerek alternatif hipotezin kabulü sonucuna ulaşılmaktadır. Dolayısıyla eğim katsayılarının heterojen olduğu bulgusuna ulaşılmıştır.

Çizelge 7. Homojenlik Testi

Test istatistiği	Test İstatistiği	Olasılık Değeri
Delta_tilde	18.163	0.000
Düzeltilmiş Delta_tilde	19.897	0.000

Dumitrescu ve Hurlin (2012), Granger nedensellik testini heterojen panel için genişletmiştir. Denklem 1 de yer alan panel VAR modelinin birinci eşitliği ele alındığında, gecikme uzunluğu (k) panelin her bir birimi için aynı ve panel dengeli olduğunda, otoregresif parametre $\gamma_i^{(k)}$ ve eğimler $\beta_i^{(k)}$ birimlere göre farklılaşmaktadır. Temel hipotez “ β_i lerin tümü sıfıra eşittir şeklinde kurulmaktadır ve tüm panel için X’den Y’ye doğru nedensellik olmadığını ifade etmektedir (Yerdelen Tatoğlu, 2020: 154-155).

$$Y_{i,t} = \alpha_i + \sum_{k=1}^K \gamma_i^{(k)} Y_{i,t-k} + \sum_{k=1}^K \beta_i^{(k)} x_{i,t-k} + \varepsilon_{i,t} \quad (1)$$

Çizelge 8. Dumitrescu-Hurlin Panel Nedensellik Analizi Sonuçları

İlişkinin Yönü	W İstatistiği	Z bar İstatistiği	Olasılık Değeri
GDP → İNO	2.4403	2.4946	0.0126
İNO → GDP	18.3381	6.3308	0.0000
GDP → CAP	11.2836	2.0108	0.0443
CAP → GDP	13.5737	3.4132	0.0006
GDP → EMP	30.6079	13.8445	0.0000
EMP → GDP	7.0146	6.1416	0.0000

Not: ** %5 anlamlılık düzeyini göstermektedir.

Dumitrescu-Hurlin panel nedensellik testi sonuçlarına göre ekonomik büyüme ile inovasyon arasındaki nedensellik ilişkisi incelendiğinde; olasılık değeri 0.05'ten küçük olduğundan; H_1 hipotezi kabul edilmiştir. Dolayısıyla hem ekonomik büyümeden inovasyon değişkenine hem de inovasyon değişkeninden ekonomik büyümeye doğru nedensellik ilişkisi tespit edilmiştir. Burada ekonomik büyüme ile inovasyon arasında çift yönlü nedensellik ilişkisi bulunmaktadır. Ekonomik büyüme ile sermaye arasında ve ekonomik büyüme ile istidam arasında da çift yönlü nedensellik ilişkisi tespit edilmiştir.

Sonuç

Ekonomik büyümenin istikrarlı olması ülkeler açısından oldukça önemlidir. BRICS-T ülkelerinde inovasyon ve ekonomik büyüme ilişkisini incelediğimiz bu çalışmada nedensellik analizi kullanılmıştır. Nedensellik testi sonuçlarına göre hem ekonomik büyümeden inovasyon değişkenine hem de inovasyon değişkeninden ekonomik büyümeye doğru nedensellik ilişkisi tespit edilmiştir. Sonuçlar Sinha (2008), Dereli ve Salğar (2019) çalışmalarlarıyla benzerlik göstermektedir. Sonuç olarak ekonomik büyüme inovasyon faaliyetleri ile yakından ilişkilidir. Patentlere ayrılan harcamalar ve yatırımlar ekonomik büyümeyi teşvik edebilecektir ve ülkeler arasında rekabete karşı avantajlı konuma getirebilecektir.

REDEFINING TEACHERS' PROFESSIONAL DEVELOPMENT: HOW VIRTUAL ENVIRONMENT SHAPE MOTIVATION AND SELF-EFFICACY

Daniel ORIFAMAH

Faculty of Education, Department of physical Education, IMO State University, Owerri.

Email:danielorifamah@gmail.com

Abstract

This paper investigated the effects of 'utilizing virtual learning environments (VLEs)' on teachers' professional development (TPD). A quasi-experimental design was employed to contrast two groups of serving teachers who took part in a teachers' professional development program on the use of technology. One of the groups received the professional development program in a traditional face-to-face (F2F) arrangement, while the other group received the same program in a virtual learning environments setup. In the end, the participants who had already received a pretest of self-efficacy and motivation were given post-tests of motivation scales, using a questionnaire with a reliability of 0.79 centered on their perceptions of the professional development program. The result showed that the VLEs group had significantly higher gains in self-efficacy and motivation when compared to the face-to-face group. In addition, the VLEs group showed greater satisfaction, engagement, and learning outcomes. The findings indicated that VLEs are an effective and innovative tool for TPD. Nevertheless, F2F could equally be employed for teachers' professional development as a significant increase was equally found in its mean and standard deviation between the pretest and the post-test scores.

Keywords: virtual environments, teachers' professional development, self-efficacy, motivation, technology integration.

Introduction

Technology integration is one of the key competencies that teachers need to develop to meet the demands and expectations of 21st-century education (Huang, Backman McGuire & Moore, 2019). Technology integration refers to the effective and meaningful use of technology tools and resources to support and enhance teaching and learning (Randall, Davies, 2014). Technology integration can offer several benefits for teachers and students, such as increasing: motivation, engagement, collaboration, differentiation, feedback, and assessment. However, technology integration also poses several challenges and barriers for teachers, such as lack of access, skills, confidence, support, and time. Although, most often; traditional teachers' professional development programs fail to meet the needs and the expectations of teachers, as they are often delivered in a more or less inactive and abstract manner. Therefore, there is a need to investigate alternative and innovative ways of providing teachers' professional development that can harness the benefits of technology utilization either as self-sponsored or employer-sponsored to address the challenges and opportunities of 21st-century education and improve teacher technology integration practices. Professional development (PD) is a process of continuous lifelong learning, and improvement that aims to enhance the knowledge, skills, attitudes, and beliefs of an individual (indeed.com, 2022) in this instance- the teachers' professional development can have a positive impact on teacher quality, student achievement, and school improvement; through improved confidence, skill development, increase in job opportunities, increase in hiring potential and networking opportunities such as seminars, webinars, conferences, workshops and so on (indeed.com, 2022). Nevertheless, not all professional development programs are effective and successful in achieving the above outcomes. Research has identified several characteristics of effective professional development programs, such as being relevant, collaborative, active, reflective, sustained, and situated. Unfortunately, many traditional professional development programs do not exhibit these characteristics, as they are often delivered in a one-size-fits-all, passive, and mostly presented without proper context. Therefore, there is a need to explore alternative and innovative ways of providing professional development that can address the limitations and shortcomings of traditional professional development programs. One of the ways to achieve professional development for teachers is the use of virtual learning environments (VLEs) as a platform for professional development. Virtual learning environments are software-based environments which allow users to interrelate with both the computing environment and the work of other users. Virtual learning environments can create, run, and

manage several isolated operating systems or applications on a single physical hardware system. Virtual learning environments can also provide immersive and realistic experiences for users by simulating physical environments and objects using 3D graphics, sound, and other features that tend to unfold teaching concepts to real-life situations. Some examples of Virtual learning environments are email, chat, web-based document sharing, virtual reality, augmented reality, and 3D printing (Girvan, 2018). Virtual learning environments can potentially offer several benefits for professional development, such as increasing access, flexibility, engagement, collaboration, feedback, and reflection. Virtual learning environments can also provide teachers with opportunities to practice and apply their skills in genuine and safe scenarios that bear a resemblance to their real classrooms. However, there is limited empirical evidence on the effectiveness and impact of using Virtual learning environments for professional development especially on teachers' self-efficacy and motivation.

Self-efficacy and motivation are significant psychological factors that control teachers' behaviour, performance, and satisfaction. Self-efficacy refers to the belief in one's capability to perform a given task efficiently and effectively or attain a specific goal with the greatest self-assurance. (Bandura, 1997. In Michael & Andrew, 2009). Motivation means the longing or the curiosity to engage in a given activity or pursue a specific goal (Andrea, & Melissa, 2023). Both self-efficacy and motivation are significant psychological factors that can be affected by a variety of intervening and extraneous variables, such as feedback, goal setting, rewards, recognition, and social support.

Therefore, this study intends to examine the effects of using virtual learning environments for professional development on teacher self-efficacy and motivation, compared to a traditional face-to-face professional development program. The study also seeks to explore teacher perceptions of the virtual learning environment -based professional program in terms of satisfaction, engagement, and learning outcomes. The study used a quasi-experimental design with two groups of serving teachers who participated in a professional development program on the utilization technology into their teaching profession.

Purpose of the Study

The purpose of this study was to compare the effects of using virtual learning environments (VLEs) for professional development (PD) on teachers' self-efficacy and motivation, with a traditional face-to-face professional development program. The study was also aimed to

explore teachers' perceptions of the virtual learning environment-based professional development program in terms of satisfaction, engagement, and learning outcomes. The study is significant because it can contribute to the literature on the use of virtual learning environments for professional development, and provide insights and recommendations for teachers, educators, policymakers, and practitioners who are interested in designing and implementing effective and innovative professional development programs that can enhance teachers' quality and students' achievement.

Objective of the Study

The objective of this study was to find: the effects of using virtual learning environments (VLEs) for professional development (PD) on teachers' self-efficacy and motivation. That is to find out teachers' perceptions of virtual learning environments-based professional development programs in terms of satisfaction, engagement, and learning outcomes.

The Research Question:

1. What is the mean difference between the Pretest and Post-Test of Teachers who use face to face for professional development in terms of satisfaction, engagement, and learning outcomes?
2. What is the mean difference between the Pretest and Post-Test of Teachers who use virtual learning environments for professional develop in terms of satisfaction, engagement, and learning outcomes?

The Research Hypotheses:

H0 1: There is no significant mean difference between Pretest and Post-Test of Teachers who use face to face for professional development in terms of satisfaction, engagement, and learning outcomes.

H0 2: There is no significant mean difference between the Teachers' Pretest and Post –Test using virtual learning environments for professional development in terms of satisfaction, engagement, and learning outcomes.

Research Design and Procedures

The research design was a quasi-experimental research design consisting of a control group and a treatment group (two groups): the treatment group made use of virtual environments (VLEs) for professional development (PD) and the control group made use of traditional face-to-face (F2F) for professional development (PD). The population of the study was 59, with a sample size of 40. The sampling technique was both purposive and census. Purposive sampling was used to eliminate 16 teachers from a population of 36 teachers in one of the schools, while census was used in the second school with a population of 23 and three were reported sick. The participants were teachers from two different schools (Alaka Grammar School, Ozoro and Emo-Eni Grammar School Ellu), both schools are located in Isoko North LGA Delta State, Nigeria. The researcher approached these teachers and they volunteered to take part in the professional development program on the topic of utilization of technology in the classroom. These two schools were selected because these schools have modern computer laboratories with all it entails to make use of the computers.

The professional development program was made up of four parts, each part lasting for one hour in each school, over four days which excluded an extra one hour of pretest and post-test respectively. The period was taken to start immediately after school hours. That is, from 2.00 pm to 3.00 pm. The researcher also voluntarily provided mineral drinks; sachet water and biscuits for the participants each day in addition to standby fuel for the school generator in case of light failure.

The parts or sections briefly covered the following topics:

- 1) Introduction to the use of technology
- 2) Pedagogical models and strategies for the use of technology
- 3) Appraisal and evaluation of the use of technology, and
- 4) Reflection and feedback on the use of technology.

The treatment group took part in the professional development program through a virtual learning platform that stimulates a virtual classroom, in which they could interact with the instructor and other participants using avatars (graphical representations of persons or characters in a digital environment, such as a video game, a chat room, or a virtual world, voice chat, text chat, and gestures). The control group participated in the professional development program through a face-to-face (F2F) classroom setting, in which they could

interact with the instructor and other participants through verbal and non-verbal communication format.

Before the professional development program, both groups completed a questionnaire that measured their self-efficacy and motivation for the utilization of technology. The questionnaire was designed by the researcher based on the Teacher Self-efficacy Scale (TSES) and the Motivational Strategies for Learning Questionnaire (MSLQ). The internal consistency of the questionnaire was tested using Cronbach Alpha and was found consistent at 0.79 before it was adopted for the experiment. At the end of the professional development program, both groups again completed the same questionnaire to measure their perceptions of the professional development program in terms of satisfaction, engagement, and learning outcomes. This time the questionnaire was titled differently, and based on the Course Experience Questionnaire (CEQ) and the Instructional Materials Motivation Survey (IMMS) though with the same content,

The data collected from the questionnaires (instrument) were analyzed using descriptive statistics: and t-tests, This was to compare the mean scores of the Pretest and Post-Test of each group's variable to find out whether there was a mean difference after the treatment.

Results

RQ1: What is the mean difference between the Pretest and Post-Test of Teachers who use face to face for Teachers' Professional Development in terms of satisfaction, engagement, and learning outcomes?

H0 1: There is no significant difference between the mean of Teachers' Pretest and Post –Test using F2F for professional development in terms of satisfaction, engagement, and learning outcomes.

Table 1 shows the mean and standard deviation of pretest and post-test results of face to face

PRETEST F2F	POST-TEST F2F		Items		N	\bar{X}_1	Std 1
N	\bar{X}_2	Std 2					
Average	20	3.5	1.05	20	3.5	1.06	

N = number of teachers for the professional development program

\bar{X}_1 = Mean of pretest

\bar{X}_2 = Mean of Post-test

Std 1 = Standard deviation for pretest

Std 2 = Standard deviation for Post-test

Table 2, shows the descriptive statistics and Paired Samples t-Test result for HO 1:

n	\bar{X}	Std	95% confidence interval		df	t	Sig.
			Lower	Upper			
7	2.0	0.72	1.59	2.42	13	10.485	<0.001

- n: is the number of pairs = 7.
- \bar{X} : the mean difference between the paired samples = 2.0.
- Std: is the standard deviation of the differences = 0.72.
- Lower: is the lower bound of the 95% confidence interval for the mean difference = 1.59.
- Upper: is the upper bound of the 95% confidence interval for the mean difference = 2.42.
- df: is the degrees of freedom for the t-distribution = 13.
- t: is the calculated t-value = 10.485.
- Sig: is the p-value associated with the t-value of 10.485 which is less than 0.001, which mean, the difference between the means is statistically significant.

Note, the 95% confidence interval for both lower and upper boundaries all fall to one side (not crossing the zero [0]): 1.59 and 2.42 for the lower and upper boundary respectively.

Therefore, we reject the null hypothesis and conclude that there is a significant difference between teachers' means pretest and post-test using face to face for professional development in terms of satisfaction, engagement, and learning outcomes. That is, the mean score of teachers' Pretest in the face to face for professional development was slightly higher or lower than their post-test in the professional development program which is 3.51 and 3.50, $p < 0.001$. The difference in scores within each group was similar (Std1 = 0.52 and Std2 = 0.49), and much smaller than the difference between groups ($t = 10.485$). The null hypothesis is

therefore rejected that is: $\mu_{F2F} \text{ Pretest} \neq \mu_{F2F} \text{ Post-Test}$ (There is a significant mean difference between Pretest and Post-Test of Teachers who use face to face for professional development in terms of satisfaction, engagement, and learning outcomes. $t(13, n = 7) = 10.485, P < 0.05 = 0.001$).

RQ 2: What is the mean difference between the Pretest and Post-Test of Teachers who used Virtual Learning Environments for professional development in terms of satisfaction, engagement, and learning outcomes?

H0 2: There is no significant difference between means of Pretest and Post-Test of Teachers using Virtual Learning Environments (VLEs) for professional development.

Table 3 shows the mean and standard deviation of pretest and post-test results of VLEs

	PERTEST VLE			POST-TEST VLE		
	N	\bar{X}_1	Std1	N	\bar{X}_2	Std2
Average	20	3.9	0.80	20	4.2	0.98

Table 4, shows the descriptive statistics, and paired Samples t-test result for HO 2:

95% confidence interval							
	n	$\bar{\tilde{X}}$	Std	Lower	Upper	df	t
Sig.	7	2.5	0.58	2.18	2.85	13	16.25
							<0.001

n: is the number of pairs = 7.

- $\bar{\tilde{X}}$: is the mean difference between the paired samples = 2.5.
- Std: is the standard deviation of the differences = 0.58.
- Lower: is the lower bound of the 95% confidence interval for the mean difference = 2.18.
- Upper: is the upper bound of the 95% confidence interval for the mean difference = 2.85.
- df: is the degrees of freedom for the t-distribution = 13.
- t: is the calculated t-value = 16.25.

- Sig: is the p-value associated with the t-value of 16.25 which is less than 0.001, which mean, the difference between the means is statistically significant.

Note, the 95% confidence interval for both lower and upper boundaries all fall to one side (not crossing the zero [0]): 2.18 and 2.85 for the lower and upper boundary respectively.

Therefore, the null hypothesis is rejected and concludes that there is a significant difference between teachers' means pretest and post-test using virtual learning environments for professional in terms of motivation and self-efficacy. That is, the mean score of teachers' Pretest for the virtual learning environments in the professional development was slightly higher or lower than their post-test, (3.51 and 3.50), $p = < 0.001$. The difference in scores within each group was (Std1 = 0.80 and Std2 = 0.98), and much smaller than the difference between groups ($t = 16.25$). The null hypothesis is therefore rejected that is: $\mu\text{VLEs Pretest} \neq \mu\text{VLEs Post-Test}$ (There is a significant mean difference between Pretest and Post-Test of Teachers who use virtual learning environments for Professional Development in terms of satisfaction, engagement, and learning outcomes. $t(13, n = 7) = 16.25, P < 0.05 = 0.001$).

Conclusion:

From the results presented, both types (face to face and virtual learning environments) could be used for professional development (PD) programs depending on the time allocated, available funds, and other materials. This is because both programs (face to face and virtual learning environments) showed an increase between the pretest and the post-test in mean and standard deviation. Though in the face-to-face (F2F) program, the increase in the mean and the standard deviation is statistically significant, $t(13, n = 7) = 10.485, P < 0.05 = 0.001$, which is an improvement of 10.5 per 1000, there could be improvement with an increase or reduction of other intervening variables. But, comparatively, based on these results, the virtual learning environments professional development program was more effective in enhancing teachers' knowledge of teaching and learning, as there was a significant greater increase in their mean score and standard deviation from the pretest to the post-test. At a p-value of 0.001 the virtual learning environments recorded an increase of 16.25 ($t[13, n = 7] = 16.25, P < 0.05 = 0.001$) as against 10.5 increase in the face to face ($t[13, n = 7] = 10.485, P < 0.05 = 0.001$). the proportionate ratio of face to face to virtual ;learning environments professional development programme is 5:8

Recommendation:

Based on the conclusion, the paper recommends that virtual learning environments should be optimized for teachers' professional development programs to provide teachers with opportunities to learn new ways of using technology in teaching and learning. However, the choice of the mode of delivery should depend on various factors such as availability, accessibility, cost, time, preference, and learning style of the teachers.

The paper also suggests that future research should explore other aspects of teachers' professional development such as attitudes, beliefs, knowledge, skills, and practices related to the utilization of technology in teaching and learning. Additionally, future research should use a larger sample size, a longer duration of intervention, and a more rigorous experimental design to increase the validity and reliability of the findings.

Abstract

A collection of copper(II) azo complexes with the formula $[CuL^{1-4}(nH_2O)] OAc \cdot xH_2O$ have been created utilizing azo dyes that contain the thiadiazole and triazole moieties. Thermal analyses molar conductance magnetic moment measurements, Elements, electronic mass, IR, and ESR spectra were used to describe azodyes and their metal complexes. IR spectra revealed tridentately organized ligands with a triazole moiety with copper(II) ion, naphthyl OH donor sites, azo group N-atoms, triazole moiety. Comparatively, azodyes with thiadiazole moiety had ON donor positions of the azo moiety's N-atom and the naphthyl OH. The TG curves were used to determine the thermodynamic activation constants ΔE^* , ΔH^* , ΔS^* , and ΔG^* . Electronic spectroscopy and transition electron microscopy included as analyze the produced spherical copper nanoparticles (TEM). The spectrum data revealed that the (OH) attaching group formed a surface complex between azodye ligands and colloidal copper nanoparticles. Resulting in greater surface area of the produced copper nanoparticle complexes, their stability constant of the produced copper nanoparticles complexes is higher than the equivalent bulk ones.

Keywords: Formulation ; spectroscopy ; Cu(II) nano complexes ; monobasic

Introduction

Metal complexes of heterocyclic azo compounds are widely used in various practical uses, including technology to operate, nonlinear optical components, and storage devices for molecular memory. Additionally, It's possible that heterocyclic azo dyes and their metal complexes are important. Because of their bioactivity and analytical uses. Nowadays, much emphasis has been placed on and 1,3,4-thiadiazole ,1,2,4-triazole derivatives are a significant family of N-including aromatics. The heterocycles have piqued the interest of researchers as a result of their bioactive components like antitumor,antimycotic,anti-inflammatory, antibacterial, antimicrobial, and powerful agents of antifungal. These derivatives, on either side, are a significant characteristic of heterocyclics that exhibit a wide range of biocidal actions, presumably attributed to the combination of the toxophoric ANACAS group. Metal complexes of these derivatives are now of attention, owing to their importance in metal connections with biomolecules. Nanoparticle coordination chemistry is a relatively young area of modern chemistry. Nanoparticles are massive pseudomolecules with a complicated internal structure; they consist mainly of a core and a shell. They often contain active surface centers. Cu(II) nanoparticles are attractive because of their low cost (compared to Ag and Au), catalytic, optical, mechanical, magnetic, and electrical properties. The thermal conductivity properties differ from those of solid metals. We have successfully synthesized and reported Cu(II) complexes with four azo dyes ranging from 1-methyl-1H-1,2,4-triazole-3-amine, 5-phenyl-1H-1,2,4-triazole- 3 -amine, 5-methyl-1,3,4-thiadiazole-2-thiol or 2-amino-5-(ethylthio)-1,3,4-thiadiazole with β -naphthalene. Favorable conditions also for the complex structure, complexation and spectroscopic measurement of Cu(II) ions in ongoing work on heteroazo dyes and their complexes with metals. It is also important to examine the financial institutions of the tested azo dyes based on elemental analysis, magnetic moments, spectral techniques (UV-Vis, ESR and IR), conductivity and thermal properties. Having aroused our interest in the interaction between metal nanoparticles and organic ligands, we investigated the interaction between the investigated azo ligand and the colloidal solution of copper nanoparticles.

2.Experimental

2.1. Materials and analyses The solvents and reagents were of sample solution purity and employed just as specified. Sigma–Aldrich provided starting material. The onductivity studies for the synthesized solid Cu(II) azo complexes were taken using a Hana model 1331 conductometer. In this study, Hg[Co(SCN)₄] was used as a calibrant for the Sherwood

Scientific Magnetic Susceptibility Balance. Shimadzu Qp-2010 plus mass spectra were recorded. Perkin–Elmer model 2400 automated analyzer was used for (C, H, and N) analysis. We used Shimadzu TG-50 thermal analyzer to record both TG and DTG curves. A spectrophotometer of Shimadzu UV-visible acquired UV-Vis absorption spectra. The observations were made in a nitrogen environment with a heating rate of $10^{\circ}\text{C min}^{-1}$ using platinum crucibles. The morphology of the copper nanoparticles was studied using a JEOL-JEM-100SX transmission electron microscope. Image analysis provided the particle size and size distribution. Also, the spectrophotometer of IR- generated as a KBr disk. The Cu ion content was calculated using an atomic absorption spectrophotometer.

Preparation of the ligands

1-Methyl-1H-1,2,4-triazole-3-amine (0.134g, 1mmol), 5-Phenyl-1H-1,2,4-triazole-3-amine (0.133g, 1mmol), 2-Amino-5-methyl-1,3,4-thiadiazole (0.115g, 1mmol) or 2-amino-5-(methylthio)-1,3,4-thiadiazole (0.147g, 1mmol) a was dissolved dissolved in 3 ml (1 M) HCl solution and slowly dissolved until diazotization (0.069 g, 1 mmol) NaNO_2 in a mixture of ice and water (6 mL). The resulting diazonium salt solution was mixed with β -naphthalene (0.144 g, 1 mmol), diluted in 30 mL of sodium hydroxide solution (30%) and cooled to $5-0^{\circ}\text{C}$ in an ice bath. The colored solids were sucked off and rinsed with bidistilled water, refined by recrystallization, finally the cleaned binders were dried in a desiccator over anhydrous CaCl_2 . The purity of azo dyes was originally determined by m.the constancy p, then the elementary search and finally the differential equations (diagram 1).

Fig.1. Structure of azo-dye ligands (HL₁₋₄).

2.4. Synthesis of solid complexes

The formed colored solids were suction purified and rinsed with bidistilled water many times, refined by recrystallization, and finally, the purified ligands were dried in a desiccator over anhydrous CaCl_2 . Thus, the dyes' purity (azo dyes) (Scheme 2) was determined using the m.p constancy, followed by means of elemental analysis, and then lastly differential equations. Next, to defining the end of the response, the reaction mixture was stirred over many hours utilizing TLC plates. Finally, to extract Cu(II) complexes, the precipitated particles were recovered by filtering, over anhydrous CaCl_2 and rinsed with twice distilled water in a dried desiccator.

Table 1 provides detailed information about every complex.

Scheme 2. Structure of complexes (A1–A4).

2.5. Synthesis of copper nanoparticles

The reaction was performed in an open 125 ml flask. Dropwise adding of a 10ml amount of 0.003 M $\text{Cu}(\text{NO}_3)_2$ generated in solution of IPA (approximately 1 drop/s) to 0.090 M of CTAB/IPA solution in a typical reaction. Specifically, a dropwise (1 drop/s) addition of (0.003 M) $\text{Cu}(\text{NO}_3)_2$ generated in solution of IPA (10ml) to (0.090 M) of solution CTAB/IPA. Then, use a board of magnetic stir, the reaction mixture was vigorously swirled. After adding 2 ml $\text{Cu}(\text{NO}_3)_2$, the changed colour after adding 5 ml copper nitrate, and dark violet after adding the entire volume of $\text{Cu}(\text{NO}_3)_2$. The emergence of colour revealed the existence of Cu nanoparticles. A spectrum measured minutes after the colour appeared revealed the plasmon absorption at 560 nm. The product remained stable for a week when sealed in a vial. After one week, however, the violet colour and plasmon band began to fade.

3. Results and discussion

3.1. UV.-vis. Spectra of ligands and their complexes Figure 2 displays the UV.-vis. spectra of compounds in methanol. The absorption spectra readings were calculated by subtracting the

absorption maxima of the azo-copper complexes from the ligand. UV.-vis. spectra of azo bonds, using electronic spectroscopy, except for HL₂, showed just two bands. The frequency range 210-800 nm revealed three major absorption bands. The 1st peak observed in the reign (220–280)nm is attributed to a moderate energy $\pi-\pi^*$ transformation within the moiety of phenyl representing the (¹La→¹A) state. The 2nd peak detected in the 285–345nm reign is due to decreased energy $\pi-\pi^*$ electronic transition of the phenyl ring and heterocyclic structure. Both solvent and substituent kind utilized have little effect on these two bands. The 3rd peak in the reign 460–550 nm represents the n- π^* electronic transition in which the electron system is involved and charge transfer. Cu(II) complexes spectra showed that the significant ligand-associated band had moved to higher-frequency wavelengths. The peaks at 540, 570, 580, and 600 nm differed by a bathochromic change of LMCT. The resulting finding supports modern molecular orbital theory by suggesting that the Cu(II) central ion influences the complexes bands according to this hypothesis. Any factor affecting the electronic density of a conjugated system, electron negativity, for instance. the radius, or the metal(II) ion's electrical configuration, must result in a band variation.

3.2. Mass spectroscopy

The spectrum of mass for HL¹ revealed a molecular ion peak [M]⁺ at m/z = (253,76%) corresponding to its molecular mass of C₁₃H₁₁N₅O. Fragments of the molecular ion [M]⁺ occur at various sites. However, the base peak was observed at m/z = (130, 100%), indicating the chemical formula C₉H₆O. The peaks represented the other fragmentation at m/z = 114, 83, and 69. Peak [M]⁺ at m/z=(316, 64 %) indicated that HL² had a molecular mass of C₁₈H₁₃N₅O, which provided a starting peak at m/z=(298,100%) because of OH-radical loss followed by H-radical loss, respectively. The peak fragments lose C₁₀H₆ to generate a peak at m/z= (172, 42 %), which then loses N₂ and C₆H₅ H-radical is then made to increase a 2nd peak at m/z = (68, 48%), which corresponds to C₂H₂N₃. This molecular mass was represented by HL³ with the empirical formula C₁₃H₁₀N₄OS at m/z = (270). This peak was also the starting peak, with 100% abundance of relative. A peak confirmed a fragmentation ion at m/z =145 (32%) corresponding to the formula of C₁₀H₇O. N₂ gas may leak from the fragment ion with m/z =100(56%), due to the C₂N₂S formulas, the CH₃ group produces a fragment ion at m/z =84(40 %). Finally, the peak of molecular ion [M]⁺ at m/z = (302,48 %) for HL⁴ is related to the formula C₁₃H₁₀N₄OS₂. This ligand is more plentiful than the previous ones. A large, great peak at m/z = (159, 100%) announced the break of connection between the azo group and the ring of naphthalene.

3.3. The production of Cu(II) complexes in solution

"The continuous variation method" CVM, "mole-ratio method" (MRM) was used to determine the structure of the complexes in solution. According to the findings, Cu (II) complexes developed in solution at a molar ratio of 1:1 (M/L). Harvey and Manning's Equation was used to derive the conditional formation constants stated in Table 2. The (DG) of Cu(II) complexes production was also computed. Conductometric titrations revealed a 1:1 (M/L) Cu(II) complex stoichiometry. The rise in conductance has demonstrated a covalent association to the O-atom of the OH moiety, which is the reaction between azo dyes and Cu(II) ion. In addition, specific absorptivity, Beer's law's validity limits, molar extinction coefficient, correlation coefficient, and standard deviation were determined. Cu(II) ion-dependent EDTA ligand measurement revealed that possible Cu(II) titration indicators are ligands for this ion-dependent titration. Table 2 demonstrated that the existing spectrophotometric approach could determine the Cu(II) ion. The obedience to Beer's law and Ringbom plot is shown in Fig 3. The absorption of long-wavelength absorption peaks produces Cu (II) complexes. For cells with a 1 cm optical path length, the equation of Benassi–Hildebrand (B–H) was used to calculate the formation constant of azo-complexes with a 1:1 stoichiometry (acceptor-donor):

$$\frac{[L_0]}{A - A_0} = \frac{1}{\epsilon_{ML} - \epsilon_L} + \frac{1}{(\epsilon_{ML} - \epsilon_L)K[M_0]}$$

ϵ_L and ϵ_{ML} , respectively, are the coefficients for the molar extinction and Cu complexes. A_0 and A are free ligand absorbents and Cu complexes at the ligand and Cu complexes' given wavelength. Also, $[M_0]$ is the Cu ion concentration, $[L_0]$ is the initial ligand concentration and the final coefficients.

Table 1: Spectrophotometric data (ϵ , a), For Cu(II) with HL1–4, the Sandell sensitivity (S), standard deviation (SD), correlation coefficient (CC), and Beer's law range are all positive

ΔG^* , Gibbs free energy; X represents the concentration of the prepared sample (mol L^{-1}); β_n , complex stability constant; “EDTA-titration” denotes the presence of EDTA in the sample. Y represents the concentration of the sample. (mol L^{-1}) was calculated through practical means. “EDTA-titration”.

Under 1:1 donor-acceptor complexes, Equation (1) is valid. A straight line is obtained when only a 1:1 complex is generated; a curve is obtained when a system contains a mixture of 1:1 and 1:2 complexes. Then, To obtain a linear plot, we must employ another equation. The data of the formation constant (K) for Cu(II) complexes are determined using plots of $[L_0]/(A A_0)$ vs. $1/[M_0]$. Figure 4 Table 2 displays the results. The findings showed that copper (II) complexes with ligands are more stable than copper(II) complexes with ligands., led to the expansion of two rings that provide more stability than one ring, providing adequate proof to the proposed structure of the produced complexes

3.4. Solid copper complexes are being studied for their properties

The proposed formulae $[CuL^{1-4}(nH_2O)]AcO \cdot xH_2O$ were confirmed by the elemental analyses shown in Table 1, where $n = 1$ for A1, A2; $n = 2$ for A3, A4, and $x = 1$ for A1, A3; $x = 2$ for A2, A4 Table 1. The majority of organic solvents are insoluble in Cu complexes, except for DMF and DMSO. Table 2 shows molar conductivity data that are in the electrolyte region (1:1).

IR spectra

The IR spectra of compounds were compared., evidence for complex formation was established. Table 3 shows the most distinctive bands and their assignments. For example, the bands in the range 1460-1500 cm^{-1} associated with ν (N=N) stretching were displaced to a smaller number of different frequency bands 1443-1464 cm^{-1} indicating N=N as evidenced by the formation of new bands the ν (Cu-N) bond in the region 426-464 cm^{-1} . Because of ν (C=N) of triazole nitrogen, the IR spectrums of HL₁ and HL₂, respectively, showed a frequency of 1655 and 1670 cm^{-1} . This band was reduced to a lower frequency in the complexes, demonstrating the engagement of N-azomethine in the chelation of the Cu(II) ion. The vibrational mode of ν (O-H) was observed at 3456-3480 cm^{-1} , caused by the presence of lattice water in complexes A1–A4. The appearance of bands in the spectra of all complexes at 3323–3311, 1709–1686, 845–819, and 624–582 cm^{-1} were due to the pooled water's ν (O-H), δ (H₂O), ρ_r (H₂O), and ρ_w (H₂O) vibrations, respectively. The phenolic ν (C-O) band was observed in the region 1250–1282 cm^{-1} in the free ligands HL¹⁻⁴ and (as a moderate to the high band) in complexes A1–A4 Cu-O bonds through hydrolysis. The emergence of ν (Cu-O) at 520–545 cm^{-1} showed coordination via O- phenolic moiety. According to the initial results and micro-analyses, the triazole azo is associated with the Cu(II) ion via N-azo moiety, N-triazole. O-phenolic, the HL₁, and HL₂ act as monobasic tridentate ligands. The chelation centres for the thiadiazole of ligands are the O-phenolic moieties and N- azo moieties, respectively. Thus, the ligands HL₃ and HL₄ act as monobasic bidentate ligands shown in Scheme 2.

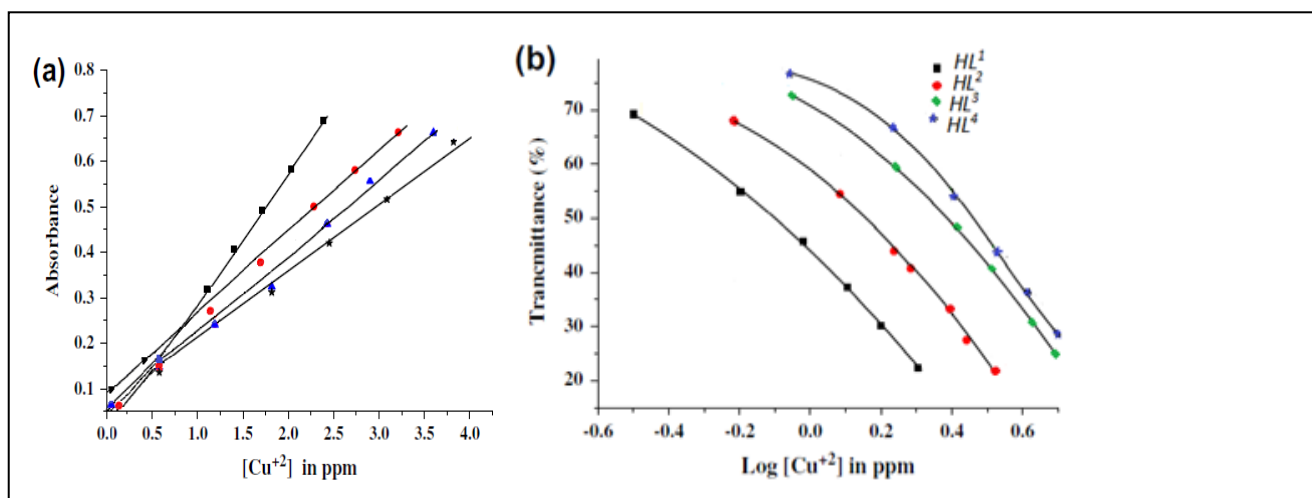

Fig. 3. (a) Beer's law is observed for complexes of (L₁₋₄) with Cu(II). (b) Cu(II) compounds with (L₁₋₄) ringbom plots.

3.4.2. TGA studies of Cu(II)-complexes (A1–A4) were performed, and reasonable degradation was observed. Table 4 illustrates the mass loss, possible shards, and reign of temperatures for all Cu(II)azo- complexes investigated. In addition, the complex A1's thermogram is used to illustrate [Cu L¹(H₂O)]OAC.H₂O is complex. Therefore, complex A1 is used as a reflective thermogram. This complex [Cu L¹(H₂O)]OAC.H₂O thermally disintegrates four steps over a 25–800 °C temperature range. The 1st step takes place at 32.78–151.74 °C with a mass loss estimate of approximately due to the loss of lattice H₂O molecules. The 2nd step occurs within the temperature range 151.74–182.83 °C. It results in a mass loss of approximately 4.17% (calcd. 4.32%) due to the loss of H₂O chelated molecules. Therefore, this stage requires 143.643 kJ mol⁻¹ as activation energy. The 3rd degeneration stage involved losing hetero ring at 182.83–460 °C with an approximated weight loss of 16.75% (calcd. 16.80%). This stage requires 287.543 kJ mol⁻¹ as activation energy. The 4th degradation step responsible for the pyrolysis of the HL¹ molecule with the last CuO remains was the loss of C₁₀H₆, acetate, and N₂ gas within the temperature range 460–700.65 °C with an estimated weight loss of 2.42% (calcd. 52.38%). This stage has 89.4 kJ mol⁻¹ as activation energy. In the neutralization of Horowitz-Metzger and Coats-Redfern. The kinetic and thermodynamic parameters for the stages of thermal degradation were investigated.

Table 4 :Thermochemical analysis (DrTGA and TGA) results for Cu(II) complexes(A1-A4)

Compounds	(TGA)				DrTGA (°C)
	Step	Temperature (°C)	wt. % loss (calcd.)/found	Assignment

A3	1st	30.34–150.63	(4.01)/4.15	Loss of H ₂ O lattice	80
	2nd	150.63– 180.53	(4.21)/4.19	Loss of H ₂ O coordinated	165
	3 rd	180.53– 440	(28.58)/28.79	Loss of hetero ring	240
	4th	440–670.32	(38.87)/38.76	Loss of (N ₂ , C ₁₀ H ₆ , CH ₃ COO)	468
A4	1st	35.42–153.76	(7.27)/7.31	Loss of H ₂ O lattice	85
	2nd	153.76– 186.65	(7.21)/7.18	Loss of H ₂ O coordinated	187
	3 rd	186.65– 430	(26.70)/26.79	Loss of hetero ring	242
	4th	430–680.54	(43.43)/43.55	Loss of (N ₂ , C ₁₀ H ₆ , CH ₃ COO)	486

Coats–Redfern equation: Where α denotes the decomposed fraction, β denotes the rate of heat, The absolute temperature is indicated by T, while the universal gas constant is R., A is the pre-exponential Arrhenius constant, while E_a is the activation energy. Thus, the expression $(AR/\beta E_a) (1-2RT/E_a)$ is nearly constant, as is the value of $(1-2RT/E_a)$.

$$\text{For } n = 1: \log \left[\frac{-\log(1 - \alpha)}{T^2} \right] = \log \left(\frac{AR}{\beta E_a} \right) \left(1 - \frac{2RT}{E_a} \right) - \left(\frac{E_a}{2.303RT} \right) \quad (2)$$

$$\text{For } n \neq 1: \log \left[\frac{1 - (1 - \alpha)^{1-n}}{T^2(1 - n^2)} \right] = \log \frac{AR}{\beta E_a} \left(1 - \frac{2RT}{E_a} \right) - \left(\frac{E_a}{2.303RT} \right) \quad (3)$$

For $n = 1$, a straight line with a slope equal to $(-E_a/2.303R)$ was obtained by plotting $\log(-\log(1-\alpha)/T^2)$ vs. $1000/T$, this can be used to compute activation energy. Moreover, an intercept equal to $\log(AR/\beta E_a)$ can also be used to calculate the Arrhenius pre-exponential factor. For $n \neq 1$, plotting $\log(-\log(1-\alpha)/T^2)$ vs. $1000/T$ provided a straight line with a slope of $(-E_a/2.303R)$, an intercept equal to $\log(AR/\beta E_a)$, and A and ΔE .

Table 5 :Heat capacity of Coats–Redfern and Horowitz–Metzger procedures were used to create complexes.

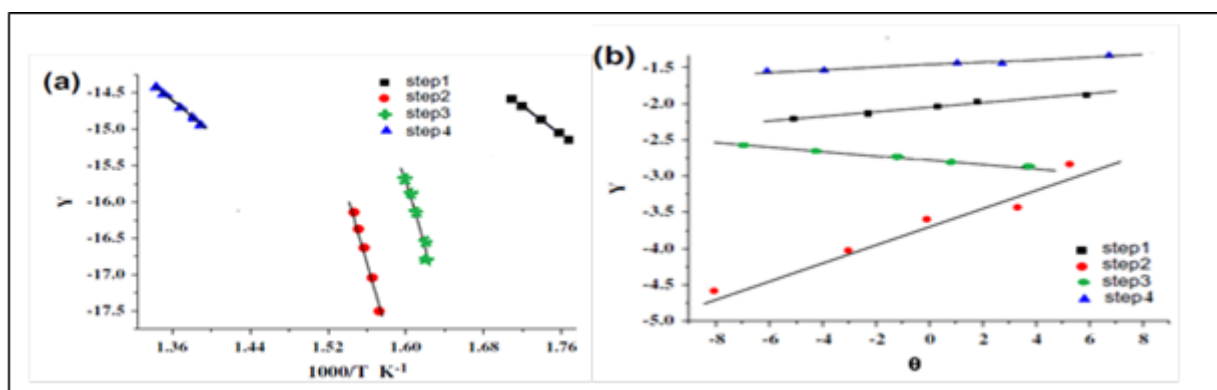

Fig1. (a) Use the Coats–Redfern equation to display $Y = \log(-\log(1-T_2))$ vs. $1000/T$ (k_1) for the different decomposition steps of complex A2. (b) shows the Horowitz–Metzger decomposition of complex A2 using the Horowitz–Metzger equation.

Horowitz–Metzger equation:

$$\text{For } n = 1: \log[-\log(1 - \alpha)] = \frac{E_a \theta}{RT_s^2} \quad (4)$$

$$\text{For } n \neq 1: \log \left[\frac{1 - (1 - \alpha)^{1-n}}{1 - n} \right] = \log \left(\frac{A}{\beta} \frac{RT_s^2}{E} \right) - \frac{\theta E_a}{RT_s} \quad (5)$$

$$\Delta H = E - RT$$

$$\Delta S = R \ln[Ah/KT]$$

$$\Delta G = \Delta H - T\Delta S$$

The findings lead to the following conclusions:

- 1- The activation complexes have more energy data. Second, they demonstrate because of their covalent nature, the investigated compounds are extremely stable.
- 2- The final residue's free energy is greater than the first compound's was revealed by higher than the value of the first compound. Thus, all of the degradation stages are non-spontaneous.
3. With each consecutive level of a complex's breakdown, the data of ΔG increased. Thus, increasing the ΔG data of a complex indicated that the subsequent ligand was being eliminated slower than the primary ligand. Likewise, it was because the data of $T\Delta S$ increase from one stage to the next that overrides the data of ΔH .
4. The ΔS data (-) showed a better ordered complex than a reactant or a sluggish reaction.
5. The endothermic nature of the breakdown process is indicated by the data (+) of ΔH .

6. In Table 5, the approximation method (Horowitz–Metzgar) provided higher kinetic parameter values than the integral method (Coats–Redfern). This is because the obtained data has been subjected to various mathematical approaches

3.4.3. Mechanistic aspects

On the assumption that $g(\alpha)$ is constant, the thermal decomposition mechanism is assigned, that is dependent on the reaction mechanism. According to the Equation, using Satava's nine forms of $g(\alpha)$, the integral approach (Coats–Redfern) was employed to elucidate the thermal decomposition mechanism in each stage.

$$\ln[g(\alpha)/T^2] = \ln(AR/\beta E) - E/RT$$

The significance of the various symbols are well-known: where β is the heating rate, α is the fraction decomposed, T is the absolute temperature, R is the universal gas constant, E is the activation energy, A is the Arrhenius pre-exponential and $g(\alpha)$ is the kinetic mode. As a function of $(1/T)$, the quantity $\log[g(\alpha)/T^2]$ is displayed. For each of these nine forms, as well as the form of $g(\alpha)$, the correlation coefficient was determined. The maximum value for correlation is used as the reaction mechanism. The TGA process was repeated for the Cu(II) complex C1 at various rates of heating, namely 5, 10, and 15 C/min.

At heating rates of 10 and 15 C/min or 5 C/min, respectively, 2 or 3 distinct and the thermal decomposition reaction has well-defined steps. First, the decomposition is analyzed using the Coats–Redfern method. Second, The activation energy (E) and the Arrhenius pre-exponential function were calculated using the slope and intercept (A). Next, the slope and the intercept were used to calculate the activation energy (E) and the Arrhenius pre-exponential (A). Additionally, the outcomes indicated that, except step II, the heating rate increased the thermodynamic functions of activation of the thermal decomposition.

3.4.4. Measurements of magnetic moments and electronic spectra

Cu(II) complexes (A1–A4) influential electronic absorption bands recorded as Nujol mull are shown in Table 3. Magnetic moments exist in complexes of Cu(II). Table 1 proposed square planar organization for complexes A1, A2, A3, and A4. Cu(II) complexes have a magnetic moment. For complexes A1, A2, A3, and A4, Table 1 suggested square planar chelation. Two bands within 15,152–17,786 and 22,342–25,324 cm^{-1} , usually in a square planar geometry location that can be allocated $^2B_{1g} \rightarrow ^2E_{1g}$ and $^2B_{1g} \rightarrow ^2E_g$ respectively, exhibited the Cu(II) complexes spectrum in the solid-state.

3.4.5. ESR spectra

The ESR spectra of Cu(II) complexes (C1–4) were recorded at room temperature (25°C) and are displayed in Table 3. Complex ESR spectra are characterized dx^2-y^2 ground state with type of axial symmetry and monomeric structure, most prevalent for Cu(II) complexes. Cu(II)-azo complexes had two different g data in their ESR spectra. Because the azo and metal ions are covalently bound, all complexes have positive g -data compared to the free electron (2.0023). The $g_{11} > 2.3$ data suggest that the bonding of metal-ligand in the complex is covalent.

Additionally, the expression $G = (g_{11} - 2) / (g_{\perp} - 2)$. If $G > 4$, the exchange interaction is negligible, whereas if $G < 4$, the stable complexes exhibit a significant exchange interaction. The g -data of Cu(II)-complexes with a $^2B_{1g}$ ground state can be expressed as ($g_{11} > g$) by

$$k_{11}^2 = (g_{11} - 2.0023)\Delta_2/8\lambda$$

$$k_{\perp}^2 = (g_{\perp} - 2.0023)\Delta_1/2\lambda$$

$$k^2 = [k_{11}^2 + 2k_{\perp}^2]/3$$

Where k_{\perp}^2 and k_{11}^2 are the components of perpendicular and analogous of the factor of orbital lowering k , the electronic transitions $^2B_{1g} \rightarrow ^2B_{2g}$ and $^2B_{1g} \rightarrow ^2E_g$ are represented by Δ_2 and Δ_1 , respectively. The computed data of k_{\perp}^2 and k_{11}^2 due to $k_{\perp} < k_{11}$, that is convincing proof for the assumed $^2B_{1g}$ state of the ground. The fact that k is lower than the unit shows covalence, which aligns with the conclusion drawn from the g_{11} data. All complexes $k_{\perp} > k_{11}$ had bonding of in-plane π , $k_{\perp} \sim k_{11} \sim 0.77$, which Hathaway claims is significant, and bonding of out-plane π , Hathaway claims is not significant.

3.5. Cu- nanoparticle coordination

Classical coordination chemistry is concerned with metal complexing, chelation numbers, ions, and electronic information structure, efficient charge, coordinating impact, ligands, size, and charges, distribution of charges, orbitals, appropriate for forming a bond with a metal ion, and appropriate for forming metal-ligand

To some extent, these concerns arise, when the chelation object is a spheroidal particle containing 10^3 to 10^5 atoms rather than a single metal ion or several combined ions as (atoms). Only the surface ions (atoms) of a particle will interact with its surroundings (ligands), not the atoms. The ligand of organic- nanoparticle interaction has the same fundamental interactions as the classic metal ion composition: acceptor-donor sites, the electrocution of ions and vacant metal orbitals, and the covalent connection. However, here dispersion interactions and nanoparticle surface spatial screening are far more critical.

The chemical process is copper(II) nitrate reduction with isopropyl alcohol:

According to TEM Fig. 3, the technique yields particles with a size of 20 nm. At 560 nm, the plasmon absorbance. From the ligand absorption spectra in the absence and existence of colloidal Cu^0 nanoparticles at various concentrations.

Fig.2:Transmission electron microscopy image of prepared copper nanoparticles,

We found that as the concentration of colloidal Cu^0 nanoparticles increases, The absorption of ligands (HL_{1-4}) consistently decreases due to ligand adsorption on the surface of Cu^0 nanoparticles as colloidal, a new peak has appeared. Thus, we result in the surface complex's configuration up to where the Cu^0 surface is saturated with ligand molecules.

Concentration There is no increase in the absorption spectrum, as evidenced by the image of TEM.

Equation (6) can be used to compute the equilibrium for complicated composition between azo-ligands and Cu^0 nanoparticles, where K_{app} symbolizes the apparent constant of association (see Scheme 3)

Fig. 3. According to equation of the Hildebrand and Benesi, the reciprocal concentration of colloidal copper nanoparticles coordinated with (HL¹⁻⁴) and the linear dependence of 1/(A_{obs} A₀) on the reciprocal concentration.

Scheme 3. The interactions of L1-4 with the surface of colloidal Cu⁰.

$$K_{app} = \frac{[\text{Azo-ligand} \cdots \text{Cu}^0 \text{ nanoparticles}]}{[\text{Azo-ligand}] \cdot [\text{Cu}^0 \text{ nanoparticles}]} \quad (6)$$

According to Benesi and Hildebrand the variation in the strength of the absorption peak resulting from the surface complex formation was used to calculate K_{app}.

$$A_{obs} = (1 - \alpha)C_0\varepsilon_{\text{azo-ligand}} + \alpha C_0\varepsilon_{\text{complex}}$$

Eq. (7) can be written as Eq (8), where α is the degree of association between Cu⁰ nanoparticles and azo-ligand, The measured absorbance of a solution containing varied concentrations of colloidal Cu⁰ nanoparticles is denoted by A_{obs}, α is the degree of

association between azo-ligand and Cu⁰ nanoparticles, and A_{obs} is the observed absorbance of a solution containing different concentrations of colloidal Cu⁰ nanoparticles. Moreover, α represents the degree of connection between the azo-ligand and the Cu⁰ nanoparticles. The molar extinction coefficients at the given temperature are $\epsilon_{\text{complex}}$ and $\epsilon_{\text{azo-ligand}}$. As a result, in the water Equation (7), Azo-ligand and formed complex wavelengths, respectively, can be written as Equation (8), where A_c and A⁰ denote the complex with a C⁰ concentration and the ligand absorbance:

$$A_{obs} = (1 - \alpha)A_0 + \alpha A_c \quad (8)$$

$$(K_{app}[\text{Cu}^0 \text{ nanoparticles}] / (1 + K_{app}[\text{Cu}^0 \text{ nanoparticles}])). \quad (9)$$

$$\frac{1}{A_{obs} - A_0} = \frac{1}{A_c - A_0} + \frac{1}{K_{app}(A_c - A_0)[\text{Cu}^0 \text{ nanoparticles}]} \quad (10)$$

Based on the strong linear relationship between 1/(A_{obs} - A₀) and the reciprocal, the increase in absorbance was due to surface complex absorption, i.e., donor–adaptor behavior. Colloidal Cu⁰ nanoparticle concentration (stock solution) = 8.46 10⁹ mole HL⁻¹), The intercept is equal to 1/K_{app}(A_c-A₀), while the slope is 1/K_{app}(A_c-A₀) (A_c- A₀). That obtained from this graphic, derives the apparent association constant (K_{app}).

Conclusion

The some heterocyclic azo compounds reaction with Cu(OAc)₂ resulted in coordination. Furthermore, the IR spectra revealed ligands with triazole moiety coordinate with the copper (II) ion tridentately with ONN donor sites. Azo-dyes containing a thiadiazole moiety coordinate with the copper (II) ion and ON donor sites in a bidentate manner. The UV spectra, magnetic moments, conductance, and thermal analysis are used to determine the structure of the complexes. Spectrophotometry is also used to investigate the reaction between the solution of Cu(II) ion and azodyes. We determine the constants of stability and stoichiometry. The findings suggest which the azo dyes under investigation can be used as a spectrophotometric indicator to determine Cu(II) ion. The interaction between azo dyes under investigations and the Cu nanoparticles are regarded. The data of spectral showed the surface complex formation between colloidal copper nanoparticles and azodye ligands by the (OH) anchoring moiety. The prepared copper nanoparticle complexes' stability constant has been calculated.

Özet

Fıstık çamı sert kabuklu bir meyve türüdür ve ekonomik değeri yüksektir. Akdeniz ülkelerinde doğal olarak yayılış gösteren tür, en uygun ve kaliteli yetiştirme koşullarını Kozak Bölgesi'nde bulmaktadır. Kozak Bölgesi fıstık çamı plantasyonları aynı zamanda dünyada özel mülkiyete ait tek fıstık çamı ormanıdır. Bölgedeki devlet ormanları ile iç içedir. Çalışmalar orman işletmeciliği ile koordineli yürütülmektedir. Ürünlerin toplanması ve ağaçların bakımları kontrollü bir şekilde yapılmaktadır. Kozak Kooperatifi bünyesinde çalışmalar yürütülüyor. Köy İdaresi etkili bir otoritedir. Bölge halkının sosyo-ekonomik yapısı elde ettikleri yüksek gelir sayesinde oldukça yüksektir. Kendine özgü bir yapı sergiler. Kadınlar yapı içerisinde önemlidir. Bu çalışmada fıstık çamı yetiştiriciliğinin teknik özelliklerinin yanı sıra bölgenin sosyo-ekonomik durumu ve fıstık çamı plantasyonlarının örnek olma durumu değerlendirilmiştir. Fıstık çamı ağaçlandırmalarının olumlu yönleri ve karşılaşılabilecek olumsuz yönleri tartışılmıştır. Bölgedeki sorunlar tespit edilerek çözüm önerileri sunulmaya çalışıldı. Sorunların çözümünde rol oynayabilecek paydaşlar ve olası iyileştirmeler ve bunların etkileri tartışılmaktadır.

**EVALUATION OF OWNED STONE PINE PLANTATIONS IN KOZAK REGION OF
TURKIYE**

Abstract

Stone pine is a type of hard-shelled fruit and has high economic value. The species, which spreads naturally in Mediterranean countries, finds the most favorable and high-quality growing conditions in the Kozak Region. The Kozak Region stone pine plantations are also the only privately owned stone pine forest in the world. It is intertwined with the state forests in the region. There are a total of 8 villages in the region. The works are organized together with forest management. Collection of products and maintenance of trees are carried out in a controlled manner. Studies are carried out under the Kozak Cooperative. Village Administration is an effective authority. The socio-economic structure of the people of the region is quite high thanks to the high income they earn. It exhibits a unique structure. Women are important within the structure. In this study, the technical characteristics of stone pine cultivation, as well as the socio-economic situation of the region and the exemplary status of stone pine plantations were evaluated. The positive aspects of stone pine plantations and the negative aspects that may be encountered are discussed. Problems in the region were identified and solution suggestions were tried to be presented. Stakeholders who can play a role in solving problems and possible improvements and their effects are discussed.

Keywords: Stone pine, Kozak, Socio-economy, Forest, Rural development

GİRİŞ

Türkiye birçok odun dışı orman ürünlerinin bulunduğu zengin orman kaynaklarına sahiptir. Çam fıstığı, kestane, ardıç, mahlep, safran, funda ve daha birçok çiçekli ve yapraklı türler bunlar arasında sayılabilir. Ülkemizde toplam orman alanı 21.678.134 ha dır. Fıstık çamı orman alanı ise 89.028 ha dır. Ülkemiz orman alanların yalnızca %0,40 fıstık çamı ormanıdır (Anonim 1). Bu ürünlerin değerlendirilmesi ve toplanmasında orman ekosistemlerine zarar verilmemesi; kendi doğal ortamlarının korunarak değerlendirilmeleri önemlidir.

Fıstık çamı altın değerinde bir ağaç olup (Batur 2015), özellikle dünyanın en kaliteli fıstık ağaçlarının yetiştiği Kozak Bölgesinde öne çıkmaktadır. Bu bölgede gelişmeler 1940'lerden sonra hız kazanmıştır. Kozak coğrafik konum olarak Ege Denizi'nin kuzeyinde, Bergama'nın 20 km kuzeybatısında yer almaktadır. Doğuda Madra Dağı, Yaylacık Dağı ve Bezirgan Dağı, kuzeyde Dede Dağı, batıda Eşirik Çayı, güneyde Kozak Çayı (Madra) ve Sakar Dağı ile çevrilidir. Dağların ortasında, Kozak çayının nemli iklimi ile güzel bir mikroklima alanıdır (Batur 2015, Eriz ve ark., 2022).

Kozak bölgesi, Türkiye'nin batısındaki İzmir ilinin Bergama ilçesinin eteklerinde yer almaktadır. Halkı okuryazar olan Kozak, eğitim, nüfus planlaması (doğum kontrolü), ulaşım altyapısı açısından örnek bir bölgedir. Bölge halkının ana geçim kaynakları tarım ve ormancılıktır. Arazinin neredeyse %50'si dik ve taşlık olduğundan ve üretim alanları oldukça dağınık olduğundan hasat makinelerle değil insan emeğiyle yapılmaktadır (Eriz ve ark., 2022). Bölgedeki sınırlı su kaynakları tarımsal üretimi sınırlandırmaktadır (Sülüoğlu, 2004). Fıstık çamı yetiştiriciliğinin yüksek değerli bir orman ürünü olarak yaygınlaştırılması bölgenin kalkınmasına yardımcı olmuştur. Ekonomik getirisi, kolay pazarlanabilirliği, düşük girdi maliyetleri ve yılın yaklaşık yarısında yalnızca küçük bir işgücü kullanılarak hasat edilebilmesi yetiştiriciliğine ilgiyi artırmıştır.

Fıstık Çamının Genel Özellikleri

Fıstık Çamı ağaçlarından kozalak toplama süresi uzundur. Hasat Aralık ayında başlar ve Mayıs ayına kadar sürer. Nisan ortasından sonra sıcaklıkların artmasıyla koniler açılır ve ürün kayıplarına neden olur. Ağaçtan yapılan "keye" adı verilen uzun ucu çengel şeklinde sırkılarla toplama yapılır (Akgül, 2016). Fıstık çamı kozalak hasadı bir meslektir. Toplayıcılar önceki yılların kuruyan ve kesilen dallarının uzantılarını merdiven gibi kullanarak tırmanırlar. Kozalıklara vurarak aşağı indirirler. Sadece 3 yaşındaki olgun kozalakların alınmasına özen gösterilmektedir (Akgül, 2016). Düşen kozalaklar daha sonra kadınlar tarafından toplanarak kurutma alanlarına taşınıyor. Kozalaklar güneş ışığı altında kurur ve kendiliğinden açılır.

Fıstık çamı ağaçlarının tohumları fide üretiminde rahatlıkla kullanılabilir. 20-25 yaşındaki ağaçlar ortalama 50 kozalak verir, kozalak başına 60 gram tohum verimi olur.

Kozalakların Olgunlaşması ve Hasadı

Fıstık çamı büyük bir şemsiyeye benzer ve İngilizcede "Umbrella Pine" olarak bilinmektedir. Uzun boylu ağaçlardır, uzun ömürlüdür (Anonim 4). Kozak bölgesindeki köylüler ürünün olgunlaşmasını bekleyerek uygun dönemde hasat yapar. Bu konuda orman işletme müdürlüğü ile iletişim sağlanmaktadır. Kozalak içindeki meyveler tam olgunlaşmadan hasat izni verilmemektedir. Genellikle Kasım ortasından sonra hasat başlamaktadır.

Fıstık Çamı ağaçlarından kozalak toplama süresi uzundur. Hasat Mayıs ayına kadar sürer. Nisan ortasından sonra sıcaklıkların artmasıyla koniler açılır ve ürün kayıplarına neden olur. Ağaçtan yapılan "keye" adı verilen uzun ucu çengel şeklinde sıırıklarla toplama yapılır (Akgül, 2016). Fıstık çamı kozalak hasadı bir meslektir. Toplayıcılar önceki yılların kuruyan ve kesilen dallarının uzantılarını merdiven gibi kullanarak tırmanırılar. Kozalıklara vurarak aşağı indirirler. Sadece 3 yaşındaki olgun kozalakların alınmasına özen gösterilmektedir (Akgül, 2016). Düşen kozalaklar daha sonra kadınlar tarafından toplanarak kurutma alanlarına taşınıyor. Kozalaklar güneş ışığı altında kurur ve kendiliğinden açılır. Fıstık çamı ağaçlarının tohumları fide üretiminde rahatlıkla kullanılabilir. 20-25 yaşındaki ağaçlar ortalama 50 kozalak verir, kozalak başına 60 gram tohum vermektedir.

Fıstık çamı hasadı ülkemizde geleneksel yöntemle yapılmaktadır. Hasadı yapan kişi hiçbir güvenlik önlemi almadan ağaca tırmanmakta ve keye yardımı ile kozalıklara vurarak düşürmektedir. Fıstık çamı kozalakları makineli hasada uygundur. Hasat platform yardımı ile dalı sarsma şeklinde yapılabilir. Bu şekilde keye ile vurarak verilen zarar önlenir. Aynı zamanda çamkese böceğinin artışı azaltılmış olur (Akgül 2016).

Kozak Bölgesinin Ekolojik Profili

Kozak'ın iklimi, Ege kıyı bölgelerine göre kışların daha sert ve yazların daha sıcak olduğu karasal Akdeniz iklim tipidir. Kozak hem kışın ilk karını hem de baharın ilk yağmurunu görür. Yaz aylarında gündüzler sıcak, geceler soğuk olur. Karasal iklimin karakteristik özelliği olan gece ve gündüz arasındaki sıcaklık farkı burada çok yaygındır. Yaz aylarında gündüzler sıcak, geceler soğuk olur. Karasal iklim hüküm sürmektedir ve gece-gündüz sıcaklık farkı belirgindir. Yaylanın rakımı 500 ile 1.000 metre arasındadır (Sulusoglu 2004). Kozak'ın ana kayası granittir ve toprak bileşimi, kumlu, çakıllı toprakları tercih eden, son derece sert ağaçlı bir bitki olan fıstık çamı'nın yetiştirilmesi için dünyadaki en uygun toprak bileşimidir. Kozak'ın ana bitki örtüsünü karasal Akdeniz ikliminin hâkim olduğu bölgelerde

Çam türleri, fıstık çamları, meşeler ve yabancı armutlar, sulak alanlar ve nehir kıyılarında ise kavak vb. ağaçlar oluşturmaktadır. Eski yıllarda yaylanın batısındaki köylerde yoğun üzüm ekimi, doğu köylerinde ise bahçecilik yaygınken, o zamandan beri her ikisinin de yerini fıstık çamı almıştır (Eriz ve ark., 2022). En geniş ve ürün açısından kaliteli coğrafi dağılımı Anadolu'da bulunur. Portekiz'in doğu kısımlarına kadar uzanan geniş bir yayılım alanı vardır. Batı Anadolu'daki Kozak doğal ormanlık bölgesi özellikle Fıstık Çamlarının yetişip geliştiği bölgedir (Sülüşoğlu, 2004).

Kozak'ta Arazi Mülkiyetinin Oluşması ve Arazi Mülkiyetinin Şahıslara Verilmesi

Ormancılık literatüründe fıstık çamı (*Pinus pinea*), ana orman ağaçları kategorisinde yer alan pinus familyasının bir üyesidir. Orman köylüleri, özellikle Anadolu'nun batı kesimlerinde uzun yıllardan beri Fıstık Çamının faydalarından yararlanmaktadır. Padişah Tapu Kayıtları köylülere ilk kez Osmanlı İmparatorluğu döneminde verilmiştir. Türkiye Cumhuriyeti'nin kuruluşundan sonra ormanlık alan ilk kez 18 Şubat 1937 tarihli ve 3116 sayılı Orman Kanunu'nda şu şekilde tanımlanmıştır: "Kendi kendine yetişen veya insan eliyle yetiştirilen ve herhangi bir fayda sağlayan ağaç ve çalılar topluluğudur. Bir tür orman getirisi veya verimi, habitatlarıyla birlikte orman olarak tanımlanmaktadır." Ancak yasada Fıstık Çamlarına ilişkin özel bir madde veya hüküm yer almamıştır. 1940 kadastro çalışmalarından sonra halkın yoğun talebi üzerine Fıstık Çamları'nın statüsünün belirlenmesine yönelik çalışmalar hızlanmıştır. 1945 yılında yürürlüğe giren 4785 sayılı Devletleştirme Kanunu'nun 2 (B) maddesinde özel fıstık çamı ormanlarının Millileştirme Kanunu kapsamı dışında bırakıldığı belirtilmektedir. Fıstık çamları 8 Eylül 1956 tarih ve 6831 sayılı Orman Kanununda muafiyet maddesinde yer almış ve özel arazilerde yetişmesi veya yetiştirilmesi ve orman şartlarına uygun olması şartıyla ormanlık alan tanımı dışında tutulmuştur.

Fıstık Çamı ormanları ile ilgili özerklikler tanıyan kanun ile ilgili açıklayıcı maddeler:

Tanım yalnızca kanunun yürürlüğe girdiği tarihte şahıslara ait arazilerde olduğu tespit edilen fıstık Çamlarını ilgilendirmektedir; kanun bu toprakların dışında kalan fıstık çamlarını kapsamamaktadır. İlgili bir maddede ayrıca; Türkiye Cumhuriyeti Anayasası'nın 169. maddesinde "1945 yılında devlet ormanları içinde bulunan ve sahibi bulunmayan/bilinmeyen fıstık çamlarının bu tarihten sonra özel mülkiyete dönüştürülmesi kabul edilmez" denilmektedir. Bu durumun gelişmesinde ve kanunlaşmasında Kozak halkının kendi topraklarına sahip çıkmasının, Osmanlı Devleti zamanından bu yana sahalarında düzenli bir bakım yapmalarının ve gelir seviyelerini koruyarak artırmalarının büyük önemi

bulunmaktadır. Bölge halkının eğitimli olmasının da bunda katkısı yadsınamaz. Türkiye’de ve dünyada tek sahipli orman arazisi statüsüne sahiptir (Sülüsoğlu 2004).

Kozak Fıstık Çamı Ormanlarının Yönetim Sistemi

- Kişilerin tapulu arazileri,
- Devlet ormanları

olmak üzere üç farklı arazi mülkiyeti türü bulunmaktadır.

Bölgede tüm ağaç kesimleri orman idaresinden izin alınmak suretiyle kontrollü yapılabilmektedir.

İhracat ve İthalat Durumu

Kozak Bölgesindeki fıstık çamı üretiminin ana dayanağı ihracattır. En fazla fıstık çamı ihracatı yapan ülkeler Çin, Kuzey Kore, Türkiye, Rusya Federasyonu, İspanya ve Portekiz’dir. Türkiye üretiminin önemli bir kısmını ihraç etmektedir.

2021 yılında 34 ülkeye çam fıstığı ihraç edilmiş, İtalya 29 milyon dolarla ilk sırada yer almıştır. İhracat yapılan diğer ülkeler arasında Almanya ve Birleşik Arap Emirlikleri 2. Ve 3. Sırada yer almıştır. Geçmiş yıllarda ağırlıklı olarak AB ülkelerine ihracat gerçekleştirilirken, son dönemde Orta Doğu ülkelerindeki pazar payımız artış göstermiştir (Anonim 2).

Üretilen fıstık çamı kooperatif aracılığı ile veya toptancılara doğrudan satılmaktadır. Üretimin bir kısmı iç pazarlarda değerlendirilirken, üretilen çam fıstığının %85’i ihraç edilmektedir (Anonim 3). Türkiye genelinde 84.809 hektar alanda Çam fıstığı bulunmaktadır. 2022 yılı içerisinde 1.141 ton çam fıstığı üretimi gerçekleşmiştir. TÜİK verilerine göre çam fıstığının son 3 yıldaki ihracat miktarları incelendiğinde ortalama 565 ton çam fıstığı ihracatına karşılık 33.107.813 dolar ülke ekonomisine döviz girdisi sağlanmıştır (Anonim 3).

Fıstık çamı ithalatı son yıllarda artmıştır. 1993 yılından bu yana Çin’den fıstık ithalatı yapılmaktadır. 2000 yılından sonra İtalya, İspanya ve Özbekistan’dan ithalat başlamıştır. Bu durum üreticiler açısından risk oluşturmaktadır.

Kozak Fıstık Çamı Ormanlarında Geçmişten Günümüze Risk Değerlendirilmesi

1920’de yılındaki arazi kayıtlarında bölgede 20.000 hektarlık Fıstık Çamı kaydedilmiş, ancak 1931’de yapılan bir araştırmaya göre on yıldan biraz daha uzun bir süre içinde bu alanlar yarıya inerek yalnızca 10.000 hektar kalmıştır. 1940 yılında eyalet Orman Kadastro Komisyonları ormanlardaki arazi kullanım haklarına ilişkin talepler üzerine 7.486,9 hektarı saf Fıstık Çamı ormanı olmak üzere toplam 9.424,4 hektar Fıstık Çamı ormanı kaydedilmiştir. Kozak’ta Fıstık Çamı yetiştiriciliğinin bugünkü ekonomik değerine ulaşana kadar geçen

yıllarda bölgedeki demir madenleri, ev yapımı amaçlı kesimler, bahçe çiti, ısıtma, odun kömürü üretimi ve endüstriyel amaçlı kesimler; kontrolsüz otlatma gibi amaçlarla Fıstık Çamı ormanları tahrip edilmiştir (Sülüsoğlu 2004).

Kozak'taki madenlerden çıkan duman ve çamur, bölgelerde çevre sorunu oluşturmaktadır. Taş ocaklarında yapılan patlatma işlemleri yeraltı su seviyesinin düşmesine neden olmaktadır. Yüzey örtüsünün bozulması erozyonu şiddetlendirmektedir. Bütün bu faktörler fıstık çamı yetiştiriciliğini olumsuz etkilemektedir. Kuraklık Son yıllarda Kozak ormanlarını tehdit eden en önemli faktörlerden biridir. Ağaç dikim yoğunluğu sorun olmakta, düzgün gövdeler oluşturulamamaktadır. Ürün kalitesi düşmekte ve özellikle devlet ormanlarındaki dikimlerde kalite azalmaktadır (Batur, 2015). Bölgede yangın neredeyse oluşmamaktadır. Oluşsa bile kısa sürede söndürülmektedir. Köylüler bu konuda oldukça hassastır. Kuraklık nedeniyle kozalakların içlerini dolduramaması son yıllarda yaşanan diğer bir problemdir.

SONUÇ VE ÖNERİLER

Depolama koşullarının iyileştirilmesi, standardizasyonun sağlanması ve marka oluşturulmasına yönelik adımlar çok önemlidir. Çam fıstığının işlendikten sonra yarı mamul veya işlenmiş ürün olarak pazarlanması da gelirleri artıracaktır. Reklam ve tanıtım da ihmal edilmemelidir. Kozak modellerine benzer modellerin oluşturulması, ikincil ürünlerde kırsal kalkınmanın yanı sıra Türkiye'nin diğer bölgelerinde Fıstık Çamı üretilen alanlar için de büyük önem taşıyor. Orman köylülerine öncelikli olarak diğer odun dışı ürünlere yönelik eğitimler verilmesi gerekmektedir. "Kozak modeli" bunun için iyi bir anahtar olabilir.

ÖZET

Sumak bitkisinin yaprak ve meyveleri, içerdikleri çeşitli maddelerden dolayı uzun yıllardır ilaç hammaddesi olarak kullanılmaktadır. Sumak yapraklarının antiseptik, ishal ve kan kesici özellikleri ile ateş düşürücü özelliklerinden yararlanılarak enfüzyonu ilaç sanayinde kullanılmaktadır. Hazmı kolaylaştırma ve içeriğinde bulunan tanen ile şeker hastalarındaki şekeri düşürme ve ishali durdurma etkisine sahiptir. Ayrıca sumak boya sanayide kumaş ve derilerin sarı renge boyanmasında değerlendirilmektedir. Baharat olarak meyve ezilerek toz hale getirilir ve yemeklere ekşi bir tat vermesi için kullanılmaktadır. Türün bu geniş kullanım alanları gibi önemli özelliği de deri, boya, tıp ve gıda endüstrisinde yaygın bir kullanım alanının olmasıdır. Ülkemizde birçok tıbbi ve aromatik bitki doğadan toplanmakta ve bir kısmının da belirli ölçüde tarımı yapılmaktadır. Sumak türünün ormancılığımızda ve kamuoyunda hak ettiği konuma ulaştırılması ve beklenen ekonomik, sosyal ve kültürel faydaları yerine getirebilmelerini sağlanması için türün öncelikle ülkemizdeki doğal yayılış alanları, ekolojik istekleri, birlikte bulunduğu türlerle olan ilişkileri ile tohum ve fidan üretim esaslarının daha kapsamlı bilimsel araştırmalarla ortaya konulması gerekmektedir.

THE IMPORTANCE AND USAGE AREAS OF SUMAC (*Rhus coriaria* L.)

ABSTRACT

The leaves and fruits of the sumac plant have been used as pharmaceutical raw materials for many years due to the various substances they contain. The infusion of sumac leaves is used in the pharmaceutical industry, taking advantage of their antiseptic, diarrheal and anticoagulant properties, as well as their antipyretic properties. It facilitates digestion and has the effect of reducing blood sugar and stopping diarrhea in diabetic patients with the tannin it contains. Additionally, sumac dye is used in the industry to dye fabrics and leather in yellow color. As a spice, the fruit is crushed into powder and used to give a sour taste to dishes. An important feature of the species, such as its wide usage areas, is that it is widely used in the leather, dye, medicine and food industries. In our country, many medicinal and aromatic plants are collected from nature and some of them are cultivated to a certain extent. In order to bring the sumac species to the position it deserves in our forestry and in the public opinion, and to ensure that it can fulfill the expected economic, social and cultural benefits, the natural distribution areas of the species in our country, its ecological demands, its relationships with the species it co-occurs with, and the principles of seed and sapling production must be revealed through more comprehensive scientific research.

Keywords: Sumac, Utilization, Culture, Distribution

GİRİŞ

Tıbbi ve aromatik bitkiler tarih boyunca hem tıbbi hemde gıda amaçlı olarak kullanımı ve önemi de gün geçtikçe artmaktadır. Bu bitkilerin kök, yaprak, çiçek ve meyve gibi kısımlarından elde edilen özler tıp alanında kullanılan pek çok ilacın ana maddesini oluşturmaktadır. Ayrıca, bu bitkiler gerek hastalıkların tedavisinde ilaç olarak gerekse beslenme, kozmetik, güzel koku ve tat vermeleri için de kullanılmaktadır (Faydaoğlu ve Sürücüoğlu, 2011). Bu bitkiler tedavi amaçlı işlenmemiş veya işlenerek bir veya daha fazla bitkilerin bileşiminden oluşup insan sağlığına faydalı olabilecek madde ve ürünleri içermektedir. Bundan dolayı tıbbi ve aromatik bitkilerin işlenmemiş, işlenmiş bitkisel ürünler ve şifalı ot ürünleri olarak üç şekilde bulunmaktadır (Van Overwalle, 2007).

Doğa ile iç içe yaşayan insanlar doğayı gözlemlerken, bitkileri nasıl kullanılması gerektiğini öğrenmiş ve deneme yanılma yöntemleri ile bitkilerin faydalı veya zararlı etkilerini inceleyerek günümüze aktarmıştır (Akın, 2022).

Sumak Güney Anadolu'da baharat olarak tüketildiği gibi sumak ekşisi olarak da sıklıkla tüketilmektedir (Tiryaki, 2010). Sumak, sumak ekşisi akıtı ürünleri bölgenin yaprak sarma, lahana sarma, dolma çeşitleri, kaşık salatası, paça, kısır çeşitleri, etli tencere yemekleri, piyaz gibi yemeklerinde sıklıkla kullanılmaktadır. (Çelik ve Özkaya, 2022).

Ülkemizde tıbbi bitkiler doğadan toplama ve kısmen de kültürü yapılarak yetiştirilen bitkilerden oluştuğundan, bu bitkilerin devamlı olarak doğadan bilinçsizce toplanması doğal vejetasyonun bozulmasına, endemik bitki türlerinin yok olmasına ve son zamanlarda önemli bir sorun olan erozyonun artmasına ayrıca neden olabilmektedir (Özhatay ve Atay, 1997).

Sumak (*Rhus coriaria* L.), Anacardiaceae familyasından şifalı ve çok yıllık yabani bir bitki türüdür. Doğal yetişme ortamı olarak ılıman ve tropikal bölgelerde, yol kenarı, yamaç, çalılık ve ormanlık alanlarda kendiliğinden büyüme gösterebilmektedir. Ülkemizin genellikle batı ve güney kesimlerinde bulunmakla birlikte Marmara, Ege, Doğu Anadolu, Güney Doğu Anadolu bölgeleri ve Karadeniz Bölgesinin kıyı kesimlerinde de görülebilmekte ve "titre, somalık, tutum, tatari, tetri, somak" gibi farklı isimlerle de anılmaktadır (Dalby, 2003; Nayeypour ve Asadi-Gharneh, 2019; Rayne ve Mazza, 2007; Ünver ve Özcan, 2006).

Antosiyantinler, doğal olarak renklendirme sağlayan, pek çok meyve, sebze ve çiçeğin rengini kırmızı veya maviye boyayan, özellikle üzüksü meyvelerin renginden sorumlu flavonoid yapısındaki fenolik maddelerdir. Farklı formlarının (pelargonidin, siyanidin, peonidin, delfinidin, petunidin ve malvidin) başka şekerlerle oluşturduğu glikozitler nedeniyle doğada

birçok çeşidi bulunmaktadır (Gradinaru ve ark., 2003). Antosiyaninler sumak meyvelerinde bol miktarda bulunur (AbouReidah ve ark., 2014).

Antioksidanlar, hücreleri hasardan korumak ve vücutta oluşabilecek oksidatif stresi azaltmak için çalışır, serbest radikalleri temizleyerek etkisiz hale getirebilir. Hidrojen atomu vererek veya metalleri şelatlayarak oksidanların etkisini engelleyebilir (Prakash ve ark., 2007). Antioksidanlar, kontrolsüz büyüme sonucu oluşan tümör riskini azalttıkları gibi, hücre yıkım seviyesini düşürdüklerinden ötürü sağlıklı yaşam şansını artırmaktadırlar (Niki, 1987). Bu durum, beslenmedeki daha doğal ve güvenilir antioksidan kaynaklarına yönelik talebi arttırmaktadır.

Sumak bitkisi içeriğinde bulunan organik asit, protein, uçucu yağ, mineral, vitamin ve fenolik gibi bileşikler barındırmaktadır. Bahsi geçen bileşikler farklı alanlarda insan sağlığının iyileştirilmesi yönünden önemli olmaktadır. Günümüzde gıda endüstrisinde öncelikli olarak insan beslenmesinde sentetik bileşiklerin yerini alabilecek antioksidan yeteneği olan bitki bileşenlerine önem verilmektedir. Sumak bitkisi, fenolik bileşiklerden gallik asit ve türevleri bakımından zengin olmasından dolayı güçlü ve önemli bir antioksidan kaynağına sahip olup; meyvelerinin yağ ve yağ asitleri bakımından da zengin olmasından ötürü onu oksidatif bozulmalara karşı daha dayanıklı ve uzun süre saklanabilir hale getirmektedir (Chakraborty ve ark., 2009; Mavlyanov ve ark., 1997; Rad ve ark., 2020; Sakhr ve Khatib, 2020; Karaduman, 2022).

Sumak meyvesin yağ ve yağ asitleri içeriği yönünden zengin olması gıdalarda kullanım açısından değerli kılınacağı düşünülmektedir. Ayrıca, sumakta bulunan yağ, yüksek oranda tekli doymamış yağ asidi içeriğine sahip olduğundan dolayı oksidatif bozulmalara daha dayanıklı ve daha uzun süre saklanabilir özelliğine sahip olduğunu göstermektedir. Bu da sumak yağının, özellikle zeytinyağı ile karıştırılarak salata ve yemeklerde kullanıldığında iyi bir ürün olabileceği ve bu sayede zeytinyağının da raf ömrüne katkı sağlayabileceği ifade edilmektedir (Doğan ve Akgül, 2005; Kızıl ve Türk, 2010).

Sumak bitkisinin sap, yaprak ve kabuklarının yüksek oranda tanen içeriğinden dolayı ipek, deri ve yünlü kumaş boyamalarında değerlendirilmiştir (Güvenç ve ark., 2017; Gezer ve Yücedağ, 2006; Göktürk ve ark., 2006; Güvenç ve ark., 2017). Ayrıca yüksek tanen içeriği açısından sumak özleri ve izolatlarının, gıda kalitesini ve et ve süt gibi ürünlerin oksidatif stabilitesini arttırdığı yapılan birçok çalışmada belirtilmektedir (Batiha ve ark., 2022). Sumak'ın antiviral, antimikrobiyal, antiinflamatuvar ve antioksidan özelliklerinin yanı sıra serbest oksijen radikali temizleyici etkisi, karaciğer hasarına karşı koruyucu etkisi,

antihemolitik, lökopeni ve antifibrojenik etkileri olduğu çeşitli bilimsel araştırmalarla ifade edilmiştir (Singh ve ark.,2007; Ebrahimzadeh ve ark., 2010; Hamdan ve ark., 2017; Alpsoy ve ark., 2019; Hüseyinova ve Mammadoya, 2020).

Halk arasında bitkinin kök ve yapraklarını mide hastalıklarında ve olgun meyvelerini böbrek taşlarını düşürmek için kullanılmaktadır. Ayrıca bitkinin taze yaprakları ise ayakkabının tabanına bırakılarak derideki çatlakları gidermek için, meyvesinin ise çiğnenerek ağız yarası veya mide kramplarında tercih edildiği ifade edilmektedir (Güner, 2012; Tuzlacı, 2006; Tuzlacı 2011). Sumak yaprakları Dioscorides ve İbni Sina tarafından hemoroit, ağız yaraları, ishal, göz hastalıkları, el ve ayak çatlaklarının tedavisi için önerilmiştir. Bu bitki türünün yaprakları ve meyveleri Anadolu'da ağız yaraları ve şeker hastalığına karşı halk arasında yaygın bir şekilde tüketilmektedir (Kurucu ve ark., 1993).

Sumağın vitamin bileşimi ile ilgili yapılan çalışmalarda piridoksin, askorbik asit, tiamin ve riboflavin, siyanokobalamin, nikotinamid ve biyotin bakımından zengin olduğu rapor edilmiştir (Alsamri ve ark., 2021). Kanser araştırmalarına dair yapılan bilimsel raporlar, sumağın tümör büyümesi ve hayatta kalması üzerindeki inhibitör rolüne dair güçlü kanıtlar ortaya koyduğu ifade edilmektedir (Mirian ve ark., 2015).

Yapılan çalışmalarda, sumak tüketiminin insan ve hayvanlarda güvenli olduğu ve yan etki göstermediği rapor edilmiştir (Wu ve ark., 2018).

Sumak meyvesinin olgun meyvelerinin kimyasal özellikleri üzerine yapılan çalışmalarda; taze meyvelerde %2,6 protein içeriği, %7,4 yağ içeriği, %14,6 lif içeriği, %1,8 kül bulunduğu rapor edilmiştir (Özcan ve Haciseferoğulları 2004; Raodah ve ark. 2014).

Türkiye'de sumak meyvesi üzerinde yapılan bir çalışmada, sumak sulu metanol ekstresinin en yüksek verim yüzdesi ve toplam fenolik içeriği (Bozan ve ark., 2003) ve bunun devamında etil asetat ve sulu özütlerde yüksek düzeyde fenolik içerik belirlenmiştir (Raodah ve ark. 2014). Sumağın güçlü bir antimikrobiyal ve antifungal etkisi bulunmaktadır, bu nitelikler sadece terapötik olarak değil, aynı zamanda gıda endüstrisinde de önemli bir yer tutmaktadır ve ürünlerin raf ömrünü artırmak ve kalitesini korumak için sumağın doğal bir koruyucu olarak kullanılması gerekmektedir (Gülmez ve ark., 2006).

Rhus türleri geniş bir kök sistemi oluşturduklarından dolayı yol kenarlarındaki dolgularda, afet sebebi aşınmış sığ olmayan toprakların ağaçlandırılmasında, maden topraklarının iyileştirilmesinde ve diğer iyileştirme amaçlı ağaçlandırmalarda erozyon kontrolü çalışmalarında önem ihtiva etmektedir (Brinkman, 1974; Humphrey, 1983).

SONUÇ ve ÖNERİLER

Sentetik ilaçların oluşturduğu zararlı yan etkilerini en aza indirmek için bitkisel takviyelerin kullanılması gerekmektedir. Sumak meyvesi bitkisel takviye olarak alternatif tıpta, antioksidanlar, flavonoidler ve hidrolize olabilen tanenler içermesinden dolayı kullanılabilir örnek bir bitkidir. Sumak tozunu günlük hayatımızda kullandığımız diğer baharatlarla birlikte tüketmemiz gerektiği söylenilebilir. Devamlı olarak kullanılmasında hiçbir sakınca yokken, sağlık açısından faydaları yapılan çalışmalar ve elde edilen verilerle belirtilmiş olan sumak meyvesinin beslenmemize bulunduğu katkılardan dolayı günlük besin tüketimimizdeki yeri çok önemli olmaktadır.

ÖZET

Turizm endüstrisi, tüm dünya ülkelerinde olduğu gibi, Kuzey Kıbrıs ekonomisinin de mihenk taşlarından birini oluşturmaktadır. Günümüzün modern dünyasında yaşanan teknolojik yenilikler, potansiyel turistlerin aradıkları bilgiye saniyeler içinde ulaşmasını olası kılmıştır. Tüm bu gelişmeler dâhilinde gezginlerin yapacakları seyahatlerden beklenti düzeyleri artmış, amaçları çeşitlilik göstermeye başlamıştır. Bu anlamda alternatif turizm modelleri arasında yer gastronomi turizmi kapsamında yapılan seyahatlere olan ilgi, gün geçtikçe artmaktadır. Kuzey Kıbrıs, yüzyıllar boyunca ev sahipliği yaptığı birçok uygarlığın da etkisinde kalarak gastronomi turizmi kapsamında değerlendirilebilecek çok değerli kültürel miras değerlerine sahiptir. Kıbrıs, sayısız otantik yemeklerinin yanı sıra, kendine özgü içecekleri de kültüründe barındıran bir adadır. Bu yiyecek ve içeceklerden bazıları yüzyıllar boyunca varlığını sürdürmeyi başarmış, kimileri ise unutulmaya yüz tutmuştur. Kıbrıslıların eskiden evlerinde ürettikleri bilinen Sumada, bademden üretilen bir çeşit şerbettir. Eski dönemlerde, kahvehanelerde kahvenin yanında, düğünlerde ikram olarak sunulduğu bilinir. Çalışmada gastronomi turizminin önemi vurgulanırken, adanın gastronomi miras öğelerinden olan içeceklerine değinilmiş özellikle unutulmaya yüz tutmuş olan kültürel içeceği Sumada'ya yer verilmiştir. Ayrıca çalışmada, Kuzey Kıbrıs'a özgü kültürel değerlerden Sumada'nın bir kültürel miras öğesi olarak değerlendirilmesi ve destinasyon markalaşması adına atılacak adımlarda hak ettiği değere kavuşması ve turizme kazandırılması adına önerilerde bulunulmuştur.

Anahtar kelimeler: Kıbrıs, Kültürel Miras, Gastronomi Turizmi, Destinasyon Markalaşması, Sumada

**IMPORTANCE OF GASTRONOMY TOURISM IN DESTINATION BRANDING:
THE CASE OF SUMADA**

ABSTRACT

The tourism industry, as in all countries worldwide, is one of the pillars of the economy of North Cyprus. The technological advancements in the modern world enable potential tourists to access the information they seek within seconds. In light of these developments, travelers' expectations for their trips have increased, and their purposes have become more diverse. In this sense, the interest in travels within the scope of gastronomy tourism, which is among alternative tourism models, is growing day by day. North Cyprus, influenced by many civilizations it has hosted for centuries, possesses numerous valuable cultural heritage values that can be evaluated within the framework of gastronomy tourism. Cyprus is an island that harbors various authentic dishes and distinctive beverages within its culture. Some of these foods and drinks have managed to survive for centuries, while others are on the verge of being forgotten. Sumada, a cultural beverage traditionally made by Cypriots in their homes and derived from almonds, is one such example. In the past, it was known to be served alongside coffee in coffeehouses and offered as a treat at weddings. This study emphasizes the importance of gastronomy tourism and delves into the island's gastronomic heritage, particularly focusing on cultural beverages. The research highlights Sumada, a cultural beverage that is on the brink of being forgotten, as a cultural heritage element specific to North Cyprus. Furthermore, the study offers recommendations for Sumada, as a cultural heritage element unique to North Cyprus, to be valued and integrated into tourism initiatives to enhance destination branding.

Keywords: Cyprus, Cultural Heritage, Gastronomy Tourism, Destination Branding, Sumada.

Giriş

Gastronomi kelimesi, anlam olarak Yunanca mide anlamına gelen “gastro” mide ve kural, yasa anlamında kullanılan “nomos” kelimelerinin birleşmesinden oluşmuştur. Günümüzde bir bilim dalı olan gastronomi, antropoloji, sosyoloji, ekonomi, kimya, ziraat, çevre-bilim, tıp bilimleri ve özellikle turizm gibi çeşitli bilim dallarıyla etkileşim halindedir (Göker, 2011). Gastronomi sadece bir yemek kültürünü ifade etmenin ötesinde, yeme-içme ile ilgili tüm kural ve normları ifade eder ve kültür, tarih, yetenek ve tecrübe ile harmanlanmıştır (Aksoy, 2015). Bunun dışında gastronominin kültürlere ve bölgelere ait yerel ürünler, yaşam tarzı, örf adet ve geleneklerle de şekillendiği söylenebilir. Bu nedenle gastronomi kavramı kültür ve gelenekleri, özgünlük, sürdürülebilirlik ve turizm anlamında ise farklı deneyimleri içerdiğini söylemek yanlış olmaz. (Küçükömrler, Şirvan, Sezgin, 2018).

Turizm sektörü, ekonominin diğer sektörleriyle yakın ilişkilidir; birbirlerinin faaliyetlerini karşılıklı olarak desteklerler. Dünya genelindeki önemi göz önüne alındığında istihdam konusunda önemli bir rol oynadığı ve işsizliği azaltarak diğer sektörlerden fazla işgücünü çektiği açıktır (Nica, 2011).

Gastronomi turizmi, seyahatinde tamamen veya kısmen yerel ürünleri tatmak veya gastronomi ile ilgili etkinliklere katılmak amacıyla turizm faaliyetinde bulunan turistler ve ziyaretçiler için oldukça önemli bir kavramdır (Gheorghe, Tudorache, Nistoreanu, 2014).

Bir bölgeye ait bitkiler ve bu bitkilerin yerel halk tarafından kullanım şekli, somut olmayan kültürel miras kapsamında değerlendirilir. Günümüzde bölgelere ait geleneksel yiyeceklerin genellikle kırsal bölgelerde olmak üzere özellikle de bölge kültürünü yansıtan törensel gün ve gecelerde yapılarak korunduğu görülmektedir. Kültür turizmine ağırlık veren bölgelerde ise bu yiyecek ve içecekler ziyaretçilerin ilgisini çekmek amacıyla restoranlarda sunulmaktadır (Sorcaru, 2019) Gastronomi turizmi, alternatif turizmin önemli bir parçasıdır ve özellikle bu bağlamda gastronomi öğeleri, Avrupa'da fuarlar ve festivallerde yoğun bir şekilde tanıtılmaktadır. (Kendir, Güvenç, 2010).

Günümüz teknolojisinin etkisiyle, turistler, aradıkları bilgiye saniyeler içinde ulaşmakta ve ilgi alanları doğrultusunda daha fazla seyahat etmektedirler. Bu anlamda daha deneyimli oldukları ve seyahat etmek için daha fazla bütçe ve boş zaman ayırdıkları görülmektedir. Yoğun iş hayatı insanları turizm aracılığıyla, günlük rutinlerinden kaçabilmeleri ve özgürlüklerini hissederek yeni bir dünyaya kısa süreliğine de olsa dalabilmelerine olanak tanır. Bu bakış açısıyla gastronomi turizminin, bu kapsamındaki faaliyetler ile bölge ekonomisinin gelişmesinde önemli bir paya sahip olduğu söylenebilir.

Geleneksel otantik yiyecekler ve içeceklerin şüphesiz turistik çekicilikleri yüksektir. Daha önemlisi, yıl boyunca yüksek sezona ve hava durumuna bağlı olmadan ziyaretçilerin kullanımına sunulur. Belirli meyve veya bitkilerin yalnızca belirli dönemlerde taze yiyeceklerde ve içeceklerde kullanıldığı bazı durumlar olmasına rağmen, yiyecekler ve özellikle içecekler genellikle tüketilmeden önce uzun süre saklanabilir veya korunabilir. Bununla birlikte unutulmamalıdır ki geleneksel yiyecek ve içecekler, günümüzde turistlerin aradıkları otantik bir deneyimlerin önemli bir parçasıdır (Sorcaru, 2019).

Günümüzde bireyler, ziyaretler konusunda hızlı bir arayış geliştirmiş gibi görünmektedir. Dünyada ziyaret yerleri, adalar, deniz kenarı şehirler, ünlü tarihleri olan yerler, çeşitli doğal özellikleri veya rezervleri sergileyen destinasyonlar, politik istikrarsızlık yaşayanlar ve genellikle tamamen farklı kültürlerle sahip olanlar gibi stratejik bazı değişkenlere sahiptir. Bu nedenle, ziyaretçilerin belirli bir destinasyonu seçmeleri şaşırtıcıdır. Öte yandan, medya ve reklamcılık, ziyaretçilerin zihinleri üzerinde güçlü bir etkiye sahiptir. İnsanlar, pazarlamacılar tarafından tasarlanan çeşitli görüntülere maruz kalarak, belirli yerler ve sunulan ürünler ile etkilenirler. Görseller, insanlara o kadar çok gösterilmektedir ki bu durum, onların asıl istekleri olmayan bir ilgi geliştirmelerine neden olmaktadır (Ekonde, 2010). Bu anlamda destinasyon markalaşması ve tanıtım, bölge kültürlerini tanıtmada ve turizm ekonomisine kazandırmada çok önemli bir faktör olarak karşımıza çıkar.

Bazı görüşlere göre adını adada yetişen kına çiçeği bitkisinden (Kypros) aldığına inanılan Kıbrıs adası başka görüşe göre adını sahibi olduğu en önemli yer altı zenginliklerinden olan bakır madeninden (Lat. cyprum / cuprum) alan (Gürsoy, 2002) Kıbrıs adası, tarih sahnesine çıktığı dönemden itibaren birçok uygarlığa ev sahipliği yapmıştır. Adanın ismi Mısır ve Hititliler tarafından Alasya ve Asi, Fenikeliler tarafından Hettim, Asurlular tarafından ise Yatnana olarak anılmıştır (Akçay, 2018,138).

Dünyanın sekseninci (<https://vividmaps.com>), Sicilya (25710 km²) ve Sardinya'dan (24090 km²) sonra Akdeniz'in üçüncü büyük adası (9251 km²) olarak karşımıza çıkmaktadır. (Koday, 2010, s. 17). Adanın komşuları kuzeyinde Türkiye (70 km), doğusunda Suriye (102 km), ve Lübnan (165 km), güney doğusunda İsrail (233 km), güneyinde Güney Kıbrıs Rum Yönetimi ve Mısır (347 km), kuzey batısında ise Yunanistan (835 km) olarak sıralanabilir (KKTC Enformasyon dairesi, <https://pio.mfa.gov.ct.tr>). Jeopolitik önemi itibarıyla birçok devletin hükümdarlığına katmak istediği adanın ele edilen bilgilere göre Hititlerden günümüze kadar en az on beş kez el değiştirdiği bilinmektedir (Mor, Çitçi, 2011, s.227). Milattan önceki yıllardan günümüze kadar gelen tarihi süreç içinde Mısırlılar, Hititler,

Fenikeliler, Asurlar, Persler, Makedonyalılar, İyonyalılar, Ptolemeler, Romalılar, Bizanslılar, Lüzinyanlar, Venedikliler ve Osmanlılar uzun veya kısa süreli adanın sahibi ve yöneticileri olmuşlardır (Özyürek, Karamanoğlu, Özler, Selçuk, Taş, Beratlı, Gergin, 2014, s. 2). Bahsi geçen uygarlıklara yüzyıllar boyunca ev sahipliği yapmış olan adanın, bu uygarlıkların kültürlerinden, örf ve adetlerinden, değerlerinden, dilinden, dini adetlerinden, yiyecek ve içecek alışkanlıklarından veya mimarisinden etkilenmemesi mümkün görünmemektedir. Bu anlamda adanın, bir medeniyetler beşiği olarak bir çok kültürü bünyesinde barındırdığını, kendine has ada kültürünü oluştururken, ev sahipliği yaptığı medeniyetlere kendi kültürünü sunmanın yanında, hakimiyeti altına girdiği uygarlıklarında kültürlerinden etkilenmiş olduğunu söylemek yanlış olmaz (Özerden, Ilgaz, 2022). Bu kültürel değerlerin belki de başında gastronomi kültürü gelmektedir. Ada halkı yüzyıllar boyunca birlikte yaşadığı uygarlıkların yiyecek ve içecek kültürlerinden kendi karakteristik yapısına uygun olanlarını içselleştirmiş ve kendi kültürünün bir parçası haline getirmiştir. Fakat ne yazık ki bazı kültürel değerler zamanla yok olmaya yüz tutmuştur. Bunların en çarpıcı örneklerinden biri yerel bir içecek olan sumadadır.

Çalışmada, Kıbrıs adasının gastronomi kültürüne ait yerel içeceklerine değinilmiş, özellikle de unutulmaya yüz tutmuş içeceklerden sumadanın kullanım şekli ve kullanıldığı alanlar araştırılmış, gastronomi turizmi anlamında değerlendirilmesi ve somut olmayan kültürel miras kapsamında hak ettiği değeri kazanması adına görüş ve önerilere yer verilmiştir.

Kıbrıs Gastronomi Kültürü Değerleri Kapsamında İçecekler

Daha önce de değinildiği üzere Kıbrıs, tarih sahnesine çıktığı günlerden günümüze kadar gelen süre zarfında birçok uygarlığa ev sahipliği yapmıştır. Bu süreçte kendi kültürünü hâkimiyeti süren medeniyetlere taşıırken aynı zamanda bu medeniyetlerin kültürlerinden de etkilenmiştir. Son yüzyıla bakıldığında, adanın yaşayan yerel iki toplumu olan Kıbrıslı Türkler ve Kıbrıslı Rumlar arasında yaşanan savaş, 1974 yılında sona ermiş, yapılan nüfus mübadelesine göre Güney Kıbrıs'ta yaşayan Türk halkı kuzeye, kuzeyde yaşayan Rum halkı da adanın güney kısmına göç etmek durumunda bırakılmıştır. Savaş sonucu göçmen durumuna düşen halk, farklı farklı köylere yerleştirilmiştir. (Koday, 1995). Her ne kadar adanın genel kültürü Kıbrıslı Rumlar ile Kıbrıslı Türkler açısından büyük benzerlikler gösterse de bölgesel anlamda bazı farklılıkların olduğu bilinmektedir. Yerleştirildikleri köylerde 1974 yılından itibaren hayatlarını idame ettirmekte olan her iki bölge halkı, beraberlerinde getirdikleri bölgesel kültürü de yerleştirildikleri yeni yerleşim yerlerinde yaşatmaya çalıştıkları görülmektedir (Adalier, 2020).

Kıbrıs Şarabı

Yapılan çalışmalara göre tarihi bulgular, (Bozkurt, 2011; Şah, 2017; Sadrazam & Öznur, 2013) Kıbrıs'ta üzüm yetiştiriciliğinin çok uzun bir geçmişi olduğunu göstermektedir. Halk arasındaki yaygın söylence ise Kıbrıs adasının yüzyıllar boyunca şarap adası olarak bilindiği yönündedir. Hatta Osmanlı İmparatorluğunun padişahlarından II. Selim'in 1571 de adayı fethetme sebebinin adada yetişen mükemmel nitelikteki şaraplar olduğu halk arasında söylenegelen efsanelerdendir. Yapılan arkeolojik kazılar ile adada bağcılık ve şarap üretiminin M.Ö. 2000 yıllarına dayandığı, hatta bu üretim sayesinde, deniz aşırı ülkelere gemilerle ihracat yapıldığı ortaya çıkmıştır. Romalıların adaya hâkim oldukları dönemde şarap üretiminin var olduğu bilinir. Şu an Kıbrıs'ın güneyinde yer alan Güney Rum Kesiminde yapılan arkeolojik kazılarda, M.Ö. III. yüz yıl ile tarihlenen paralar bulunmuştur. Bu paraların üzerinde asma yaprağı baskısının bulunduğu resmi kaynaklarda yer almaktadır. (Şah, 2017; Altan, 2016). 1200 yılının ikinci yarısında adanın en önemli şarabını tadan Fransız Kralı Philippe Augustus Commandaria şarabını “*Kralların şarabı, şarapların kralı*” olarak nitelendirmiştir. Kıbrıs'ta üretilen şaraplar arasında öne çıkan “Commandaria” isimli şarap Kıbrıs'ta üretilmiş, Kıbrıs'ın ilk şarabı olarak bilinir ve 1947 yılında Guinness rekorlar kitabında yer almıştır (Şah, 2017;Altan, 2016).

Zivanya

Kıbrıs adasına özgü bir diğer içecek ise zivaniyadır. Üzümünden elde edilen zivaniya, saf spirtodur. Soğuk kış günlerinde “bodiri” olarak isimlendirilen küçük bardaklarda servis edilir. Aynı zamanda vücut ağrılarının giderilmesi amacıyla medikal alanda da kullanılır. Kıbrıs halkı, vücudun ağrıyan yerlerini, özellikle gripal enfeksiyondan kaynaklanan ağrılarda zivaniya ile ovarak ağrıdan kurtulma yolunu seçerler. Renksiz ve berrak bir içkidir. Kuzey Kıbrıs'ta içki üretimi yarı resmi ve özel kuruluşlar tarafından yapılmakta ve 70cl ile 35 cl olmak üzere iki farklı hacimde içki şişeleri içinde satışa sunulmaktadır (Altan, 2016). Alkol derecesi çok yüksek olan bir içecek olmasından dolayı adanın İngiliz hâkimiyetinde olduğu dönemde kısa bir süreliğine de olsa evde yapılması yasaklanmıştır. Sıkılıp suyu alınan üzüm posası, kaplara konularak yaklaşık iki hafta bekletilir. Daha sonra zivaniya kazanlarına konularak kaynatılır. Kaynayan ve buharlaşan alkol, suyun içindeki borudan geçerken soğur ve damıtılır. İlk çıkan zivaniyanın alkol derecesi çok yüksek olduğundan, içilmez ve daha çok dezenfektan olarak kullanılır (Yeniasır, Gökbulut,2020).

Cyprus Brandy (Kapsula, Anglia, 31)

Kıbrıs halkının günümüzde hala tüketmekte olduğu bir diğer içecek ise bir çeşit konyak olan Otuzbir'dir. Halk arasında aha çok Otuz bir, Kapsula, Anglia ya da Kıbrıs Brandy'si olarak isimlendirilen bu içeceğin kullanımı oldukça yaygındır.(KK1). Bodiri diye adlandırılan küçük bardaklarda içilen konyaklar, Kıbrıs Türklerinde meyhane kültürünün en önemli parçalarından biridir (Şah, 2017, s. 15).

Güllü Süt ve Gül Şerbeti

Gül şurubu, Kıbrıs'ta özellikle sıcak yaz gecelerinde serinlemek için içilen geleneksel içeceklerdendir. Gül şurubu, geçmiş yıllarda Kıbrıslı hanımlar tarafından evlerde yapılarak, buzdolabında muhafaza etmekteyken günümüzde daha çok marketlerden hazır olarak bulunmakta ve temin edilmektedir. Ayrıca Kıbrıs kültürünün bir parçası olan gül şurubu günümüzde hem kahvehanelerde tüketilmekte hem de evlerde ikram edilmektedir. Güllü süt ise günümüzde de varlığını koruyan bir içecek olup, gül şurubu ile sütün karıştırılması ile elde edilir. Özellikle çocuklarına sütü sevdirmeyi amaçlayan anneler tarafından kullanılır. Tadı farklılaşan ve rengi pembeleşen süt, Kıbrıslı çocuklar tarafından bolca tüketilmektedir (Yeniasır, Gökbulut, 2020).

Bir Kültürel Miras Değeri Olarak Sumada

Sumada, Kıbrıs Türklerinde özellikle kahvehane kültürünün önemli bir parçası olarak dikkat çekmektedir. Acı bademden yapılan sumada, günümüzde özellikle kış gecelerinde tüketilen sıcak bir içecektir. (Şah, 2017, s. 342). Kahvehanelerin dışında soğuk kış gecelerinde, insanların birbirlerini ziyaret ettiklerinde sunulan sumada, aynı zamanda sosyalleşmenin de önemli bir aracı konumundadır (Yeniasır, Gökbulut, 2020).

Tarihi, Roma dönemine kadar uzanan ve özellikle 1364 yılında Polonya'da düzenlenen Kraków Kongresi'nde Kıbrıs Kralı I. Peter tarafından Polonya Kralı Büyük Casimir'e egzotik bir lezzet olarak verilmiş olan sumada (Dembinska, 1999), başta Kıbrıs adası olmak üzere birçok Akdeniz adasında (Sakız Adası, Girit, Nisiros, Andros, Sifnos, Kithira ve Lefkad) nişan ve düğünlerde ikram edilen geleneksel bir içecektir. Yunanistan'ın Sakız ve Nisiros adalarında benzer bir şurup soumáda (Yunanca: σουμάδα) olarak bilinmekte ve kullanılmaktadır. Farklı bir formu Malta'da "ruġġata" adıyla bilinir ve badem ve vanilya özünden yapılır. Ayrıca içine tarçın ve karanfil eklenir (<https://www.tasteatlas.com>). Özellikle Girit adası, sumadayı destinasyon markalaşmasında ileri seviyeye taşımış ve Girit geleneksel içeceği adı altında "Girit Badem içeceği-Soumada" olarak tanıttıklarını yapmaktadır. (<https://cretashop.gr/>, <https://www.uniquecreta.com>)

Yapılışı: Kabukları kırılan bademler, iç kabuklarının kolayca çıkarılabilmesi için sıcak suda bekletilir. İç kabukları soyulan bademler, havandan dövülür. Bir tencere içine bir litre su, bir kilogram şeker, yarım limon suyu eklenerek kaynatılır ve şurup hazırlanır. Ardından dövülmüş bademler hazırlanan şurubun içine eklenir. Kısa bir süre kaynadıktan sonra bademlerin tüm aromasının şuruba geçebilmesi için en az yirmi dört saat, en fazla ise kırk sekiz saat bu şerbetin içinde bekletilir. Şerbetin içinde bekletilen bademler süzülür ve kalan şerbet şişelere doldurulur. Konsantre olarak şişelenen sumada, içilmek için hazırdır. Konsantre bir içecek olduğundan sunumu için kullanılacak bardağa bir parmak kadar koyulan sumadanın üzeri sıcak servisler için sıcak su ekleyerek ve üzerine tarçın serpiştirilerek hazırlanır. Sıcak yaz gülerinde soğuk sunumu da yapılabilen sumada için elde edilen konsantre, bardağa yine bir parmak kadar koyulduktan sonra üzerine soğuk su ve buz eklenerek servis edilir (Altan, 2021, <https://www.google.com>, Özçil, A. & Özçil, İ.E, 2019). Bir enerji deposu olan sumadanın sağlık açısından çok sayıda faydası vardır. İçerdiği potasyum normal kan basıncının korunmasına yardımcı olurken, magnezyum içeriği ise tükettiğimiz besinlerin enerjiye dönüştürülmesine ve krampların önlenmesine etki eder. Aynı zamanda bir antioksidan olan E vitamini ve bağışıklık sisteminin işleyişine ve tiroid metabolizmasına yardımcı olan selenyum da içerir (<https://gastronomytours.com>).

Sonuç ve Öneriler

Alana özgü çalışmalar araştırıldığında, maalesef Kuzey Kıbrıs'ta sumada ile ilgili yeterli sayıda yayına rastlanamamıştır. Yapılan yazın taramasında sumada da dahil olmak üzere Kuzey Kıbrıs'ın içecek kültürüne ait bir tek çalışma göze çarpmaktadır. Yeniasır ve Gökbulut (2020) tarafından yürütülen bu çalışmanın sonuçlarına göre, Kıbrıs Türk kültüründe sosyal hayatın önemli bir parçası konumunda bulunan bazı içecekleri halk, adaya özgü olarak kabul edip sahiplenirken (limonata, Neskafe, sütlü çay, kefir),bazıları ise (güllü süt, gül, şerbet, sumada) günümüzde popüler kültürün etkisiyle unutulmaya yüz tutmuştur.

Kültürel miras öğeleri bir toplumun kimliği, karakterini ortaya koyan öğeleri içerir. Somut ya da soyut olsun, bu mirasa gereken önemin verilmemesi ve zamanla unutulması o toplumu toplum yapan kimliğinin yok olmasında önemli faktörlerden biri olarak karşımıza çıkar. Bu anlamda Kıbrıs'ın gastronomi kültürel mirası öğelerinden sumadanın hak ettiği değeri koruması ve ileriki kuşaklara aktarımı konusunda bazı önlemler alınabilir. Buna göre; öncelikle Kuzey Kıbrıs'a ait gastronomi miras öğelerinden içeceklerin envanteri çıkarılmalıdır. Bu envanter ile unutulmaya yüz tutan içecekler belirlenerek tanıtım faaliyetleri arttırılabilir. KKTC Başbakan Yardımcılığı Turizm Kültür Gençlik ve Çevre Bakanlığı

önderliğinde, Kıbrıs Türk Oteciler Birliği (KITOB), Kıbrıs Türk Restorancılar Birliği (Res-Bir)'in, ve akademisyenlerin bir araya gelerek gastronomi miras öğelerinin korunması adına yapılacak çalıştaylar ve bu çalıştaylarda belirlenecek yol haritaları oldukça faydalı olacaktır. Kuzey Kıbrıs'ın kültürel mirasını oluşturması ve bu mirasın öncelikle çocuklara aktarılması kapsamında sumada, çocuklara okullarda ikram edilebilir ve farkındalık sağlanabilir. Kuzey Kıbrıs'ın kültürüne ait içecekler okulların müfredatına eklenebilir. Üniversitelerin bünyesinde açılacak gastronomi yarışmaları ile sumada ile hazırlanacak alkollü ve alkolsüz içecekler yarışması düzenlenebilir ve kazanan ürün Kuzey Kıbrıs'ın tanıtım içeceği olarak festivallerde ve yurt dışı fuarlarında tanıtılabilir.
